Interest group: SIG 11 - Teaching and Teacher Education

Resilience is an important factor that helps teachers deal with the challenges they encounter. But how, in teacher education, can we already address the topic of resilience? We developed an educational board game 'FLORERAAR?! that focuses on making (future) teachers more aware of their own resilience and how to develop their resilience. The board game addresses five different themes: understanding resilience, enhancing your social-network, the importance of well-being and self-care, taking initiative in your own professional development and emotion regulation before, during and after teaching. In our workshop, we would like to introduce the board game and focus on two aspects: experiencing what it is like to play the board game and discover how as an educator you might use this game in your own programme. For the first part, the main goal is for participants to become aware of the importance of resilience and know what resources and strategies they can use to increase their resilience. After a short introduction, participants will start working with the theme of resilience in a creative and educational way by playing the board game in small groups. The board game will help participants think about their own resilience while sharing experiences with each other. During the second part of the workshop, we would like to discuss our experiences of using the board game with both students and teacher educators in our own teaching programme, and talk about how the board game can be used in participants own contexts.

FLORERAAR?! A board-game to enhance (pre-service) teachers' resilience

ICT Demonstration
Learning and Social Interaction

Designing technology to support multimodal dialogue and participation: the third generation Talkwall

Keywords: Computer-supported Collaborative Learning, Dialogic Pedagogy, Educational Technologies, Social Interaction
Interest group: SIG 10 - Social Interaction in Learning and Instruction

Please bring your own device if you are attending this ICT demonstration.Aligned with an appropriate pedagogy, dialogue and digital technology can interact to enhance learning in various ways (Major et al., 2018). This demonstration will introduce participants to Talkwall, a free-to-access, cloud-based micro-blogging platform that has been developed through a process of systematic design-based research over the past decade. Talkwall has been designed to encourage students to engage and share their developing ideas, support multimodal dialogic interaction and promote student participation. Participants can use their own mobile/computing devices to experience Talkwall. They will also be introduced to concrete examples of Talkwall-supported dialogic lesson designs, including teacher and student support materials. During the session, the intention is to build on the attendees' rich experience using related pedagogical and technological designs, and audience comments will be collated using Talkwall. Finally, options for future large-scale deployment will be explored. Please note, this demonstration does not require participants to sign up to be able to use Talkwall. Additionally, there is no need for participants to install any software, as the system is accessible through standard web browsers available on PCs, smartphones and tablets. Talkwall is freely available in English and Norwegian at www.talkwall.uio.no .

Session J 1

24 August 2023 14:45 - 16:15
UOM_A03
Invited Symposium
Learning and Social Interaction

Aesthetic experience as a tool for learning and development

Keywords: Art Education, At-risk Students, Competencies, Cooperative/Collaborative Learning, Creativity/Divergent Thinking, Developmental Processes, Digital Literacy and Learning, Emotion and Affect, Engagement, Higher Education, Inclusive Education, Lifelong Learning, Qualitative Methods
Interest group: SIG 10 - Social Interaction in Learning and Instruction
Chairperson: Laure KLOETZER, Switzerland
Discussant: Antonio Iannaccone, University of Neuchâtel, Switzerland

This invited symposium of SIG 10 builds on previous discussions at EARLI conferences on arts-based methodologies and social interactions for learning and development. In this symposium, we will focus on aesthetics as a tool and trigger for learning and development, through an analysis of the social interactions at play. The symposium discusses the following questions:How can the concept of aesthetic experience be useful to understand learning and developmental dynamics in diverse projects?How is the aesthetic experience of the participants being used in these projects, and what are the results of this?What are the institutional and curricular implications of these pedagogical investigations into the field of aesthetics?The four papers will define aesthetic experience and operationalise it in specific contexts. The first paper (Italy) reports on a long-term experience of intervention with arts-based projects for teenagers who have dropped out of school. The second paper (USA) analyzes choice poetics in a interactive digital narratives workshop as a space for the intersubjective construction of culturally-diverse university students. The third paper (Switzerland) investigates multimodality as semiotisation of the aesthetic experience in undergraduate and graduate university courses in Switzerland. The fourth paper (France) explores the developmental dynamics of the use of arts as a way to reflect on and express one's professional career in a program for professionals transitioning to retirement.

"SIC EST": THE ARTEDUCATION OF MAESTRI DI STRADA VIDEO-NARRATED BY A GROUP OF ADOLESCENTES
Presenting Author:ELISABETTA FENIZIA, University of Naples Federico II, Italy; **Co-Author:**Filomena Carillo, Non-profit Association Maestri di Strada, Italy; **Co-Author:**Santa Parello, University Federico II of Naples, Italy

Italy is among the European countries with the highest school drop-out rates. It is well known that extra-curricular activities can foster dropout recovery, strengthening engagement and social ties. The non-profit Association Maestri di Strada (MdS) carries out educational projects in the suburbs of Naples to combat educational wastage, social marginality and deviance, using arteducation and storytelling as devices. MdS organises theatre, music and visual arts workshops, in which around 100 adolescents at psycho-social risk participate every year. Art and beauty enable adolescents who experience school and their neighbourhood as a senseless and painful experience to feel that they are the subjects of their own growth in a shifted and protected space, where they can mend their ties with society. This contribution presents the stages of a work aimed at documenting, narrating and evaluating the art workshops in terms of their impact on the development of a group of adolescents. It was in itself a process of shared artistic creation. In a first step, focused video-recorded narrative interviews were conducted with 13 adolescents who took part in the workshops. From this corpus, subjected to categorical analysis, 5 macro-themes emerged: Outer and Inner Suburbs - Street School - Ties and 'heavy blows' - Arts and Crafts: turning pain into beauty - Sic Est: the time for storytelling. Starting from these macro-themes, a documentary film, *Sic Est*, was elaborated and edited, which was finally presented to the local educational community and to several social film festivals, where it received positive feedback and awards.

Semiotising the aesthetic experience in education: multimodality in students' diaries
Presenting Author: Ramiro Tau, Ecole Polytechnique Fédérale de Lausanne (EPFL), Switzerland; **Co-Author:**Laure KLOETZER, Institute of Psychology & Education, University of Neuchâtel, Switzerland

In this paper, we investigate the contribution of aesthetic experience to learning in Higher Education, based on the analysis of three university courses making

use of performing arts as a pedagogical tool. The two problems we will address are: what is an aesthetic experience for the students, and what are their potential benefits. Personal diaries and students' final reports were used as an instrument for reflecting on the experience of the course. Using a qualitative analysis of content of these diaries, we explore different dimensions of the educational experience. One of the distinctive features of these diaries is their multimodality. Indeed, they do not contain exclusively narrative textual content, but also poetry, textures, collages, drawings, small objects, images, references to music and online audio-visual materials, etc. The richness of multimodality seems to account for a quest to semiotise the students' experience, that is highly ineffable. We will show examples of these uses and identify three uses of multimodality: a) as a strategy to render the aesthetic experience intelligible and circumscribe it, b) as a resource to account for the inseparability between intellectual understanding and aesthetic experience, c) as a resource to become aware of an essentially aesthetic activity. From these results we will try to contribute with empirical evidence to a non-dichotomous semiotic and axiological aesthetics for learning sciences, and we intend to contribute to the field of curriculum design by offering elements to consider the aesthetic possibilities offered by multimodality especially in the field of course assessment.

Choice Poetics in Interactive Digital Narrative Design Learning
Presenting Author: Yasmeen ElGerbi, CUNY Graduate Center, Libya; **Co-Author:**Colette Daiute, The Graduate Center, CUNY, United States; **Co-Author:**John T. Murray, CUNY Graduate Center, United States

This paper explores tensions between learning to use a digital tool for creating a new type of collaborative narrative and *un*learning more familiar individualistic narrative genre. With a secondary analysis of interactive digital narratives (IDN) by undergraduates new to IDN (Daiute, Murray, Wright, and Calistro, 2022), we explored how students used the choice tool to offer their players narrative co-authoring. We extended choice poetics theory (Mawhorter, Mateas, Wardrip-Fruin, 2015) to examine whether and how student designers offered their players choices for creative engagement in the IDN process. The 64 participants learned the choice/branching function, indicated by their introduction of 273 choices for players to apply across four design-play turns. In addition to the conceptual quality of each choice (trait, adventure, socioemotional, moral), we noticed how choices affected the storyline. Designer-focused options allowed the player to make selections tightly integrated into the designer storyline, whereas player-engaged options required the player to make decisions that would alter the narrative trajectory. Those player-engaged choices allowed for different possible storylines, requiring the player to make decisions about character development, social issue, or moral implications thereby embarking on relevant other choices, such as in one design a predictable yet happy path through marriage or an uncertain career path; and in another design and adventurous romp or a soul-searching inner dialogue. Because choice functions engaged players more or less collaboratively, they manifest the rather difficult shift from what scholars refer to as legacy narrating (Koenitz, 2015) to this novel aesthetic interactive digital narrating.

Learning from one's own aesthetic inner world: aesthetics as a modality of language
Presenting Author: Maurin Coralie, Institut National de la Recherche pour l'Agriculture et L'Environnement, France

In this presentation, I will discuss the exploration of one's aesthetic experience (Dewey, 1933) as a way of exploring the meaning of one's life/work experience and as a way of learning from it (Schaefer, 2015). I will first present the core principles of the design of a professional support programme offered to employees transitioning to retirement at the National Institute for Agricultural and Environmental Research (Auricoste et al. 2019; Maurin et al. 2020; Maurin, 2022). I will then show how aesthetics - when language is considered as a multimodal medium (De Saint Georges, 2003) to shape and restore one's experience (Varela, 1983; Eschenauer, 2019) - is one of the linguistic modalities that helps to connect with layers of meaning that are difficult to access through verbalisation alone. Finally, I will use two case studies to discuss the potential for learning from the process on the part of participants and those who accompany them.

Supporting Researchers at risk: the key role of European Academia

Keywords: Citizenship Education, Educational Policy, Inclusive Education, Social Aspects of Learning and Teaching
Interest group:
Chairperson: Ioanna Kostarella, Aristotle University of Thessaloniki, Greece

Academic freedom and freedom of scientific research are considered core principles for scientific progress; however, in many countries around the world academics face risks to their life, liberty, and research careers due to discrimination, persecution, disaster, violence or war. When researchers are at risk, and excluded from participating in the global research circuit, not only are individual lives and careers at risk; the very future of research is also at stake.
The session aims to raise awareness on academic freedom challenges and promote active involvement in the support of academics at risk, not only as a manifestation of solidarity and defense of human rights, but also as a means to enrich research in European institutions, as the skills and attributes of at-risk researchers can carry significant research potential for hosting countries in Europe. Furthermore, the session aims to foster exchange on challenges, good practices, expectations and experiences with regard to supporting researchers at risk. - The Global Scholars at Risk Network and the *Inspireurope: Supporting Researchers at Risk* Initiative
Joel Hanisek, SAR Europe, Maynooth University, Ireland;

- Academic freedom and inclusion of at-risk researchers
Andreas Takis, Aristotle University of Thessaloniki, Greece

- Funding opportunities for scholars at risk
Frank Albrecht, Alexander von Humboldt Foundation, Germany

- Guidelines for successful hosting
Malamati Tsapoutzoglou, Aristotle University of Thessaloniki, Greece

The importance of academic mentoring; a scholar's experience
Yudit Namer, University of Twente, Netherlands

Cognitive Science, Educational Policy and Systems

Contributions of Greek psychological research in Education

Keywords: Attitudes and Beliefs, Cognitive Development, Cognitive Skills and Processes, Conceptual Change, Developmental Processes, Engagement, In-service Teachers, Pre-service Teachers, Quantitative Methods, Resilience, Self-regulated Learning and Behaviour, Special Education, Teacher Effectiveness, Teacher Professional Development
Interest group:
Chairperson: NIKOLAOS MAKRIS, Democritus University of Thrace, Greece
Organiser: - Hellenic Psychological Society, Greece
Discussant: NIKOLAOS MAKRIS, Democritus University of Thrace, Greece

Education is a dynamic field where several factors are continuously interacting to promote effective teaching and learning. Predominant, among these factors, are teachers' individual characteristics, such as their own flexibility and adjustment to the demands of their profession, personal beliefs about learning and teaching, but also students' features, like their cognitive skills and competences, which may facilitate or impede learning in various school subjects. The symposium presents four studies demonstrating the current interests of Greek psychological research in education. Daniilidou and Platsidou's study present a new scale addressing teachers' resilience that takes into account personal and environmental protective factors, like values and beliefs, emotional adequacy, relationships within and outside the school environment and the legislative framework of education. Based on the argument that teachers' beliefs affect their teaching practices and students' school adjustment, Karakasidou et al. present a study on teachers' beliefs about their efficacy in supporting children with special needs. Karousou et al. present a study regarding the effects that various cognitive factors, such as executive functions, metalinguistic awareness and theory of mind, have on narrative competence among children of pre-school and school age. Kyriakopoulou and Skopeliti, on the basis of the framework theory approach on conceptual change, present a study on pre-service teachers' epistemic beliefs and their relation to their beliefs of learning and educational practices. The theoretical and practical implications of the studies are discussed. Proposals for developing educational policy are also made.

TPFRS: A new measure for assessing resilience in teachers
Presenting Author: Athena Daniilidou, University of Macedonia, Greece; **Co-Author:**Maria Platsidou, University of Macedonia, Greece

Recently developed scales addressed -specifically- to teachers' resilience, although profited the field, they do not include some of the critical protective factors of teachers' resilience identified in the literature. To address this limitation, we aimed at designing a more comprehensive scale for measuring teachers' resilience which encompasses personal and environmental protective factors. To this end, two studies were carried out. In Study 1, 407 primary school teachers were tested with the new scale named Teachers' Protective Factors of Resilience Scale (TPFRS). The Multidimensional Teachers' Resilience Scale (Mansfield & Wosnitza, 2015) and the Teachers' Resilience Scale (Daniilidou & Platsidou, 2018) were used to test the convergent validity, while the Maslach Burnout Inventory (Maslach & Jackson, 1986) and the Teachers' Sense of Efficacy Scale (Tchannen-Moran & Woolfolk Hoy, 2001) were used to assess the discriminant validity of the new scale. Data analysis performed by confirmatory factor analysis and item response theory analysis revealed that the TPFRS includes 29 items, which assess three personal and three environmental protective factors of teachers' resilience, and it presents a satisfactory discriminant validity. Study 2, in which 964 primary and secondary school teachers were tested, confirmed the factorial structure of the TPFRS as well as its discriminant validity which was tested with the Schutte Emotional Intelligence Scale-Short Form (Diamantopoulou & Platsidou, 2019). In conclusion, our results confirmed that the TPFRS is a valid instrument for assessing teachers' protective factors of resilience and it can be safely used in future research and interventions in the teaching profession.

What do Greek teachers need to better support students with special learning needs?
Presenting Author: Eirini Karakasidou, Panteion University of Social and Political Sciences, Greece; **Co-Author:**Olga Lainidi, University of Leeds, United Kingdom; **Co-Author:**Anastassios Stalikas, Panteion University, Greece

The aim of the current study was to explore the perceptions and educational needs of secondary education teachers regarding their preparedness to support students with Special Learning Needs (SLNs) in Greece. A quantitative cross-sectional study was carried out and data were collected using a structured questionnaire consisting of closed questions (N=103, 82.5% women). The results of the study indicated that having attended additional training in SNLs has a significant effect on participants' perceptions of their knowledge and adequacy to support students with SNLs. Most of the participants highly agreed with the need to have additional training programs related to SNLs, because they will allow them to specialise in SNLs and respond to the increasing numbers of students with SNLs. The study highlighted the need for trainings that connect theory with practice and employ contemporary teaching methods. The educational system needs to address this gap in teacher training, especially as secondary education teachers do not undergo mandatory training in SNL pedagogy as part of the undergraduate education. Including teachers' voices in the design and implementation of these training can be critical both for increasing teacher participation but also for ensuring that the skills teachers obtain can be transferred in the classroom.

The combined effect of cognitive factors on preprimary and primary school students' narrative skills
Presenting Author: Alexandra Karousou, Democritus University of Thrace, Greece; **Co-Author:**Dimitra Oikonomakou, Democritus University of Thrace, Greece; **Co-Author:**Smaragda Kazi, Panteion University of Social and Political Sciences, Greece; **Co-Author:**Tryfonas Bikos, Democritus University of Thrace, Greece

The ability to produce a meaningful, coherent and cohesive account of a series of events is a complex skill that develops gradually through the school years and is shown to be related to academic success. Recent research confirmed a relationship between students' narrative skills and several cognitive processes (e.g., executive functions, metalinguistic awareness, Theory of Mind). Nonetheless, available research is limited to studying the effect of these factors independently, while focusing each time on very restricted developmental periods. To our knowledge, there has been no unitary account of the complex ways these parallel developments interact to affect children's narratives. The present study aimed to measure various cognitive factors hypothesized to affect oral narrative skills and uncover the combined effect of these factors on narrative competence at different ages. A sample of 293 students aged 4-12 years was tested with an extensive battery of tasks, assessing: oral narrative skills, language skills, verbal fluency, executive functions, metalinguistic awareness, and Theory of Mind. Regression and path analysis models illustrated the complex interactions and interconnections among the factors studied, as well as their effect on children's

narrative competence. Direct and indirect effects were confirmed between linguistic competence and narrative skills. These were mediated, to a lesser or greater extent, by different cognitive processes and skills depending on the children's age. Results are discussed for their theoretical implications, as well as their potential applications in the design of interventions to enhance narrative competence. *Research supported by the "Hellenic Foundation for Research and Innovation" (Project:FM17-13).

Preservice teachers' epistemic and educational beliefs on their educational practices
Presenting Author: Anastasia/Natassa Kyriakopoulou, National & Kapodistrian University of Athens, Greece; **Co-Author:**Irini Skopeliti, University of Patras, Greece

Which are pre-service teachers' beliefs about learning, self-regulated learning, teaching and mode of engagement? Are these beliefs influenced from pre-service teachers' epistemic beliefs? How do these two belief systems interact during the educational practice? Two-hundred and thirty-two pre-service teachers were administered (a) a questionnaire investigating their epistemic beliefs, (b) a questionnaire investigating their beliefs about learning, self-regulated learning and teaching, (c) a questionnaire investigating their beliefs about specific teaching practices and students' cognitive engagement in the learning process, and (d) four teaching scenarios based on four modes of cognitive engagement. We expected that pre-service teachers will hold beliefs about learning and teaching that may be both consistent and inconsistent with more constructivist and student-centered approaches to learning. Additionally, we hypothesized high correlations between their epistemic beliefs, their beliefs about learning and teaching and their educational practices. The results confirmed our hypotheses and indicated that preservice teacher's epistemic beliefs had a direct impact on their beliefs about teaching and learning and on their educational practices. An indirect impact of their epistemic beliefs through educational beliefs was also found on their educational practices. The findings will be discussed in light of the framework theory approach on conceptual change and their implication for pre-service te

Higher Education

Improving university teaching through teachers' professional learning and development

Keywords: Higher Education, Learning Approaches, Teacher Professional Development, Teaching Approaches
Interest group: SIG 04 - Higher Education
Chairperson: Jan Vermunt, Eindhoven University of Technology, Netherlands
Organiser: Perry den Brok, Eindhoven University of Technology, Netherlands
Organiser: Frans Prins, Utrecht University, Netherlands
Discussant: Vincent Donche, University of Antwerp, Belgium

Many universities nowadays are experimenting with new ways to improve the quality of their teaching, teachers and students' learning. Often these improvements have in common that they are aimed at fostering more active, self-regulated, collaborative, deep and application-oriented student learning. These innovations require quite different teacher roles and skills than many lecturers are familiar with. Unfortunately, research on teacher professional learning and development (PLD) in higher education is still in its infancy. A wide variety of professional development initiatives is being practiced, but a solid research base founded on research about whether, how and why different approaches work in different contexts is lacking. Moreover, research on teacher PLD is often disconnected from research on student learning.The scientific aim of this symposium is to increase our understanding of whether, why and how different approaches to PLD work for different populations and contexts. The four papers report on research in different countries: Romania, Finland and The Netherlands. They employ a variety of quantitative and qualitative research methodologies. Most importantly, the papers report on research on different pedagogical approaches to teacher PLD. They not only consider the effects of professional development programs on teacher learning outcomes, but also look into the processes of teachers' learning. Finally, the papers aim to increase our understanding of the impact of PLD on teachers' teaching practices. The educational relevance of the symposium lies in the provision of new knowledge that universities can use to improve the quality of their teaching, teachers and students' learning.

Academics' pedagogical training: Effects on teachers and students' outcomes, a multilevel analysis
Presenting Author: Marian Ilie, West University of Timisoara, Romania; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands; **Co-Author:**Velibor Mladenovici, West University of Timisoara, Romania; **Co-Author:**Zselyke Pap, Department of Psychology, West University of Timișoara, Romania; **Co-Author:**Laurențiu P. Maricuțoiu, Center for Academic Development and Department of Psychology, West University of Timișoara, Romania

Between July 2018 and July 2021, academics from five Romanian universities participated in three 15 ECTS pedagogical programs. The main purpose of these programs was to change academics' teaching towards a learning-centered approach to teaching. Excepting the specific contents of each program (i.e., P1 – general principles and methods for teaching in higher education; P2 – Maastricht University model of Problem-Based Learning and P3 – evidence-based teaching in higher education), all programs had the same structure (i.e., 150 hours, of which 40 hours theoretical courses, 80 hours practical applications, and 30 hours peer to peer observation and group reflection).To evaluate the programs' effect, we collected data, in four waves with six months between, about participants' perception of the quality and usefulness of the programs, academics' teaching approaches, students' perception of the teachers' classroom behavior, and students' learning approaches. For data analysis, students' answers were aggregated at the teacher level.The programs sustained academics in adopting more positive approaches to teaching especially by decreasing their teacher-centered intentions and related strategies. Students' deep approach has been significantly and positively linked to *challenging beliefs* and *motivation* as teachers' classroom behaviors. The surface approach has been significantly and negatively related to *understanding the fundamental concepts, relevance, organization, and flexibility*while positively associated with *teacher-student relationships*. Also, it seems that students in classes taught by older male professors have adopted a deeper approach to learning. Generally, the data highlight that the training programs achieved the objectives proposed.

How does developing an innovation as part of a PDI impact mid-career teachers' learning?
Presenting Author: Indira Day, Utrecht University, Netherlands; **Co-Author:**Tim Stevens, Eindhoven University of Technology, Netherlands; **Co-Author:**Frans Prins, Utrecht University, Netherlands; **Co-Author:**Perry den Brok, Eindhoven University of Technology, Netherlands; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands

Higher education teachers need professional learning and development to be able to adapt to or design educational innovations. However, it is currently unclear how professional development initiatives (PDI's) in the context of educational innovation should be designed to make a meaningful impact on teacher learning. To further this knowledge, the current study investigates two PDI's where teachers design an educational innovation. These PDI's are well-established programmes for the professional development of mid-career teachers, but are usually not evaluated on the interplay between innovation and professional development. This study aims to further investigate this interplay by interviewing participants and facilitators of the two PDI's. Interview questions focus on teachers' and facilitators' perspectives on effective facets of the programmes, as well as critical learning moments for the teachers. Preliminary findings show similarities in general programme design between the two PDI's, both last 18 months, have a few communal meetings, and focus on exchange between peers. Teachers had designed a variety of innovations. Interviews with the course facilitators of programme 1 showed that throughout the years there have been clear "general themes" in innovations, where a majority of teachers wanted to focus on a specific innovation. Facilitators noted that teachers' learning goals often got more specific throughout the programme, following teachers' increased knowledge about educational sciences. Critical learning moments are currently being analysed. Tentatively, peer exchange seems to be an important factor. This study will provide evidence-informed guidelines for PDI design.

HE pedagogy developers' regulation skills and ways to develop their own pedagogical expertise
Presenting Author: Mari Murtonen, University of Turku, Finland; **Co-Author:**Henna Virtanen, University of Turku, Finland; **Co-Author:**Henna Vilppu, University

of Turku, Finland

This study looks at Finnish higher education pedagogical developers' own readiness for pedagogical development and how it connects to the actual ways to develop their pedagogical expertise. The readiness for pedagogical development consisted of their regulation skills, appreciating collegiality, prioritizing work time for pedagogical development and nativist conceptions of teacher ability. The actual practices included, for example, taking part in pedagogical development groups at my own work community, which was the most common activity, and participating by writing pedagogical texts for science community, which was the least common practice. Two groups were constituted based on their differences in their readiness for pedagogical development. These groups had significant differences in their concrete actions to develop their own pedagogical expertise, such as, reading pedagogical literature, participating in short pedagogical trainings, and participating in pedagogical developmental networks.

Supporting teachers' learning in the context of self-initiated educational innovations: what works?
Presenting Author: Tim Stevens, Eindhoven University of Technology, Netherlands; **Co-Author:**Remco Coppoolse, Utrecht University of applied science, Netherlands; **Co-Author:**Roeland M. Van der Rijst, ICLON-Leiden University Graduate School of Teaching, Netherlands; **Co-Author:**Arjen de Vetten, VU University Amsterdam, Netherlands; **Co-Author:**Indira Day, Utrecht University, Netherlands; **Co-Author:**Perry den Brok, Eindhoven University of Technology, Netherlands; **Co-Author:**Frans Prins, Utrecht University, Netherlands; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands

Research on teacher professional learning and development (PLD) in the context of innovation in higher education (HE) tends to focus on the impact of PLD programmes on teachers' implementation of a predefined educational innovation. However, little is known about the learning of teachers in programmes that stimulate teachers to develop, implement and evaluate educational innovations themselves, such as in innovation fund programmes. These programmes often involve peer consultancy to enhance teacher PLD and the quality of educational innovations, but little is known about why and how teachers in these programmes can best be supported. In order to better understand how key features of the programme influence the learning process of teachers and their impact on education and students, this study investigates two programmes in The Netherlands: a 'teacher academy' at a university, and a 'knowledge platform' for teachers from different universities. In both cases, six teachers are interviewed for an in-depth inquiry about their learning process, and interviews with PD facilitators and secondary data is used for triangulation. The preliminary results indicate that a critical element for teacher learning and successful innovation is the alignment of the teachers' personal learning goals with the collective learning and the organisational learning beyond the programme. A plea is made to move from outcome-oriented approaches in teacher PLD programmes and educational innovation programmes, to a process-oriented approach that connects teachers' research-based learning with evidence-informed innovation. This can enhance the sense of ownership among teachers and support the development of appropriate innovations.

Symposium
Teaching and Teacher Education

Understanding and Developing Teacher Practices that Promote Self-Regulated Learning

Keywords: In-service Teachers, Learning Strategies, Metacognition, Pre-service Teachers, Secondary Education, Self-regulated Learning and Behaviour, Teacher Professional Development
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Michael Lawson, Flinders University, Australia
Discussant: Patricia Alexander, University of Maryland, United States

The symposium will present theoretical and empirical work that examines the role of teachers in the promotion of self-regulated learning (SRL), through the review of the relevant literature, classroom observation studies, and professional development courses. The first presentation provides a comprehensive review of research on the professional competencies of teachers as they relate to SRL. It also suggests the questions that need to be addressed in future research in order to better understand the complex relations between teachers, teacher practices and the development of students' SRL. The second presentation describes research that investigated the direct and indirect promotion of SRL in the classroom through the development of a theoretical framework and a corresponding coding guide. The SRL coding guide was used to analyze the transcripts of classroom observations from 23 participating teachers. The third study to be presented investigated the effects of an online professional learning program (PLP) addressed to pre-service teachers. Through video viewing and the coding of transcripts of viewed classroom observations, the PLP was instrumental in helping preservice teachers to learn how to promote SRL indirectly, through the design of lesson tasks that encourage constructive and interactive student engagement. The last presentation describes a theoretical framework and a practical model for professional development designed to help teachers improve their SRL knowledge for in-class practices. A 30-hour professional development program will be described.

Using the COACTIV model to explain teachers' SRL professional competence
Presenting Author: Charlotte Dignath, TU Dortmund University, Germany; **Co-Author:**Mareike Kunter, DIPF | Leibniz Institute for Research and Information in Education, Germany

Research has shown that SRL can be learned and promoted using various methods. Promoting SRL should therefore be an important goal of instruction. Yet, only recently has there been research on the role of teachers in developing and promoting students' SRL. In order to provide a comprehensive overview of previous research on these issues and to identify research gaps, a literature review was conducted that classified the available evidence using the COACTIV model. The Coactiv model specifies determinants and consequences of teachers' professional competence (Kunter et al., 2011). The identified studies were sorted according to the research questions of (1) which aspects of professional competence predict teachers' classroom behavior in terms of promoting SRL, (2) how SRL classroom behavior is related to different student and teacher variables, (3) how individual and contextual conditioning factors are related to the aspects of competence, and (4) which learning opportunities are effective for developing professional competence in SRL and how teachers use these learning opportunities. The findings provide a specific overview of research on determinants and consequences of teachers' professional competence with regard to promoting SRL and offers concrete insights into research gaps that remain to be filled. Moreover, we suggest directions for future research by providing explicit guidance on what questions would need to be addressed to better understand the complex interactions between teachers, their instruction, and their students' learning success with respect to SRL.

A "Triple SRL–SRT Framework" for Supporting Teachers Self- regulation and Students' Outcomes
Presenting Author: Bracha Kramarski, Bar-Ilan University, Israel; **Co-Author:**Orna Heaysman, Hemdat College of Education, Israel

Addressing teachers' difficulties in implementing effective self-regulated learning (SRL) for their professional knowledge and practice as well as for their students' SRL learning, a "Triple SRL–SRT Framework" and a practical model for professional development is proposed to help teachers' lack of SRL knowledge for in-class practices. To cope with these challenges, a clear conceptualization that differentiates teachers' self-regulation as learners (SRL) vs. teachers (SRT) is needed.Expanding on prior dual frameworks that differentiate teachers' own SRL from their self-regulated teaching (SRT), the "triple SRL–SRT framework" distinguishes teacher-focused from student-focused aspects of SRT. Specifically, three types of self-regulation are proposed:(1) teachers self-regulate their own learning as learners (SRL)(2) teachers self-regulate their practice as teachers (teacher-focused SRT)(3) teachers as agents of SRL activate students' SRL (student-focused SRT).To support teachers' self-regulation using this framework, an SRL-SRT theoretical-practical professional PD (30 h) was developed and supported by research findings among teachers and their students. Teachers' SRL–SRT in-class practices' duration(N = 76 language teachers) and their students' language achievement (reading comprehension; grades 3-5; N = 313) increased. Conceptual contributions, practical implications and research findings will be discussed.

Helping pre-service teachers improve the indirect promotion of SRL in the classroom

Presenting Author: Helen Stephenson, University of South Australia, Australia; **Co-Author:**Sean Kang, The University of Melbourne, Australia; **Co-Author:**Wendy Scott, The University of Melbourne, Australia

The research investigated the effectiveness of an online professional learning program (PLP) on preservice teachers' ability to design lesson plans that facilitate the indirect promotion of self-regulated learning (SRL) through the design of a learning environment that encourages constructive and interactive student engagement. The PLP was based on the Interactive, Constructive, Active, Passive (ICAP) theory (Chi & Wiley, 2014). It developed an ICAP Coding Guide (ICAP-CG), which was used to analyze the transcripts of viewed videos of classroom observation, focusing on the analysis of lesson tasks. Seventy-eight education students participated in the study. The results indicated that the great majority of the participants understood the ICAP theory and the ICAP coding guide adequately, and that the PLP significantly increased their ability to design constructive and interactive lesson tasks that increase student cognitive engagement. Relationships between beliefs about learning and teaching and PLP performance are also discussed

How teachers promote self-regulated learning: A classroom observation study
Presenting Author: Stella Vosniadou, Flinders University, Australia; **Co-Author:**Erin Bodner, Flinders University, Australia; **Co-Author:**Michael Lawson, Flinders University, Australia; **Co-Author:**Lorraine Graham, The University of Melbourne, Australia

The purpose of the research was to investigate the direct and indirect promotion of SRL in the classroom. For this reason, we developed a theoretical framework and a coding guide, which was used to analyze the transcripts of filmed classroom observations from 23 participating teachers. The direct promotion of SRL was evaluated by examining the explicit and implicit promotion of strategies, the promotion of knowledge and beliefs about SRL, and the promotion of metacognitive support and reflection. The indirect promotion of SRL was evaluated by examining whether the teachers designed constructive and interactive lesson tasks that gave their students opportunities to develop self-regulation. Regarding the direct promotion of SRL, the results showed very little explicit promotion of strategies and of SRL knowledge or beliefs. The teachers engaged mainly in the implicit promotion of strategies and also provided their students with metacognitive support and metacognitive reflection. The results regarding the implicit promotion of SRL showed that the teachers designed few constructive and interactive lesson tasks and gave their students few opportunities to make decisions about their learning. There were considerable teacher differences in the frequency of SRL promotion as well as in lesson task design.

Symposium
Cognitive Science, Developmental Aspects of Instruction

Different perspectives on the impact of cognitive skills on early academic achievement

Keywords: Achievement, Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Early Childhood Education, Learning and Developmental Difficulties, Mathematics/Numeracy, Primary Education, Writing/Literacy
Interest group: SIG 05 - Learning and Development in Early Childhood, SIG 12 - Writing
Chairperson: Michelle N. Maurer, University of Oslo, Norway
Discussant: Bert De Smedt, KU LEUVEN, Belgium

The purpose of the proposed symposium is to bring together findings and expertise from researchers from the Netherlands, Switzerland, Norway, and Belgium on the impact of cognitive and affective skills on children's early academic achievement in typically developing 3- to 11-year-old children. Using a person-centered approach (latent profile analysis), the first paper examines the impact of cognitive and affective variables on school readiness and early academic achievement and discusses multiple pathways to school readiness. The second paper investigates the impact of cognitive and fine motor variables on handwriting skills in a large-scale longitudinal study in first grade children. Applying a latent profile analysis as well, the third paper aimed to identify executive functions profiles in first grade children to investigate whether weaknesses in one executive function component can be compensated by strength in another with respect to certain academic outcomes. The fourth paper applies a network analysis to examine the interrelations among cognitive and affective variables, and mathematical achievement, which is a novel approach to study these interrelations at a system level. The symposium takes different methodological perspectives on the interrelation between cognitive and affective variables, and early academic achievement. The proposed research projects are timely, interesting, and the findings contribute to a more nuanced understanding of how interindividual differences in cognitive and affective processes impact children's academic achievement.

Cognitive skills and academic achievement: a person-centered approach.
Presenting Author: Erica Kamphorst, University of Groningen, Netherlands; **Co-Author:**Gerda van der Veer, University of Groningen, Netherlands; **Co-Author:**Suzanne Houwen, University of Groningen, Netherlands; **Co-Author:**Marja Cantell, University Groningen, Netherlands; **Co-Author:**Alexander Minnaert, University of Groningen, Netherlands

Different cognitive skills have been found to be pivotal for a child's school readiness and subsequent academic achievement. A promising approach for studying school readiness involves a person-centered (PC) approach, aimed at exploring how functioning in diverse developmental domains conjointly affects children's school outcomes. Therefore, we aimed to explore how cognitive skills, in combination with school readiness skills from other domains predict academic achievement. To this end, we examined the school readiness skills of typically developing children (N = 91) with a mean age of 3 years and 4 months (46 % girls). We used a multi-informant (*i.e.,* performance based tests and parent ratings) test battery to assess children's school readiness in terms of motor, socioemotional, language and executive function skills, as well as first grade academic outcomes. Preliminary findings based on a Latent Profile Analysis revealed 4 distinct school readiness profiles, characterized by between-profile differences in both level and pattern of school readiness skills, specifically in some of the cognitive skills. Children from distinct profiles differed in terms of first grade academic achievement. Further testing will be aimed at distribution of background variables (*e.g.,* gender) over profiles, and predictive validity concerning specific first grade academic achievement outcomes. Our findings highlight the importance of a multifaceted description of a child's cognitive- and non-cognitive school readiness, rather than a summary label, such as 'average' or 'high'. Importantly, gained insights could help (early) childhood education and care professionals to prepare themselves to be ready for each child's unique needs.

The development of handwriting processes and involved cognitive processes
Presenting Author: Lidia Jana Truxius, PHBern, University of Teacher Education, Switzerland; **Co-Author:**Michelle N. Maurer, University of Oslo, Norway; **Co-Author:**Judith Sägesser, University of Teacher Education Bern, Switzerland; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

Handwriting is still an important task as it predicts further academic achievement. At the beginning of school, pen movements are strongly controlled and demand a lot of cognitive resources. With increasing practice, handwriting becomes more automatized. Before children reach automaticity in handwriting, it remains unclear how motor processes of handwriting develop and which cognitive and fine motor processes might support handwriting processes. For this reason, we aim to investigate developmental trajectories of motor handwriting processes in the first year of handwriting acquisition. Additionally, we investigate how executive functions and visuomotor integration support the development of handwriting processes. We tested first-grade children (N = 359, M_{age} = 84, *SD* = 5) in their first year of handwriting tuition in three waves, each three months apart. Analyses of the first measurement point reveal links between handwriting processes, executive functions, and visuomotor integration. These preliminary findings indicate the importance of executive functions and visuomotor integration on the motor aspects of handwriting.

Executive Functions: Development and differential profiles in first grade children
Presenting Author: Michelle N. Maurer, University of Oslo, Norway; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

Executive functions (EF) are a crucial school readiness factor predicting gains in academic achievement from kindergarten to second grade (e.g., Brock et al., 2018). As investigations on EF typically use EF as a source of individual differences for predicting several outcomes, relatively little is known about subgroups of

children (i.e., profiles) with similar strengths and weaknesses in the different EF components. With the present study, we aimed to identify potential EF profiles, that is, to investigate whether weaknesses in one EF component can be compensated by strength in another with respect to a certain academic outcome. Specifically, we investigated children's EF (inhibition, shifting, verbal and visual-spatial working memory) across three tasks and three measurements, each three months apart. We used a person-centered approach, specifically a Latent Profile Analysis, to explore EF profiles. Three-hundred fifty-nine children aged 6-8 years (M_{age} =7 years, 0 months; *SD*= 5 months) at the beginning of the study were investigated. Data analysis is still under way but preliminary results of the Latent Profile Analysis point to one subgroup of children with low inhibition skills, whereas two other subgroups are characterized by between-profile differences in the level of EF skills, instead of patterns of strengths and weaknesses across the different EF components. More specific findings on the different EF profiles and potential compensatory mechanisms with respect to specific academic outcomes will be presented and discussed at the conference. Findings will enable teachers to better understand and meet children's unique needs and help to tailor effective interventions.

A network model of cognitive and affective variables related to mathematics achievement
Presenting Author: Anne van Hoogmoed, Radboud University, Netherlands; **Co-Author:**Paul Adriaanse, Radboud University Nijmegen, Netherlands; **Co-Author:**Myrthe Vermeiden, Radboud University Nijmegen, Behavioural Science Institute, Netherlands; **Co-Author:**Rianne Weggemans, Radboud University Nijmegen, Netherlands

Development of mathematical skills is a complex and multidimensional process, with many factors associated to this development. The relation between these factors and mathematical achievement is often studied in isolation, or with a small set of factors. However, research has shown that relations between these factors and mathematical achievement are not unidirectional. Moreover, relations between these different factors themselves also exist. Therefore, this study aims to examine the relations between math skills and related cognitive and affective factors using a network approach. Data on math development and associated cognitive and affective factors are gathered from a typically developing sample of Dutch primary school children in grade 4 (currently 150 participants, data collection still ongoing). A network analysis using a mixed graphical model was used to examine how cognitive variables fluid reasoning, arithmetic fluency, number sense, ordering, shifting, inhibition, updating, and affective variables math anxiety, and math confidence are interrelated with mathematical achievement. Mathematical achievement was found to be associated with arithmetic fluency, fluid reasoning skills, and with the confidence in one's math skills. Arithmetic fluency, was associated with ordering, and was directly and indirectly associated with symbolic number sense. The network also found supporting evidence for the relations between symbolic and non-symbolic number sense and number ordering. Of the executive functions, only updating was indirectly related to mathematics achievement. These results show the benefit of using a network approach, and can eventually aid the development of a more personalized approach of dealing with differences in math development.

Students as Citizens: Exploring Lived Democratic Citizenship Through Attitudes and Behaviors

Keywords: Attitudes and Beliefs, Citizenship Education, Cultural Diversity in School, Dialogic Pedagogy, Morality and Moral Development, Peer Interaction, Primary Education, Quantitative Methods, Reasoning, Secondary Education, Social Aspects of Learning and Teaching, Social Interaction, Teaching Approaches
Interest group: SIG 13 - Moral and Democratic Education
Chairperson: Bjorn Wansink, Utrecht University, Netherlands
Organiser: Minke Krijnen, Leiden University, Netherlands
Discussant: Jeremy Stoddard, United States

To sustain increasingly diverse democratic societies, people need democratic citizenship competences more than ever. The classroom context provides students with rich experiences that fit a broad conceptualization of citizenship (i.e., lived citizenship), which acknowledges students' attitudes and everyday behaviors as acts of citizenship. This lived citizenship perspective offers opportunities for implicit democratic citizenship learning. In line with this, this symposium integrates international research on students' attitudes and behaviors as aspects of democratic citizenship. It asks how students' democratic citizenship attitudes and behaviors can be fostered or hindered by students' own experiences, experiences with peers, and with their teachers. The first two papers look at students' citizenship attitudes: Paper 1 focuses on whether students' sense of school membership can promote their generalized social trust. Paper 2 explores how teacher fairness and an open classroom climate can contribute to students' political tolerance. The other two papers focus on students' citizenship behavior: Paper 3 examines deliberative discussions as practising democratic citizenship competences in interaction with classmates. Paper 4 focuses on how everyday teacher support and conflict can shape the classroom as democratic practice ground, by looking at acts of citizenship at the level of the peer group. Finally, the discussion explores how teachers and education more in general can foster citizenship learning, beyond offering a formal citizenship curriculum. With this symposium, we contribute to the EARLI conference theme by broadening our perspective on democratic citizenship learning, hereby exploring new, hopeful ways to sustain democracy in times of uncertainty.

Diverse Sources of Trust: Sense of School Membership, Generalized Social Trust and School Diversity
Presenting Author: Willemijn Rinnooy Kan, Amsterdam University of Applied Sciences (AUAS), Netherlands; **Co-Author:**Anke Munniksma, University of Amsterdam, Netherlands; **Co-Author:**Monique Volman, University of Amsterdam, Netherlands

This study investigated how schools can contribute to students' generalized social trust (GST). Positive social experiences with trust and the experience of being part of a fair and predictable social system are important sources of trust. Students' sense of school membership (SSM) reflects these sources. We investigated the association between three aspects of SSM and GST in 9^{th} grade of Dutch secondary schools (78 schools, 230 classrooms, 5167 students). The diversity of the school population, in terms of track and ethnicity, was included as a moderator. All three aspects of SSM appeared to be positively associated with GST. School ethnic diversity strengthened the association between 'identification and participation' and GST, but weakened the association between 'peer acceptance' and GST. This creates an impetus to support all students to experience a sense of school membership and raises the question how students can profit more from the diversity of the school community.

Teachers Are Important for Political Tolerance – Results from ICCS 2016
Presenting Author: Johanna Fee Ziemes, University of Duisburg-Essen, Germany

Political tolerance describes the support of rights of all groups to participate in political decision-making processes. Teachers are important for the political development of adolescents. Beside teaching content, they can treat student's more or less fair and foster discussions in the classroom. Teacher fairness can demonstrate students that all voices have a right to be heard and that everybody deserves to be treated with respect. A true open classroom climate for discussion can enable students to hear perspectives from students that otherwise might be more reluctant to share their perspectives. This paper explores the opportunities teachers have to foster political tolerance in schools with data from the International Civic and Citizenship Education Study 2016 (ICCS 2016). The study included three scales on support of equal rights. Using selected items of each of those scales and the alignment method one scale with a satisfactory fit for all 15 participating European educational systems was created. Multilevel and multigroup analyses revealed that on the individual student level a fair treatment by teachers is a significant predictor of political tolerance in all countries, while an open classroom climate for discussion is relevant at the classroom level. The results indicate that students that feel like they are being treated unfairly are less likely to develop political tolerance. Additionally, teachers that manage to foster discourses with the whole class, are on good path to foster political tolerance with this class.

CANCELLED: The Imagined Other in Classroom Deliberations (...)
Presenting Author: Lee Jerome, Middlesex University, United Kingdom; **Co-Author:**Anna Liddle, Sheffield Hallam University, United Kingdom; **Co-**

Author: Helen Young, London South Bank University, United Kingdom

This paper has been cancelled and will not be presented at the conference.Deliberative democracy offers a means for developing inclusive collective decision-making, and its proponents argue it can also build citizens' knowledge, reasoning, and critical thinking as well as develop empathy and mutual understanding among diverse groups. Those applying deliberative democratic principles in education have also tended to focus on the mechanisms for talking and listening to others (as opposed to more established hierarchical forms of teacher led talk), as well as the impact on critical thinking about arguments and a willingness to listen to and appreciate the views and beliefs of others. This article considers data from deliberative discussions in secondary classrooms in England about what the Government refers to as 'fundamental British values' (FBVs). The data shows that once students had engaged with the stimulus material provided, they often used their imagination to move significantly beyond the facts they were given. This reflects a playful commitment to develop empathy and de-centre their discussions through forms of speculative thought experiments as a way to recognise the legitimate other in such debates. As such the article makes a contribution to the literature on deliberative pedagogies in schools and begins to outline some potentially novel elaborations on deliberative democratic theory.

Teacher Practices Shape The Elementary Classroom as Practice Ground for Democracy
Presenting Author: Minke Krijnen, Leiden University, Netherlands; **Co-Author:**Bjorn Wansink, Utrecht University, Netherlands; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands; **Co-Author:**Tim Mainhard, Leiden University, Netherlands

The elementary classroom can be considered as a practice ground for democracy, where daily experiences with peers reflect and contribute to democratic citizenship learning. Here, children can learn to engage with others in a peaceful and democratic way, which ultimately may contribute to sustaining increasingly diverse democratic societies. This perspective of enacted or lived citizenship asks for researching democratic citizenship learning beyond solely focusing on individual development and effects of teaching the formal curriculum. The current study investigates how teachers shape this practice ground via daily teaching practices. Children's observations of peers' behaviors (i.e., listening, cooperation, conflict resolution, involving others, aggression and engaging in positive relationships) were assessed via peer nominations to consider the context-dependent and relational nature of children's citizenship, and used to create classroom descriptive norms of enacted democratic citizenship. Teacher practices were assessed by multi-informant measures of support and conflict. Classroom diversity was measured by indicators for migration history and socioeconomic background, to test whether the association between teacher practices and democratic citizenship outcomes is dependent on classroom diversity. Preliminary analyses revealed that especially peer-perceived teacher support is positively associated with democratic citizenship behavior at the level of the classroom, whereas peer-perceived and self-reports of teacher conflict was associated with more aggression. These results indicate that children actively observe teachers' implicit democratic practices and that this can affect how children interact with each other as democratic citizens in the classroom.

Symposium
Learning and Instructional Technology

A look behind immersive scenes: Experiments on effective learning in virtual reality environments

Keywords: Computer-assisted Learning, Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Educational Technologies, Emotion and Affect, Higher Education, Immersive Technologies for Learning, Learning Strategies, Mathematics/Numeracy, Multimedia Learning, Problem Solving
Interest group:
Chairperson: Christian Hartmann, Technical University Munich, Germany
Chairperson: Valentina Nachtigall, Ruhr University Bochum, Germany
Organiser: Christian Hartmann, Technical University Munich, Germany
Organiser: Valentina Nachtigall, Ruhr University Bochum, Germany
Discussant: Eleni Kyza, Cyprus University of Technology, Cyprus

Immersive virtual reality (IVR) media enable authentic experiences by locating the user and the user's own actions in a virtual environment (cf. "immersion"). Although IVR has been shown to enhance learning by increasing motivation and cognitive engagement, some studies also show negative effects of IVR on learning. Hence, the promising potential of nearly limitless, authentic learning opportunities is contrasted by heterogeneous findings on the effectiveness of IVR. Our symposium aims to understand heterogenous findings through empirical contributions investigating both learning mechanisms and ways for supporting learning with IVR. The first paper shows that learners' visual imagery compensates for disadvantages of non-immersive media over IVR-technology in terms of sense of spatial presence and motivational effects. The second paper presents theoretical and empirical evidence of how embodied interactions in IVR support students' conceptual understanding. In addition, two contributions explore how learning strategies can support learning with IVR. Both compare individual and collaborative learning with IVR as well as identify ways to support students, either by promoting cognitive learning strategies or by helping students to regulate their emotional arousal through the immersive experience. All contributions take an experimental research approach, cover different features of IVR technology (visuality & interactivity) and represent different domains (mathematics, biology, history, and architecture). By addressing a variety of aspects of IVR-technology in different domains, against a backdrop of sound experimental methodology, this symposium helps understanding mechanisms underlying the effectiveness of IVR and contributes to the question of how learners can be effectively supported while learning with immersive media.

Imagine & immerse yourself: Does visual-spatial-imagery moderate learning in virtual reality?
Presenting Author: Christian Hartmann, Technical University Munich, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

Findings on the effectiveness of learning in immersive virtual reality (IVR) are mixed. While studies suggest that feeling spatially present in IVR enhances motivation and therefore learning, it is unclear whether IVR also presents information in a manner more conducive to learning than less-immersive presentations. According to theories on multimedia learning, combining pictorial and semantic representations in IVR lead to a more coherent mental model compared to presenting only one of these representations. Because IVR represents spatial-situational details more accurately than less-immersive media, IVR-presentations should promote the acquisition of spatial and thus additionally (mostly auditory) presented semantic knowledge. However, research hints that students' visual-spatial-imagery may compensate for incomplete spatial representations, that is, learners who are presented less immersive, and accordingly, less accurate representations of spatial-situational details may compensate missing information by means of their imagination. Consequently, positive effects of IVR-presentations on learning and also IVR's effects on the feeling of spatial presence and motivation might be compensated by learners' visual-spatial-imagery. We addressed this research gap by conducting an experiment in which a virtual-learning-environment was presented either using immersive IVR-technology or less-immersive desktop-VR (DVR). Results unexpectedly show that IVR did not better support learning spatial and semantic knowledge, and this was not moderated by visual-spatial-imagery. Spatial presence and motivation mediated semantic knowledge acquisition in both conditions, and this effect was moderated by the learners' level of visual-spatial-imagery: IVR's advantages over DVR in promoting spatial presence, motivation, and semantic knowledge diminished as learners' visual-spatial-imagery increased. These findings explain mixed results of IVR-research.

Embodied interaction in virtual reality for learning mathematics
Presenting Author: Julia Chatain, ETH Zurich, Switzerland; **Co-Author:**Robert W. Sumner, ETH Zurich, Switzerland; **Co-Author:**Manu Kapur, ETH Zurich, Switzerland

Although mathematics has often been thought of as disembodied, recent work highlights the major role of the learners' bodies in learning mathematics. Immersive virtual-reality (IVR) technologies offer an outstanding potential for investigating and supporting embodied learning in mathematical education. However, so far, this potential has not yet covered sufficiently by theoretical and empirical support. In this paper, we address this research gap by, firstly, spotlighting three theoretical approaches to embodiment involved in IVR learning activities: (1) embodied cognition, (2) embodied interaction, and (3) avatar embodiment. We, secondly, present four empirical studies and connect our findings to two use cases: "Grasping derivatives" and "Grounding graph theory". Our

results show that IVR provides an error-friendly space for students to learn, specifically math anxious students. Moreover, our findings suggest that IVR is a powerful tool to ground abstract concepts in embodied concreteness, which, unlike other forms of concreteness, does not impair transfer abilities. However, not all IVR activities were shown to promote embodied learning: compared to position-centered approaches, movement-centered embodied interaction impaired learning outcomes and persistence. Based on two theoretically and empirically supported use cases, our contribution discusses and highlights design aspects of embodied IVR that should be considered in further studies and educational practice.

Aids to learning in virtual reality: Adding individual and collaborative generative activities
Presenting Author: Gustav Petersen, University of Copenhagen, Denmark; **Co-Author:**Valdemar Stenberdt, University of Copenhagen, Denmark; **Co-Author:**Richard E. Mayer, University of California, United States; **Co-Author:**Guido Makransky, University of Copenhagen, Denmark

Immersive virtual reality (IVR) technology can provide engaging learning experiences that would be inaccessible in the real world. However, a persisting issue with learning in IVR is that learners get distracted by the novelty of the technological experience, and neglect to engage in generative processing devoted to making sense of the learning material; unless prompted to do so by generative learning strategies (GLSs) added to the virtual environment. The majority of prior studies on using GLSs in IVR have focused on individual learners. However, as indicated by classic theories of learning such as Social Cognitive Theory, learning is also a social process, and better understanding is often achieved through performing collaborative learning activities with others. The aim of this study is therefore to investigate the effectiveness of individual and collaborative generative activities in IVR compared to a control condition. We conducted an experiment with Danish high school students who were randomly assigned to three conditions: individual experience without generative learning activities (control group), individual experience with generative learning activity prompts, and collaboration in IVR with generative learning activity prompts. The instructional material was an IVR experience involving a journey through the human bloodstream. The learning outcomes were factual, conceptual, and spatial knowledge. Results indicate that collaborative generative activities is more effective than individual learning without generative activities in terms of spatial knowledge. A trend favoring collaboration can also be observed with regard to factual knowledge. These preliminary findings support the educational value of multiplayer IVR experiences.

Promoting cognitive processing of 360° videos through emotion regulation and collaboration
Presenting Author: Valentina Nachtigall, Ruhr University Bochum, Germany; **Co-Author:**Selina Yek, Ruhr-University Bochum, Germany; **Co-Author:**Nikol Rummel, Ruhr University Bochum, Germany

History-related 360°-videos are characterized by immersive characteristics and an emotionalized representation of the content. These features of immersive virtual reality (IVR) media bear the risk to emotionally overwhelm learners, preventing them from cognitively processing the content. In a previous study, we examined whether a strategy training on the use of cognitive strategies (e.g., summarizing the content, formulating conclusions) can foster a more cognitive and less emotional processing of history-related 360°-IVR-videos and found first positive effects of this training. The present study aims to investigate whether a more cognitive and less emotional processing of the 360°-IVR-videos can be further supported by an extended training promoting not only cognitive but also emotion-regulation strategies (e.g., accepting and redirecting one's emotions). We additionally explore how a collaboratively conducted video analysis affects students' processing of the content. For this purpose, we are currently conducting a quasi-experimental study (current sample: $N = 146$) varying two factors: type of training (basic vs. extended) and social form (individual vs. collaborative). We expect positive effects of the extended training on students' use of emotion-regulation strategies for analyzing the 360°-videos and on the type of their analyses (e.g. more reflective). Regarding the social form, preliminary findings suggest differences in students' video processing prior to the training: for instance, students who collaborated in small groups focused more strongly on drawing conclusions in their analyses than students who worked alone.

Symposium

Self-regulated Learning at Different Levels of Granularity: From Single Lessons to Entire Lectures

Keywords: Achievement, Educational Technologies, Eye Tracking, Higher Education, Learning Analytics, Metacognition, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Luise von Keyserlingk, University of Tübingen, Germany
Chairperson: Fani Lauermann, University of Bonn, Germany
Discussant: Philip Winne, Simon Fraser University, Canada

Self-regulated learning (SRL)—as a cyclical process of planning, monitoring, and evaluating one's learning—is central to academic success in higher education. Increasingly, online learning management systems (LMS) are being used in education as a means to better understand and potentially support students' SRL—i.e., their self-regulatory cycles of planning, monitoring, and self-evaluations. However, the use of LMS data poses theoretical and methodological challenges. These include, for instance, questions about the validity of SRL measures such as digital trace data (e.g., click activities) and the extent to which such data can be used to capture SRL at different levels of granularity (e.g., in single tasks, course-units, or entire courses). This symposium brings together four studies that use LMS data from higher education contexts in three countries. All studies use multiple data sources and address questions regarding the validity of SRL measures and/or investigate SRL cycles at different levels of granularity. Study 1 uses multi-channel data to validate SRL measures based on LMS data in micro-level settings with specific learning tasks. Study 2 uses previously validated SRL measures in science courses to investigate which types of SRL-behaviors in single course-units predict end-of-course performance. Study 3 investigates whether variation in click activities across one quarter predicts end-of-course performance, and if self-reported SRL-intentions predict click activities in subsequent weeks. Study 4 investigates whether initial SRL-goals predict SRL-behaviors and course performance across entire lectures. The discussant is a leading expert in SRL research with multi-source data and will discuss unique directions for future research.

Triangulation and Integration of Measuring Self-regulated Learning with Trace and Think Aloud Data
Presenting Author: Yizhou Fan, Peking University, China; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Joep van der Graaf, Radboud University Nijmegen, Netherlands; **Co-Author:**Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Johanna Moore, University of Edingburgh, United Kingdom; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Dragan Gasevic, Monash University, Australia

Many learners struggle to productively self-regulate their learning. To support the learners' self-regulated learning (SRL) and boost their achievement, it is essential to understand the cognitive and metacognitive processes that underlie SRL. To measure these processes, contemporary SRL researchers have largely utilised think aloud or trace data, however, not without challenges. In this paper, we present the findings of a study that investigated how concurrent analysis and integration of think aloud and trace data could advance the measurement of SRL and assist in better understanding the mechanisms of SRL processes. We concurrently collected think aloud and trace data generated by 44 university students in a laboratory setting and analysed those data relative to the same timeline. We found that the two data channels could be interchangeably used to measure SRL processes for only 17.18% of all time segments in a learning task. Moreover, SRL processes for around 45% of all time segments could be detected via either trace data or think aloud. For another 27.17% of all time segments, different SRL processes were detected in both data channels. Our results largely suggest that the two data collection methods can be used to complement each other in measuring SRL. The integration of the two methods further allowed us to reveal a more complex, complete, and comprehensive SRL process model compared to using a single method. In future research, the integrated measurement of SRL can be used to improve the detection of SRL processes and provide a fuller picture of SRL.

Studying Cyclical and Temporal Aspects of Self-Regulated Learning with Validated Digital Trace Data

Presenting Author: Jeff Greene, university of north carolina at chapel hill, United States; **Co-Author:**Matthew Bernacki, University of North Carolina at Chapel Hill, United States; **Co-Author:**Michael Berro, University of North Carolina at Chapel Hill, United States; **Co-Author:**Robert Plumley, University of North Carolina at Chapel Hill, United States; **Co-Author:**Shelbi Kuhlmann, University of North Carolina at Chapel Hill, United States

Digital trace data offer scalable, unobtrusive ways of capturing college students' self-regulated learning processes in large science courses. However, inferences from digital trace data must be validated before they can be used to understand and predict performance. In a previous study, we used multimodal data collection methods to validate inferences from digital trace data via aligned think-aloud protocol data collected during a laboratory session designed to mirror an actual biology lesson. Having validated what those digital trace data imply about self-regulated learning processing, in this study we gathered the same digital trace data at scale, in a large undergraduate science course, before and during the same lesson we modeled in our laboratory study. Then, we investigated whether and how self-regulated learning processing in a single cycle (i.e., one lesson) predicted performance on a subsequent exam covering the learning objectives from that lesson. We found validated digital trace data, capturing self-regulated learning processing during the lesson, predicted exam performance above and beyond the role of prior knowledge and an ancillary treatment. These findings provide evidence of the predictive validity of digital trace data validated via aligned think-aloud protocol data, pointing to new opportunities for exploring understudied aspects of self-regulated learning theory, including its dynamic, temporal, and contingent aspects.

From Time to Deadline to Time After Deadline: Steady Study Activities are Key for Course Performance

Presenting Author: Luise von Keyserlingk, University of Tübingen, Germany; **Co-Author:**Fani Lauermann, University of Bonn, Germany; **Co-Author:**Renzhe Yu, Teachers College, Columbia University, United States; **Co-Author:**Qiujie Li, University of California, Irvine, United States; **Co-Author:**Jutta Heckhausen, University of California, Irvine, United States; **Co-Author:**Jacquelynne S. Eccles, University of California, Irvine, United States; **Co-Author:**Richard Arum, University of California, Irvine, United States

Self-regulated learning (SRL) is highly relevant for academic success in higher education. However, incoming students often struggle with self-regulating their learning in college. We use self-report data and digital trace data from a learning management system (LMS) to measure students' SRL-behaviors and their links with academic performance in the Fall 2020—a quarter when LMS were particularly relevant for remote teaching due to the COVID-19 pandemic. We used behavioral trace data from four chemistry lectures at a public U.S. university (N = 1,597 students). Additionally, we used self-report data on the intended use of SRL-strategies from a small subsample (N=55). Results revealed that students' click activity in their courses showed substantial variation across the 10 weeks of the quarter, with decreases in clicks across the quarter and increased click activity in exam weeks. Students with a lower decline and more regular click activities attained better grades. Increased click activity during exam weeks did not predict students' final course grades, whereas a smaller decline in click activity in the week after each exam predicted higher end-of-term performance. Intentions to increase time and effort to prepare for a future exam only led to short-term increases in click activity after the midterm exams and were not predictive of increased end-of-term click activity (around final exams). Jointly, the conducted analyses indicate that steady study activities are important for students' end-of-term performance but students seemed to struggle with implementing long-lasting adaptations to their study activities, despite reporting positive SRL-intentions.

Self-testing in Higher Education: What Predicts the Use of Self-testing and Who Achieves Their Goals

Presenting Author: Jakob Schwerter, Institute for School Development Research (IFS), TU Dortmund, Germany; **Co-Author:**Fani Lauermann, University of Bonn, Germany; **Co-Author:**Taiga Brahm, University of Tübingen, Germany; **Co-Author:**Kou Murayama, University of Tübingen, Germany

Practice tests in conjunction with performance feedback can support student self-regulation (Ibabe & Jauregizar, 2010). However, evidence suggests that students' willingness to take self-tests is often low (e.g., about 25% in Förster et al., 2018). To date, we know very little about the psychological characteristics of students who are most likely to use and benefit from self-testing. Accordingly, using a wide range of predictor variables and the machine learning approach LASSO, this study examined the psychological characteristics of students who are most likely to use self-tests, meet their self-set course goals, and use self-tests continuously throughout the semester. We used data from two studies: economics students (N=312, 54% female) enrolled in a first-semester mathematics gateway course (Study 1) and social science students (N=117, 58% female) enrolled in a third-semester statistics course (Study 2). In both studies, students had different opportunities to self-test during the semester. There was little overlap in the selected variables for the number of self-test attempts or achievement of self-set self-testing goals between the two studies. Finally, the results highlight the need to consider not only the psychological but also contextual features of self-testing.

Symposium
Motivational, Social and Affective Processes

Well-being in school as a hope in challenging times: Insights from various perspectives

Keywords: Burnout, Developmental Processes, Emotion and Affect, Engagement, Pandemic, Resilience, Secondary Education, Self-efficacy, Social Aspects of Learning and Teaching, Teacher Professional Development, Well-being
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Caroline Mansfield, Australia
Organiser: Tina Hascher, Switzerland
Organiser: Julia Morinaj, University of Bern, Switzerland
Discussant: Daniela Raccanello, University of Verona, Italy

Within educational systems, individuals' thriving and success depend on educational environments that enable experiences of positive emotions and cognition such as enjoyment and positive attitudes and that prevent negative experiences such as worries and complaints. Particularly uncertain times, such as the COVID-19 pandemic, call for a better support of student, teacher, and principal well-being. Due to its multidimensional character, the idea of well-being in education includes a variety of approaches and perspectives that consider an array of aspects related to well-being. The common goal of the four presentations from four countries (Portugal, Finland, Switzerland, and Germany) in this symposium is to identify factors that contribute to well-being in school and that can inform us about possible well-being intervention programs in school and teacher education. The presentations mirror the variety of theoretical approaches as well as methodological designs. The first presentation investigated cross-sectionally the associations of physical, mental, and social well-being with resilience, motivation, commitment, and self-efficacy based on a questionnaire with Portuguese teachers. The second presentation assessed changes in work engagement and burnout of Finish teachers and principals by applying a person-centreed approach with five measurement points during the COVID-19 pandemic. The third presentation examines through semi-structured interviews how Swiss teachers cope with subjective challenges, activate a resilience process, and try to maintain their well-being. The fourth presentation analyses the effectiveness of three form of an art-of-living intervention program on the well-being of German high school students.

Framing teacher well-being: A study with Portuguese teachers

Presenting Author: Francisco Peixoto, ISPA - Instituto Universitário | Center for Research in Education, Portugal; **Presenting Author:**José Castro Silva, ISPA-Instituto Universitário, Portugal

Teacher well-being has a significant impact on schools, teachers, and students. Many of the negative effects of low well-being are well publicized, with stress or burnout being linked to attrition and the resulting teacher shortages worldwide. This has led to calls for teacher well-being to be taken seriously for the long-term sustainability of the profession. Although a great deal of literature highlights the stressful nature of the teaching profession, there is a lack of consensus in how to operationalize teacher well-being. Furthermore, only a minority of scholars grounded their studies in the teaching profession (Hascher & Waber, 2021). The main goal of the present study was to examine the interplay between the factors that frame well-being among Portuguese teachers. Participants are primary and

middle school teachers from Portugal (*n* = 1807). Preliminary results showed that: 1) at the cognitive level, resilience and self-efficacy related positively with physical and mental well-being; 2) at subjective level, the motivation related to the societal impact of teaching is negatively associated to the physical and mental well-being, whereas the motivation related to the benefits of teaching and commitment are positively associated to well-being; and 3) at the social level, the three factors considered (relationships with students, colleagues, and directive board) are positively related to physical and mental well-being.

Teachers' and principals' work engagement and work burnout during the pandemic
Presenting Author: Katariina Salmela-Aro, Helsinki University, Finland; **Co-Author:**Katja Upadyaya, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland

The aim was to examine teachers and principals work engagement and burnout during the pandemic. 5864 teachers filled in the questionnaire during the pandemic (spring 2020, fall 2020, spring 2021, fall 2021, spring 2022). The person-oriented results among the teachers showed that during spring 2020, four groups among the teachers were identified: burnout (10%), engaged-exhausted (10%), risk of burnout (40%) and engaged (40%), while during the fall 2021 five groups were identified: burnout (14%), burnout-cynical (8%), engaged-exhausted (29%), risk of burnout (29%) and engaged (20%). Burnout and engaged-exhausted groups were twice as large in year 2021 than in the beginning of the pandemic, while the engaged was twice as large in the beginning of the pandemic. The variable-oriented results also showed silver-lining. Work engagement first decreased among the teachers during the years 2020 and 2021, while work engagement recovered during the spring 2022. In turn, teachers' work burnout increased during the years 2020 and 2021, while small decrease was identified in spring 2022. About 600 principals filled in principal barometer annually from 2019 to 2022. These results showed that in the first measurement time spring 2019, about 10% suffered from work burnout, while during the spring 2022 24% suffered from work burnout. These results showed that pandemic was related to severe decreased in work-related well-being both among the teachers and principals. Interesting during the year 2022 teachers started to recover, whereas among the principals the work burnout increased even during 2022.

Understanding the resilience process that supports teacher well-being
Presenting Author: Isabelle Krummenacher, Abteilung für Schul- und Unterrichtsforschung, Institut für Erziehungswissenschaft, Bern, Switzerland; **Co-Author:**Irene Guidon, PHBern, University of Teacher Education, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland; **Co-Author:**Julia Morinaj, University of Bern, Switzerland; **Co-Author:**Caroline Mansfield, University of Notre Dame Australia, Australia; **Co-Author:**Susan Beltman, Curtin University, Australia

Recent studies have intensified research efforts examining contextual and individual factors contributing to teachers' professional well-being (Ainsworth & Oldfield, 2019; Mansfield et al., 2016). Maintaining well-being and responding resiliently to professional challenges are valuable skills for teachers. Teacher well-being and resilience are broad constructs used across disciplines. The two constructs are dynamic and often conceptualized as multidimensional (Hascher et al., 2021). Research on teacher resilience explores why certain teachers stay in the profession despite challenges (Beltman et al., 2011; Mansfield et al., 2016). In Switzerland, however, there has been little research on this. Hascher et al. (2021) recently introduced the Aligning Well-being and Resilience in Education (AWaRE) model, which describes a resilience process embedded in contextual and individual challenges and resources. Within this process, individual teachers aim to maintain, restore, and develop their well-being. This qualitative study aims to explore the resilience process proposed in the AWaRE model and to identify relevant challenges and resources. Semi-structured interviews with *N*=29 teachers addressed the coping strategies teachers use in challenging situations. The results showed that the central contextual challenges are related to the school management, parents, and the class constellation. Support systems from the school management and the staff as well as cooperation among teachers were essential contextual resources. Problem-solving, capitalizing on social support, was a frequent coping strategy. The results will be discussed in terms of supporting a successful resilience process among teachers.

How to choose strategies to enhance art-of-living and well-being in high school students
Presenting Author: Corinna Anders, TU Darmstadt, Germany; **Co-Author:**Bernhard Schmitz, TU Darmstadt, Germany

Background: German students suffer under the pressure to perform and therefore show psychosomatic problems. Studies show, that Art-of-living (AoL) is a convenient way to enhance well-being (Tavakoli et al., 2022). To learn how to derive the optimal intervention, if not all strategies can be applied, three possible intervention types were developed, implemented and evaluated.Methods: Intervention I is based on Deci and Ryan's self-determination theory (1993) and allows participants to choose freely from a number of AoL strategies. Participants of intervention II carry out a theory guided set of five AoL strategies. Participants of intervention III apply strategies of AoL areas that show the biggest individual potential of further development. The structure of the four-hour training follows the concept of Perels et al. (2008). Well-being and AoL was measured with the AoL questionnaire (pre-, posttest and follow up) and with an online AoL diary over a 14-day period. The sample consists of N = 184 students.Results: In comparison to the control group intervention II and III show significant outcomes in the overall AoL scale. Intervention I did not show any significant changes in comparison to the control group. The trend analyses show a significant increase in well-being over a 14-day period for interventions II and III.Conclusions: The findings suggest how to choose strategies to enhance AoL and well-being in high school students.

The Social Side of Digitization: Knowledge Mobilization among Educational Professionals on Twitter
Keywords: Informal Learning, Social Interaction, Social Media, Teacher Professional Development
Presenting Author: Martin Rehm, University of Regensburg, Germany; **Co-Author:**Lennart Klein, Universität Tübingen, Germany; **Co-Author:**Tim Fütterer, University of Tübingen, Germany; **Co-Author:**Christian Fischer, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Marie Lockton, University of California, San Diego, United States; **Co-Author:**Anita Caduff, University of California, San Diego, United States; **Co-Author:**Alan J Daly, University of California, San Diego, United States

Digitization offers a wide range of opportunities for teaching and learning, while simultaneously creating new and unprecedented challenges for schools. Educational professionals must, therefore, continuously update and expand their knowledge and skills to meet these challenges. We draw on knowledge mobilization and network theory to analyze and compare how educational professionals in Germany and the U.S. use Twitter to informally mobilize knowledge and tackle the challenges presented by digitization in schools. We combine network science and natural language processing to analyze the communication between educational professionals on Twitter. Accessing Twitter's academic API, we collected more than 1.4 million Tweets from January 1, 2020, until December 30, 2021. The data collection focused on two popular hashtags among educational professionals in the U.S. (#edchat) and Germany (#edchatde) around mobilizing knowledge about digitization in education. Our results suggest similar network structures between the two countries and the existence of brokers that are active in both hashtag conversations and seemingly contribute to knowledge mobilization across the two countries. Next to structural similarities, our findings also revealed that a number of hashtags that deal with topics around digitization in education and are used across countries. Moreover, we identified semantic differences between the two countries. More specifically, the German context was more "individual" centered, knowledge mobilization in the U.S. was more "We" focused. These insights contribute to a better understanding of network structures and shed light on how educational professionals use different types of semantics to access and share information.

Twitter's Potential for Knowledge Brokers to Improve their Knowledge Mobilization Efforts
Keywords: Foreign and Second Language Acquisition, Informal Learning, Mixed-method Research, Social Media
Presenting Author: Anita Caduff, University of California, San Diego, United States; **Co-Author:**Martin Rehm, University of Regensburg, Germany; **Co-Author:**Marie Lockton, University of California, San Diego, United States; **Co-Author:**Alan Daly, Universityof California, San Diego, United States

To improve student experiences and outcomes, education systems and organizations must enhance their knowledge mobilization. Knowledge brokers are central to the profoundly relational process of knowledge mobilization. While many knowledge brokers move in online spaces, many primarily use social media to broadcast information without its two-way engagement functionality to learn from and about their audiences. Hence, a considerable potential for using social media stays untapped. This mixed-methods case study combines interviews, social network analysis, and natural language processing to determine what knowledge brokers *want* and *can* learn from Twitter. We show that analyzing Twitter data allows us to examine communities' interests, sentiments, and the roles of users. As such, this paper starts to unpack Twitter's potential for knowledge brokers.

How do Teachers in German Twitter Communities Share, Perceive, and Use Materials?
Keywords: Computer-supported Collaborative Learning, Informal Learning, Social Media, Teacher Professional Development
Presenting Author: Fitore Morina, University of Tübingen, Germany; **Co-Author:**Tim Fütterer, University of Tübingen, Germany; **Co-Author:**Joshua M. Rosenberg, University of Tennessee-Knoxville, United States; **Co-Author:**Jeffrey Carpenter, Elon University, United States; **Co-Author:**Christian Fischer, University of Tübingen, Germany

Twitter has become important for collaboration and informal professional learning among teachers. Prior research has suggested that teachers primarily use Twitter to share and acquire materials for their teaching, but research has not documented the specifics of what curricular or other materials teachers use. This study investigates how teachers in four German hashtag community types, for example the STEM education community, share and perceive education materials. Our sample consists of more than 1,705,000 tweets from over 90,000 users. The results suggest that materials are not shared equally among the community types, for example, in the STEM community more materials are shared than in the Twitterlehrerzimmer community (German for "Teacher's Twitter lounge"). Furthermore, the sentiment of replies to tweets that contain materials is generally more positive than negative across all community types. This study advances educational research on Twitter and informs educational stakeholders about the possibilities of Twitter as a medium for informal teacher learning and a place to acquire materials for teaching.

Online Communities of Practice on Twitter: A Case Study of the German Educational Twittersphere
Keywords: Communities of Learners and/or Practice, Learning Analytics, Social Media, Teacher Professional Development
Presenting Author: Christian Fischer, University of Tübingen, Germany; **Co-Author:**Fitore Morina, University of Tübingen, Germany; **Co-Author:**Conrad Borchers, Carnegie Mellon University, United States; **Co-Author:**Lennart Klein, University of Tübingen, Germany

Twitter provides an online community space for teachers to engage in collaborative discussions with their colleagues. While most prior research often examined singular hashtag-based communities, this study provides a detailed mapping of the entire German Twittersphere (N = 2,806,873 tweets, N = 143,004 users). We describe interaction patterns across community types regarding participation patterns and sentiment to identify important communities and longitudinal engagement trends. Additionally, we provide a blueprint for nationwide mappings of educational Twitterspheres for researchers in other countries. We highlight the utility of such large-scale educational data by examining how the most popular German Twitter community, the "Twitterlehrerzimmer" (TWLZ; German for "Twitter's teacher lounge"), may fulfill characteristics of an online community of practice. Combining educational data science and qualitative methods, we examined the three dimensions of communities of practice, that is, domain, community, and practice. For educational research, this study indicates the potential of large educational Twitter data. For stakeholders in education, this study suggests that participation in online teacher communities on Twitter may provide teachers with meaningful informal online professional learning opportunities to broaden their professional networks and engage in productive collaborations with colleagues.

Complementing "Traditional" School Organization - Leveraging Social Opportunity Spaces on Twitter
Keywords: Informal Learning, School Leadership, Social Interaction, Social Media
Presenting Author: Martin Rehm, University of Regensburg, Germany; **Co-Author:**Marie Lockton, University of California, San Diego, United States; **Co-Author:**Anita Caduff, University of California, San Diego, United States; **Co-Author:**Regina Mulder, University of Regensburg, Germany; **Co-Author:**Alan J Daly, San Diego State University & University of California, San Diego, United States

Schools are facing a wide range of challenges and the importance of further enhancing collaborative approaches to share information and resources among educational professionals is increasingly more important. However, existing formal structures are often not always effective in supporting educational professionals in accessing and sharing relevant just-in-time information and resources. In this context, it has been argued that school organizations might also need to consider more informal communication and information channels to support educational professionals in their work. In this study, we employ innovative methods to examine the notion of schools as organizations, suggesting that online social opportunity spaces (SOS) are becoming an ever-increasing, complementary pillar of schools to gain valuable access to new information and resources. Using a combination of social network analyses and natural language processing, we analyze Twitter data, as an exemplary SOS, and associated user profile information over two years, from January 1, 2020, to December 31, 2021, yielding a total of 473,470 tweets and 174,552 unique users. Our findings suggest the potential of online SOS, broadening the conceptualizations of schools as organizations, and opens up the space for rethinking schools as fixed and formal organizations. Given these considerations and findings, we identify a number of practical implications for schools as organizations.

Self-Efficacy and Emotions in Teachers: A Random Intercept Cross-Lagged Panel Model
Keywords: Emotion and Affect, Quantitative Methods, Secondary Education, Teacher Efficacy
Presenting Author: Barbara Balaž, Catholic University of Croatia, Croatia; **Co-Author:**Irena Burić, University of Zadar, Croatia; **Co-Author:**Mara Šimunović, Institute of Social Sciences Ivo Pilar, Croatia

Teacher self-efficacy (TSE) is assumed to have reciprocal relationship with emotions teachers experience while teaching and interacting with students. However, previous research on the relationship between TSE and teacher emotions were either based on cross-sectional designs or failed to separate stable individual differences from changes in TSE and emotions that occur within teacher over time. Thus, in the present longitudinal study, we examined the relationship between TSE and a series of teacher discrete emotions (i.e., enjoyment, pride, love, anger, hopelessness, exhaustion), by testing the random-intercept cross-lagged panel model (RI-CLPM) that separates the between-person from within-person effects. In total, 1141 teachers (881 females) from 73 secondary schools from Croatia filled out online questionnaires four times within one school year. The results showed that, at the between-person level, stable parts of TSE were positively associated to positive emotions and negatively to negative emotions. The same pattern of the relationship was found at the within-

person level concurrently. On the other hand, results pertaining to longitudinal cross-lagged effects at the within-person level, were not that straightforward. Specifically, TSE and emotions of enjoyment and exhaustion were reciprocally related over time, while emotions of pride, anger, and hopelessness predicted TSE, but not vice versa. Lastly, longitudinal relationship between love and TSE was not confirmed. Our findings provide important implications for finding ways to promote teacher emotional well-being and motivation. *This work was supported by Croatian Science Foundation (Grant No. IP-2019-04-5472)

Instructional Self-Efficacy and Student Resistance: Beliefs Matter
Keywords: Motivation, Science and STEM, Self-efficacy, Teaching/Instructional Strategies
Presenting Author:jenefer husman, University of Oregon, United States; **Co-Author:**Maura Borrego, University of Texas - Austin, United States; **Co-Author:**Cynthia Finelli, University of Michigan, United States; **Co-Author:**Michael Prince, Bucknell University, United States; **Co-Author:**Lea Marlor, University of Michigan, United States

In this study we examine the influence of STEM faculty's self-efficacy for using active learning on changes in their plans to use active learning in their courses. Additionally, we examine the mediating influence of both faculty's perception and student self-report resistance to active learning. We found that faculty's self-efficacy for active learning predicted changes in their plans to use active learning in the classroom, and that this relation was largely mediated by their perception of student resistance to active learning. However, we found that faculty's perception and students' self-reported resistance was unrelated. These findings suggest that the underlying barrier to faculty adoption of active learning is not students' behavior, but rather faculty's misinterpretation of students' responses. This study is unique for its longitudinal research design, the geographic and disciplinary diversity of the sample, and for using validated measures of both student report and faculty perception of how students respond to active learning.

Patterns of Teacher Self-Efficacy: A Latent Profile Analysis with Secondary School Teachers.
Keywords: Large-scale Assessment, Self-efficacy, Teacher Efficacy, Teacher Professional Development
Presenting Author: Jing Huang, Lingnan University, Hong Kong; **Co-Author:**Youliang Zhang, Beijing University of Technology, China

This study aimed to empirically identify different self-efficacy patterns among lower secondary school teachers in Singapore, investigate possible differences in job satisfaction, constructivist beliefs, and teacher co-operation across different distinct profiles, and examine the predictions of teacher background characteristics to profile membership. The study included 3,095 lower secondary school teachers who participated in the Teaching and Learning International Survey (TALIS) 2013. Using latent profile analysis, four distinct self-efficacy profiles were identified: (a) *Low Self-Efficacy* (18.8%), (b) *Moderate Self-Efficacy* (40%), (c) *High Self-Efficacy* (27.2%), and (d) *Divergent Moderate Self-Efficacy* (14%), characterized by a high level of self-efficacy in student engagement and moderate levels of self-efficacy in classroom management and instruction. Results also demonstrated significant differences in teachers' job satisfaction, constructivist beliefs, and teacher co-operation across self-efficacy profiles. Teaching experience of teachers significantly predicted self-efficacy profile membership. These findings shed light on the heterogeneous patterns of self-efficacy among lower secondary school teachers.

"I believe in my skills!"- A meta-analysis on intervention studies promoting teacher self-efficacy.
Keywords: In-service Teachers, Meta-analysis, Pre-service Teachers, Teacher Efficacy
Presenting Author: Janina Täschner, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany

A high level of teacher self-efficacy has been identified as an important predictor for several positive outcomes such as teachers' well-being (e.g., Zee & Koomen, 2016) or high job commitment and satisfaction (e.g., Chesnut & Burley, 2015). However, it is still unclear (1) whether teachers' self-efficacy can be promoted at all, (2) whether it can be promoted equally for pre-service and in-service teachers, and (3) whether promotion effects differ depending on the sources of self-efficacy that are addressed in the interventions. Our meta-analysis summarizes the results from 119 intervention studies with 11526 pre-service and in-service teachers. Results from multilevel random effects meta-analysis reveal interventions can promote teacher self-efficacy (g = 0.47*, CI = 0.40; 0.54). Neither the career stage of the sample nor the addressed sources in the interventions moderated the effects significantly. However, characteristics of successful interventions differences across studies are detected and will be discussed.

Underlying mechanisms of number comparison skills in young children
Keywords: Cognitive Development, Cognitive Skills and Processes, Early Childhood Education, Mathematics/Numeracy
Presenting Author: David Munez, National Institute of Education / Nanyang Technological University, Singapore; **Co-Author:**Josetxu Orrantia, University of Salamanca, Spain; **Co-Author:**Rosario Sánchez, University of Salamanca, Spain; **Co-Author:**Laura Matilla, Univeresity of Salamanca, Spain; **Co-Author:**Veronica Carreton, Universidad de Salamanca, Spain

Understanding the meaning of symbol numbers—or that "7" is larger than "5"— is a crucial milestone in the child's development of mathematical abilities. Performance on number comparison tasks in which children (and adults) are presented with two Arabic numbers and tasked to choose the larger number is typically used to assess such knowledge of symbol number meaning—a.k.a. symbol number magnitude processing skills. In this study, we investigated the decision-making process during number comparison in kindergarten children (n=58; M_{age}=71 months, SD_{age}=5.7; 41% females). To that end, we modeled performance data on a number comparison task according to a drift-diffusion model that parceled out stages and components of the decision-making process. In contrast to processes that have been described for adults, we found that familiarity with small numbers rather than the distance between numbers drove the decision-making process. The rate of accumulation of evidence was also affected by the order of numbers. These findings suggest different mechanisms in young children, hence, challenging extant theories regarding the meaning of children's performance/ability on number comparison tasks.

How does early maths develop? A visual representation of domain-specific maths skills across time.
Keywords: Cognitive Development, Developmental Processes, Early Childhood Education, Mathematics/Numeracy
Presenting Author: Zahra Siddiqui, UCL, United Kingdom; **Co-Author:**Laura Outhwaite, University College London, IOE, United Kingdom; **Co-Author:**Jo Van Herwegen, UCL Institute of Education, United Kingdom

Early mathematical development is vital for future educational outcomes (Davis-Kean et al., 2021). It is thus important to understand developmental pathways of mathematics in the early years (i.e., 3-7 years) that encompasses all relevant domain-specific skills. Although previous studies have considered developmental pathways from a domain-general perspective (e.g., LeFevre et al., 2010), further work is required to understand pathways within domain-specific abilities of mathematics. The present study collated, via a meta-review, relevant domain-specific intervention studies to plot a mechanistic visual representation of pathways of mathematical development. The protocol was preregistered on the Open Science Framework (https://osf.io/n4dys/). The meta-review identified 191 relevant systematic reviews, meta-analyses, and narrative reviews. All references from these reviews were collated, and 38 interventions studies were identified. These 38 studies contained 2,033 individual participants and 30 different domain-specific abilities were targeted in the interventions. Cumulatively, this resulted in 86 individual strands that were used to construct multiple pathways. Ages ranged from 43 – 83 months, with a mean of 64 months (i.e., 5.3 years). The most common domain-specific intervention strand was symbolic number line training, which showed links to abilities such as cardinality (45 months), symbolic

magnitude comparison (59 months), and arithmetic (56 months). This visual developmental model demonstrates when domain-specific abilities are most developmentally appropriate to be introduced to children. It also illustrates the developmental pathways of mathematical abilities in the early years that can be translated to the design of effective interventions and inform theoretical models of mathematical development.

Mediated paths from early fine motor and executive function skills to later math and reading fluency
Keywords: Cognitive Development, Early Childhood Education, Mathematics/Numeracy, Reading
Presenting Author: Kiat Hui Khng, National Institute of Education/Nanyang Technological University, Singapore, Singapore; **Co-Author:**David Munez, National Institute of Education / Nanyang Technological University, Singapore; **Co-Author:**Beth Ann O'Brien, National Institute of Education/Nanyang Technological University, Singapore, Singapore; **Co-Author:**EeLynn Ng, National Institute of Education, Singapore

The mechanisms and pathways underlying longitudinal links between early fine motor skills (FMS) and executive functions (EF) to later math and language skills, especially much later in development, is not yet well understood. We examined whether children's EF and FMS at the start of kindergarten predicted their later math and reading fluency towards the end of primary school—five to six years later—via mediated paths from their early math and reading skills near the end of their kindergarten schooling. Path analysis was conducted on data collected from a sample of children (*N*=514) when they were in the first and second years of kindergarten, and in late primary school. Children's FMS and EF at the start of kindergarten predicted math and reading fluency in late primary school, indirectly through their early math and reading skills by their second year of kindergarten. Additionally, early FMS directly predicted math fluency while early EF directly predicted reading fluency. Early FMS, EF, math, and reading skills accounted for a substantial amount of variability in later math and reading fluency. Early advantages in FMS and EF may allow for better skills acquisition in early education that persist through to later specific component skills. Early screening of EF or FMS difficulties at or before the start of kindergarten may be important. Preschools can include activities for FMS and EF training, which may be especially important for children who enter with poor status.

Executive function and academic outcomes across development: from kindergarten to secondary school
Keywords: Cognitive Development, Early Childhood Education, Mathematics/Numeracy, Reading
Presenting Author: Dieuwer ten Braak, University of Stavanger, Norway; **Co-Author:**Ragnhild Lenes, University of Stavanger, Norway; **Co-Author:**Ingunn Størksen, University of Stavanger, Norway

Executive function (EF) is a robust correlate of academic success but there may be important developmental changes in the relations between EF and academic subskills across development. This study investigates the relations between EF and measures of academic outcomes (literacy and mathematics) across kindergarten, 1st grade, and up to 8th grade (ages 5 – 13). Moreover, it is investigated whether the predictive strength of EF to academic outcomes varies depending on children's level of academic outcomes. EF was measured in kindergarten and 1st grade with a measure of working memory, the Digit Span (DS; Wechsler, 2003), and a more complex self-regulation measure, the Head-Toes-Knees-Shoulders task (HTKS; McClelland et al., 2014). Multiple regression models showed that in kindergarten working memory was especially predictive for 8th grade achievement while in 1st grade it was the more complex HTKS that significantly predicted secondary school achievement. Preliminary results from quantile regression analyses showed that in the early years, EF - especially working memory, was a particularly salient predictor at the lower end of the academic competence distribution. The results suggest that more complex EFs gain in predictive power as children encounter more formal learning situations in 1st grade, that EF has persistent predictive value for academics (especially mathematics) up to secondary school, and that EF may be especially important for children with low academic competence in the early years. Early screening for EF difficulties may therefore be especially beneficial for children at risk as it can provide opportunities for timely support.

Professional development emanating from new technologies in nurses' work
Keywords: Competencies, Informal Learning, Lifelong Learning, Mixed-method Research
Presenting Author: Regina Mulder, University of Regensburg, Germany; **Co-Author:**L. Romina Bornhaupt, University of Regensburg, Germany; **Co-Author:**Patrick Beer, University of Regensburg, Germany

Technological developments cause changes in nursing, such as new tasks and related activities which may not be valued, nor explicitly mentioned, but are pivotal for good performance. These tasks and activities can be considered meta-work. The objective of this study is to discover aspects of meta-work that foster becoming and staying a professional, especially in times of change. Therefore, we focus on informal learning activities that are part of professional development, the continuous process of developing and adapting competences relevant to the profession, which occurs for instance during working, by answering: What components of professional development emanate from the implementation and use of new technology in nurses' work?A mixed-method approach was applied consisting of a systematic review (*N*=11 studies) and two explorative, and guideline-based interview studies with nurses (*N*=9; *N*=10). We conducted extraction of evidence and narrative synthesis and deductive-inductive qualitative content analysis. The review discovered components of work that changed due to technology and that led to informal learning activities. The interviews also revealed many such learning activities that resulted from the use of new technologies, such as reflection. Especially regarding changes at work, activities of externalisation seem to be crucial. These results indicate that changes at work, due to new technologies cause activities that might be considered meta-work. Furthermore, new tasks arose in changing contexts. This shows that in further developing the concept of meta-work attention could be paid to the difference between the job tasks, and actual behaviour of nurses accomplishing the work tasks.

Evidence-Based Practices of nursing students during clinical internships
Keywords: Assessment Methods, Attitudes and Beliefs, Competencies, Health-care Education
Presenting Author: Carla Quesada-Pallarès, Universitat Autònoma de Barcelona, Spain; **Presenting Author:**Anja Garone, University College Leuven Limburg, Belgium; **Co-Author:**Elena Roig Ester, Autonomous University of Barcelona, Spain; **Co-Author:**Ellen Westhof, University College Leuven Limburg, Belgium; **Co-Author:**Antonio Vega-Martínez, Autonomous University of Barcelona, Spain

Evidence-based practice is understood as conscious, explicit and judicious application of the best evidence of nursing knowledge to make decisions about the care of patients, taking into account their preferences and values, and incorporating professional expertise in this decision making. (Alonso et al., 2004). This study aims to determine the behaviours, beliefs and attitudes of nursing students towards evidence-based practice. At the same time, it assesses whether the students apply EBP and how they choose to incorporate it into their clinical practice. The questionnaire was applied to 168 nursing students after finishing their clinical internships at two universities in Flanders and one in Catalonia. Results suggest that even though there are differences among universities, these are not significant. We discuss the implications of this and other important findings in relation to nursing study programs and their clinical internships.

Relational meta-work emerging during technology integration in primary care
Keywords: Communities of Learners and/or Practice, Health-care Education, Lifelong Learning, Qualitative Methods
Presenting Author: Monika Nerland, University of Oslo, Norway; **Co-Author:**Isabel Brandenberger, University of Oslo, Norway; **Co-Author:**Mervi Hasu,

University of Oslo, Norway

The primary health services are subjected to intensified digitalisation with the aim of transforming care provision. As part of these ambitions, smart and assistive technologies are introduced to handle the growing elderly population and enhancing the opportunities for independent living among patients in need of continuous care. Recognising that technologies cannot simply be implemented in professional services, various groups of care personnel are mandated to facilitate technology integration and adapt the services for these purposes. This paper examines forms of relational meta-work that emerge in their efforts to facilitate technology integration; work that is not recognized as part of their formal tasks or job description, yet necessary for the primary tasks to be accomplished. We analyse data from research conducted in one city district within a large Norwegian municipality, comprising ethnographic observations and interviews with various groups of care workers and middle managers. Our findings show how work related to supporting, interpreting, adapting, coordinating and negotiating technology use in the services imply a range of new and often unnoticed relational demands to the care workers' expertise. These included a need to redefining and navigating relations to their colleagues, their leaders, technology vendors and clients. We argue that these forms of meta-work are essential for digitalisation processes to be realised, and should be recognized in ways of theorizing and supporting professional learning and development.

Expanding healthcare practice: meta-work generated when AMR healthcare processes are digitalised
Keywords: Communities of Learners and/or Practice, Lifelong Learning, Qualitative Methods, Sustainable Development
Presenting Author: Littlejohn Allison, University College London, United Kingdom; **Co-Author:**Koula Charitonos, The Open university UK, United Kingdom; **Co-Author:**Heli Kaatrakoski, University of Stavanger, Norway

Digitalisation of health sectors is important for social transformation in areas of health that relate to major global health challenges where fast and decisive action is needed. However, digitalisation places demands on professionals expertise by generating new forms of unseen work, termed meta-work. These forms of work are important to ensure new practices and ways of working are enabled, yet remarkably little is known about them. This study examines the evolution of healthworkers practices during the digitalisation of health sectors in three low-and-middle-income countries. We examine forms of meta-work needed to support these new practices, including building good relationships in ways that support work across disciplinary boundaries. These forms of meta-work take time and effort and are important for the expansion of practice so it is vital they are recognised and supported through policy. Organisations need to find ways to encourage dialogue across sites to acknowledge forms of meta-work then take steps to support these as authentic and valid forms of professional practice.

Conceptualizing domain-specific student engagement by combining qualitative methods
Keywords: Computer-assisted Learning, Engagement, Qualitative Methods, Science and STEM
Presenting Author: Elissavet Papageorgiou, Delft University of Technology, Netherlands; **Co-Author:**Jacqueline Wong, Utrecht University, Netherlands; **Co-Author:**Annoesjka J. Cabo, Delft University of Technology, Netherlands

The use of educational videos in engineering mathematics has been associated with the facilitation of student engagement. Despite the increasing interest in the topic, little is known about how students engage and learn with mathematics videos. To date, no study has focused on domain-specific aspects of engagement in engineering mathematics. This study employs a bottom-up approach by examining engineering students' perceptions of their subject- and task-specific engagement, i.e., in learning mathematics with a video. We employed a qualitative method by combining mind maps with semi-structured interviews, followed by deductive and inductive content analysis. Results showed that student engagement was conceived as a three-dimensional construct. However, the level of granularity (i.e., subject, task) was found to influence students' definitions for each dimension. Furthermore, the findings reveal that student engagement in engineering mathematics plays a mediating role between student-context interactions and learning outcomes. When focusing on the specific learning task, activity-related factors were identified as the most relevant facilitators. Three activity elements were emphasized as engaging by the students: the design, the topic, and the activity's position in the course. The findings inform research on the construct conceptualization and provide insights for strengthening the development of video-based activities and interventions to improve engagement. Finally, by revealing indicators that have been less frequently examined in mathematics, the study contributes to the discussion of developing context-relevant measures for capturing engagement.

Examining proximal group progress toward high-quality disciplinary engagement
Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Engagement, Science and STEM
Presenting Author: Toni Rogat, Purdue University, United States; **Co-Author:**Britte Cheng, Menlo Education Research, United States; **Co-Author:**Cindy Hmelo-Silver, Indiana University, United States; **Co-Author:**Anne Traynor, Purdue University, United States; **Co-Author:**Temitope F. Adeoye, Purdue University, United States; **Co-Author:**Reina Fujii, Menlo Educational Research, United States; **Co-Author:**Alexandria Holmes, Purdue University, United States

We are interested in advancing understanding of how collaborative groups make progress toward productive engagement during STEM activities. Toward this end, we investigated how collaborative groups' engagement at one time fuels their proximal engagement in the subsequent time segment of activity. This research is grounded in our situative theory and measurement of *group disciplinary engagement*, conceptualized as shared engagement norms, co-negotiated as a collective. We draw on our observational quality ratings, assigned along five dimensions, from a larger video dataset of 28 groups and our previous quantitative finding that disciplinary engagement afforded a disciplinary hook for group engagement. In the present study, we aim to richly describe this temporal pattern using our longitudinal case studies, engaging in additional qualitative analysis in a return to the video and case narratives. Results indicated that a disciplinary hook was initially afforded by: (1) the group's monitoring of their understanding, leading to voiced uncertainty, and (2) uptake of the curriculum task prompts and simulation features when exploring connections and solving the unit problem. This initial disciplinary engagement encouraged the group to join together in knowledge co-construction and elaborate in a more coordinated and collaborative fashion (i.e., high-quality collaborative engagement). Findings contribute to theory for understanding engagement dynamics of short duration and have implications for supporting ways to initiate and grow group disciplinary engagement.

Prosocial Education Supports Elementary Math and Science Classroom Climate and Engagement
Keywords: Motivation, Social Aspects of Learning and Teaching, Social Interaction, Teacher Professional Development
Presenting Author: Christi Bergin, University of Missouri, United States; **Co-Author:**Jennifer Foster, University of Missouri - Columbia, United States; **Co-Author:**Lindsay Brockmeier, University of Missouri/Columbia, United States; **Co-Author:**Bo Zhu, American Institutes for Research, United States; **Co-Author:**Ryan Williams, American Institutes for Research, United States; **Co-Author:**Cara Wylie, eMINTS National Center, United States

Prosocial Education focuses on altering teacher-student interaction using research-based strategies that increase students' prosocial behavior (e.g., helping others). It is especially important in STEM classes that use teamwork for problem-based learning among students who do not yet have the social skills for team science. We report on an intervention that provides 5th grade math and science teachers with one year of professional development (PD) in Prosocial Education (e.g., use of inductive discipline and praise for students' prosocial behavior). Teachers in 36 schools were randomly assigned to treatment and control groups. Results from blinded classroom observation and student surveys indicate that teachers receiving the PD provided more emotional support and created a more

positive classroom climate in their classrooms and that students experienced more personal engagement, more prosocial behavior from peers, and better teacher-student relationships (statistics forthcoming). While this project focused on 5th grade STEM classes, the PD model of Prosocial Education could be applied widely to other subjects and grades to increase prosocial behavior and improve classroom climate.

To What Extent Can Meta-Creative Pedagogy Foster Elementary School Students Creative Thinking?
Keywords: Creativity/Divergent Thinking, Metacognition, Primary Education, Problem Solving
Presenting Author: Nurit Paz-Baruch, Bar Ilan University, Israel; **Presenting Author:**Zemira Mevarech, Bar-Ilan University, Israel; **Co-Author:**Guy Grovas, School of Education, Bar-Ilan University, Israel

Fostering creative thinking and promoting metacognitive processes are two major goals of 21st-century education. However, studies examining how these components could be combined are rare. The purpose of the present study was threefold: 1) to design an innovative meta-creative pedagogy for fostering creative thinking; 2) to examine the immediate and transfer effects of this pedagogy on three components of creative thinking: fluency, flexibility, and originality; and 3) to explore students' implementation of meta-creative processes during creative problem-solving. Three sixth-grade classes (74 students) were randomly assigned as experimental and control groups. Students in the experimental group were exposed to the meta-creative pedagogy. Results indicated that students exposed to the meta-creative pedagogy scored significantly higher than the control group on both the immediate and transfer creative thinking tasks. Furthermore, students in the experimental group implemented meta-creative processes to a greater extent than those in the control group. These findings highlight the importance of using the meta-creative pedagogy to foster students' creative thinking. The theoretical and practical implications of the study are discussed.

Do We Need Metacognition for Creativity? The Necessary Condition Analysis of Creative Metacognition
Keywords: Art Education, Creativity/Divergent Thinking, Metacognition, Quantitative Methods
Presenting Author: Marek Urban, Institute of Psychology of Czech Academy of Sciences, Czech Republic; **Co-Author:**Kamila Urban, Institute for Research in Social Communication, Slovak Academy of Sciences, Slovakia

Necessary condition analysis (NCA) is a novel statistical approach following *necessity* causal logic. NCA tests whether a predictor acts as a necessary condition allowing an outcome to exist. The approach is different from the traditional *sufficiency* causal logic in which the predictor produces the outcome.The present study examines whether metacognition is an actual necessary condition of creative performance. This hypothesis assumes that metacognition is necessary for creativity to occur, but metacognition alone does not have to suffice to produce creative performance; i.e., individuals with low levels of metacognition cannot perform creatively, but individuals with high levels of metacognition may - but do not have to - perform creatively. This assumption is based on recent studies suggesting the importance of metacognitive knowledge and accurate metacognitive monitoring with subsequent regulation for the creative process. The study employs 385 graduate psychology majors and tests whether the metacognitive monitoring accuracy during resolution of the Unusual Uses Task acts as a necessary condition for creative performance in a complex Product Improvement Task. The Absolute Accuracy Index was calculated for self-evaluation and comparison judgments. In both cases, NCA found that accurate metacognitive monitoring acts as a necessary condition of creative performance with large effect sizes (d = .46, p = .008, for self-evaluation; d = .52, p < .001, for comparison). The findings open a space for re-evaluation of the role of metacognition in more traditional domains; e.g., is metacognition a necessary condition of efficient learning or reading comprehension?

Creative Problem Solving in Primary School Students
Keywords: Inquiry Learning, Qualitative Methods, Quantitative Methods, Teaching/Instructional Strategies
Presenting Author: Mare van Hooijdonk, Radboud University Nijmegen, Netherlands; **Co-Author:**Tim Mainhard, Leiden University, Netherlands; **Co-Author:**Evelyn Kroesbergen, Radboud University, Netherlands; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands

Schools need to foster creative problem solving (CPS) in students from an early age onwards to meet the demand for creative problem solvers in modern society. Insight is needed in the nature of the CPS process and product in primary school students in order to adequately assess and nurture them. More specific, insight is needed in both the CPS *process* and *product* in these young students. Findings from a think-aloud study with fourth graders (N = 13) indicated that students' behaviors in response to a CPS task largely matched the CPS model as proposed by Treffinger, Isaksen and colleagues. Findings from a large quantitative study with 4th to 6th grade students (N = 594) showed that the relations among the CPS indicators and those with divergent thinking and academic achievement corresponded with relations found in different age groups. We therefore concluded that the CPS model can be applied in the primary school context and that CPS capability is already present in this young age group.

Creativity-Fostering Teacher Behaviors in Higher Education: A Transdisciplinary Systematic Review
Keywords: Creativity/Divergent Thinking, Higher Education, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Rene Brauer, Maastricht University, Netherlands; **Co-Author:**Jarrod Ormiston, University of Technology Sydney, Australia; **Co-Author:**Simon Beausaert, Maastricht University, Netherlands

As a key 21st century skill, creativity has the power to shape new paths into a more socially and environmentally responsible, personally gratifying, and economically sustainable future. However, while society's demand for creativity is echoed across the world, higher education institutions, particularly teachers, struggle to support students' development of creative competencies due to insufficient research and teacher training regarding creativity-fostering skills. This transdisciplinary systematic literature review aims to address this gap by providing a comprehensive overview of creativity-fostering teacher behaviors identified in empirical studies across all academic disciplines (humanities, social-, natural-, formal-, and applied sciences).Our keyword search of all education-relevant databases identified 3356 studies. After screening abstracts, we selected 603 studies for detailed full-text review. After applying inclusion/exclusion criteria and scientific quality assessments, we included 58 studies in our final sample.Our thematic analysis identified 22 themes grouped into 6 overarching themes, framed as the 6 *Dimensions of Fostering Creativity (Affective, Cognitive, Behavioral, Meta-Cognitive, Creativity-In-Action,* and *Uncertainty*). On the basis of these dimensions, we propose a comprehensive conceptual model of teacher behaviors for creativity: *"The Unleash Creativity Model"*.This model highlights the transdisciplinary and interactive nature of creativity-fostering teacher behaviors, which were found to be largely similar across disciplines. It further highlights the complexities and challenges of teaching for creativity as an ever-changing process (balancing act) subject to conflicting needs and tensions. This review provides key practical insights for teachers and policymakers, and new research directions for a more holistic approach to teaching for creativity.

Chairperson: Erik De Corte, KU LEUVEN, Belgium

Antecedents and Consequences of Students' Emotion Profiles in Mathematics.
Keywords: Attitudes and Beliefs, Emotion and Affect, Mathematics/Numeracy, Secondary Education
Presenting Author: Tanja Held, University of Bern, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland

In everyday school life, students experience a wide range of different emotions. Existing research emphasized the relevance of achievement emotions for learning processes, academic outcomes, and lifelong learning. However, the various emotions a student may encounter in everyday school life are not mutually exclusive, and students may experience multiple emotions simultaneously. Investigating co-occurring emotions with person-centered analyses may provide new perspectives by identifying individuals with common characteristics and assuming heterogeneous effects on outcomes across these subgroups. In this study, we identified subpopulations of students characterized by distinct emotion profiles in mathematics in the lowest ability tier in lower secondary education (Grade 7). Moreover, we examined whether students' gender, and control and value appraisals predict these profiles. Finally, we investigated the relations of the profiles with effort, inattention, motivation, and achievement. Latent Profile Analysis (LPA) was used to assess emotion profiles of 414 lower secondary school students regarding their experiences of enjoyment, pride, anxiety, anger, and boredom in mathematics. Results revealed three emotion profiles: a *negative emotion profile*, a *low emotion profile*, and an *only positive emotion profile*. Furthermore, results showed that emotion profiles can be predicted by gender and control appraisals. Moreover, profiles differed regarding students' motivational and behavioral outcomes. Therefore, the co-occurrence of emotion is an important approach to investigate emotions, their antecedents, as well as their effects on important academic outcomes.

Mathematics Emotions – Interaction Between Distance Learning and Math Performance
Keywords: Emotion and Affect, Mathematics/Numeracy, Pandemic, Quantitative Methods
Presenting Author: Anni Sydänmaanlakka, University of Helsinki, Finland; **Co-Author:**Jokke Häsä, University of Helsinki, Finland; **Co-Author:**Marja Holm, Finnish Institute for Health and Welfare, Finland; **Co-Author:**Markku Hannula, University of Helsinki, Finland

During the COVID-19 pandemic, schools faced a new challenge when students could not attend school in person. Although previous studies have found that distance learning during the pandemic was associated with more negative achievement emotions, there is little information on whether this association varied between adolescents with different levels of mathematical performance. This study examined whether students' mathematics-related achievement emotions differed between contact and distance learning across adolescents with different performance in mathematics. We controlled for student gender, their mathematics syllabus (basic or advanced), and the school's academic level.We collected data from 1,222 high school students across COUNTRY during the spring term in 2021, using a modified version of the Achievement Emotions Questionnaire – Mathematics (AEQ-M) to assess their mathematics-related achievement emotions in both contact and distance learning environments. We assessed students' levels of mathematical performance using their self-reported grade point average (GPA) for mathematics in general upper secondary school. Data were analysed using linear mixed effects modelling to examine the interaction between learning environments (contact vs. distance) and performance levels on achievement emotions. Results show that higher performing students reported more negative emotions in distance learning compared to contact learning. In contrast, lower performing students reported less anxiety in distance learning. The strengthening and dampening of different emotions between lower and higher performing students should be considered when planning distance learning.

The relationship between affective factors and basic numeracy skills in pre-service teachers
Keywords: Emotion and Affect, Mathematics/Numeracy, Pre-service Teachers, Quantitative Methods
Presenting Author: Heidi Hellstrand, Åbo Akademi University, Faculty of Education and Welfare Studies, Finland; **Co-Author:**Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Airi Hakkarainen, University of Turku, Finland; **Co-Author:**Pirjo Aunio, University of Helsinki, Finland; **Co-Author:**Anu Laine, University of Helsinki, Finland; **Co-Author:**Pekka Räsänen, University of Turku, Finland

Abstract (words 177)This study seeks to investigate how affective factors in mathematics (i.e., self-concept, enjoyment, utility value, and anxiety) are related to basic numeracy skills (i.e., number processing and arithmetic fluency) in pre-service teachers. The sample consisted of 111 teacher students (101 female; 7 male; 3 not reported) from three universities. Affective factors were measured with a twelve-item self-reported questionnaire, modified from the Fennema-Sherman Mathematics Attitude Scale (Fennema & Sherman, 1976). Basic numeracy skills were measured with a computerized, online functional numeracy test battery that focuses on number processing and arithmetic fluency (Räsänen et al., 2021). In the preliminary analysis, correlation analysis was used to establish the relationship between the affective factors (i.e., self-concept, enjoyment, utility value, and anxiety), number processing and arithmetic fluency. The preliminary results indicate that significant moderate correlations exist between self-concept ($r = .430$, $p < .001$), enjoyment ($r = .351$, $p < .001$), utility value ($r = .221$, $p < .05$), anxiety ($r = -.375$, $p < .001$), and arithmetic fluency. However, none of the affective factors was significantly correlated to number processing.

Numerical and emotional conflict processing: Evidence from behavioral and pupil dilation data
Keywords: Achievement, Cognitive Skills and Processes, Emotion and Affect, Mathematics/Numeracy
Presenting Author: Adrien Nicolay, Universität Innsbruck, Austria; **Co-Author:**Elise Klein, Université de Paris, Sorbonne Paris Cité, Paris, France; **Co-Author:**Ronen Hershman, Department of Psychology, University of Innsbruck, Innsbruck, Austria; **Co-Author:**Dorothea Hämmerer, Department of Psychology, University of Innsbruck, Innsbruck, Austria; **Co-Author:**Elisabeth Weiss, Department of Psychology, University of Innsbruck, Innsbruck, Austria; **Co-Author:**Liane Kaufmann, Department of Psychology, University of Innsbruck, Innsbruck, Austria

Accumulating evidence suggests that numerical and emotional processing are interrelated. Nevertheless, the mechanisms underlying this interplay are still poorly understood. Against this background, we examined (i) whether the automaticity of basic numerical and emotional processing is associated and (ii) whether interindividual variability in conflict processing remains stable across different functional domains (i.e., numerical and emotional processing).Overall, 57 young healthy adults completed two Stroop tasks: a number-size Stroop task (requiring a response to the physical stimulus size while ignoring the numerical value) and a picture-word Stroop task (requiring to read the emotion word while ignoring the emotion conveyed by the simultaneously presented scenic picture).

In the picture-word Stroop task we also collected pupil dilation data, a sensitive indicator of Stroop-related conflict processing.[1] While the number-size Stroop task is an established marker of task-irrelevant automatic numerical processing, the novel picture-word task seems to trigger task-irrelevant emotional processing.[2]Behavioral results indicate an association of the automaticity of basic numerical and emotional processing. Importantly, this interrelation was also reflected in the pupillometry data (i.e., congruency effects upon processing task-irrelevant emotional stimuli). Moreover, interindividual differences remained rather stable across tasks, suggesting that domain-general cognitive conflict processing has a stable intraindividual expression in cognitive functions as diverse as emotion and number processing. Finally, the conceptual and educational implications will be discussed. References[1]Henik, A., Moyal, N., & Landstein, G. (submitted). Emotion congruity suggests automatic activation of emotional experience. [2]Hersman, R., & Henik, A. (2020). Pupillometric contribution to deciphering Stroop conflicts. *Memory & Cognition, 48*, 325-333.

Revisiting Bronfenbrenner's bioecological theory during a time of global crisis
Keywords: Developmental Processes, Early Childhood Education, Knowledge Construction, Pandemic
Presenting Author: Caroline Cohrssen, University of New England, Australia; **Presenting Author:**Maria Hatzigianni, University of West Attica, Greece

This theoretical paper proposes the revisiting of Bronfenbrenner's bioecological theory in response to unexpected, global phenomena which disrupt the balance of ecological systems. COVID-19 is one such phenomenon. The global impact of the pandemic has exerted pressure on macrosystems around the world as countries have taken steps to control the spread of the virus. Mandates issued by governments such as social distancing regulations, 'lockdowns' and school closures have had a profound effect on economies, employment, education, families and children. The long-term consequences of the disruption of ecological systems are not yet fully known, but the impact of the pandemic and other events with global impacts Reexamining the theory will provide us with helpful insights for the future and increase readiness in the case of another crisis (e.g., the energy crisis arising from Ukrainian war) suggest the need to reflect on increased influences on the macrosystem during times of crisis, and the impact such influences have on systems more proximal to the child. Finally, the need for longitudinal research to evaluate these modifications is also underlined.

Families in COVID-19 Pandemic - Relations of Family Type and Resources on Home Learning Environment
Keywords: Anxiety and Stress, Early Childhood Education, Pandemic, Parental Involvement in Learning
Presenting Author: Luisa Prokupek, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Franziska Cohen, University of Education Freiburg, Germany; **Co-Author:**Elisa Oppermann, University of Bamberg, Germany; **Co-Author:**Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

In March 2020, the COVID-19 lockdown led to many challenges, especially for families with young children. We examined the adaptability of families with regard to changes in parents´ provision of home learning activities (HLA) in traditional two-parent families, single parent families and extended families compared to before the lockdown. We focused on family resources such as a supportive role distribution within the partnership and social support as predicting factors of adaptability in $N = 8.513$ families with children aged 18 to 69 months. In addition, we considered parental stress as a further influencing factor. The data depicts German families from a nationwide online survey. We found that all three family types offered more home learning activities, albeit with slight differences between the families. However, we identified differences in factors influencing family adaptability: Across all family types, we found slight to medium negative relations between adaptability and parental stress. The relations were most evident in extended families. Furthermore, social support shows medium positive relations to the adaptability of extended families. For the adaptability in single-parent families, gender-specific differences first emerged. Single fathers offered their children more parental HLA compared to the time before the lockdown than single mothers. This relation disappeared when we took parental stress and social support into account. For two-parent families and single parents, our analyses revealed barely significant relations between the investigated predictors and changes in HLA during lockdown. The results provide important indications about the functionality of extended families in crises.

A cross-cultural study during a pandemic: Parental behaviors of young children in times of lockdown
Keywords: Anxiety and Stress, Pandemic, Resilience, Well-being
Presenting Author: Galia Meoded, Tel Aviv University, Israel; **Co-Author:**Dorit Aram, Tel Aviv University, Israel; **Co-Author:**Merav Asaf, Kaye Academic College of Education, Israel; **Co-Author:**Margalit Ziv, Kaye Academic College of Education, Israel; **Co-Author:**Katerina Shtereva, Sofia University, Sofia, Bulgaria; **Co-Author:**Carmen López-Escribano, Complutense University of Madrid, Madrid, Spain; **Co-Author:**Susan Sonnenschein, University of Maryland, Baltimore County, United States

The COVID-19 pandemic triggered a substantial change in the lives of parents and children around the globe and created a unique situation that enabled studying parenting from a cross-cultural perspective in times of a shared crisis. The study portrays parenthood's universal and culturally specific characteristics during the lockdowns of March-May 2020. Parenting behaviors were studied in five cultures through the prism of the Parenting Pentagon Model. The model specifies five constructs of beneficial parenting behaviors: Partnership between the parents; parental Leadership; Love expressions; encouraging child's Independence; and adherence to Rules. Participants were 1080 parents (153 Bulgarian, 192 Israeli Arabs, 290 Israeli Jews, 304 Spanish, and 141 American) who answered online self-report questionnaires on the frequency of their daily behaviors, focusing on their young children aged 2-8-years. Findings showed that parents' Love expressions toward their children were the most prominent and expressed the centrality of these behaviors in parenting, regardless of culture. Partnership behaviors were reported as least frequent across cultures, suggesting that spouses' collaboration was challenging. Additionally, coping with the lockdown circumstances was more challenging for larger families. Findings highlighted some significant points regarding cross-cultural aspects of parenting in the five cultures and their manifestation in parent-child bonds in times of crisis. Acknowledging parents as the central agents in their children's lives during stressful times can empower and contribute to their awareness of their behaviors at home. Educational implications may assist in planning and implementing programs to improve parents' coping and agency skills in times of increased stress.

How did Germany parents of primary school children perceive remote schooling during COVID pandemic?
Keywords: Digital Literacy and Learning, Pandemic, Parental Involvement in Learning, Primary Education
Presenting Author: Katrin Gottlebe, University Leipzig, Germany; **Co-Author:**Brigitte Latzko, University of Leipzig, Germany

Parental support moderately affects students learning outcome in school (Hattie, 2013). During school closings due to the COVID-19 pandemic, parental support had to increase substantially. On the other hand, infrastructure for digital remote teaching was only on an insufficient level (Lorenz et al., 2021). The current study aims to describe how parents supported their primary school children during remote schooling in 2020/21 and how distant learning for the subject German Language in Saxon primary schools was implemented. The survey was carried out in June 2022.Parents were contacted by letter that contained the link to the anonymous online questionnaire containing questions on school achievement of the children, teaching methods and organisation of remote schooling during the pandemic restricting measures in 2020-2021. The sample consists of 105 parents (77 female; median age 42) of urban primary school children from grade 2 to 4 in Saxony.The paper presents first descriptive results that show that technical equipment of the families was rather good. Parents, mainly women, report having to combine support of their child's school assignments and their own work. As for the implementation of distant learning, data shows that student-teacher contact was very rare, feedback was seldomly given and teaching was limited to do-it-yourself by the students with support of the parents.To limit the results, the sample is very specific from an urban area in Saxony with high education level of the parents and also high school achievement level in the subject German Language.

Analyzing teaching strategies to promote oral communication in the classroom by teachers in training
Keywords: Instructional Design, Pre-service Teachers, Qualitative Methods, Teaching/Instructional Strategies
Presenting Author: María Fernanda Rodríguez, Universidad Finis Terrae, Chile; **Co-Author:**Camila Barahona, Pontificia Universidad Católica de Chile, Chile

When teachers are in their first year of professional practice, one of their main difficulties is mastering didactic resources and teaching methods. Due to the COVID-19 lockdown, pre-service teachers had few opportunities to apply and practice teaching strategies. This study presents a case study with 20 teachers in training in a course on Didactics of Language and Communication, where activities were proposed that encourage the analysis and reflection of didactic strategies to develop and promote oral communication in primary school. Through a qualitative methodology of content analysis, the result was obtained that it was possible to introduce innovative teaching methodologies in teacher training, that the teachers in training positively valued the proposed activities; they had opportunities for peer interaction and had opportunities to link theoretical-didactic knowledge to their professional practices.

Comparing Experienced and Novice Teachers' Visual Attention to Students' Hand-Raising Behavior
Keywords: Cognitive Skills and Processes, Engagement, Eye Tracking, Teacher Professional Development
Presenting Author: Tina Seidel, Technische Universität München, Germany; **Co-Author:**Christian Kosel, TUM School of Education, Germany; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany; **Co-Author:**Katharina Schnitzler, Department Erziehungswissenschaft der Universität Potsdam, Germany; **Co-Author:**Jürgen Pfeffer, Professorship of Computational Social Science and Big Data, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

This paper adds to the understanding of teachers' professional vision by analyzing their gaze in an instructional situation of whole-class discourse using eye-tracking data. We followed an expert-novice paradigm (10 experienced teachers and 10 novice teachers) and focused on the relationship between teachers' attentional processes and students' hand-raising behavior. We found that teachers' attentional processes were positively related to the number of hand-raisings, and that experienced teachers' gazes were more student-centered. Furthermore, experienced teachers were able to distribute their attention among more students, regardless of their hand-raising behavior. The results of the study confirm previous assumptions that experienced teachers can focus their attention on more students and their learning-relevant behaviors. The findings are integrated into recent research on teachers' knowledge-based classroom management scripts that are of relevance to understanding the visual expertise of (experienced) teachers.

Promoting teachers' diagnostic competence in self-regulated learning
Keywords: In-service Teachers, Mixed-method Research, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Kerstin Baeuerlein, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Sabrina Brunner, PH FHNW, Switzerland; **Co-Author:**Xenia-Lea Weber, Ruhr-University Bochum, Germany; **Co-Author:**Ferdinand Stebner, University of Osnabrück, Germany; **Co-Author:**Joachim Wirth, Ruhr-University Bochum, Germany; **Co-Author:**Yves Karlen, University of Zurich, Switzerland

Self-regulated learning (SRL) is considered an important educational goal. However, teachers struggle with diagnosing and promoting SRL. Using a mixed-methods control group design, the present study examines in-service teachers' knowledge, beliefs, and diagnostic competence regarding SRL. Furthermore, it investigates to what extent improvements can be achieved in these respects by training carried out in addition to the use of an online diagnostic tool. Forty-three teachers completed online questionnaires and used an online diagnostic tool to assess their students' SRL at two measurement time points. Twenty-nine of the teachers also participated in training between the two measurement time points. A combination of qualitative and quantitative data analysis revealed that, on average, teachers had medium-high knowledge about SRL and its diagnosis and held positive beliefs about SRL. They reported that diagnosing students' SRL is more challenging than diagnosing their subject-specific competencies. Knowledge of methods for diagnosing SRL and self-assessed competence in diagnosing SRL increased over time. However, training had no additional effect. Conclusions for teacher training on SRL and further research on teachers' diagnostic competence regarding SRL are discussed in this contribution.

Any experience?: Linking teacher efficacy, professional learning community and experiential learning
Keywords: In-service Teachers, School Leadership, Teacher Efficacy, Teacher Professional Development
Presenting Author: Takumi Yada, Finnish Institute for Educational Research, Finland; **Co-Author:**Akie Yada, University of Jyväskylä, Finland; **Co-Author:**Daisuke Choshi, Teikyo University, Japan; **Co-Author:**Tetsuhito Sakata, Otsuma Women's University, Japan; **Co-Author:**Takehiro Wakimoto, Yokohama National University, Japan; **Co-Author:**Masahiro Nakada, Shirayuri University, Japan

This study focused on how professional learning communities (PLCs), experiential learning, and teacher self-efficacy are linked. A conceptual model that relates PLCs elements including shared vision, interactive reflection, and collegiality, experiential learning and to teacher self-efficacy has been examined. Data included 3604 teachers from 204 elementary schools and 787 teachers from 90 lower secondary schools in Japan. The results of a multi-group structural equation modeling showed that some PLCs elements were linked to teachers' self-efficacy. Experiential learning worked as a mediator role in the connection between PLCs and teacher self-efficacy. Based on the results, theoretical and practical significance are discussed.

Elementary school students' mindsets and attentional neural processing of feedback
Keywords: Educational Neuroscience, Feedback, Mathematics/Numeracy, Mindsets
Presenting Author: Ita Puusepp, University of Helsinki, Finland; **Co-Author:**Tanja Linnavalli, University of Helsinki, Finland; **Co-Author:**Tuisku Tammi, University of Helsinki, Finland; **Co-Author:**Minna Huotilainen, University of Helsinki, Finland; **Co-Author:**Teija Kujala, University of Helsinki, Finland; **Co-Author:**Sonja Laine, University of Helsinki, Finland; **Co-Author:**Elina Kuusisto, Tampere University, Finland; **Co-Author:**Kirsi ja Tirri, University of Helsinki, Finland

The aim of this study was to examine the development of the associations between elementary school students' mindsets and attentional neural processing of positive and negative feedback in math. For this, data of 104 Finnish elementary school students were collected twice; during the autumn semesters of their 3^{rd} and 4^{th} grade. The participants' general intelligence mindsets were measured with a questionnaire and their brain responses elicited by performance-relevant feedback were recorded during the completion of a two-alternative choice arithmetic task. We found students' general intelligence mindset to be associated with their feedback-related P300 response in grade 4, but not in grade 3. More specifically, in the 4^{th} grade a stronger fixed mindset was associated with a larger P300 elicited by both negative and positive feedback in the arithmetic task. The change in the strength of the association from grade 3 to grade 4

possibly reflects the development of coherent mindset meaning systems during elementary school years. The found association between mindset and brain responses elicited by both positive and negative feedback possibly indicates that in evaluative situations mindsets have an effect on stimulus processing more generally.

Children's gender stereotypes in STEM ability following a growth mindset intervention
Keywords: Attitudes and Beliefs, Gender Issues, Mindsets, Science and STEM
Presenting Author: Fidelia Law, University of Exeter, United Kingdom; **Co-Author:**Luke McGuire, 1University of Exeter, United Kingdom; **Co-Author:**Mark Winterbottom, University of Cambridge, UK, United Kingdom; **Co-Author:**Adam Rutland, University of Exeter, United Kingdom

Research shows that gender stereotypes may undermine women's willingness to pursue STEM and it is damaging to girls' career aspirations, motivation, and self-efficacy in STEM. The present research breaks new ground by linking theory to educational practice and demonstrates how growth mindset intervention can be effectively executed in informal science learning contexts. The study was conducted during an hour-long interactive space science show in a science centre. Participants (n =147, female n = 77, 5 – 12-years-old; Mage= 8.60, SD= 1.70) were visitors to a science museum. Half of the sample experienced the growth mindset intervention in a space science show and the other half experienced the show without intervention (control condition). The intervention was delivered in the middle of the show, and it consisted of three elements: a growth mindset message, a writing task, and a manipulation check at the end of the survey. The findings show that mindset interventions can be successfully carried out in a science museum. This research-practice partnership offers many opportunities to explore research questions, test novel educational interventions, and design and implement impactful theory-based and outcome-focused practice. Lastly, the findings demonstrate that growth mindset messages are associated with more equitable gender stereotype awareness around STEM which are known to be instrumental in the rising gender disparity between men and women in STEM.

Parents in learning: The influence of mindsets and behavior on students' reading achievement
Keywords: Achievement, Mindsets, Parental Involvement in Learning, Parents' Beliefs and Affect
Presenting Author: Caroline Villiger, University of Teacher Education Bern, Switzerland; **Co-Author:**Nadine Schuler, PH Bern - School of Teacher Education, Switzerland; **Co-Author:**Edith Niederbacher, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

Parents play an important role when it comes to student learning and academic achievement. Family background explains an important portion of the variance in achievement between students. Other factors, such as parental beliefs and behavior, have received much less attention in previous research. This paper examines the importance of factors such as implicit theories (growth vs. fixed mindset) in predicting the development of reading achievement. At the same time, the mediating role of parental behavior will be examined. Using a structural equation model, the postulated mechanisms are analyzed with a sample of N = 726 5th and 6th Grade students and their parents. Preliminary results show that parental beliefs (e.g., growth mindset) are particularly crucial in predicting controlling behavior, but also in predicting reading achievement over a period of seven month. The paper provides new insights in factors which are relevant to predict parental learning-related behavior, and it shows to what extent parental mindsets influence academic development of students. The results allow conclusions to be drawn regarding the question of how parents can optimally support their child in learning.

Is your mind set? Growth mindsets of students and teachers and their interaction
Keywords: Achievement, Metacognition, Mindsets, Self-regulated Learning and Behaviour
Presenting Author: Silke Hertel, Ruprecht-Karls-Universität Heidelberg, Germany; **Co-Author:**Johannes Jud, University of Zurich, Switzerland; **Co-Author:**Carmen Nadja Hirt, University of Zurich, Switzerland; **Co-Author:**Yves Karlen, University of Zurich, Switzerland

The mindsets of students and teachers play an essential role in everyday school life. Our paper links to recent research on students' growth mindsets, self-regulated learning (SRL), and academic achievement. The class-based sample allows us to extend the perspective to teachers' growth mindsets and instructional practices. We present multi-level SEM analyses based on data from N=1468 students from N=117 classes and their teachers. We applied questionnaires and knowledge tests at the student and teacher levels. At the student level, the results indicated that students' SRL growth mindset positively relates to their academic performance. Furthermore, the analyses revealed that the effect of students' SRL growth mindset on academic achievement is entirely mediated by academic self-concept and metacognitive knowledge. At the class level, teachers' intelligence growth mindset was positively related to students' intelligence growth mindset. Although the data is cross-sectional and no causal conclusions can be drawn, the findings provide important insights for further research and school practice.

Using knowledge maps as attention-directing support for writing instructional texts
Keywords: Computer-assisted Learning, Educational Technologies, Higher Education, Pre-service Teachers
Presenting Author: Inka Haehnlein, Martin Luther University Halle-Wittenberg, Germany; **Co-Author:**Pablo Pirnay-Dummer, Martin-Luther-Universität Halle-Wittenberg, Germany

Writing texts that are suitable for learning is an important aspect of teaching. External representations can help with the cognitive demands of the writing process by guiding conceptual attention and directing the focus of understanding. This experiment examines the effects of different kinds of automatically generated support on pre-service teachers' writing for teaching purposes. In a cross-sectional control-group design N=98 pre-service teachers first read a text on "metacognitive learning" and second, based on that text, wrote an instructional text for 10^{th} graders. Experimental group 1 was aided in their writing with a knowledge map, that was automatically generated from the provided source text by means of computer-linguistic technology. Experimental group 2 received a list of terms based on the knowledge map. The control group received no aid. The quality of the student texts was assessed with regard to content and transfer-criteria by trained raters. This study found transfer abilities lacking across all groups, with no effects of the type of writing support on text quality. The type of support impacted students' motivation.

Promoting Media-Didactic Skills through Multimedia Tools – Influencing Factors on Learning Success
Keywords: Higher Education, Multimedia Learning, Pre-service Teachers, Teaching/Instructional Strategies
Presenting Author: Katharina Frank, Johannes Gutenberg-Universitaet Mainz, Germany; **Co-Author:**Olga Zlatkin-Troitschanskaia, Johannes Gutenberg-Universität Mainz, Germany; **Co-Author:**Jasmin Schlax, Johannes Gutenberg-Universität Mainz, Germany; **Co-Author:**Christian Dormann, Johannes Gutenberg-Universität Mainz, Germany; **Co-Author:**Sebastian Brueckner, Chair of business education, Germany

Prospective teachers often report that their teacher education studies do not adequately prepare them for actively applying their knowledge in complex teaching situations. This might be due to the fact that teaching practice is currently not satisfactorily anchored in teacher education curricula. In this respect, in recent years, there has been increasing demand for the targeted use of digital media in the classroom, which requires action-oriented media-didactic skills of teachers. In university teaching, multimedia teaching-and-learning tools can effectively complement traditional approaches and allow for greater individuality of use, so

that the increasing heterogeneity of trainee teachers' learning preconditions can be addressed. A German project, presented here, aims to develop, and evaluate such tools in a pre-post design with a control group to determine their key influencing factors. In the following, results regarding the influence of teacher characteristics (e.g., personal beliefs) are presented and critically discussed, also in terms of limitations.

Utility-Value Interventions Support Technology-Related Knowledge Integration but not Learning
Keywords: Competencies, Digital Literacy and Learning, Educational Technologies, Pre-service Teachers
Presenting Author: Iris Backfisch, University of Tuebingen, Germany; **Co-Author:**Leonie Sibley, University of Tübingen, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany; **Co-Author:**Kenneth Tulku Kirchner, University of Tuebingen, Germany; **Co-Author:**Christoff Hische, University of Tübingen, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany

To be able to meaningfully use technologies for teaching, teachers need appropriate knowledge and motivational beliefs concerning their utility. The relevant knowledge is often framed as technological pedagogical content knowledge (TPACK, Mishra & Koehler, 2006) which is a very complex amalgam of diverse knowledge components. Therefore, research suggests that teachers need distinct support to integrate them. We therefore aimed at fostering pre-service teachers' knowledge integration with a utility-value intervention in a laboratory experiment (N= 43) and an online experiment (N= 115): After a pretest, pre-service teachers randomly either received the intervention (experimental group) or not (control group). Afterward, all pre-service teachers were asked to read through a hypermedia learning environment with chapters on the different knowledge components of TPACK and to answer a posttest. Whereas analyses showed no effects of the intervention on pre-service teachers' knowledge and value beliefs, epistemic network analyses demonstrated that the intervention group put more emphasis on developing integrated TPACK compared to the control group. Therefore, the utility-value intervention seemed to impact pre-service teachers' learning behavior, but not their learning outcomes, which should be aimed at in further studies.

Video Annotations to Support Pre-Service Teachers' Professional Vision for Technology Integration
Keywords: Digital Literacy and Learning, Educational Technologies, Pre-service Teachers, Teaching/Instructional Strategies
Presenting Author: Franziska Tschönhens, University of Tübingen, Germany; **Co-Author:**Ulrike Franke, University of Tübingen, Germany; **Co-Author:**Tim Fütterer, University of Tübingen, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany

Professional vision (noticing and reasoning of critical classroom situations) is a crucial prerequisite to effectively integrate educational technology during teaching. The use of annotation tools that allows to comment on video-taped classroom situations has the potential to enhance pre-service teachers' technology-related professional vision. However, pre-service teachers need additional support in using such annotation tools. In a field-experiment, we examined, whether and how the availability of support strategies (i.e., video-modeling examples, prompts) during using an annotation tool differently affected pre-service teachers' professional vision. Pre-service teachers (N = 167) were randomly assigned to one of four conditions in which we crossed two factors: availability of video-modeling examples before the annotation tasks (yes, no), and prompts during the annotation task (yes, no). Our findings suggest that neither video-modeling examples nor prompts had an effect on noticing. However, video-modeling examples but not prompts contributed to pre-service teachers' reasoning abilities. The findings highlight the role of advance and direct support strategies (i.e., video-modeling examples) for fostering pre-service teachers' professional vision, as a prerequisite for technology integration.

Interaction effect between parenting and teacher support on students' help-seeking behavior
Keywords: Communication Skills, Parents' Beliefs and Affect, Primary Education, Teacher Effectiveness
Presenting Author: Ayafumi Goto, Gifu Shotoku Gakuen University, Japan

This study investigated the interaction effect between parenting and teacher support on students' help-seeking behavior. A self-report questionnaire was used to assess students' perceptions of teacher support regarding help-seeking from their teachers and classmates, parenting (i.e., acceptance and control), and social competence and help-seeking behaviors toward teachers and classmates. The questionnaires were completed by 424 elementary school students. The hierarchical regression analysis controlling with grade revealed that: (a) help-seeking behavior toward classmates, among low parenting (acceptance and control), was higher when there was a low level of teacher support regarding help-seeking from teachers for boys; (b) help-seeking behavior toward classmates, among high parenting (acceptance and control), was higher when there was a high level of teacher support regarding help-seeking from classmates for boys; (c) controlled parental acceptance or control and social competence, and teacher support regarding help-seeking from teachers significantly predicted help-seeking behavior toward teachers for both boys and girls; and (d) social competence significantly predicted help-seeking behavior toward classmates for girls. These results indicate that teacher support regarding help-seeking from their teacher had a direct effect on help-seeking from teachers for boys and girls and teacher support regarding help-seeking from their classmates had a moderation effect on help-seeking from classmates for boys. Strong evidence was revealed in this study regarding the role of teacher support and family influences in promoting students' help-seeking.

Shifting online early: Online vs. face-to-face early childhood STEM parent-engagement workshop
Keywords: E-learning/ Online Learning, Early Childhood Education, Parental Involvement in Learning, Science and STEM
Presenting Author: Mona Wong, Yew Chung College of Early Childhood Education, Hong Kong; **Co-Author:**Brad Chan, Yew Chung College of Early Childhood Education, Hong Kong

Online classes have become part of the "new normal" in education. Yet, not all students, particularly young children, are well-prepared for this new teaching method. To provide quality online learning experience for children in the early year and to compensate for their loss of online learning opportunities due to developmental limitations, our project designed and implemented an online workshop for parents and children to explore STEM experiments at home. The results were compared with that from the face-to-face workshop and found that the online workshop was more able to equip parents with suitable STEM-teaching knowledge, and to engage children with STEM explorations. The results demonstrated the possibility of applying effective instructional technology in early childhood education to provide active learning.

Free access to a digital library at home: The panacea for home reading by G2 beginning readers?
Keywords: Digital Literacy and Learning, Parental Involvement in Learning, Reading, School Effectiveness
Presenting Author: Maria T. Sikkema-de Jong, Leiden University, Netherlands; **Co-Author:**Simone Vogelaar, Education and Child studies, Leiden University, Netherlands; **Co-Author:**Jane Pieplenbosch, Utrecht University, Netherlands; **Co-Author:**Ralph Rippe, Education and Child studies, Leiden University, Netherlands

We experimentally tested whether making a digital library of age-appropriate e-books available at home for free to Grade 2 beginning readers (N = 140) would result in (frequent) spare time reading. Half of the teachers involved in the study were asked to nudge the participating students aimed at using the digital library

at home (intervention group). Teachers in de the control group did not get instructions to nudge. In addition to registering log data of digital library use at home, we collected information from their parents or caretakers about the student's home environment and student characteristics like reading level, reading attitude, and executive functioning. Log data showed that just over half of the students (52%) logged on to the digital library at least once during the study that took a school year. Teachers in the intervention group had hardly ever nudged students to read at home during the schoolyear. Results are discussed in the light of the value of evidence based digital interventions in up leveling the home literacy environment.

An investigation of the relation between household chaos and students' academic outcomes
Keywords: Emotion and Affect, Parental Involvement in Learning, Primary Education, Self-concept
Presenting Author: Xiaozi Gao, The Education University of Hong Kong, Hong Kong; **Co-Author:**Frank Tian-fang Ye, The Hong Kong Polytechnic University, Hong Kong; **Co-Author:**Kerry Lee, The Education University of Hong Kong, Hong Kong; **Co-Author:**Lan Yang, The Education University of Hong Kong, Hong Kong; **Co-Author:**Kuen Fung Sin, The Education University of Hong Kong, Hong Kong

Household chaos and students' academic outcomes: The role of parental involvement and students' self-regulated learning
Research has demonstrated direct links between household chaos and impairments in child academic performance (Garrett-Peters et al., 2016). However, the underlying mechanisms responsible for the relations have not been well-established. The current study aims to contribute to this effort by examining the role of parental involvement, chaos, and children's self-regulated learning. A sample of 251 parent-child dyads were recruited in Hong Kong (M_{age} = 8.2 yrs., 51.4% girls). Students reported their academic emotional experience in home learning, academic self-concept, and self-regulated learning via an online survey. Parents reported their involvement in the children's home learning and household chaos levels. Structural equation modeling revealed that household chaos was associated with poorer academic emotion (r = .25, p = .017), less parental involvement in children's learning (r = -.65, p < .001), and poorer self-regulated learning in children (r = -.32, p < .001). However, it was not associated with children's academic self-concept (r = -.040, p = .67). Children's self-regulated learning marginally mediated the relationship between household chaos and academic emotion (β = -.82, p = .065), but parental academic involvement was not a significant mediator (β = -.17, p = .19). These findings suggest that household chaos is one potential intervention target for improving children's self-regulated learning and academic-related outcomes.

Linking Family Economic Pressure to Early Chinese Reading and Writing Skills
Keywords: Economics of Education, Parental Involvement in Learning, Reading, Writing/Literacy
Presenting Author: Ian Lam, The Education University of Hong Kong, Hong Kong; **Co-Author:**Kevin Kien Hoa Chung, The Education University of Hong Kong, Hong Kong

Little is known about the joint role of family poverty and parent-child relationships in the development of early literacy skills—a strong predictor of later cognitive and academic outcomes—among Chinese children. This study examined the longitudinal associations of family economic pressure with early Chinese reading and writing skills and tested maternal warmth as a moderator. Participants were 330 kindergarten children (mean age at Time 1 = 4.81 years; 56% were girls) and their mothers from Hong Kong, China. Children completed tests on Chinese word reading and writing at Times 1 and 2; mothers completed questionnaires on family economic pressure and parental warmth at Time 1. Multilevel models indicated that family economic pressure was linked to declines in child Chinese word reading and writing skills for children with low but not high maternal warmth, highlighting the possibility of targeting maternal warmth to promote child development in financially disadvantaged Chinese families.

The role of the home in children's critical reading skills development: A Delphi study
Keywords: Critical Thinking, Informal Learning, Parental Involvement in Learning, Reading
Presenting Author: Leena Paakkari, University of Jyväskylä, Faculty of Sport and Health Sciences, Finland; **Co-Author:**Jenni Ruotsalainen, University of Jyväskylä, Finland; **Co-Author:**Henri Lahti, University of Jyväskylä, Finland; **Co-Author:**Markus Kulmala, University of Jyväskylä, Faculty of Sport and Health Sciences, Finland; **Co-Author:**Panayiota Kendeou, University of Minnesota, United States; **Co-Author:**Tiia-Liina Raittila, University of Jyväskylä, Finland; **Co-Author:**Mari Manu, University of Jyväskylä, Finland; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Minna Torppa, University of Jyväskylä, Finland

Using a Delphi method, we aimed to gain a better understanding of home-related factors that support or hinder the development of critical reading skills. Experts (N =32) identified a set of home-related factors that can either hinder or support the development of critical reading skills among children and adolescents. The experts then evaluated and ranked the factors according to their perceived importance. An abundant collection of home-related factors was produced. Out of these we identified 13 factors that were seen as the main supportive factors, and 9 factors that were seen as the main hindering factors. The factors highlighted the importance of having a space for the child to be heard and involved family discussions, having a space for differing viewpoints and for critical thinking, and parental competencies to support critical reading skills and their attitudes towards schooling and learning. The findings can be used for measurement and intervention development purposes.

Routes to change: Development of teacher educators in an educational neuroscience program
Keywords: Educational Neuroscience, Higher Education, Synergies between Learning / Teaching and Research, Teaching Approaches
Presenting Author: Efrat Luzzatto, MOFET Institute for Research, Israel; **Co-Author:**Gal Ben-Yehudah, The Mofet Institute, Israel; **Co-Author:**Orit Elgavi, Achva Academic College of Education, Israel; **Co-Author:**Etty Grobgeld, Achva Academic College, Israel

Educational neuroscience is an interdisciplinary field combining insights from education, neuroscience and psychology to enrich educational practice and improve education for all (Thomas, Ansari, & Knowland, 2019). Our research investigates changes in participants' neuro-pedagogical knowledge, attitudes and self-efficacy in a pioneering year-long program in educational neuroscience for teacher educators, school principals and policy makers. Previous research focused on programs for teachers, while this study focused on teacher educators from various cultures and disciplines. We used a mixed methods approach - a quantitative questionnaire to investigate participants' attitudes towards the relevance of educational neuroscience knowledge for learning and teaching processes, and a qualitative component, comprising reflective exercises and open-ended questions. Initial findings show that participants arrived with a positive attitude towards the importance of brain science for education and teacher training and this remained stable throughout the program, while pedagogical self-efficacy increased. Qualitative analysis of participants' reflections raised four main themes: (1) the perception of neuro-pedagogy as important and relevant (2) the new neuroscientific knowledge the participants learnt (3) the quality of teaching and special teaching methods used in the course (4) the conflict between verification of former knowledge and the questioning of ingrained concepts. The intensive program also significantly improved participants' knowledge, as evidenced by the improvement in use of neuro-pedagogical terms. The main implication of these findings is the ability to widen dissemination of educational

neuroscience among teachers by shifting the focus to teacher educators as agents of change who have a broader impact on the field.

Dialogic Teaching Development Program: what about professional identity for changing?
Keywords: Dialogic Pedagogy, In-service Teachers, Lifelong Learning, Teacher Professional Development
Presenting Author:MARIBEL CALDERON, Universidad Católica Silva Henríquez, Chile; **Co-Author:**Marisol Gomez, Universidad Alberto Hurtado, Chile

Some continuous teacher training programs from dialogic approaches have shown changes in student practices. Success is related to reflection and support for the practice itself. It is known that pedagogical decision-making and its reflection in a community as a dialogical space for taking a position, expanding perspectives, and handling contradictions emerges as an opportunity for change. Also, the construction of new senses and meanings can imply a personal dimension that can be conceived as identitary.Do a Professional Teacher Development Program for improving dialogic teaching mobilise a sense of professional identity? Does the practice change related to that? Is there any difference between explicit or implicit identity job to change the practice?20 teachers from two schools participated in a six session TDP organized by six Principles of Dialogic Teaching. One group of teachers used a logbook with specific identity tasks to complete out of the course. Research was carried out using a mix method approach, focusing on pedagogical thought about dialogue in the classroom and measuring professional identity in participants (pre-post). Register of workshop sessions, pre-post classes, individual interview, and professional identity questionnaire were used to collect information. The results are presented showing different trajectories and turns in the process of reflection on dialogue as a pedagogical object and the relation to teacher professional identity. The benefit of working with colleagues and the logbook will be discussed as tools in the relation to the domains (practice and personal respectively) to mediate in the relation to changing practice professional identity.

Classroom Observations: how teachers teach learning strategies?
Keywords: In-service Teachers, Learning Strategies, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Mikk Granström, Tallinn University, Estonia; **Co-Author:**Eve Kikas, Tallinn University, Estonia; **Co-Author:**Eve Eisenschmidt, Tallinn University, Estonia

The aim of this study was to find out which learning strategies teachers teach either directly or indirectly and how classroom observations are related to teachers' knowledge of learning strategies (seven different learning strategies were used for that). In the course of this study, the Learning Strategy Teaching Observation Instrument (LSTOI) was developed. 45 video-based classroom observations were conducted. The teachers' knowledge of learning strategies is good, but this knowledge is not conveyed into direct strategy teaching in the classroom. In addition to general results, a detailed description of two teachers was conducted, who provided the greatest amount of direct instructions on using strategies, in order to find out how these teachers teach learning strategies in the classroom. The results showed that although the teachers give more direct strategy instruction in the classroom than other teachers, the teachers justify the usefulness of strategies by saying that students will achieve a better result in the upcoming test/examination. However, teachers should explain to students the long-term impact of learning strategies and develop the students' skills in independently applying strategies in the future.

Correlations Between Biology Teachers' Self-Reflection, TPACK and its Reflection in Practice
Keywords: In-service Teachers, Multimedia Learning, Quantitative Methods, Teacher Professional Development
Presenting Author:Jörg Zumbach, University of Salzburg, Austria; **Co-Author:**Lena von Kotzebue, University of Salzburg, Austria; **Co-Author:**Bettina Mann, University of Salzburg, Austria

Teachers' self-reflection on the one hand and their technological pedagogical content knowledge (TPACK) on the other hand have gained significant importance over the last few years, especially since teaching is gradually shifting towards using digital technologies (Boholano et al., 2021; Koehler & Mishra, 2009). We argue that the combination of teachers' self-reflection and their TPACK leads to a new construct which we call reflected technological pedagogical content knowledge (rTPACK). However, interactions and influence of biology teacher's TPACK and self-reflection on rTPACK have not been examined yet. In order to analyze which factors can predict rTPACK we developed a quantitative questionnaire inquiring about biology teachers' self-assessment concerning self-reflection, reflective practitioner, TPACK, and rTPACK. Our findings indicate that biology teachers' self-reflection and their TPACK significantly and positively correlate with rTPACK and also predict rTPACK.

Engaged teachers and well-being: The moderating role of burnout
Keywords: In-service Teachers, Quantitative Methods, Social Aspects of Learning and Teaching, Teacher Professional Development
Presenting Author: Caterina Fiorilli, University of LUMSA, Italy; **Co-Author:**Giacomo Angelini, LUMSA University of Rome, Italy; **Co-Author:**Vanessa Marchetti, Free University Maria Santissima Assunta, Italy; **Co-Author:**Luciano Romano, European University of Rome, Italy

In recent years, attention has grown regarding teacher well-being's antecedents, including work engagement, defined as a positive, fulfilling, and work-related state of mind. Work engagement has demonstrated a positive effect on improving the well-being of teachers, reducing the impact of burnout. Nevertheless, the moderating role of burnout is still unexplored. The current study aims to overcome this lack of investigation by hypothesizing the moderating effect of burnout on the association between work engagement and well-being. The study involved 807 Italian workers (Female: 91.7%) with a mean age of 47.54 years (age range = 19-68; SD = 9.91) who completed the Burnout Assessment Tool, World Health Organization Well-Being Index, and Utrecht Work Engagement Scale. The results showed that the relation between the interaction term burnout x work engagement on well-being was significant ($\beta = -0.304$, p

Design-based Research at scale: teacher professional development program on technology-enhanced math
Keywords: In-service Teachers, Mathematics/Numeracy, Teacher Professional Development, Tool Development
Presenting Author:Jüri Kurvits, Tallinn University, Estonia; **Presenting Author:**Marina Kurvits, Tallinn University, Estonia; **Co-Author:**Tobias Ley, Danube University Krems, Austria; **Co-Author:**Kairit Tammets, Tallinn University, Estonia

Introducing innovations in the classroom through design-based research often entails single classroom interventions with subsequent attempts to generalize to other settings. We introduce an alternative model to scale DBR across 25 classrooms. Such scaling has required developing the following elements: A teacher professional development program engaging 25 teachers into the design, implementation and evaluation process; an iterative research design built into the program, and a research infrastructure that allows data collection and feedback across those 25 classroom settings. We present a case study of a teacher training in the context of math for enhancing students' engagement and demonstration of upscaling DBR.

Counselling competence of student teachers – development of an action-oriented assessment format
Keywords: Competencies, Higher Education, Pre-service Teachers, Simulation-based Learning
Presenting Author: Philipp Wotschel, Paderborn Centre for Educational Research and Teacher Education - PLAZ-Professional School - University of Paderborn, Germany; **Co-Author:**Christoph Vogelsang, Paderborn University, Germany; **Co-Author:**Jana Meier, University of Paderborn, Germany, Germany; **Co-Author:**Thomas Janzen, PLAZ Professional School - Paderborn University, Germany

Although counselling is an activity that is central (inherent) to teacher's job, a considerable number of teachers do not feel sufficiently prepared for future counselling activities through their academic education (Hertel & Schmitz, 2010). Teacher students are often unsuccessful in adequately applying their acquired knowledge in such contexts of action (Zeichner, 2010). Furthermore, there is a gap - especially in Germany - between non-action-oriented examinations in the university phase of teacher education and examinations under non-standardized conditions in the actual field of practice in the ensuing induction phase. In line with other professions, such as medicine, role-play-based simulations may potentially foster counselling competence of (prospective) teachers (Dotger et al., 2010; Gerich, 2016), as typical standard requirements of the profession are simulated under conditions that are as authentic as possible, though complexity is reduced (St. Pierre & Breuer, 2013). As a possible prototype of a standardized, action-oriented assessment, a performance-oriented test and related evaluation criteria were developed to record and assess counselling-related performance of student teachers. The results of a pilot study (N=9) indicate a good fit between the conceptual preliminary considerations and the feasibility of the performance tests. In feedback interviews, the student teachers consider the performance assessments as more authentic, more professionally relevant and objective, compared to written and oral exams, while the use of simulated counselling sessions is accepted as a possible summative assessment format in teacher education.

No Silver Bullet: Development of a first Sketch of a Prompt Design for Vocational Education Students
Keywords: E-learning/ Online Learning, Immersive Technologies for Learning, Simulation-based Learning, Vocational Education and Apprenticeship Training
Presenting Author: Herbert Thomann, University Mannheim, Germany; **Co-Author:**Viola Deutscher, University of Mannheim, Germany; **Co-Author:**Andreas Rausch, University of Mannheim, Germany; **Co-Author:**Juergen Seifried, University of Mannheim, Germany

Considering the shift in competency requirements for vocational students caused by digitalization, learning simulations enriched with educational prompts can make a significant contribution to meeting these changed requirements (Rausch et al., 2021). However, prompting in the context of vocational education has received only little attention. This study examines the development and potential of a prompt design in the digital office simulation LUCA, which is assumed to support problem-solving performance. During a 65-min learning sequence on the working scenario topic “supplier selection”, 680 vocational education students received either no prompts or a selection of three types of prompts (cognitive, meta-cognitive and non-cognitive) based on the learners’ individual log data. The results showed no effect of the adaptive prompts on problem-solving performance compared to the control group without prompts. A deeper analysis revealed that learners often did not perceive the prompts because they were sent through the mail system and did not appear as pop-up windows. Moreover, high cognitive load due to the immersive learning simulation and the complex working scenario could be why prompts did not lead to the expected positive outcomes (e.g., Eckhardt et al., 2013). This illustrates, that prompting is not per se always conducive to problem-solving or learning achievement and there is no silver bullet when designing prompts. For this, the prompt design was revised, and the data from additional 200 vocational students are currently being collected to test the adapted prompt design.

Simulation based learning for facilitating understanding of others’ emotions in preservice teachers
Keywords: Communication Skills, Emotion and Affect, Pre-service Teachers, Simulation-based Learning
Presenting Author: Shira Iluz, Bar Ilan University, Israel; **Co-Author:**Jacob Israelashvili, Bar Ilan University, Israel; **Co-Author:**Yaacov Boaz Yablon, Bar-Ilan University, Israel

The use of simulation based learning to facilitate social-emotional skills of teachers is an emerging and promising component in teacher education, but to date, research supporting its effectiveness is rare. The current study (N_{total}=116) is the first to measure performance in understanding others’ emotions after participation in simulation-based learning using an objective, naturalistic and validated instrument. Findings provide *proof-of-concept* demonstration that a single day of simulation training can help preservice teachers learn emotional knowledge valuable for understanding another person’s subjective experience. Furthermore, we found that simulations are particularly helpful for individuals who score high on their propensity to take others’ perspectives.

How do student teachers perceive a novel VR environment for students?
Keywords: E-learning/ Online Learning, Pre-service Teachers, Quantitative Methods, Simulation-based Learning
Presenting Author: Florentine Hickethier, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Mathias Dehne, Friedrich Schiller University Jena, Germany; **Co-Author:**Tova Michalsky, Bar-Ilan University, Israel; **Co-Author:**Engin Ader, Boğaziçi University, Turkiye; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany

According to the Technology Acceptance Model (TAM; Davis et al., 1989), perceptions regarding the usefulness of new media, such as virtual reality (VR), may influence prospective teachers’ willingness to use these technologies in their subsequent teaching practice. This question, and how perceived usefulness changes as experience with the new medium is gained, will be explored in the current study. To implement the research project, a new VR environment designed was piloted by $N = 57$ student teachers from Finland, Germany, Israel, and Turkey. By addressing the spread of infectious diseases, the VR environment – which was basically designed for students – tangibly addresses the topic of exponential growth from mathematics classes. For the mixed-methods approach, student teachers were asked to complete a questionnaire before and after going through the VR, as well as participate in an interview on the relevance of simulation-based applications. Preliminary results indicate a positive change in terms of perceived usefulness after going through the VR simulation. This speaks to the need for teachers to gain experience with new technologies during their training phase in order to want to use them in their later professional practice.

Preservice teachers' motivations and perceived benefits of using a decision simulator
Keywords: Classroom Management, Pre-service Teachers, Simulation-based Learning, Tool Development
Presenting Author: Eli Lejonberg, University of Oslo, Norway; **Co-Author:**Eyvind Elstad, University of Oslo, Norway; **Co-Author:**Katrine Nesje, University of Oslo, Norway

Virtual classroom simulations are highlighted as a valuable addition to more traditional learning activities in teacher education. Simulation tools offer simplified simulations of classroom events and provide student teachers with an arena in which to practice performing the tasks of a teacher. We developed a decision simulator where PTs make choices related to six different scenarios in the classroom, inspired by the scenario-based SIMPROV simulation (Arvola et al., 2018). Authoritarian, authoritative, democratic, and compliant approaches to the teacher role are built into the choices PTs make in this simulation. In order to be able to optimize and adapt the use of the decision simulator to different groups of students, we investigated how students with different motivations for teaching experienced the benefits of the simulator. Our sample consisted of 88 respondents from a one-year postgraduate certificate in education (PGCE) programme. We used structural equation modelling and found a positive relationship between ability beliefs, extrinsic and altruistic motivation and the perceived use of the simulator. A surprising finding was that intrinsic motivation was negatively related to the perceived benefit of using the decision simulator.

The role of executive functions when learning in authentic learning environments
Keywords: Cognitive Skills and Processes, Higher Education, Quantitative Methods, Simulation-based Learning
Presenting Author: Maike Achtner, LMU Munich, Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

Learning environments must be adapted to the learner's prerequisites to ensure optimal learning success. First studies showed that depending on the executive functions working memory capacity or shifting ability, instructions can be more or less effective. However, these interactions between executive functions and learning environments have yet to be investigated in authentic learning environments. Developing complex competencies such as teachers' diagnostic skills requires authentic learning environments. Simulations are well suited for this purpose as they provide opportunities to reproduce real situations in a controlled environment. In the following study, three roles (teacher, student, observer) were designed, with different challenges and requirements to accommodate different learners. The presented study aims to answer whether executive functions play a role when learning with simulation-based roleplay. The results showed that executive functions did not influence simulation-based roleplay.

Does domain specific mindset make a difference in learning? Two metanalysis
Keywords: Achievement, Cognitive Skills and Processes, Meta-analysis, Motivation
Presenting Author: Madalin Marian Deliu, University of Salamanca, Spain; **Co-Author:**José Ricardo García Pérez, University of Salamanca, Spain

The aim of the present study is to understand the relations of domain specific mindsets (growth vs fixed) with different motivational and achievement variables and analyse the impact of manipulating the first ones on measures of the second ones. For this purpose, a systematic searching was carried out in several relevant databases (APA PsycInfo, APA PsycArticles, ERIC, Web of Science, Academic Search Complete and Scopus). With those studies, two meta-analyses are being conducted: one for correlational data, analysing the relations between domain specific mindsets (mathematical, reading, and science) and motivational factors (self-regulation, grit, perseverance, and self-efficacy) or academic achievement (self-assessed competence, specific tasks performance, academic grades, or GPA); and another for instructional studies. In both meta-analyses effect sizes are being compared in the searching for moderators related to the participants characteristics (sex, socioeconomical status…), study methods (e.g., quasi-experimental vs experimental in the case of interventions) or intervention aspects (length, content…). The knowledge obtained will allow a better understanding of the mindset involvement in the academic learning in different domains, such as reading, and a better design of intervention to promote it.

The Role of Conditional Parental Support in the Development of Impostorism
Keywords: Developmental Processes, Parents' Beliefs and Affect, Self-concept, Well-being
Presenting Author: Thérèse Bouffard, Université du Québec à Montréal, Canada; **Co-Author:**Carole Vezeau, Université du Québec à Montréal, Canada; **Co-Author:**Pascal Pansu, Université Grenoble Alpes, France

The objective of this longitudinal study was to examine the direction of the relationship between the perception of parental conditional support and the feeling of imposture. 504 students (249 girls) aged 10-11 at the start of the study answered questionnaires on their perception of conditional parental support and their feeling of imposture over a period of five years. Using structural equation modeling, the results of cross-lagged analyzes with overlapping stability paths of each variable showed that the model where the perception of conditional support predicted the presence of the feeling of imposture the following year was the most parsimonious and the one that also best fit the data. The discussion will focus on how to prevent children from internalizing parental expectations as standards that lead them to feel like an impostor.

Situational interest, perceptions of task difficulty and Motivation2Learn more
Keywords: Assessment Methods, Interest, Mathematics/Numeracy, Motivation
Presenting Author: Luke K. Fryer, The University of Hong Kong, Hong Kong; **Co-Author:**Alex Shum, The University of Hong Kong, Hong Kong

BackgroundSituational interest and perceptions of difficulty are widely recognised components of academic task experience. Yet, how they interact across time, are affected prior knowledge and interest, and together support future interest is poorly understood.AimsThe present study aimed to extend our understanding of these components of task experience and their contribution to longer-term interest. MethodsAfter completing a pre-test, providing demographic information and prior interest, participants (n = 301; Female =167; aged 20-49) completed a series of math task, reporting their situational interest and perceptions of difficulty after each task. An online, longitudinal, micro-analytical study was designed to assess individual's situational interest and perceptions of difficulty across a series of algebraic tasks. After the set of tasks, participants were offered a follow-up opportunity to learn more about the tasks' content (i.e., personal finance).ResultsThe contributions of prior interest and knowledge to task experience were consistent with theory: raising situational interest and perceived difficulty across the four math tasks. The auto and cross-lag relationships between situational interest and perceived difficulty between sequential task signaled the positive (situational interest) and negative (perceived difficulty) roles these task components play across a pattern of learning experiences. The convergence of these aspects of the learning experience pointed to the complex sources of an individual's ongoing interest: i.e., knowledge, perceptions of task difficulty and situational interest.

Checkmate: Examining Chess Masters' Expertise in Relation to Interest and Motivation
Keywords: Achievement, Goal Orientations, Interest, Motivation
Presenting Author: Eric Schoute, University of Maryland, United States; **Co-Author:**Joshua Jaffe, University of Maryland, United States; **Co-Author:**Doug Lombardi, University of Maryland, College Park, United States

Relations between interest, motivation, and expertise have been of particular interest to educational researchers for decades. However, due to the lack of consensus of what constitutes an expert within academia, relations between these factors remain unclear. To further examine these constructs, we recruited expert chess players ($N = 48$) that have achieved National Master status from the United States Chess Federation (USCF). Players responded to items regarding their individual interest towards chess, intrinsic motivation to play chess, and extrinsic motivation to play chess. Players also reported their USCF Elo-rating (systematic measure of a player's chess strength), confirmed by the USCF public database. Statistical analysis revealed that although players expressed higher levels of individual interest and intrinsic motivation compared to extrinsic motivation, extrinsic motivation was the only significant predictor of USCF rating. Unlike previous work emphasizing the importance of individual interest and intrinsic motivation to achieve competency and expertise, the present study, which examined the top players in the United States (top .9% according to the USCF), revealed that extrinsic motivation played a significant role in chess performance. This study highlights the importance of extrinsic motivation to succeeding and becoming an expert within the field of chess.

On making biology education meaningful: Students' motivation for brewing beer
Keywords: Instructional Design, Interest, Motivation, Science Education
Presenting Author: Niels Dohn, Aarhus University, Denmark

This study investigates the significance of brewing beer on upper secondary students' interest and motivation. Since beer is an important part of the youth culture, brewing was supposed to be experienced meaningful and thus motivating. A qualitative approach was used to gather data. Student responses were coded according to motivation theory, but also open for emerging themes. The preliminary results suggest that brewing beer was interesting due to relevance and novelty but was challenged by task effort costs in terms of waiting time. The findings suggest that beer brewing can trigger situational interest due to personal relevance, which is important for students with limited interest in biology.

Are Peer and Teacher Relatedness Always Adaptive? An Analysis of (A)symmetric Congruence Processes
Keywords: Engagement, Peer Interaction, Quantitative Methods, Social Aspects of Learning and Teaching
Presenting Author: Elisa Santana Monagas, University of Las Palmas de Gran Canaria, Spain; **Co-Author:**Fernando NUNEZ-REGUEIRO, Université Grenoble Alpes, France; **Co-Author:**Jaime León, Universidad de las Palmas de Gran Canaria, Spain

Research shows that feelings of relatedness at school (i.e., feeling accepted, connected, understood, close, included, etc.) support adolescent development. Little is known, however, on how sources of school relatedness—i.e., peer and teacher relatedness—combine to create adaptive or maladaptive outcomes. To address this gap, this poster presents a study on the joint effects of peer and teacher relatedness on adolescent well-being and school engagement, by using response surface analysis (RSA), a technique that combines features of variable-centered and person-centered approaches to analyze the interplay between peer and teacher relatedness. Based on preliminary evidence and theories (self-determination theories, good lives model), 4 hypotheses are postulated in the

form of cumulative benefits (H1- additive effects), interdependent benefits (H2- negative congruence effect), peer-specific compensatory benefit (H3- positive asymmetric congruence effect), and non-specific compensatory benefits (H4- positive asymmetric incongruence and congruence effects). Using high school data ($N > 600$ adolescents aged 15 to 18), results show that well-being and engagement are strongest when both sources of relatedness are provided for, but that situations of imbalance may be detrimental to these outcomes, even at high levels of peer or teacher relatedness. Implications for theories and practices on relatedness at school are drawn. Keywords: school relatedness; adolescent well-being; school engagement; cubic polynomials

Innovative Behavior and Antecedents: Comparing Teachers with other Academic Professions
Keywords: Motivation, School Effectiveness, Teacher Effectiveness, Teacher Professional Development
Presenting Author: Verena Jörg, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Franziska Baier, Goethe-Universität Frankfurt, Germany; **Co-Author:**Ulrike Hartmann, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Stefanie Gaeckle, German Centre for Higher Education Research and Science Studies (DZHW), Germany; **Co-Author:**Mareike Kunter, DIPF | Leibniz Institute for Research and Information in Education, Germany

Todays' teachers are required to show adaptability and innovative behavior (Paniagua & Istance, 2018). Still, teachers are often seen as inert to innovation (in public and research). This claim is based on the assumptions that people who enter the teaching profession either show certain unfavourable characteristics (low openness for new experiences, risk aversion) or that characteristics of the school environment prevent innovative behavior (high workload and bureaucratic structures).The present study analyzes whether teachers show less innovative behavior than comparable employees and investigate what factors (of the individuals and the workplaces) might contribute to possible differences. We use longitudinal data of a representative German panel sample ($N_{teachers/other\ (semi-)professionals}$=435/897). Participants were surveyed at three measurement points, before entering their professional lives as well as five and seven years later.We find that while teachers differ from other (semi-)professionals in their risk aversion and openness before career entry, they even report more innovative behavior than the compared group after entering their professions. This can be explained by higher autonomy of their jobs, while earlier openness and risk aversion do not affect teachers' later innovative behavior significantly. Possible reasons for differential effects and further analysis required are discussed.

The development of students' ideas during group conversations in secondary education.
Keywords: Argumentation, Creativity/Divergent Thinking, Inquiry Learning, Secondary Education
Presenting Author: Martina van Uum, Radboud Teachers Academy, Netherlands; **Co-Author:**Petrie van der Zanden, Educational Institute of Social Sciences, Radboud University, Netherlands

In the current study, we investigate students' creative group processes during an inquiry- and design-based project in secondary education. Our research question is: How do ideas of students in secondary education develop over time during group conversations in which they share, criticize and integrate each other's ideas? The participants are 40 students in their second year of secondary education. In 10 lessons, the students (in groups of 3 or 4 students) designed a part of a garden for a residential care center in the Netherlands. We audio recorded the conversations of each group and, subsequently, transcribed fragments that focused on students' ideas. These fragments were inductively analyzed via open coding to find out how the students talked about their ideas. Subsequently, we made a timeline for each group to find out how the ideas of the students developed over time during their group conversations. Our preliminary results show that most groups of students generated and selected ideas for their garden design at the start of the project; after a few lessons when visualizing their ideas on a mood board; and in the second part of the lesson series when developing models for their part of the garden. Most of the time, students built on each other's ideas. In addition, there were moments when students provided arguments in favor of or against ideas, or ignored ideas of others. We plan to further investigate the group conversations of the students to find out how their ideas developed over time.

The influence of enjoyment on self-regulated learning from texts
Keywords: Emotion and Affect, Metacognition, Reading, Self-regulated Learning and Behaviour
Presenting Author: Celina Safferthal, University of Education Karlsruhe, Germany; **Co-Author:**Anja Prinz-Weiß, University of Education Karlsruhe, Germany

For successful self-regulated learning from texts, learners must accurately judge their comprehension and engage in effective regulation activities. Despite the well-known influence of enjoyment on learning processes and outcomes, little is known with regard to its role for judgment accuracy and regulation. First evidence indicates that higher levels of positive emotions, such as enjoyment or hope, are related to more overconfident judgments, and higher levels of negative emotions, such as anger and hopelessness, to more underconfident judgments. In the present study, we aim at investigating the impact of middle school students' enjoyment on self-regulated learning from texts. The experimental group receives a training to increase enjoyment, whereas the control group receives no training. We expect that increased enjoyment will lead to better comprehension. However, at the same time, we assume that increased enjoyment will lead to greater overconfidence in one's comprehension, which in turn will inhibit regulation activities and prevent further comprehension improvements. These results would indicate that teachers and learners must be sensitized to the circumstance that there is a downside of enjoyment because it can impair self-regulation processes.

ICT Demonstration

Real-time coding of lesson activities with a mobile web application

Keywords: Educational Technologies, Pre-service Teachers, Science Education, Tool Development
Interest group:

Please bring your own device if you are attending this ICT demonstration.Video records are widely used in educational research. Although valuable, the amount of video, and possible data, can be too expansive producing challenges of their own. To help with the challenges of video selection and analysis, we developed simple web-based app for real-time coding of lesson activities. The coding can by synchronized with video records, making it easy to select relevant video segments for further use. Later the app has also been used to activate lesson observation and reflective discussion in pre-service teachers practical training without the video collection. In the demonstration we'll present how the app can be used in video-based research and how it is being used in teacher-students' practical training. The main focus will be how to setup and use the app for observations, how to share the observational frame with others and how to effectively use the app. Updated version of the app will be made available, free of charge, for all conference participants.

Real-time coding of lesson activities with a mobile web application
Presenting Author: Miikka Turkkila, University of Helsinki, Finland

Please bring your own device if you are attending this ICT demonstration.Video records are widely used in educational research. Although valuable, the amount of video, and possible data, can be too expansive producing challenges of their own. To help with the challenges of video selection and analysis, we developed simple web-based app for real-time coding of lesson activities. The coding can by synchronized with video records, making it easy to select relevant video segments for further use. Later the app has also been used to activate lesson observation and reflective discussion in pre-service teachers practical training without the video collection. In the demonstration we'll present how the app can be used in video-based research and how it is being used in teacher-students' practical training. The main focus will be how to setup and use the app for observations, how to share the observational frame with others and how to effectively use the app. Updated version of the app will be made available, free of charge, for all conference participants.

Lifelong Learning

A Look Into the Crystal Ball: Which Directions should Metacognition and SRL Research take?

Keywords: Assessment Methods, Early Childhood Education, Educational Technologies, Emotion and Affect, Learning Strategies, Lifelong Learning, Metacognition, Self-regulated Learning and Behaviour, Teacher Professional Development
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Yves Karlen, University of Zurich, Switzerland
Chairperson: Charlotte Dignath, TU Dortmund University, Germany
Organiser: Yves Karlen, University of Zurich, Switzerland
Organiser: Charlotte Dignath, TU Dortmund University, Germany
Discussant: Yves Karlen, University of Zurich, Switzerland
Discussant: Charlotte Dignath, TU Dortmund University, Germany

The next generation of research in the field of metacognition and self-regulated learning (SRL) promises to make significant advances in our understanding of how individuals learn and think about their learning. Recent technological developments offer new opportunities for studying, measuring and supporting metacognitive and SRL processes. At the same time, new technologies significantly affect learning. There is also increasing recognition of the importance of social and emotional factors in metacognition and SRL. Researchers examine how these factors shape learning and thinking processes, and how they can be leveraged to support more effective learning. Current evidence indicates that the increasing individualization of education and professional development is important, as one size does not fit all. We can develop more individualised and effective learning and training approaches by better understanding and supporting individual differences in metacognition and SRL. In this field of tension in which we are currently operating, we should offer solutions to support individual learning in the present and the future. In this symposium, five world-leading experts discuss which next steps should be taken regarding theory development, the relation between metacognition/SRL and emotions, its development from early childhood on, collaborations with teachers on interventions and approaches to support SRL and metacognitive development, as well as the ongoing challenge to assess metacognition/SRL and its implementation by teachers and schools. The five contributions provide innovative insights into new directions that research on metacognition and SRL could take and will be followed by a discussion with the audience.

Looking Backwards to Move Forward: Missed Opportunities in Developing Metacognition and SRL Theory
Presenting Author: Daniel Dinsmore, University of North Florida, United States; **Co-Author:**Meghan Parkinson, University of North Florida, United States

The purpose of this presentation is to examine theories and models of metacognition and self-regulated learning (SRL) to better conceptualize better theory development moving forward as well as how these theories can inform practice. Specifically, we examine the lack of integration or unification in these theories and examine why the development of metacognition and SRL has not been a stronger focus. This analysis is framed by Kuhn’s attributes of good theory as well as the types of theories laid out by Gigerenzer and colleagues. Overall, theories of metacognition and SRL are not well integrated (i.e., there are still a diverse range of theories with significantly different assumptions) and due to the theories being built on empirical works – rather than the other way around – theory development is still weak in these areas. An exemplar is given integrating a model of SRL (i.e., Winne & Hadwin’s COPES model) and a developmental model

of expertise (i.e., Alexander's Model of Domain Learning).

SRL and emotions: Social and emotional factors in metacognition in the age of AI
Presenting Author: Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Márta Sobocinski, University of Oulu, Finland; **Co-Author:**Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland

The aim of this paper is to discuss social and emotional factors in research on metacognition using artificial intelligence (AI) and multimodal data for understanding self-regulated learning processes. We present two studies to demonstrate our progress in that research and discuss how it can contribute to future research. In study 1 we investigated markers that indicate both successful regulation, and lack of regulation in moments when regulation should have been triggered but it failed to be. In the study *2* we detected and modelled SSRL with multimodal data and AI. We argue that researchers and practitioners could benefit from methodological development incorporating human-AI collaboration for capturing, processing, and analysing multimodal data to examine and support social and emotional processes in learning.

Looking into the future of metacognition and SRL research in early childhood
Presenting Author: Deborah Pino-Pasternak, University of Canberra, Australia

The past decades have seen significant advances in the understanding of metacognition and SRL development in young learners. We now accept that precursors of metacognitive activity and SRL emerge much earlier than previously accepted, we have grown to understand the role that significant adults and peers play on this development, and we recognize the long term implications of young children developing as self-regulated learners into the future. Despite such progress, some issues remain elusive for researchers, while other gaps emerge as locally and globally, humanity experiences both steady and dramatic changes. This paper presents a thematic discussion informed by literature published since 2010 to unpack what is yet to be better understood in the investigation of young children's metacognition and SRL. In this paper we argue that advances in developmental research and measurement are still required to disentangle longitudinal associations between higher order cognitive functions like executive functions, metacognition and self-regulated learning during the first years of life. From a socio-cultural perspective, as educational environments become more diverse and technology-based, our understanding of metacognition and SRL development ought to reflect the richness and complexity of such contexts. Lastly, this paper makes a call for researchers to examine affective processes that influence how young children access (or not) executive processes that underpin metacognition and SRL. As more and more young children grow in contexts of displacement, conflict, climate change and health emergencies, understanding the connections between trauma and SRL has become critical, particularly for the end users of our research endeavours.

From Intervention to Collaboration: Researchers Working With Teachers to Advance SRL in Classrooms
Presenting Author: Nancy Perry, University of British Columbia, Canada

In this presentation, I will use examples from my research on self-regulated learning (SRL) to promote participatory approaches as one way to close gaps between theory/research and practice. In particular, I will focus on how collaborations, rather than researcher-led interventions, support the development of robust, ecologically valid, and sustainable supports for SRL in classrooms. I will describe researchers partnering with teachers and engaging in collaborative inquiry to design and implement supports for students' SRL and argue the goal of increasing opportunities for SRL in classrooms requires researchers attend to teachers' learning about SRL and also to their guidance about how to make interventions work in diverse settings and situations.

Assessing SRL and SRL implementation: A matter of multi?
Presenting Author: Hilde Van Keer, Ghent University, Belgium

There is general consensus on the importance of self-regulated learning (SRL) and SRL implementation. At the same time, there is also concern that a large number of students experience persistent difficulties with SRL and that teachers and schools struggle with adequate SRL implementation to support learners' in their development. To alter this, it is first and foremost important to be able to accurately capture the complexity of SRL in learners in a reliable and valid way, as well as to map SRL implementation by teachers in daily classroom and school practice. This brings us to assessment issues in the literature and evolving traditions, confronting us with actual challenges we should address to help the field move forward. In this respect, the presentation will aim at positioning challenges both in the field of assessing learners' SRL as in the field of assessing teachers' and schools' SRL implementation and at reflecting on potential avenues for the future.

Invited Symposium
Higher Education

Transitions in researcher education and careers

Keywords: Competencies, Doctoral Education, Emotion and Affect, Higher Education, Informal Learning, Lifelong Learning, Metacognition, Researcher Education, Self-determination, Synergies between Learning / Teaching and Research
Interest group: SIG 24 - Researcher Education and Careers
Chairperson: Erika Löfström, University of Helsinki, Finland
Organiser: Erika Löfström, University of Helsinki, Finland
Discussant: James Burford, University of Warwick, United Kingdom

The growing scope and quality of the exchanges between research, researchers, and various professional and societal actors push for, but also enable, new forms of researcher transitions between institutional, professional, and societal contexts. Transitions involve career progression, and identity shifts. They involve moving in and out of academia, and they may be temporal and spatial. The increased mobility in researcher education and careers create transitions between national and cultural contexts. This symposium explores transitions in the PhD, post PhD, and mid-career/seniority transitions. It continues to bring forth the collaboration of SIG 24 members on the theme of transitions in researcher education and careers started in the SIG 24 bi-annual meeting in 2022.

Transitions in the PhD
Presenting Author:Søren Bengtsen, Aarhus University, Denmark; **Presenting Author:**Kelsey Inouye, University of Oxford, United Kingdom; **Co-Author:**Patrícia Alves, University of Porto, Portugal; **Co-Author:**James Burford, University of Warwick, United Kingdom; **Co-Author:**Montserrat Castelló Badia, Blanquerna, Universitat Ramon Llull, Spain; **Co-Author:**Dely Elliot, University of Glasgow, United Kingdom; **Co-Author:**Liezel Frick, Stellenbosch University, South Africa; **Co-Author:**Sofie Kobayashi, University of Copenhagen, Denmark; **Co-Author:**Lynn McAlpine, University of Oxford / McGill University, Canada; **Co-Author:**Paula Meesters, University Utrecht, Netherlands; **Co-Author:**Hatice Nuriler, Aarhus University, United Kingdom; **Co-Author:**Signe Skov, Aarhus University, Denmark

In this presentation, we explore how transitions in the PhD get shaped by shifts at macro (societal), meso (policy and positionality) and micro contexts interacting with individual experiences, intentions and affect/emotion. The presentation explores tensions and interactions between individual and structural contexts, and how transitions involve time, place and mobility. We analyze and discuss the transitions in the PhD from two major themes: 'meaning and value of research', and 'emotion, affect and well-being'. We discuss how our own approach has emerged from an awareness that there has been over time a transition in the PhD from a predominant focus on cognitive, rational, and individual approaches toward an increasing interest in emotions, bodies, relations and wellbeing.

Potentials, challenges, uncertainties: Cross-cultural transitions in doctoral/post-doctoral context
Presenting Author: Dely Elliot, University of Glasgow, United Kingdom

Cross-cultural studies often carry a sense of mystique about what lies ahead resulting from mixed experiences of deliberate and serendipitous cultural

interactions during the sojourn. The continuing and steady surge in the number of scholars and early career researchers who travel overseas in pursuit of doctoral or post-doctoral education as well as those many others who while remaining at home, also find themselves working in close proximity with these international scholars, arguably make this area both a fascinating and a crucial area of study. By offering a newly proposed model for understanding what may underpin the quality of international scholars' experience based on metacognition and Self-Determination Theory, I will aim to elucidate the inherent potential, challenges and uncertainties embedded in the sojourn. In particular, I will discuss, the roles of intercultural engagement, intercultural competence and intercultural relations – regarded as extra routes by default in every international scholarly journey. I will use various exemplars from other empirical studies to discuss and elaborate on this model, with a view to pursuing not only successful PhD completion or a successful career, but also in achieving a transformative experience and sustaining sound psychological well-being for these scholars. Overall, I will highlight how holistic international doctoral or postdoctoral development can be fostered to bring hope and help manage transitions and uncertainties more effectively.

Academic mid and late career transitions and supervision
Presenting Author: Irene Lokhtina, University of Central Lancashire Cyprus, Cyprus; **Presenting Author:**Solveig Cornér, University of Helsinki, Finland; **Co-Author:**Cecilia Almlöv, Swedish University of Agricultural Sciences, Sweden; **Co-Author:**Erika Löfström, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland; **Co-Author:**Henrik Viberg, Swedish University of Agricultural Sciences, Sweden; **Co-Author:**Paula Meesters, University Utrecht, Netherlands

The aim of this presentation is to synthesise research on academic careers especially at the stage of transition to mid-career and senior positions. This presentation highlights insights from the extant research base on transitions viewed from the perspective of later career stages and brings in examples from SIG 24 members' own and collaborative research. The presentation evolves around the themes of supervisor learning, institutional guidelines on supervision, and mid and late career transitions as triggers for a possible identity shift. The collected research informs on how to create and facilitate institutional supportive conditions and mechanisms including the provision of learning and training opportunities at different systemic levels in order for academics to stay resilient and be prepared to successfully manage career transitions.

Transitions in post-PhD careers
Presenting Author: Inge Van der weijden, Leiden University, Netherlands; **Co-Author:**Isabelle Skakni, University of Applied Sciences and Arts Western Switzerland, Switzerland; **Co-Author:**Anna Sala Bubaré, Ramon Llull University, Spain

This presentation focuses on the transitions experienced by individuals after obtaining a PhD degree. As traditional academic career tracks are becoming scarcer everywhere, diversity in PhD holders' careers has dramatically increased, especially for recent graduates. We first present the preliminary results of ongoing empirical studies about post-PhD transitions, from three complementary perspectives: 1) institutional mechanisms supporting PhD candidates' preparation for various careers, 2) PhD holders' hybrid careers and 3) employers' perceptions of the added value of PhD holders for their organisations. Then, we discuss our findings' implications for doctoral education and career development services, and we identify gaps and challenges for future research.

Symposium
Learning and Social Interaction, Motivational, Social and Affective Processes

Interest on the Move

Keywords: Developmental Processes, Engagement, Informal Learning, Interest, Science and STEM, Social Aspects of Learning and Teaching, Social Interaction, Sustainable Development
Interest group: SIG 10 - Social Interaction in Learning and Instruction
Chairperson: Sanne Akkerman, Utrecht University, Netherlands
Organiser: Sanne Akkerman, Utrecht University, Netherlands
Discussant: Roger Saljo, University of Gothenburg, Sweden

Although frequently studied as such, learning is not isolated in single and dedicated educational contexts. This particularly yields for interest-based learning that can involve systematic pursuits of students across school, home, peers and leisure to engage in particular topics or activities of interest. Whereas we can assume interests to move and develop across contexts on a daily basis, we still have very little understanding of how this occurs. This insight is even more urgent given the increasing collaborations and partnerships of educational institutions to support life-wide development and societal engagement, often by centering on students' personal interests. This symposium bundles studies that aim to better understand interest development of students as naturally occurring in and beyond educational practice. The first paper examines on a large scale how students' parallel interests develop dynamically over three years of time, with notable variations in explorations and experience of interest. The second paper examines variations and fluctuations in how interest engagement is contextually structured, with different temporal, spatial, material and social structures. The third and fourth paper complement the first two life-wide studies by examining extra-curricular settings that form targeted transformative spaces for development of interests in relation to respectively STEM and community projects. The studies share ecological methodologies that center student experience and engagement in practice and that trace objects of interest beyond predefined disciplinary categories and curricula. The discussant is invited to reflect on implications of findings on how we are to think about education and might pursue further educational research.

Developmental dynamics of multiple interests
Presenting Author: Jael Draijer, University Utrecht, Netherlands; **Co-Author:**Larike Bronkhorst, Utrecht University, Netherlands; **Co-Author:**Sanne Akkerman, Utrecht University, Netherlands

Whereas existing interest development theories typically describe development of a single interest in a single context, findings in person-centered research strongly suggest that interest development may be more complex than that because of the idiosyncrasy, multiplicity and experientiality of interest. The current study thus explores how adolescents' interests develop in and across daily life contexts, asking 309 students from diverse educational tracks to use an experience sampling method (ESM) for 10 weeks, spread out over three years. In addition, 48 of these students are interviewed each year. Findings from growth mixture modeling extend our knowledge by showing how some adolescents specialize in their interests, whereas others pursue a select set of interests over time. Analysis of the interviews demonstrates that interest reflects not only a process of deepening, but also of broadening and connecting with other interests. Qualitative analysis of the open ESM data shows that experiencing interest in the moment is not guaranteed, even for longstanding objects of interest. This implies that development is not a linear process and continuation of an interest might be hard to predict. Results suggest revising existing interest support in classrooms, by moving towards more personalized, adolescent-driven interest support.

Developing interest pursuits during educational transitions
Presenting Author: Joris Beek, University Utrecht, Netherlands; **Co-Author:**Larike Bronkhorst, Utrecht University, Netherlands; **Co-Author:**Sanne Akkerman, Utrecht University, Netherlands

Pursuing interest can be viewed as a form of learning, with interests leading to a wealth of positive (educational) outcomes for adolescents. Pursuing interest is increasingly recognized as inherently contextual, not only for novel interests (conceptualized as 'situational'), but also for interests sustained over a longer period (conceptualized as 'individual'). The extent to which the contextuality of interest pursuits is 'a given' or susceptible to (life) changes, remains to be explored. Studying the dynamics of contextuality of adolescents interest pursuits during an educational transition will increase understanding that informs policy makers, parents, and educational practitioners about how their support of adolescents' interests features in wider interest configurations. We studied 410 adolescents' two most important, self-defined interests (N=820) along seven dimensions (epistemic, temporal, geographical, material, institutional, cultural and social) informative for the contextuality of their interest pursuit prior, during, and after an educational transition. Using person-centred analyses (i.e. Latent-Profile

Analyses and Latent-Transition Analyses) we identified structures of interest pursuits and analysed transitions between structures over time. The same four structural configurations were identified at each timepoint, indicating qualitative differences between interest pursuits. Over time, most interests are pursued within the same structural configurations. Observed changes within developing interest pursuits imply large changes illustrating the individuality of pursuing interests. More stable interest pursuits may illustrate more pressing demands, as called for by the object or by interest-related norms in larger society. Combined, (large) changes and mostly stable pursuits show how interests are both individual and collective.

Tracing objects of interest from school to out-of-school
Presenting Author: Jaakko Hilppö, University of Helsinki, Finland

Building on a cultural-historical activity theory and practice theory perspectives (Engeström, 1987; Azevedo, 2011) on human activities and interest, this study focuses on students' interest-driven engagement across different contexts. More specifically, drawing on two independent long-term ethnographic case studies of students' interest development in the US. and Finland, I argue that the object of the students interest changes over time. Through interactional and grounded theory methods (Jordan & Henderson, 1995; Strauss, 1987), the on-going analysis of the study shows that the student's object of interest progressed through a succession of multiple different articulations. Together the preliminary results suggest that with expansion of students' interests to new contexts (like from school to home), what constitutes the object of their interest can also change.

From interest to commitment towards sustainability. A critical psychology perspective.
Presenting Author: Alfredo Jornet, Universitat de Girona, Spain

Youth have become a key character in discussions about sustainability and are often portrayed as leading voice in the transition towards more just and environmental societies. Yet, despite a growing number of projects aimed at empowering students to become agents of change, we know very little about how and to what extent students engage in relevant action towards sustainability, or how their actual engagement relates to learning in and across multiple school and non-school settings. Through our research, we have documented how there is no such thing as a uniform way of being interested, and that being young in the 2020s does not necessarily involve an inherent interest in the topic. In this paper, we present and discuss our research on upper secondary students' interest and engagement in climate change. We take a critical psychology perspective according to which interest is intimately related to political commitment and *agency,* defined as the human capacity to gain, in cooperation with others, control over each individual's own life conditions. We draw on ethnographic materials from a three-years European project on open schooling, where schools collaborate with the out-of-school actors in their local communities to address local sustainability challenges. We follow the *learning lives* of six upper secondary students from three different schools. Our analyses focus on the narratives that these students mobilize to make sense of ongoing activities and envisioned futures, and the extent to which these allow them positioning themselves as committed *historical actors* in the struggle towards a more sustainable future.

Session K 4

24 August 2023 17:00 - 18:30
UOM_A03
Symposium
Assessment and Evaluation

Teachers' wellbeing, social self-efficacy, burnout and job-satisfaction in ECE across four countries

Keywords: Attitudes and Beliefs, Burnout, Early Childhood Education, Quantitative Methods, Social Interaction, Teacher Efficacy, Teacher Professional Development, Well-being
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Vasileios Grammatikopoulos, Greece
Organiser: Anastasia Vatou, Greece
Discussant: Eleni Tympa, Greece

"Promoting Teachers Well-being through Positive Behavior Support in Early Childhood Education" (ProW) is an ERASMUS+ Key Action 3 Policy Experimentation program which is funded by the European Union (Project Number: 626146-EPP-1-2020-2-EL-EPPKA3-PI-POLICY). This intervention program aims to improve teachers' well-being and careers, by developing a safe and positive preschool climate in which children's socio-emotional competencies are promoted. Promoting teachers' well-being by using the Positive Education (PERMA model) and the School Wide Positive Behaviour Support (SWPBS) frameworks could build and support mental and physical well-being in early childhood education settings. This symposium brings together findings from a research project involving Cyprus, Greece, Portugal, and Romania. The symposium will start by a brief overview of the general goals and methods used. Then four short papers will be presented addressing specific questions across countries: Paper 1 will examine differences on teachers' wellbeing across the four countries. Paper 2 will focus on the differences on teachers' social self-efficacy across the four countries. Paper 3 will present teachers' perceptions about their levels of burnout and teachers' job satisfaction (Paper 4) across the four countries. The discussion will take an international perspective to provide evidence to educational practitioners for the implementation of effective professional development programs across different countries.

Testing the Construct Validity and Cross-Country Comparability of a Teacher Wellbeing Measure
Presenting Author: Demos Michael, Center for the Advancement of Research & Development in Educational Technology (CARDET), Cyprus; **Co-Author:**Andri Agathokleous, Institute of Development, Cyprus; **Co-Author:**Vicky Charalambous Charalambous, Institute of Development, Cyprus; **Co-Author:**Christos Pezirkianidis, Department of Psychology, Greece; **Co-Author:**Charalambos Vrasidas, CARDET - University of Nicosia, Cyprus

Teacher wellbeing is increasingly gaining scientific and political interest as being associated with job satisfaction, teacher retention, quality of teaching and student outcomes. Different conceptualizations and measures for teacher wellbeing exist in the literature making its international examination and applied use complicated. In this respect, the development of universally reliable and valid measures is essential to design effective interventions and promote it in practice. This study examines the validity and cross-country comparability of the Teacher Subjective Wellbeing Questionnaire (TSWQ) in four European countries (i.e., Cyprus, Greece, Portugal, and Romania). The measure was administered to 393 ECEC teachers in total. Different validation techniques were employed to assess the TSWQ's construct validity and equivalence across sample countries. The results confirmed the factorial structure of the scale in all countries, which suggests two dimensions i.e., teacher efficacy and connectedness. The measure has good psychometric properties in all settings, and it is potentially helpful for future studies. However, measurement invariance analyses revealed that TSWQ is not necessarily invariant and equivalent across the groups of the current study. These results might indicate that the investigation of wellbeing implies further theoretical and methodological developments with measures that respond similarly to contextual and cultural differences.

Teachers' social self-efficacy in cross-national perspective
Presenting Author: Anastasia Vatou, International Hellenic University, Greece; **Co-Author:**George Manolitsis, University of Crete, Greece; **Co-Author:**Maria Evangelou-Tsitiridou, International Hellenic University, Greece; **Co-Author:**Vasilios Oikonomides, University of Crete, Greece; **Co-Author:**Maria Kypriotaki, University of Crete, Greece; **Co-Author:**Angeliki Mouzaki, University of Crete, Greece; **Co-Author:**Evridiki Zachopoulou, International Hellenic University, Greece; **Co-Author:**Vasileios Grammatikopoulos, International Hellenic University, Greece

The importance of teachers' self-efficacy, both for teachers' wellbeing and the overall quality of teaching is well established in the context of Early Childhood Education and Care (ECEC) (Guo et al., 2014; Höltge et al., 2019; Klassen & Chiu, 2010). Teachers' social self-efficacy – beliefs teachers hold that they can develop and maintain positive relationships with children (Vatou et al., 2022) – has been shown to contribute on their interpersonal interactions with their children. Teacher-child relationships quality is often mentioned as one of the core reasons for staying in the profession (Hargreaves, 1998; O'Connor, 2010). The purpose of this study was twofold. The first aim was to test the validity of the Teacher Social Self-efficacy Scale (TSSES) in four ECEC settings – Greece, Cyprus, Portugal, and the Romania. The second purpose was, by extension, to determine the importance of the teachers' social self-efficacy construct across different ECEC settings. The sample included 396 participants from Greece (N = 93), Cyprus (N = 96), Portugal (N = 95), and Romania (N = 109). The

TSSES showed convincing evidence of reliability and measurement invariance across the four countries. Results also showed mean score differences of teachers' social self-efficacy across countries. The findings are relevant to policy makers, practitioners and education researchers.

Burnout in early childhood education: cross-cultural factorial validity of MBI-ES
Presenting Author: Ana Rodrigues de Lemos, Faculty of Psychology and Educational Sciences of the University of Porto, Portugal; **Co-Author:**Filipe Piedade, University of Porto, Portugal; **Co-Author:**Tiago Ferreira, University of Porto, Portugal; **Co-Author:**Carolina Guedes, University of Porto, Portugal; **Co-Author:**Teresa Leal, University of Porto, Portugal; **Co-Author:**Catarina Grande, University of Porto, Portugal; **Co-Author:**Diana Alves, University of Porto, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal

Worldwide, several authors have recently highlighted that teacher job burnout, a psychological syndrome that emerges in response to chronic interpersonal stressors on the job (Maslach et al., 2001), is a work-related phenomenon that can have serious consequences on children and staff (Madigan & Kim, 2021, 2021a). The Maslach Burnout Inventory - Educators Survey (MBI-ES) is the most widely used scale in educational settings (Aboagye et al., 2018; Hawrot & Koriewski, 2018; Worley et al., 2008). However, this scale has revealed divergent results in factorial validity analysis across countries, calling for further cross-cultural research. In this study, we aim to test the factorial structure of MBI-ES across four European countries – Cyprus, Greece, Portugal, and Romania. Participants were 391 early childhood education professionals from the four countries, who completed the 22-item version of MBI-ES. Confirmatory Factor Analysis (CFA) was conducted to test the model fit of 1- and 2-factor structures, using the *MPlus* software. To test the cross-cultural factorial structure of MBI-ES, a multigroup CFA was conducted, using the MLR estimator to address the non-normal distribution of the data. Preliminary analyses and descriptive statistics at the item level suggested that burnout levels were generally low, with several items (belonging to the depersonalization subscale) highly skewed, resulting in significant item reduction. Although the 2-factor structure with the remaining 16 items showed acceptable fit, results from the multi-group analyses suggested several specific-country patterns. Findings will be discussed considering the specificities of working in early childhood education contexts in each participating country.

Early childhood teachers' job-satisfaction across four countries
Presenting Author: Demos Michael, Center for the Advancement of Research & Development in Educational Technology (CARDET), Cyprus; **Co-Author:**Anastasia Vatou, International Hellenic University, Greece; **Co-Author:**Katerina Krousorati, International Hellenic University, Greece; **Co-Author:**Vicky Charalambous, Institute of Development, Cyprus; **Co-Author:**Maria Evangelou-Tsitiridou, International Hellenic University, Greece; **Co-Author:**Charalambos Vrasidas, CARDET - University of Nicosia, Cyprus; **Co-Author:**Evridiki Zachopoulou, International Hellenic University, Greece; **Co-Author:**Vasileios Grammatikopoulos, International Hellenic University, Greece

The importance of teachers' role for students' learning and development is widely recognized, and the question whether teachers are commitment and satisfy with their teaching profession is often overlooked (Liang & Akiba, 2017). Research evidence showed that positive organizational climate, job autonomy, collective efficacy and job satisfaction are associated with high-quality provision and teachers' satisfaction (Aboagye et al., 2020; Penttinen et al., 2020; Vatou & Vatou, 2019). Research suggests that the possibility of teacher attrition is lessened when teachers are satisfied with their jobs (Skaalvik & Skaalvik, 2011). The study's aims were a) to test the validity of the Employee Satisfaction Inventory (ESI; Koustelios & Bagiatis, 1997) in four ECEC settings – Greece, Cyprus, Portugal, and Romania - and b) to compare the early childhood education teachers' levels of job satisfaction across these countries. The sample included 396 participants from Greece ($N = 93$), Cyprus ($N = 96$), Portugal ($N = 95$), and Romania ($N = 109$). A series of factor analyses were used to investigate ESI's cross-cultural validity. The ESI showed convincing evidence of reliability across the four countries. Results also showed mean score differences of teachers' job satisfaction across countries. This study concludes by offering implications for teachers, practitioners, and education researchers as well as for the teacher job satisfaction literature.

Session K 5

24 August 2023 17:00 - 18:30
AUTH_TE2
Symposium
Learning and Special Education

Let's play – social play as mean and goal for learning in inclusive education

Keywords: Cooperative/Collaborative Learning, Engagement, Inclusive Education, Peer Interaction, Social Interaction, Special Education
Interest group: SIG 15 - Special Educational Needs
Chairperson: Lucas Deutzmann, University of Potsdam, Germany
Organiser: Florianne Rademaker, University of Groningen, Netherlands
Organiser: Maria Gladh, Stockholm University, Sweden
Organiser: Hanna Ginner Hau, Stockholm University, Sweden
Organiser: Winnie-Karen Giera, Germany
Discussant: Elisa Kupers, University of Groningen, Netherlands

Social play provides an important context in which children can acquire various cognitive, language, and social skills (Lillard et al., 2013). The relationship between play, child development, and learning has been extensively researched, and the fundamental role of play in children's development and learning has been highlighted (i.e., Hirsh-Pasek et al., 2010). Furthermore, play increases the likelihood of learning within inclusive education settings for children with disabilities or special educational needs (SEN) (e.g., Morrison et al., 2002). Yet, children with disabilities or SEN have been shown to engage less in social play than their typically developing peers (i.e., Chen et al., 2019), which may limit their opportunities for development and learning. This symposium contains presentations of four play-based interventions, spanning from early childhood to secondary education and focusing on various perspectives of how playful learning can promote participation, engagement, and involvement. From the perspective of a multi-tiered model of special education the play-based interventions presented in the symposium target the entire classroom or even school (tier 1) as well as promoting various skills for children with disabilities or SEN (tier 2 and 3). From this perspective, and based on the interventions presented in the symposium, the importance of social play as both mean and goal for inclusive education in uncertain times is discussed. Furthermore, the symposium raises issues about the implementation of interventions in complex contexts.

Disabled in play? A multiple case study on SEN students' engagement in cooperative play activities
Presenting Author: Florianne Rademaker, University of Groningen, Netherlands; **Co-Author:**Elisa Kupers, University of Groningen, Netherlands

The social participation of SEN students is lagging behind (e.g., Garrote, 2017). Several authors have suggested that promoting positive contact between students with and without SEN can serve as an important intervention strategy and proposed cooperative learning as a suitable method (e.g., Pinto et al., 2019). Effects of cooperative learning on the social participation of SEN students depend on how cooperative learning is implemented (O'Connor & Jenkins, 2013). The Contact Theory's conditions for optimal contact (i.e., intergroup cooperation, common goals, equal status, and support by authorities; Allport, 1954) might be crucial for achieving positive effects. Therefore, it is important to study how students interact with each other during these kinds of interventions. This multiple case study investigated whether the conditions intergroup cooperation and equal status were met during cooperative play activities of the 'Everybody Belongs!' intervention. Two cooperative learning groups consisting of one student with an intellectual disability (ID) and three typically developing peers (4-6 years) were observed with a detailed systematic coding scheme of their moment-to-moment interpersonal behavior. The results indicate that students with ID were less engaged in the activities and more submissive than their typically developing peers. Both groups demonstrated high proportions of affiliative interactions, however, peers did not react to the students with ID in at least 50% of the interactions. This indicates that neither intergroup cooperation nor equal status was present during the cooperative play activities. Future research could look into better ways to promote intergroup cooperation and equal status in mixed-ability cooperative learning groups.

Studying a peer-based intervention to test the concept of explicit teaching social play skills

Presenting Author: Maria Gladh, Stockholm University, Sweden; **Co-Author:**Eva Siljehag, Department of Special Education, Stockholm University, Sweden; **Co-Author:**Mara Westling Allodi, Stockholm University, Sweden; **Co-Author:**Samuel L. Odom, Frank Porter Graham Child Development Institute, Chapel Hill School of Education, University of North Carolina, Chapel Hill, NC, United States

Some preschoolers may risk being less involved in play with peers, due to disabilities, other special educational needs (SEN), and non-adapted learning environments. Peer-based interventions and instructions (PBIIs) are complementary inclusive teaching methods. By using these, teachers can promote children's social skills and increase their social play participation. However, the outcomes of such interventions may vary for different children. To evaluate their effectiveness, researchers also need to consider the implementation contexts. Based on a holistic view of learning and development, preschools might contrast teaching and play. To test the concept and feasibility of explicitly teaching social play skills by using the PBII Play Time/Social Time (PT/ST), we conducted two multiple case studies in four Swedish preschools. PT/ST contains 28 learning activities including play, addressing social skills significant for play interactions and friendships. Four teachers implemented PT/ST in their settings. At each preschool, one child with a disability or other SEN (n = 4) and one or two socially skilled peers (n = 6) participated. We triangulated data from observational assessments, video observations, a group interview, teacher logbooks, audio-recorded coaching dialogues, and field notes. The results indicate that the teacher's implementation of PT/ST enabled the children to engage in social play and use social skills. Preliminary results also indicate that the teachers could adapt the intervention to their practice, by staging learning activities for social play, and instructing and scaffolding the children to use social skills and play together. The presentation will discuss the didactic dimension of implementing PBIIs.

Everyone is playing! A participatory theater project to promote reading competence
Presenting Author: Winnie-Karen Giera, Institute of German Studies, University of Potsdam, Germany; **Co-Author:**Sara Hauser, Institute of German Studies, University of Potsdam, Germany

Reading literacy is "the ability to understand, use, evaluate, reflect on, and engage with texts in order to achieve one's own goals, develop one's own knowledge and potential, and participate actively in society" (OECD, 2019: 38). Many students do not yet have secure reading skills by the age of 15 (ibid). For example, nearly one-third of adolescents in non-gymnasium schools lack the ability to compose and reflect on the meaning of texts, specially in non-high school settings. Yet, various models of reading literacy show how important this skill is in turn, as a lack of literacy skills leads to barriers in educational progression (Stanat et al., 2010). A play, on the other hand, enables the activation and thus participation of all due to the high action orientation through scenic play and the openness to results in the staging. According to Rosebrock & Nix` reading model (2015), playful engagement with a play leads to local and global coherence at the process level, participation at the subject level, and peer interaction at the social level. That led us to our research question in two schools: how can a theater project promote literacy and social interaction? We handle in terms of the RTI approach to identify reading levels and compare them prior and after theater intervention (LGVT 5-12; SLS 2-9). Added questionnaires to measure the self-efficacy (Jerusalem & Schwarzer, 1999), and social interaction, show in the qualitative and quantitative data improvements in social interaction, and reading competence.

Guided play and narrative skills - promoting participation and engagement for each child
Presenting Author: Hanna Ginner Hau, Stockholm University, Sweden; **Co-Author:**Heidi Selenius, Stockholm University, Sweden; **Co-Author:**David Backlund, Department of Special Education, Stockholm University, Sweden

This study explores teachers' perspectives on how using guided play as a method to promote narrative skills might influence participation and engagement also for children that have challenges in developing these skill*s.* Narrative skills refer to retelling an event or creating a story coherently and meaningfully. These skills are important for participation and communication but also for students' school achievement. Students with weak oral narrative skills will struggle with writing. Playful writing is a universal play-based intervention that promotes narrative skills (Whitebread & Basilio, 2016). It provides multimodal facilitators for developing narrative skills and is based on shared experiences in the classroom. For example, after the teacher has read a story, the students will construct the story together with Lego or other concrete materials. By talking about and constructing the story, the students are given the opportunity to develop vocabulary and retelling skills. The Lego construction also provides visual support, which facilitates narrative skills. Each student then creates their own story orally or in writing based on the Lego constructions and the conversations with their classmates. This study explores teachers' experiences of Playful Writing's potential for promoting participation, engagement, and involvement for each child in the classroom. Data were collected in focus groups with pedagogues, and the material was analyzed with thematic analysis. Our findings indicate that from the teachers' perspective building joint Lego construction of stories contributes to engagement and involvement, as well as to students' practice of social skills, and everyone contributes in their own way.

Symposium
Cognitive Science

New perspectives in unraveling the difficulties in fraction understanding

Keywords: Cognitive Development, Cognitive Skills and Processes, Conceptual Change, Mathematics/Numeracy, Misconceptions
Interest group: SIG 03 - Conceptual Change
Chairperson: Wim Van Dooren, KU LEUVEN, Belgium
Organiser: Wim Van Dooren, KU LEUVEN, Belgium
Organiser: Jo Van Hoof, University of Turku, Finland
Discussant: Xenia Vamvakoussi, University of Ioannina, Greece

Fraction understanding has been shown to be crucial for the learning of later mathematical topics, such as algebra. Still, they form a major stumbling block in education. While the topic of the teaching and learning of fractions has attracted the interest of mathematics educators already for decades, it also came a focal point of attention of educational and cognitive psychologists only rather recently. This symposium brings together groups from these three communities, and addresses some major insights gained in the last years, as well as research methods that led to revealing these insights. A first main idea – addressed in the first study – is that the magnitude of fractions is not necessarily represented in the same way as other numbers. The second study goes deeper into this issue by pointing out how various subgroups of learners have qualitatively different ways of determining fraction magnitudes, and provide a statistical method to disentangle them. The third paper focuses on inhibition as one of the important cognitive processes underlying a major obstacle in understanding fraction magnitude, i.e. the natural number bias. The fourth study, finally, points at the role of affective elements in this process, i.e. mathematics anxiety.

Equivalent fractions are not equal on the mental number line
Presenting Author: Georgios Thoma, Loughborough University, United Kingdom; **Co-Author:**Julia Bahnmueller, Loughborough University, United Kingdom; **Co-Author:**Jessica Maisey, Tampere University, Finland; **Co-Author:**Antero Lindstedt, Tampere University, Finland; **Co-Author:**Kristian Kiili, Tampere University, Finland; **Co-Author:**Manuel Ninaus, University of Graz, Austria; **Co-Author:**Korbinian Moeller, Loughborough University, United Kingdom

Recent research indicates that fraction magnitude understanding is an important predictor of later math achievement. However, there is only limited evidence on the aspect of fraction equivalence. The objective of the current study was to evaluate participants' number line estimation performance for pairs of equivalent (i.e.,1/2 and 2/4) and identical fractions (i.e., 1/2 and 1/2). Both sets of fraction stimuli were presented in both a game and a non-game task version. We hypothesized that the difference in estimating two equivalent fractions should be significantly larger than the difference in estimating the same fraction twice. However, results did not substantiate this expectation as there were no significant differences between estimation performance of equivalent and identical fractions - nor between the game and non-game task version. These findings suggest that for our adult participants equivalent fractions were associated with the same location on the mental number line. Follow-up studies with children just learning about fractions would be desirable to evaluate the emerging understanding of fraction equivalence.

The roles of magnitude processing, biases, and benchmarking in fraction comparison tasks

Presenting Author: Timo Leuders, University of Education Freiburg, Germany; **Presenting Author:**Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany

Research on fraction comparison shows that students typically follow clear and replicable biased patterns (e.g., natural number bias, i.e., 4/9 > 2/3, because 4 > 2 and 9 > 3). However, the role of benchmarking (e.g., 4/9

Inhibition in the processing of rational numbers: A correlational study with fifth graders
Presenting Author: Karen De Keersmaeker, KU Leuven, Belgium; **Co-Author:**Wim Van Dooren, KU Leuven, Belgium; **Co-Author:**Jo Van Hoof, University of Turku, Finland

Understanding rational numbers is difficult for many children. One of the many reasons that researchers give for these difficulties is the natural number bias, or the tendency to inappropriately apply natural number properties to rational numbers (Ni & Zhou, 2005). As children first encounter natural numbers, it is assumed that children create an idea of how numbers behave that is solely based on experiences with natural numbers (Gelman, 2000; Greer, 2004). However, this can lead to incorrect answers as the properties of natural and rational numbers differ (Van Hoof et al., 2017). We argue that at the point where children have acquired the correct insight, this may co-exist with the initial natural number-based ideas. Thus, in some cases children need to inhibit their ideas of natural numbers when processing rational numbers. Hence, we investigated if children with better inhibitory skills also showed less traces of the natural number bias when solving tasks involving decimal and fraction comparison. Contrary to other studies in this field, we failed to find strong evidence for the relationship between inhibition and the natural number bias. Possible explanations for the contradicting findings will be discussed.

The link between conceptual change and mathematics anxiety: the case of fractions
Presenting Author: Jo Van Hoof, University of Turku, Finland; **Co-Author:**Hilma Halme, University of Turku, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Fractions form a stumbling block in education. While there are several reasons why, ample research concluded that many learners apply natural number properties in fraction tasks, even when this is inappropriate. This phenomenon is called the natural number bias (NNB) and results in systematic mistakes, such as adding numerators/denominators separately in fraction addition tasks (e.g., 1/4 +1/3 = 2/7).
Recently, it was proposed that the NNB might influence the relation between mathematics performance and mathematics anxiety. The present longitudinal study investigates, for the first time, the influence of an increased conceptual fraction understanding on learners' fraction anxiety in a group of learners with a clear NNB profile. The hypothesis is that an increase in conceptual fraction understanding over time will increase fraction anxiety too, the reasoning being that learners become more aware of the mistakes they (used to) make and their lack of understanding. This realization can lead to higher fraction anxiety.
Results show that in a general group of fifth and sixth graders, an increased fraction understanding goes together with lower fraction anxiety. However, the opposite was found in learners with a very clear misconception, namely the natural number bias. In this group, increased fraction understanding led to increased fraction anxiety.
The present study has the implication that in mathematics anxiety research the qualitative different profiles of learners should be taken into account, with special attention to misconceptions, as increases in anxiety may occur during conceptual change.

Symposium
Learning and Instructional Technology

Using digital tools and analytics to promote regulation in individual and collaborative learning

Keywords: Computer-assisted Learning, Cooperative/Collaborative Learning, Feedback, Instructional Design, Learning Analytics, Metacognition, Qualitative Methods, Reading, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Nikol Rummel, Ruhr University Bochum, Germany
Organiser: Nikol Rummel, Ruhr University Bochum, Germany
Organiser: Inge Molenaar, Radboud University Nijmegen, Netherlands
Discussant: Susanne Lajoie, McGill University, Canada

The aim of this symposium is to provide evidence-based insights into ways in which digital technologies can provide promising new ways to support self-regulation learning (SRL) in individual and collaborative settings. The first two contributions of the symposium focus on individual learning and on exploring possibilities for adaptive SRL support. Paper 1 asks how we can use learning analytics as a form of feedback to inform learners about their learning process in such a way they can use that information for effective self-regulated learning. Paper 2 focuses on the question whether automated feedback (using NLP) can improve learners' metacomprehension accuracy when learning from texts by providing additional feedback. In paper 3 the focus shifts to collaborative learning (CL). To regulate CL the members of a group need to collect feedback about past interaction and subsequently use this feedback to adapt the collaboration if necessary. The paper discusses group awareness tools as a way to provide groups with feedback on their collaboration and investigates boundary conditions under which groups may benefit from the tool-feedback and translate it into regulation. Finally, paper 4 addresses the research gap concerning the interplay between metacognitive and socio-emotional processes in regulating CL. In particular, the focus is on epistemic emotions (here: surprise). Our discussant will tie together the implications of the findings presented by the four papers with an eye of the role the technology may play in understanding and supporting (self)regulation of learning and, this way, also learning to self-regulate.

Designing feedback interventions with learning analytics: Identifying students' information needs
Presenting Author: Jacqueline Wong, Utrecht University, Netherlands; **Co-Author:**Ioana Jivet, Goethe University Frankfurt, Germany & DIPF, Germany; **Co-Author:**Manuel Valle Torre, Delft University of Technology, Netherlands; **Co-Author:**Gabrielle Martins Van Jaarsveld, Erasmus University Rotterdam, Netherlands; **Co-Author:**Ali Soleymani, Delft University of Technology, Netherlands; **Co-Author:**Martine Baars, Erasmus University Rotterdam, Netherlands; **Co-Author:**Marcus Specht, TU Delft, Netherlands

Self-monitoring is a critical process during self-regulated learning (SRL). The information gathered through self-monitoring can influence one's study decisions. For example, when learners judge themselves as not confident in having mastered a topic, they might revise it again. To make such self-judgments, learners have to rely on cues and feedback. However, providing feedback at an individual level can be challenging for teachers. Given the increasing use of technology in education, leveraging learning analytics to transform data into information as feedback appears to be a promising solution. Currently, the information presented in learning analytics dashboards, a tool meant to provide students with feedback, is commonly driven by data availability and often lacks theoretical grounding or connection to students' SRL needs. The current study explores learners' perspectives on what information they use and what information they are missing. Our two main research questions are 1) What are students' information needs when studying?, and 2) How can we use learning analytics to provide such information? Through eleven semi-guided interviews based on Zimmerman's SRL model, we gathered qualitative data on what information learners currently use and would like to have when studying. The outcome is a list of indicators (i.e., information that could be displayed on dashboards) categorized as task-, process-, and SRL-level feedback. Potential data sources (e.g., trace logs, self-report, sensors) are identified for each indicator. We discuss the implications of designing adaptive learning analytics dashboards as feedback for SRL and motivation.

Automated feedback on causal diagrams for self-regulated learning at the metacomprehension level
Presenting Author:Héctor J. Pijeira-Díaz, Maastricht University, Netherlands; **Co-Author:**Behrooz Nikandish, University of Groningen, Netherlands; **Co-Author:**Gosse Bouma, University of Groningen, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

In learning from texts containing causal relations, completing causal diagrams after reading improves students' comprehension judgment (i.e., metacomprehension) accuracy to some extent. Metacomprehension drives self-regulated learning as it informs effort and strategy allocation. Therefore, it is crucial to maximize metacomprehension accuracy, which is typically poor. We believe that real-time automated feedback on students' diagrams (e.g., correct vs incorrect) can help them further fine-tune their metacomprehension. In this multidisciplinary study, we explore the reliability of automatic feedback in this context. We leverage the most recent developments and models in the field of natural language processing. The models are trained and tested with a dataset of 10,094 diagram answers corresponding to six topics and produced by 740 secondary school students. Our best model achieves an automated feedback accuracy of 97% and a Cohen's kappa of .93 for human-computer reliability, which clearly surpassed the .80 obtained for human interrater reliability. Further, we also explored the generalizability to new topics and still obtained accuracies above 95% and kappas above 0.88. These results support the use of automatic scoring to explore the effect of highly accurate, real-time feedback on further improving students' metacomprehension. Our automated feedback system can be embedded in adaptive learning environments and intelligent tutoring systems where the diagram context is applicable.

Boundary conditions for leveraging group-level feedback for regulation of collaborative learning
Presenting Author: Sebastian Strauß, Ruhr-University Bochum, Germany; **Co-Author:**Nikol Rummel, Ruhr University Bochum, Germany

During collaborative learning the members of a group need to monitor and regulate their interaction processes. This requires them to collect feedback about past interaction and subsequently use this feedback to adapt the collaboration if necessary. Group awareness tools are a form of technology-support that provides groups with feedback on their collaboration. However, the boundary conditions under which groups benefit from these tools have not yet been systematically investigated. In this theoretical contribution, we propose potential boundary conditions that may affect whether groups take up the information from a group awareness tool and translate them into regulation by tying together prior research on group awareness tools and two small-scale field experiments that we conducted. The boundary conditions we identified encompass properties of the learning environment and design of the group awareness tool, characteristics of the individual group members such as knowledge, perceptions and motivation of individual group members, as well processes that are crucial while transforming feed-up into regulatory actions (i.e., feed-forward). We locate these boundary conditions within a cyclical model of regulation which allows us to point to potential starting points for future research on the design of group awareness tools, on processes that are necessary to leverage group-level feedback, and on effective regulation of collaboration.

Modelling Metacognitive Awareness with Epistemic Emotions in Collaborative Learning
Presenting Author: Ahsen Çini, University of Oulu, Finland; **Co-Author:**Muhterem Dindar, Tampere University, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

Collaborative learning (CL) involves not only meta-cognitive, but also socio-emotional processes that involves group members to combine their efforts and resources to regulate and control their learning. Research has shown that a wide spectrum of emotions is manifested by learners during CL. Currently, there is limited knowledge on the interplay between epistemic emotions and metacognitive processes in CL. Therefore, the current study investigates how a specific epistemic emotion, surprise, is related to metacognitive awareness in CL. With this aim, the study investigates surprise as a dynamical system to develop and understanding on their transient and dynamic features during CL. Small groups of three high school students (N=87) worked on a collaborative task. Data collection was conducted with multiple data channels: background information, situated measures of metacognitive awareness, 360-degree video, and audio. The situated measures of metacognitive awareness included judgement of confidence, perceived task difficulty and mental effort. Machine learning was applied on the video recordings to detect surprise from participants' facial expressions. Recurrence quantification analysis was applied on machine learning output to calculate various dynamicity indices of surprise. The relationship between self-reported metacognitive awareness and dynamicity of surprise was tested with multilevel modelling. The results revealed that various dynamicity features of surprise (i.e., recurrence, determinism, laminarity, and trapping time, and average diagonal line) during CL was related to self-reported judgement of confidence, perceived task difficulty and mental effort. The current findings provide us new insights regarding individuals who display surprise use better learning strategies and show better self-regulation during CL.

Symposium

Teaching the Global Goals: teacher education programmes as a conduit for achievement of Agenda 2030

Keywords: Educational Policy, Gender Issues, Qualitative Methods, Sustainable Development, Teacher Effectiveness, Teacher Professional Development, Well-being
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Ann-Kathrin Dittrich, Austria
Discussant: Denis Francesconi, University of Vienna, Austria

This symposium reports on the work of the international Teach4Reach project. The project investigates the roles of teachers and teacher educators in supporting the global agenda for sustainability as conceptualised in the Agenda 2030. As a collaborative research project between the University of Pretoria, South Africa, the University of Innsbruck and the University of Vienna, Austria, the project engages researchers from multiple countries in the Global South and the Global North to interrogate the dynamics of sustainability within teacher education. A phenomenological approach is adopted. Data is collected through interviews, focus groups and vignette research over a period of two years. A series of webinars is utilised as the platform for data collection. Each webinar focuses on the role of teacher education in fostering support for Sustainable Development Goals (SDGs), for example, 3, 4, 5 and 10, being Good health and wellbeing, Quality education, Gender equality and Reduced inequalities. The webinars provide safe spaces for the sharing of ideas by various stakeholders, including researchers, teacher educators, teachers and postgraduate researchers. The aim of the symposium is to present emergent findings on the ways in which the sustainable development goals could be infused in and realised through teacher education programmes. The symposium will present findings on Good health and wellbeing, Gender equality and Quality education. The symposium will conclude by sharing the implications of teacher shortages in the context of quality education.

The integration of SDG 3 in Teacher Education for a sustainable future
Presenting Author: Irma Eloff, University of Pretoria, South Africa

This study investigates how teacher educators engage with the notion of good health and wellbeing, as it pertains to Sustainable Development Goal 3 (SDG 3) in Agenda 2030. The study adopts the PERMA theoretical framework on wellbeing. The study reports on a subset of the Teach4Reach research project that explores the role of teacher educators in sustainability. Data was collected during a series of international webinars over a 15-month period (2021–2022). The current study focuses on a purposefully selected webinar on SDG 3 which included participants from Austria, South Africa, Italy, Zambia, Germany, India, Uganda, Botswana, Zimbabwe, Uganda and Swaziland. The study utilises a vignette methodology, supplemented by interpretive phenomenological analysis (IPA) of interview data. Findings indicate: i) challenges of measurement and definition in the field of wellbeing, ii) high levels of intention to integrate health education, wellbeing and social emotional learning in work with future teachers, but fairly limited curricular integration, and iii) that wellbeing is studied and considered within a constellation of related wellbeing concepts.

The integration of SDG 4 in Teacher Education for a sustainable future
Presenting Author: Ann-Kathrin Dittrich, University Innsbruck, Austria

The world is facing various social, political and economic challenges. The Sustainable Development Goals (SDGs) can be seen as a guide for dealing with and reacting to global developments and their new requirements. SDG 4 "Quality Education" is more than a goal, it is a key instrument for a global transformation process and the realisation of the Agenda 2030. Teacher educators are one specific group which can play a major role as advocates of sustainability awareness,

and the attainment thereof. Their knowledge and competences are crucial for fostering and implementing education for sustainable development. Teacher educators influence the perspectives, values and pedagogical practices of in- and pre-service teachers and can in this regard lead the transformation of curricula, thus enhancing the quality of education in classroom settings. Based on interview data from the international project “Teach4Reach”, the aim of the paper is to present and stimulate discussion on ways in which SDG 4 currently features and how its visibility and impact can be improved through teacher education programmes. Preliminary findings demonstrate the urgent need to increase the awareness of SDG 4 amongst teachers and teacher-educators. Data collected through one of the Teach4Reach webinars attended by different stakeholders included ideas on how curricula can be shaped, and pointed out implementation challenges. The findings will be shared as well as the implications for theory and practice for teacher education in the Global North and South.

Forms of essentialisation of gender and culture in SDG 5 and the critical role of teacher(educators)
Presenting Author: Evi Agostini, University of Vienna, Austria

Essentialist construals of gender are often critiqued by feminists for the theoretical, empirical, and political concerns they raise. At the same time, it has also become apparent that the rejection of essentialism problematically undercuts feminist politics, by denying that women have any shared characteristics which could motivate them to move together as a collectivity. Whereas arguments against gender essentialism are supported by evidence that gender expectations differ significantly across cultures, this in turn can lead to some form of cultural essentialism. With a postcolonial perspective, this paper raises the question of how the categories gender and culture come to the fore in phenomenological vignettes and in international focus group discussions about SDG 5. Included were different stakeholders of teacher education programmes in the Global North and the Global South during an online-webinar of the Teach4Reach project in November 2021. Which categories of gender and culture are produced or reproduced? Finally, the paper discusses possibilities of how gender equality can be improved via teacher education programmes. The study indicates a global need for deeper understandings of gender, culture and stereotypes in teacher education.

Policies to address teacher shortages to achieve SDG 4 targets in Austria and South Africa
Presenting Author: Vasileios Symeonidis, University of Education Freiburg, Germany

Sustainable Development Goal 4 (SDG 4) advocates inclusive and equitable quality education for all. It is estimated that 69 million teachers need to be recruited by 2030; in this context, teacher education needs to be supported to increase the supply of qualified teachers, particularly in developing countries. This abstract aims to explore endeavours by national governments to support SDG 4 by addressing the challenges of teacher supply and demand. Drawing on two instrumental case studies, one from the Global South (South Africa) and one from the Global North (Austria), it describes policy initiatives on teacher education, alternative pathways to teaching qualifications, and school autonomy. The study posits that countries’ responses tend to have a strong national focus, with limited consideration of global challenges in teacher education, and a singular focus on *teachers* to deal with the increasing challenges in education. The study indicates a need for increased international collaboration on teacher education and a comprehensive reconceptualisation of the teaching workforce.

Symposium
Higher Education, Instructional Design, Learning and Instructional Technology

Visualizing Learning Processes in Learning From Text and Multimedia: An Eye-Tracking Approach

Keywords: Classroom Assessment, Comprehension of Text and Graphics, Computer-assisted Learning, Eye Tracking, Higher Education, Misconceptions, Multimedia Learning, Primary Education, Reading, Video-based Learning
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Emmelien Merchie, Ghent University, Belgium
Organiser: Leen Catrysse, Belgium
Discussant: Tamara Van Gog, Utrecht University, Netherlands

Eye tracking has traditionally been used to investigate learning processes and individual differences in learning processes. However, there are increasing applications of the use of eye tracking to enhance rather than investigate learning processes. Therefore, the visual analysis of eye movement data during learning is becoming an emerging field providing important means to support learning processes. In this symposium, we showcase studies that have investigated innovative visualizations of learning processes using eye tracking, with the aim of enhancing learning. It includes studies that investigate innovative visualization of learning processes that allow to better understand individual differences in learning processes (Paper 1 and 2). It also includes studies that have applied such innovative visualizations to enhance learning (Paper 3 and 4). The first paper presents a social network approach to visualize reading processes while learning from expository text. The second paper presents a dynamic educational process mining approach to analyze visual behavior patterns when reading mind maps. The third paper uses eye-movement modeling examples (EMMEs) to foster attention to sources while reading multiple documents. The fourth papers also uses EMMEs in a live classroom setting to enhance students’ attention to relevant information. The symposium will be concluded by the discussant who will discuss this emerging field both from methodological and practical perspectives.

How eye Read: A Social Network Approach
Presenting Author: Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Tine van Daal, University of Antwerp, Belgium; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Vincent Donche, University of Antwerp, Belgium; **Co-Author:**David Gijbels, University of Antwerp, Belgium

Learning from texts is one of the most essential skills in higher education. Therefore, considerable efforts have been made in educational research to better understand the reading process associated with learning from an expository text. In order to register the ongoing reading process, eye movement registration has been used to a large extent in reading research. Up to now, mostly duration measures such as first-pass and second-pass fixation durations are analyzed in reading research to gain more insight in this ongoing process. However, not only the duration in certain areas of interest (AOIs) can inform us on reading processes but also the transitions or relations between AOIs can indicate differences in integration processes while reading. Therefore, this paper offers a unique perspective on eye movement analysis in reading research by applying techniques from social network analysis. We visualized reading networks and analyzed centrality measures of reading networks from 31 students while reading three expository texts. Centrality measures are analyzed with (generalized) linear mixed-effects models. Results show that different patterns emerge and that this social network approach offers a promising way to analyze transitions or relations between AOIs in eye movement data.

How do Primary School Students Read Mind Maps? A Process Mining Analysis of Eye-Tracking Patterns
Presenting Author: Emmelien Merchie, Ghent University, Belgium; **Co-Author:**Sofie Heirweg, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

This study investigated the eye-tracked visual behavior patterns of 44 late primary education students when reading mind maps. More particularly, the processing of visual characteristics, reading sequence and presentation mode (i.e., mind map before or after text) was studied. Static early attention and dynamic educational process mining (EPM) analysis were conducted. Further, also learning performance and interview data were gathered. During initial reading, all students seem to struggle with the map’s radial structure. Also, the picture’s position in the map seems to influence if and how students read interconnected branches. Furthermore, EPM analyses revealed different reading patterns in proceeding reading behavior. The radial structure is grasped slightly more by students receiving a text first. These students also show higher information integration attempts and attain higher free recall and coherence scores. The study reflects upon didactical guidelines for explicit visual literacy instruction in primary education.

Can Video Models Help Debunk the Learning Styles Misconception When Reading in L2?

Presenting Author: Ladislao Salmerón, University of Valencia, Spain; **Co-Author:**Juliana do Amaral, FEDERAL UNIVERSITY OF SANTA CATARINA, Brazil

Misconceptions are a type of prior belief that interfere with the construction of a situation model. In L2 reading, emerging research has pointed to a moderating effect of text language (L2) in text-belief consistency (Karimi, Richter, 2021). The present study aimed at investigating the effectiveness of eye-movement modeling examples (EMMEs) to help reduce the Learning Styles misconception, among L2 readers. EMMEs are recordings of the reader's eye movements while performing a learning task. They have been explored in their potential to inform metacognitive instruction (Xie et al., 2021). We assumed that EMMEs would foster readers' attention to source features, which in turn could facilitate the identification of reliable sources contrary to Learning styles and the adoption of a critical perspective. 58 undergraduate students speakers of English (L2) participated in the study. Participants answered a demographic questionnaire, the Learning Styles questionnaire and an English test. Then, they either watched the EMMEs or the control video. Next, they read web pages that either endorsed or refuted the Learning Styles misconception while their eye movements were recorded. Last, they wrote an essay about the topic, answered a source-memory task and again the Learning Styles questionnaire. Results indicated that EMMEs partially foster attention to sources when reading multiple documents in L2, but they do not help students to reduce their beliefs on the Learning styles misconception. Additional instructional efforts may be needed to apply sourcing strategies to critically evaluate information in L2.

Look Where I Look! Real-time Eye Movement Modeling Examples (EMME) in the Classroom
Presenting Author: Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Diederick Niehorster, Lund University, Sweden; **Co-Author:**William Rosengren, Lund University, Sweden; **Co-Author:**Marcus Nyström, x, Sweden; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Classrooms are becoming increasingly digital. One novel digital technology, that might enter classrooms soon, is eye tracking. This is a method to measure someone's eye movements to infer where they looked. Thus far, eye tracking was already used to display where a teacher is looking when explaining teaching material as offline, pre-recorded videos. In this way, students were better able to follow the teacher's explanation and better learn from them (i.e., eye movement modeling examples). We present how this approach can also be implemented in real time, during teaching. We recorded the eye movements of a teacher, who was providing a lecture on eye tracking based on a PowerPoint presentation. We displayed his eye movements in real-time to 44 students who were present in the same classroom. We provided one of three different versions of the material to the students: either the PowerPoint only (n=14), the PowerPoint with an overlay of the teacher's eye movements as a circle (n=15) or as spotlight on the material (n=15). All students were sitting in a digital classroom equipped with an eye tracker per student to also record their eye movements. Results showed that the spotlight guided students' attention significantly more than the circle or no cue. However, students' learning outcomes were not affected significantly by the EMME. During the conference, we will describe the technical set-up, ideas for future research, as well as possible future applications in educational practice.

Session K 10

24 August 2023 17:00 - 18:30
UOM_A02

Motivational, Social and Affective Processes

Motivation to Read and Write

Keywords: Achievement, At-risk Students, Attitudes and Beliefs, Mindsets, Motivation, Reading, Secondary Education, Self-efficacy, Teaching Approaches, Writing/Literacy
Interest group: SIG 08 - Motivation and Emotion, SIG 12 - Writing
Chairperson: Choo Mui Cheong, The University of Hong Kong, Hong Kong

Relationships between motivational factors and reading comprehension in bilingual fourth-graders
Keywords: Achievement, Motivation, Reading, Self-efficacy
Presenting Author: Choo Mui Cheong, The University of Hong Kong, Hong Kong; **Co-Author:**Yaping Liu, The University of Hong Kong, Hong Kong; **Co-Author:**Rex Hung Wai Ng, The University of Hong Kong, Hong Kong; **Co-Author:**Shek Kam Tse, The University of Hong Kong, Hong Kong

While there are many studies that focused on the impact of motivation factors in L1 or L2 separately, less research attention has been paid to the effects of these factors on L1 and L2 simultaneously. This study aimed to 1) explore the relationship between reading self-efficacy, intrinsic motivation, extrinsic motivation, and reading comprehension in both L1 and L2; 2) identify whether self-efficacy, intrinsic motivation, extrinsic motivation, and reading comprehension performance can be transferred from L1 to L2; 3) investigate the potential transfer pathways between L1 self-efficacy and L2 reading comprehension. Structural equation modelling was conducted to analyze the data from 38 Hong Kong schools with 2,894 fourth-grade primary school students. Results found that, in both L1 and L2, self-efficacy had a positive relationship with reading comprehension, intrinsic motivation, and extrinsic motivation; and intrinsic motivation positively influenced reading comprehension, while extrinsic motivation is negatively associated with reading comprehension. For cross-linguistic transfer, intrinsic motivation, extrinsic motivation, and reading performance transferred directly from L1 to L2, while self-efficacy did not. Meanwhile, the effect of L1 self-efficacy on L2 reading comprehension was mediated by LI and L2 intrinsic motivation, LI and L2 extrinsic motivation, and L1 reading comprehension through multiple pathways. Theoretically, this study extends the language interdependence hypothesis by empirically showing the cross-linguistic transfer of motivational factors. Practically, this study provides informative evidence for teachers to tailor effective intervention targets to improve students' L2 reading comprehension.
Keywords: Self-efficacy, intrinsic motivation, extrinsic motivation, Chinese L1, English L2, cross-linguistic transfer

Group-based motivational profiles and their association with students' writing performance
Keywords: Attitudes and Beliefs, Mindsets, Motivation, Writing/Literacy
Presenting Author: Rui Alexandre Alves, University of Porto, Portugal; **Co-Author:**Ana Camacho, University of Porto, Portugal; **Co-Author:**Fien De Smedt, Ghent University, Belgium; **Co-Author:**Rui Maio, Faculty of Psychology and Educational Sciences of the University of Porto, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

Previous empirical research has documented the positive link between motivation and students' writing performance. However, this body of research has mainly relied on a variable-centered research approach and there are still few studies based on a person-centered research approach. In the current study we addressed this methodological gap by examining the association between different students' motivational profiles and their writing performance. Specifically, we aimed to: (a) identify different motivational profiles in writing, based on students' implicit theories and achievement goals; (b) examine whether students in different profiles differed in their writing performance. We recruited 212 Portuguese sixth grade Portuguese students (M = 11.11 years, SD = 0.56), who filled in motivational self-report scales and performed writing tasks. Based on hierarchical and k-means cluster analyses, our results revealed a two-cluster profile solution. We identified one motivational profile characterized by a fixed mindset and more oriented towards performance-approach and performance-avoidance goals, and another motivational profile characterized by a growth mindset and less oriented towards performance-based goals. Of note, students in the growth mindset profile outperformed students in the fixed mindset profile in terms of text quality. In addition, teachers assigned significantly higher writing grades to students in the growth mindset compared with students in the fixed mindset profile. Overall, these findings underline the key role that motivational variables play in writing performance. Importantly, teachers need to foster a growth mindset and avoid the promotion of performance-based goals to enhance students' writing performance.

Writing Motivation and Ability Profiles and Transition after a Technology-Based Writing Intervention
Keywords: Motivation, Secondary Education, Self-efficacy, Writing/Literacy
Presenting Author: Tania Maria Cruz Cordero, University of Delaware, United States; **Co-Author:**Joshua Wilson, University of Delaware, United States; **Co-Author:**Corey Palermo, Measurement Incorporated, United States; **Co-Author:**Halley Eacker, Measurement Incorporated, United States; **Co-Author:**Matthew Myers, University of Delaware, United States; **Co-Author:**Andrew Potter, University of Delaware, United States; **Co-Author:**Jessica Coles, Measurement

Incorporated, United States

We identified writing motivation and ability profiles and transition paths of 2,487 U.S. middle-school students participating in an automated writing evaluation (AWE) intervention using MI Write. Four motivation profiles emerged from a latent transition analysis with self–reported writing self–efficacy, attitudes toward writing, and writing performance measures: Low, Mid/Low, Mid/High, and High. The majority of students started the school year in the Mid/Low (38%) and Mid/High (32%) profiles. Only 12% of students started the school year in the High profile. The most common transition path was to remain in the same profile in the Spring (61%). Larger transitions (e.g., from High to Low profile or vice versa) were only found on less than 1% of students. Assignment to intervention did not significantly influence transition paths. Students receiving special education or in the priority population were more likely to be in the Low and Mid/Low profiles than in the High profile in the Fall. These students were more likely to stay in the lower profiles in the Spring. Results provide a promising profiling strategy focused on students' attitudes and motivations and show students' most likely profile and transition paths based on their demographic characteristics. Finally, despite previous research indicating positive effects of AWE on writing motivation, results indicate that simply implementing AWE in schools with a majority of at-risk populations is insufficient to produce meaningful changes in students' writing motivation profiles or writing outcomes. Therefore, interventions targeting writing motivation, in conjunction with AWE, could improve results.

Exploring the relation between autonomy supportive teacher behavior and students' reading motivation
Keywords: At-risk Students, Motivation, Reading, Teaching Approaches
Presenting Author: Nele Bleukx, KU LEUVEN, Belgium; **Co-Author:**Katrijn Denies, KU LEUVEN, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium; **Co-Author:**Koen Aesaert, K.U.Leuven, Belgium

Research points to the importance of autonomous reading motivation (ARM) for better reading comprehension. According to the self-determination theory (SDT), autonomous motivation can be promoted through teachers' autonomy supportive behavior (ASB). Unfortunately, teachers tend to offer less autonomy to their lower performing students, even though they might benefit more. The present study investigates whether different student groups within reading education experience different degrees of ASB. In addition, the relationship between ASB and ARM and differential effects of students' background characteristics are further investigated within the field of reading education. In total, data from student questionnaires of 1623 fourth-grade students nested in 94 classes were used. Multilevel analysis indicates overall positive associations between ASB and ARM. Furthermore, boys and students with a low SES report less autonomy support from their teachers compared to their high SES female peers. Finally, results suggest ASB might be particularly beneficial for boys in relation to their ARM. Results of this study are in line with previous research, revealing a disturbing educational paradox in the field of reading instruction, i.e. students at risk for lower reading comprehension abilities and motivation, experience less autonomy support from their teacher. This trend is alarming, considering the universal positive influence of ASB, independent of the students' background characteristics.

The role and function of district superintendents: A systematic literature review
Keywords: Educational Policy, Ethics, School Leadership, Sustainable Development
Presenting Author: Mona Holmqvist, Lund University, Sweden; **Co-Author:**Martin Lantz Ekström, Malmö University, Sweden

Abstract The superintendent role is not easy to identify, as the enactment differs based on contextual differences, as well as what societal expectations and policies they are expected to meet. However, a general assumption is that they shall assist the district education authority, or the local board to ensure the regulations that apply to education. Here rests many challenges. One is how superintendents position themselves within a politicised administrative system between principals and the district board, and the variety of possibilities to interpret and implement policy intentions. To contribute with knowledge about the role of the superintendent, this article synthesizes literature from research, with the goal of highlighting what has been published on the role and function of the district superintendent between the years 2000 and 2022. Systematic searches were conducted using the databases ERIC, ERC, Web of Science and Swepub. After review of exclusive and inclusive criteria, as well as a Quality check, 38 of the 315 peer-reviewed articles initially found, met the inclusion criteria. The main part of the articles (32) was reporting a US context. Six main themes emerged in the analysis: (1) contextualisation of the superintendent, (2) gender, (3) ethics, (4) policy implementation, (5) superintendent knowledge, and (6) decision making. The results of the studies' are synthesized within each category.

School reform for the future? Change processes during the establishment of all-day schools
Keywords: Conceptual Change, Educational Policy, Mixed-method Research, Primary Education
Presenting Author: Michelle Jutzi, University of Teacher Education Bern, Switzerland; **Co-Author:**Barbara Stampfli, PHBern – University of Teacher Education, Switzerland; **Co-Author:**Regula Windlinger, Institut für Forschung, Entwicklung und Evaluation, PHBern, Switzerland; **Co-Author:**Ulrich Hostettler, University of Teacher Edaucation Bern (PHBern), Switzerland

This evaluation study examined the opening and development of three schools over two years and identified opportunities and challenges in the introduction, implementation, and integration processes. These new schools aim to provide a holistic education as well as cross-grade and individualized learning for children. In addition, they serve families with high childcare needs on lunchtime and afternoons and offer of a "home away from home". The current state of research shows that there are only a few studies that deal with the level of the individual school development and describe which changes become noticeable for students, staff and parents in everyday life in the process of opening a new school. The three schools studied are labelled as “all-day schools” which means that they combine instruction and care. We conclude that the structural reorganization of the interplay between teaching and care entails far-reaching consequences, concerning the organization of teaching, questions of professionality and forms of collaboration. In this regard, the data shows noticeable differences in the relationships between teachers, caregivers and children. Furthermore, this study reveals that the reform is comprehensive, i.e., it affects pedagogical and organizational concepts, the school's strategy with regard to the public and pedagogical practice.

A Controversially Received Reform: The 2018 Renewal of Finnish Higher Education Student Admission
Keywords: Achievement, Educational Policy, School Effectiveness, Secondary Education
Presenting Author: Risto Hotulainen, University of Helsinki, Finland; **Co-Author:**Sirkku Kupiainen, University of Helsinki, Finland; **Co-Author:**Irene Rämä, University of Helsinki, Finland

The Finnish matriculation examination is the only high stakes test in the Finnish education system. The examination marks the end of academic track upper secondary education and eligibility for tertiary education. Until 2018, practically all students entered higher education through a program-specific entrance examination, a procedure largely responsible for Finnish students' slow transit from secondary to tertiary education. To remedy the situation and accelerate the transit, a reform in 2018 decreed that half of new students in all higher education programs are to be chosen based on their matriculation examination results. While the matriculation examination has a long history and it is widely accepted, the reform has been strongly contested. The main source of controversy is the way the credit is awarded for the different subject-specific exams. As the credit is based on the number of courses covered by the exam, advanced mathematics provides most credit even in fields where proficiency in it might appear of less value.

In the present study, we explore the reception of the reform in upper secondary schools (surveys for students, teachers, principals, and guidance counsellors) focusing on the impact of the reform on students' wellbeing and study and examination plans (register data). The large-scale study (N=8000) is implemented in 2022–2023, with full results available in June 2023. Due to the strong opposition, the reform will be opened up for renewal in 2024. The present study aims at providing evidence of the impact of the reform for this process.

Opportunities & Challenges of Two Policy Measures to Reduce Educational Inequalities in Switzerland
Keywords: Early Childhood Education, Educational Policy, Qualitative Methods, Secondary Education
Presenting Author: Anja Winkler, University of Teacher Education Bern, Switzerland; **Presenting Author:**Angela Rebecca Aegerter, University of Bern, Switzerland; **Co-Author:**Andrea Erzinger, University of Bern, Switzerland

In modern knowledge-based societies, education is considered a central resource. Today in Switzerland, an upper secondary level education is considered a basic requirement for successful, independent participation in adult and working life (Meyer, 2009). Those who do not hold this minimum level of educational certification can be affected by educational poverty (Quenzel & Hurrelmann, 2019). In our research project XX we examine measures to reduce educational inequality and their implementation in the political system. In this paper, we discuss two selected measures to reduce educational inequalities in Switzerland: (1) A case study of an early intervention program for children (ages 0-3) and their families with multiple stresses and (2) a school model of a public school at the lower secondary level, which particularly promotes individual learning processes in mixed-ability classes. To examine the measures, three interviews, one focus group discussion, and one guided tour were conducted for each measure. The results of the case studies point to numerous positive facets and impacts on educational inequalities while being difficult to implement and establish through complex (educational) policies. Based on the examples examined, approaches to reducing educational inequalities are derived.

Active Integration of Representations in Augmented Reality
Keywords: Educational Technologies, Immersive Technologies for Learning, Instructional Design, Multimedia Learning
Presenting Author: Jule Krüger, University of Potsdam, Germany; **Co-Author:**Franziska Schacht, University of Duisburg-Essen, Germany; **Co-Author:**Daniel Bodemer, University of Duisburg-Essen, Germany

In augmented reality (AR), interaction can take many forms, including a combined interaction with virtual and physical elements. This includes more complex forms of interaction that can lead to higher cognitive demands but also deeper learning when designed purposefully. Cognitive Load Theory proposes the reduction of extraneous cognitive load (ECL) to free resources for deeper learning, but this does not necessarily lead to desired cognitive processes. The active integration method proposes external integration of representations to elicit mental integration processes. This has been found to improve learning outcomes compared to showing pre-integrated representations in studies with classic multimedia materials. The current study aims to examine the transferability of the results on active integration in more classic multimedia learning settings to the specific case of AR. We hypothesize a higher GCL, ECL and learning outcome for active integration in comparison to pre-integrated material. $N = 94$ participants took part in a study with learning material on combined cycle power plants, including text cards with process descriptions and animated, 3D virtual models of power plant components that either had to be actively integrated or were already pre-integrated. No significant differences were found in ECL, GCL and knowledge test, rejecting all three hypotheses. Exploratory analyses of screen-recordings during the learning phase showed a less stable view and less visibility of virtual objects during active integration, which may have cancelled out potentially positive effects of the activity. Results are being discussed in view of the uniqueness of AR and potential implications of the results.

Learning by Explaining in School: Testing the Generalizability within a ManyClasses Study
Keywords: Computer-assisted Learning, Instructional Design, Learning Strategies, Teaching/Instructional Strategies
Presenting Author: Leonie Sibley, University of Tübingen, Germany; **Co-Author:**Heike Russ, University of Tübingen, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany

Prior research has shown that generating explanations for a fictional peer can be conducive to learning and seems to be more beneficial than retrieving previously learned contents. This explaining effect has been almost exclusively investigated in laboratory contexts. It is therefore still unclear whether the results can be replicated in classrooms that provide real but different learning environments. Additionally, it is not clear under which conditions explaining is effective since prior research has just started to explore potential boundary conditions of learning by explaining. Therefore, within this study, the explaining effect and its boundary conditions were tested in a *ManyClasses field study*. The approach aims at testing an effect in diverse settings to test its generalizability and to explore boundary conditions. So far, six classes participated in the study ($N = 118$ school students). We aimed at collecting data of 140 students in total until March 2023 to guarantee a power of 80%. In each class, the teacher held two teaching units about comparable but different topics. Using a within-subjects posttest design, students either explained the previously learned contents to a fictitious peer by creating a video or retrieved the contents after the teaching unit. Preliminary results showed no main effect of explaining compared to retrieving regarding students' learning. Interestingly, discipline moderated the explaining effect as students only benefitted from explaining in non-STEM-related subjects. None of the remaining moderators were significant, although grade-related rewards approached significance. This study therefore adds to prior research as crucial boundary conditions were investigated.

Do distributed practice reminders promote children's learning with a digital learning app?
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Learning Strategies, Self-regulated Learning and Behaviour
Presenting Author: Lea Nobbe, DIPF Frankfurt, Germany; **Co-Author:**Jasmin Breitwieser, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Daniel Biedermann, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Garvin Brod, DIPF | Leibniz Institute for Research and Information in Education, Germany

Studying without supervision can be challenging for children and is especially prevalent when studying in digital learning environments. Within this 37 day intensive longitudinal study, 84 children used two apps simultaneously: One app to study their vocabulary, the other to answer questions and receive interventions which were designed to help them study more regularly. While both the control and experimental group started out by watching a video on the benefits of a distributed practice strategy, only the experimental group received reminders of the strategy, which were presented on half of the study days. While the distributed practice reminders did increase the probability to study in the experimental group, overall the experimental group did not study more frequently than the control group. When only looking at the days without distributed practice reminders, they had a lower probability of studying than the control group, which suggests a detrimental side effect of the distributed practice reminders. These results warrant caution when using distributed practice reminders as a tool to get children to study more regularly. One possible mechanism leading to the detrimental side effect of distributed practice reminders could be an overreliance on them.

Implementing metacognitive prompts in segmented dynamic visualizations - Beneficial for learning?

Keywords: Educational Technologies, Instructional Design, Metacognition, Multimedia Learning
Presenting Author: Felix Krieglstein, Chemnitz University of Technology, Germany

Dynamic visualizations such as whiteboard animations can quickly exceed learners' working memory because of their transient nature. To counteract this, the segmentation principle can be used to separate the learning material into smaller, "digestible" segments. By this, the learner has more time to process the learning contents. However, it is relatively unclear whether an increase in segmentation (resulting in more pauses between the segments) leads to better learning performance. Furthermore, the idea of this work to use the pause between two segments for metacognitive activities in which learners reflect on their current learning progress. Across two experiments involving different whiteboard animations and corresponding learning topics (N_1 = 132; N_2 = 119), the number of segments was manipulated by dividing the whiteboard animations into one (i.e. no segmentation), two, three, or four segments. Moreover, the use and number of metacognitive prompts (i.e., on-screen instructions to recap already learned information) were examined by including these prompts in either pauses between the segments or after the animation. The results showed that an increase in segments did not lead to better learning performance or reduced intrinsic cognitive load perceptions. Metacognitive prompts did not result in more accurate judgment of learning evaluations. Results should encourage researchers to develop interventions designed to promote metacognitive activities while learning with dynamic media.

Role of impasse in teacher learning
Keywords: Attitudes and Beliefs, Dialogic Pedagogy, In-service Teachers, Teacher Professional Development
Presenting Author: Roman Švaříček, Masaryk University, Czech Republic; **Co-Author:**Klara Sedova, Masaryk University, Czech Republic; **Co-Author:**Zuzana Salamounova, Masaryk University, Czech Republic; **Co-Author:**Martin Sedlacek, Masaryk University, Czech Republic

The aim of this paper is to identify the role of impasse in changing a teacher's thinking and behaviour during a teacher development programme. We conducted an intervention aimed at fostering collectivity in classroom dialogue in which all the students in the class were to contribute to as similar an extent as possible. The requirement to work with all students caused an impasse because it drew attention to the subjective teacher judgment of the students' lack of ability and to the objective low level of participation of silent students who engaged exclusively in response to the teacher's questions.During the 2021/2022 school year, six classes (123 students) and their six teachers participated in the intervention. The intervention involved workshops for teachers, a series of video recordings of their lessons, and interviews with each teacher stimulated by the video recordings. This paper asks the following research questions: (1) How is the process of change in a teacher's thinking and teaching enabled in the development programme? (2) What role does impasse play in the teacher's learning process? The analysis showed that impasse plays a key role in the teacher learning process, destabilizing the cognitive-affective block that enables teachers to reach and remain in a balanced state. We analyse in detail the situations that lead to teacher beliefs and judgements being challenged and further focus on describing how teachers resolve these impasses with the help of cognitive activity. The role of a researcher in scaffolding teacher's cognitive activity is also discussed.

I reflect today, this week, or never? An experience sampling study of teacher activities
Keywords: Primary Education, School Effectiveness, Teacher Professional Development, Well-being
Presenting Author: Miriam Compagnoni, University of Zurich, Switzerland; **Co-Author:**Beat Rechsteiner, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Flurin Gotsch, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Katharina Maag Merki, University of Zurich, Switzerland; **Co-Author:**Andrea Wullschleger, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland

To enable high-quality school development, teachers must reflect on their own competencies and pedagogical work in the classroom, within their team, and at school. However, a deeper understanding of how daily reflection activities interact with stress, satisfaction, and perceived benefits for student learning, is missing. Given the lack of reliable quantitative data on current practices in everyday school life, we assessed 801 Swiss teachers as part of a 21-day experience sampling study (ESM). Using an explorative approach, we first examined the number and type of pedagogical reflection activities that teachers undertook in everyday school life. Then, we constructed several multilevel models to assess the relationship between reflection activities and teachers' daily experience of stress, satisfaction and perceived benefits at the between- and within-person level. The exploratory results demonstrated that, on nearly half of the days, teachers reported activities that involved pedagogical reflection and development; however, pedagogical reflection and development at the team or school level were rare. As expected, the multilevel models revealed that, on days with reflection activities, teachers reported greater stress but also more benefits for students, their teaching, and their team. The between-person effects demonstrated that, on average, teachers who engaged in more reflection did not report higher stress but more benefits and higher satisfaction overall. These contribution highlights the importance of ESM data for teachers' everyday work lives and fosters an understanding on how professional learning communities can become a force for positive change.

"I know I don't know" - Does metacognitive accuracy moderate the validity of TPK self-assessments?
Keywords: Competencies, Metacognition, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Ulrike Franke, University of Tübingen, Germany; **Co-Author:**Iris Backfisch, University of Tuebingen, Germany; **Co-Author:**Armin Fabian, University of Tuebingen, Germany; **Co-Author:**Patrizia Breil, Ruhr-University of Bochum, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany

Valid test instruments of technological-pedagogical knowledge (TPK) are important means to provide adequate support in the course of teacher education. However, to date, mostly distal indicators have been used to measure TPK via self-assessments, which have often been criticized for their poor validity. Nevertheless, still to date, it is an open question whether TPK self-assessments correspond to performance-based TPK tests. In addition, metacognitive research postulated that the correspondence between TPK self- assessments and performance-based TPK tests may depend on teachers' metacognitive accuracy. To investigate the correspondence between TPK self-assessments and performance-based TPK tests, we conducted two cross-sectional studies with pre-service teachers (Study 1) and in-service teachers (Study 2). The participants in both studies assessed their TPK and answered a performance-based TPK test with open-ended text-based vignettes. Before answering the TPK test, participants rated their potential performance on the TPK test. We used difference scores to model participants' metacognitive accuracy. Across both studies, we only found a weak positive relation between TPK self-assessments and the performance-based TPK test. This effect was moderated by monitoring accuracy, as the correspondence between self-assessed TPK and TPK test score was higher, when participants demonstrated higher metacognitive accuracy. This finding indicates that the acquisition of TPK via self-assessments is determined by the metacognitive accuracy of the estimation of one's own knowledge. In addition, the findings suggest that self-assessments may not optimally capture teachers' TPK regardless of their working experience. Thus, the findings provide important indications with regard to the use of different measurements of TPK.

Generative resistance as knowledge work: Teacher's Engagement with Assessment Criteria
Keywords: Assessment Methods, In-service Teachers, Knowledge Construction, Teacher Professional Development
Presenting Author: Eli Tronsmo, University of Oslo, Norway; **Presenting Author:**Hege Hermansen, Oslo Metropolitan University, Norway

The global turn to outcomes-based curricula has positioned assessment criteria as an integral part of teachers' work. However, existing research shows that teachers' work with assessment criteria is often characterized by dilemmas and contradictions (Brown and Harris 2016), because assessment practices typically involve multiple purposes and a range of epistemic and social concerns. This conceptual paper addresses how teachers navigate such dilemmas by viewing teachers' engagement with assessment criteria as a form of knowledge work, understood as work that goes beyond routine in ways that require analytic effort, innovation, questioning and explorative activities (Newell et al. 2009). Employing sociomaterial approaches (Fenwick and Nerland 2014) and the concept of "generative resistance" (Carlsen, Clegg and Gjersvik, 2012), we substantiate our conceptual argument by drawing upon three different data sets on teachers' collaborative work from 2014, 2018 and 2021. We demonstrate three different dynamics of generative resistance. The first dynamic relates to *working with doubts and dilemmas* (such as securing productive relations between the different logics informing assessment practices). The second dynamic relates to *seeking out connections* (e.g. exploring connections between the local and the universal, between practice and research). The third dynamic relates to *dwelling in and re-configuring knowledge* (e.g. developing and testing ideas, framing and defining space for action). The findings offer new insights into in-service teachers' professional development in the context of everyday work. We also contribute to advancing existing conceptualisations of teachers' knowledge work, by unpacking the dynamics that supports teachers' agentic and transformative engagement with professional knowledge.

Teacher Educators' positioning and task perception concerning the facilitation of digital competence
Keywords: Attitudes and Beliefs, Digital Literacy and Learning, Higher Education, Teacher Professional Development
Presenting Author: Ilka Nagel, Østfold University College / University of Oslo, Norway

Teacher educators have many tasks and roles but the most prominent one is being a teacher of teachers. The role of teacher educators can be seen as vague and undefined which allows for several interpretations and understandings. This qualitative study provides more insight in teacher educators' positioning and task perception concerning the facilitation student teachers' professional digital competence. Eighteen in-depth interviews with teacher educators from six teacher education institutions in Norway are analyzed in two steps. First, teacher educator profiles are identified through an abductive approach going back and forth between the data and results from previous research. Second, the profiles' task perceptions concerning the facilitation student teachers' professional digital competence are analysed. Preliminary findings reveal three main profiles and related task perceptions: (1) pedagogues with a learner-centered perspective on teaching see it as their task to let students critically explore and experiment with digital tools for teaching and learning; (2) subject teachers who follow an instructor-centered approach focus on the function of digital tools for administration and instruction; and (3) reflective teachers of teachers who position themselves in the middle and combine both approaches see it as their task to develop their students' digital competence through being a role model and critically discussing the students' digital learning experiences. However, many teacher educators are not sure what their task concerning the facilitation of student teachers' professional digital competence is. The results may be used as a starting point in professional development approaches to discuss one's teaching practice and task perception.

Higher education teachers' profiles based on digital learning activities during online teaching
Keywords: Digital Literacy and Learning, E-learning/ Online Learning, Higher Education, Teaching Approaches
Presenting Author: Anne Lohr, Ludwig-Maximlians-University Munich, Germany; **Co-Author:**Michael Sailer, LMU Munich, Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

The first aim of this study was to investigate to what extent three profiles of higher education teachers based on their initiated digital learning activities during face-to-face teaching (Lohr et al., 2021) can be replicated in the context of online teaching during the COVID-19 pandemic. We differentiated digital learning activities into four types based on the ICAP-framework (Chi & Wylie, 2014): passive, active, constructive and interactive. The second aim of this study was to investigate to what extent higher education teachers in the different profiles differ regarding their technological knowledge, technological-pedagogical knowledge and technology-related attitudes. Based on a sample of 1173 German higher education teachers we replicated two profiles from the context of face-to-face teaching: *Powerpointers*, who mainly initiated passive digital learning activities and *Clickerers,* who mainly initiated passive and active digital learning activities. However, we found that in online teaching during the COVID-19 pandemic there is a differentiation of the profile of *Digital Pros*, who initiate all digital learning activities with a similar frequency, into *Orchestrators,* who initiated all types of digital learning activities to a high degree, and *Interactivators,* who especially initiated interactive digital learning activities. Higher education teachers in the four profiles did not differ regarding technological knowledge, however, Powerpointers and Clickers each had significantly lower technological-pedagogical knowledge than Orchestrators and Interactivators. Furthermore, Powerpointers showed more critical technology-related attitudes than all other profiles, while Orchestrators showed more positive attitudes. Results highlight the importance of higher education teachers' technological-pedagogical knowledge for students' cognitive activation during online teaching.

Teacher Educators' Challenges in the Context of Digital Transformation: A Mixed Methods Study
Keywords: Digital Literacy and Learning, Lifelong Learning, Mixed-method Research, Teacher Professional Development
Presenting Author: Marlene Wagner, University for Continuing Education Krems (Danube University Krems), Austria; **Co-Author:**Tobias Ley, Danube University Krems, Austria; **Co-Author:**Lydia Kammerer, Johannes Kepler University Linz, Austria; **Co-Author:**Christoph Helm, Johannes Kepler University Linz, Austria

The ongoing digital transformation requires teachers as well as teacher educators to re-conceptualise their roles and tasks. The purpose of the present study is to examine teacher educators' challenges in the context of digital transformation, their self-reported technological pedagogical content knowledge (TPACK) and the role of personal and contextual characteristics as predictors of teacher educators' TPACK using an exploratory sequential mixed-methods research design. Data were collected from individual semi-structured interviews ($N = 8$) and an online questionnaire ($N = 179$). Findings reveal that teacher educators experience challenges in the context of digital transformation both on the lecturer and the institutional level. However, they rate their technological knowledge, their technological pedagogical knowledge and their TPACK high. The results of structural equation modelling analysis indicate that teacher educators' frequency of digital technology use and their perceived challenges on the lecturer level are significant predictors of teacher educators' TPACK. Besides, participation in informal continuing professional development (CPD) and perceived challenges on the institutional level seem to have an impact on teacher educators' TPACK. Findings of the study shed light on teacher educators' digital upskilling needs and relevant personal and contextual factors which need to be considered in the design of professional development curricula.

Still an instrumental endeavor? Developing professional digital competence in teacher education
Keywords: Digital Literacy and Learning, Educational Technologies, Higher Education, Teacher Professional Development
Presenting Author: Synnøve H. Amdam, Volda University College, Norway; **Presenting Author:**Toril Aagaard, University of Southeast Norway, Norway; **Presenting Author:**Ilka Nagel, Østfold University College / University of Oslo, Norway; **Co-Author:**Karl Vika, NIFU, Norway; **Co-Author:**Fredrik Mørk Røkenes, Norwegian University of Science and Technology, Norway

Teacher educations (TE) across the globe face the task of preparing student teachers for a profession that is increasingly shaped by digitalization. Algorithms,

artificial intelligence, simulation software and virtual worlds are among the technologies with power to influence how people acquire knowledge and with what resources. Therefore, student teachers must learn to identify and take advantage of digital technologies, but also relate to the series of challenges which are of ethical, social, or societal character and have epistemic impacts. A main critique from scholars, however, has been the instrumental focus TE has had on teaching students how to use various digital resources for different educational purposes. In this paper, we present how teacher educators from five Norwegian TE institutions approach professional digital competence (PDC) in their teaching. We analyze the results from a survey conducted in 2021 (N = 389), to investigate if developing PDC in TE still is an instrumental endeavor, or if epistemic issues are paid more attention. We find that the teacher educators still have an instrumental focus, even if all the five institutions over the past four years have tried to develop PDC in TE through major R&D projects. Consequently, we discuss how further PDC development in TE can address instrumental and epistemic issues concurrently to ensure that future teachers are qualified to develop epistemic practices in agentic, transformative ways to the better for student teachers and finally pupils' learning.

What predicts teachers' likeliness to intervene in situations of ethnicity-based exclusion?
Keywords: Bullying, Cultural Diversity in School, In-service Teachers, Multicultural Education
Presenting Author: Daria Khanolainen, University of Jyväskylä, Finland; **Co-Author:**Elena Semenova, Independent researcher, Unknown; **Co-Author:**Elvira Fatkhulova, Independent researcher, Unknown; **Co-Author:**Yulia Nesterova, University of Glasgow, United Kingdom

This study aims to examine what predicts teachers' likeliness to intervene in situations when students get excluded from peer activities because of their ethnicity and/or culture. As part of this study, 454 teachers currently employed in Russia completed an anonymous online survey. Teachers' likeliness to intervene was measured with two questions (1. How necessary is a teacher's involvement in such situations? 2. Relative to your other teaching demands, how important is it for you to address this situation?). These questions were presented after the teachers viewed a visual vignette showing a situation of student ethnicity/culture-based exclusion. The survey also included items tapping into beliefs about multiculturalism in general, beliefs about multicultural education specifically, empathic anger arising in stations of race/ethnicity-based mistreatment, and professional burnout. Various demographic data was also collected. To analyse the data, we constructed multiple linear regressions with latent variables using MPlus 7.0. Our preliminary analysis suggested that different types of teachers' multicultural beliefs were significantly predictive of their likeliness to intervene in situations of ethnicity/culture-based exclusion. Moreover, teachers with higher levels of professional burn-out were less likely to intervene, while teachers with higher levels of empathic anger were more likely to step in. At the same time, teachers' qualification level, professional experience, own minority status, and school's socio-economic status were not predictive. Implications for teacher education will be discussed at the conference.

Norwegian preservice teachers' competence to teach in multicultural and multilingual classrooms.
Keywords: Cultural Diversity in School, Mixed-method Research, Multicultural Education, Pre-service Teachers
Presenting Author: Wenche Elisabeth Thomassen, University of Stavanger, Norway

In this paper I will present findings from my PhD study about preservice teachers' competence to teach in multilingual and multicultural classrooms (Thomassen, 2021). This is a mixed- methods study and consists of three different data sets: group interviews with pre-service teachers in their 2d year of teacher training, data from a national survey with both preservice teachers, teacher educators at campus and mentor teachers in schools – as well as personal interviews with preservice teachers in their last year of teacher education. The main theoretical approaches are Critical Multiculturalism (Sleeter and May,2010) and Lucas and Villegas framework "Linguistically Responsive Pedagogy (2013). Critical Multiculturalism points to the importance of critical reflection of power relations is society and schools with an aim of creating change. The framework made by Lucas and Villegas outline important orientations, skills and knowledge teachers need for teaching second language learners in mainstream classrooms. In my presentation, I will discuss my findings related to the theoretical approaches, implication for Initial Teacher education and with an overriding goal to discuss what competence preservice teachers need to develop to be able to improve teaching and create change and hope for emergent multilingual learners in multicultural and multilingual classrooms.

Multicultural education, values and curriculum-content learning: a teacher training approach
Keywords: Inquiry Learning, Instructional Design, Multicultural Education, Teacher Professional Development
Presenting Author:ELENI PAPAGEORGIOU, Cyprus Pedagogical Institute, Cyprus; **Co-Author:**Pavlina Hadjitheodoulou-Loizidou, Cyprus Pedagogical Institute, Cyprus

Abstract The study proposes a teachers' training course, for embedding the development of values in curriculum-content instruction in multicultural classrooms. The course focuses on revealing challenges related to teaching in multicultural settings and the use of real-life social contexts as thematic frameworks for teaching the content of the school curriculum. A pre-post design process for evaluating the effectiveness of the twelve-hour training course was implemented, alongside with a qualitative approach, including teacher interviews and teaching observations. Positive effects on teachers' self-efficacy, beliefs and practices in teaching were identified after completing the course. Further professional learning opportunities for teaching that involves both the development of fundamental values and teaching of the content of curriculum subjects were also stressed.

Development and Validation of a Multiplicative Operation Sense Assessment Instrument in 5th Grade
Keywords: Classroom Assessment, Competencies, Mathematics/Numeracy, Quantitative Methods
Presenting Author: Eva Schultheis, University of Education Freiburg, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Timo Leuders, University of Education Freiburg, Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany

Abstract
Studies show that a considerable number of students start secondary school with fundamental gaps in basic mathematical skills. Especially when multiplying and dividing, many students lack a sufficient understanding of operations, which is crucial for further mathematics learning. The conceptual understanding of operations—operation sense—is the ability to relate situations (e.g., word problems) to mathematical-symbolic notations (e.g., calculations, equations) and vice versa. To allow for adaptive support for operation sense, the understanding or the lack thereof needs to be assessed systematically. However, a sensitive assessment instrument specifically tailored to the operations of multiplication and division - which can be used for a focused diagnosis and for evaluation of specific interventions in this domain - is so far missing. Based on an existing more general assessment ("Lernstand 5", Schulz et al. 2019) we developed an instrument for assessing *multiplicative* operation sense, which represents theoretically founded levels of understanding operations in multiplicative situations. In the validation study (N=66) general linear mixed models revealed that 86 % of the variance in item difficulty can be explained by the four theoretically founded levels of multiplicative operation sense. Thus, it can be assumed that this test is a valid test instrument, which can be recommended as a basis for subsequent adaptive support and formative assessment.

How PCK sharpens teachers' views when judging mathematical tasks: An eye-tracking study
Keywords: Cognitive Skills and Processes, Eye Tracking, Mathematics/Numeracy, Secondary Education
Presenting Author: Kirsten Brunner, Pädagogische Hochschule Freiburg, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Timo Leuders, University of Education Freiburg, Germany

Teachers' ability to accurately judge difficulties of mathematical tasks is an essential facet of their diagnostic competencies. Although research has suggested that pedagogical content knowledge (PCK) is positively correlated with the accuracy of diagnostic judgments, experimental studies that address causal effects are largely lacking. Specifically, it has not been investigated how PCK affects the processes of perception and interpretation of relevant task characteristics.In this intervention study with a control group, 49 prospective mathematics teachers judged the difficulty of 20 tasks involving functions and graphs while having their eye movements tracked by an eye tracker. Some of the tasks included characteristics that are well known to be difficult for students. Participants' domain-specific PCK was manipulated through a two-hour intervention, during which they learned about the most common student errors in function and graph problems. We hypothesized that such knowledge would be required to make accurate reasoning about task difficulty, and would affect participants' eye movements. Pre–post comparisons revealed a large effect of the intervention on participants' domain-specific PCK. At posttest, participants in the intervention group provided more accurate reasoning about task difficulty than participants in the control group. Furthermore, they showed more focused eye movements on task characteristics relevant to difficulty. Thus, the PCK intervention led to more efficient processing of relevant task characteristics, and to more accurate reasoning about task difficulty.

On the Perception and Effectiveness of the Feedback Quality from a Digital Learning Platform
Keywords: Computer-assisted Learning, Feedback, Mathematics/Numeracy, Secondary Education
Presenting Author: Larissa Altenburger, Leuphana Universität Lüneburg, Germany; **Co-Author:**Michael Besser, Leuphana Universität Lüneburg, Germany

The perception of the quality of two feedback types (knowledge of results and elaborated feedback) as well as its influence on students' performance is compared within the current study: 147 seven graders were assigned to either a less complex (knowledge of result) experimental or an elaborated experimental feedback condition. The two groups worked with a digital learning platform on fractions receiving feedback. Afterwards they completed a questionnaire on their perception of the feedback quality as well as a performance test on fractions. Results show no significant difference in the perception of the feedback quality of the two experimental groups. Likewise, no differences in performance have been found – however regression analyses suggest an effect of perception of elaborated feedback (but not of the less complex feedback type "knowledge of result") on students' performance. Relations to previous research as well as educational implications are discussed.

Formative assessment of early numerical concepts in Brazilian children
Keywords: Classroom Assessment, Inclusive Education, Mathematics/Numeracy, Primary Education
Presenting Author: Fernanda Rocha de Freitas, Universidade Federal de Minas Gerais, Brazil; **Co-Author:**Moritz Herzog, University of Wuppertal, Institute for Educational Research, Germany; **Co-Author:**Antje Ehlert, University of Potsdam / University of Johannesburg, Germany; **Co-Author:**Vitor Geraldi Haase, Universidade Federal de Minas Gerais, Brazil; **Co-Author:**Annemarie Fritz, Akademie Wort+Zahl, Germany

A substantial percentage of Brazilian children are struggling to learn basic numerical skills. Based on the empirically validated model of early numerical concepts, several instruments of the MARKO series have been designed to support children with mathematical learning difficulties. While originating from Germany, the MARKO instruments have been adapted in other countries, such in South Africa. The aim of the study is to evaluate the feasibility of using the model of conceptual numerical development and MARKO instruments for supporting Brazilian's children with math learning difficulties. N=135 Brazilian children from preschool, first and second grade were evaluated using MARKO-Screening via tablets by Hogrefe platform HTS-5. The MARKO-Screening was translated and adapted following the International Test Commission guidelines. A Rasch analysis was employed to estimate the difficulty of the items. Based on the infit statistics of the Rasch model, two items had to be excluded because of too high infit values. Except for three items, difficulty measures arranged as expected by model of numerical development's levels. While some items need reformulations for the assessment, in general the results also indicate that the MARKO instruments and the model of numerical concepts development might be used in Brazil for supporting children's mathematical learning.

Argumentative text comprehension by students with Reading Disabilities or Low Reading Achievement
Keywords: Instructional Design, Reading, Secondary Education, Special Education
Presenting Author: Anatoli Kirpouiki, University of Macedonia, Greece; **Co-Author:**IOANNIS AGALIOTIS, University of Macedonia, Greece

AbstractThe present study explored the effect of a systematic instructional intervention on the comprehension of argumentative texts by secondary students with Specific Reading Disabilities (SRD) and their peers with Low Reading Achievement (LRA). Eighteen students with SRD and 12 students with LRA attending the 1^{st} grade of Greek secondary schools (Gymnasia), were systematically taught via an instructional synthesis based on specific instructional objectives and the sequence of teaching phases of Systematic Explicit Instruction (SEI). The intervention lasted 10 weeks and involved 24 sessions (average duration of each session: 35min). Initial and final reading achievement of each group in Argumentative Text Comprehension (ATC) were compared through standardized and researcher-made tests. Parametric and non-parametric analyses showed that both groups presented statistically significant improvement in ATC. Post - procedure follow - up measurement verified the robustness of the findings on improvement. The results have important consequences for the implementation of reading instruction for secondary students with SRD or LRA, as they attest to the effectiveness of SEI and the importance of using instructional objectives in daily school practice. Keywords: Instructional Design, Reading, Secondary Education, Special Education

Text Comprehension Improvement in Struggling Readers via Explicit Instruction and a Reading Strategy

Keywords: Instructional Design, Reading, Secondary Education, Special Education
Presenting Author: Anatoli Kirpouiki, University of Macedonia, Greece; **Co-Author:**IOANNIS AGALIOTIS, University of Macedonia, Greece

AbstractAim of the present study was the investigation of the extent to which the combination of Systematic Explicit Instruction (SEI) with a Reading Strategy may bring improvement in the comprehension of argumentative texts by secondary students with Specific Reading Difficulties (SRD) or Low Reading

Achievement (LRA). Fifteen students with SRD and 15 students with LRA attending the 1st grade of Greek secondary schools (12-13 years of age), were taught via an instructional synthesis laying emphasis on specific instructional objectives, control of prerequisite knowledge, the sequence of teaching phases of SEI and the Repeated Readings Strategy (RRS). The intervention involved 24 sessions and lasted 10 weeks (session average: 35'). Initial and final reading achievements of each group in Argumentative Text Comprehension (ATC) were compared through standardized and researcher-made tests. Parametric and non-parametric analyses showed that both groups presented statistically significant improvement in ATC. Post - procedure follow - up measurement showed high level of knowledge maintenance. The results have important consequences for teaching reading comprehension at the secondary school level, as they prove that the combination of Systematic Explicit Instruction with the Repeated Readings Strategy may produce positive results for various groups of struggling readers. Keywords: Instructional Design, Reading, Secondary Education, Special Education

Working memory mediating word problem solving in students with and without reading disabilities
Keywords: Cognitive Skills and Processes, Learning and Developmental Disabilities, Mathematics/Numeracy, Primary Education
Presenting Author: Anastasia Chideridou-Mandari, Aristotle University of Thessaloniki, Greece; **Co-Author:**Sophia Giazitzidou, Dalhousie University, Canada; **Co-Author:**Susana Padeliadu, Aristotle University of Thessaloniki, Greece

Mathematical word problem solving involves several math skills and cognitive factors. Calculation skills and working memory have been both related to the word problem solving process. Further, students with reading disabilities are characterized by weak performance in both word problem solving and calculations and by working memory deficits as well. Despite the crucial role of working memory in mathematical performance, the interaction and the contribution of working memory and calculation skills in word problem solving remains unresolved. The aim of this study is to examine the mediating role of working memory in the relationship between calculation and word problem solving skills of primary school students with and without reading disabilities. Participants were 95 students with reading disabilities and 99 typically developing students from 4th and 6th grades. All students were assessed in number fact retrieval, written calculations and word problems (simple and complex). For working memory measurement, a phonological loop, a visuospatial sketchpad and a central executive task were administered. Separate path analyses for both groups demonstrated that within typically developing children, number facts and written calculation significantly contributed to word problem solving both directly and indirectly through visuospatial sketchpad. For students with reading disabilities, number facts and written calculation significantly affected word problem solving only directly. No significant mediation emerged from the analysis. Findings are discussed in the framework of developing educational interventions for teaching word problem solving skills.

Effectiveness of drama pedagogical reader's theater programs in special education
Keywords: Reading, School Effectiveness, Special Education, Teaching Approaches
Presenting Author: Jarkko Hautala, Niilo Mäki Institute, Finland; **Co-Author:**Enni Junttila, Niilo Mäki Institute, Finland; **Co-Author:**Miia Ronimus, University of Oulu, Finland; **Co-Author:**Roosa Karhunen, Niilo Mäki Institute, Finland

ReadDrama research project investigated the effectiveness of drama pedagogical reader's theater (RT) programs in promoting reading skills and motivation among struggling readers at elementary grades. While previous RT research has mainly utilized whole classroom programs of practicing and performing every week a new short text, our RT emphasized the drama pedagogical process of practicing and performing a complete play for the audience. The present paper summarizes the project findings from small-scale pilot study (N=22), large-scale randomized controlled trial (N=320) and from two (N=370, expected N=100) implementation studies. According to the result, drama pedagogical RT programs are equally effective than traditional targeted oral reading practice in promoting oral reading fluency in helping the struggling readers in catching up with their typically reading peers. However, no such benefit was observed for expressiveness in oral reading, silent reading fluency or reading comprehension. Moreover, the RT was well received by both male and female students and the goal to perform was found to lower anxiety associated with oral reading to others. Teachers were able to independently implement the RT according to manuals leading to reduced oral reading anxiety in their students. The presentation will end into discussion about the promise of RT with drama pedagogical emphasis to support struggling readers.

Linguistic diversity in Austria: challenges of including Ukrainian students into schools
Keywords: At-risk Students, Foreign and Second Language Acquisition, Inclusive Education, Migrant / Refugee and Minority students
Presenting Author: Flora Woltran, University of Vienna, Austria

In recent years, the linguistic diversity of students, mainly due to immigration movements forced by wars or economic crises, has become more important in school reality. As a first and immediate response, the Austrian Federal Ministry of Education has introduced so-called "classes with a German-Ukrainian focus" (CGUF), in which Ukrainian students are initially taught predominantly in their first language in separate classes until their German language skills are sufficient to participate in mainstream classes. Since the introduction of CGUF, there has been no research capturing the experiences of Ukrainian students and their teachers in Austrian schools. Therefore, problem-centered interviews were conducted to shed light on the practical implementation of CGUF and to identify barriers for students, teachers and school leaders. 15 teachers (14 female, 1 male) and 2 principals (both female) and 10 students (6 female, 4 male) from different types of schools (primary, lower and upper secondary) participated in the survey. Preliminary findings from a qualitative content analysis by Mayring (2015) suggest that teachers and principals from a variety of school sites report using both immersion programs and submersive models of language development. In addition, school staff report about a lack of support and clear information from education directorates. Finally, the results indicate that some of the staff working in CGUF do not have adequate training and expertise to provide language instruction to students as well as lacking pedagogical training. Students addressed lacking social participation with peers from regular classes as a significant issue.

Which turn to take? Using translanguaging to promote students' responsiveness in language classrooms
Keywords: Foreign and Second Language Acquisition, Multicultural Education, Quantitative Methods, Social Interaction
Presenting Author: Nienke Smit, Utrecht University, Netherlands; **Co-Author:**Jornt Holtman, Hanze University of Applied Sciences, Groningen, Netherlands; **Co-Author:**Marijn Van Dijk, University of Groningen, Netherlands; **Co-Author:**Wander Lowie, Faculty of Arts, University of Groningen, Netherlands; **Co-Author:**Marjolijn Verspoor, University of Pannonia, Veszprem, Hungary

Translanguaging, the pedagogical use of two or more languages in the same lesson, is a highly recommended practice in the foreign language (L2) classroom. However, thus far there are few quantitative empirical studies analyzing translanguaging behavior in the classroom. The present study analyzed 2594 pairs of teacher questions and student answers in a sample of 39 lessons. A cluster analysis identified four types of lessons based on the teachers' use of

translanguaging: (1) mainly L2 - low L2 response, (2) mainly L2 - high L2 response, (3) mainly L1 - low L2 response and (4) L2-L1 “translanguagers” – moderately high L2 response. A cluster analysis revealed mixed levels of student responsiveness when teachers adopt a monolingual stance (L2 only as the language of instruction). Lessons in cluster 4, the “translanguagers”, revealed a significantly higher level of student responsiveness. These results disclose the trade-off for teachers between (a) getting an answer and (b) getting an answer in the L2. Teachers who ask many questions in the L2, but receive few answers, may want to adopt translanguaging as a strategy to increase students’ active classroom participation. Strategically switching between different languages could help teachers to direct students’ response frequency and response language. We suggest that using the foreign language as the language of instruction and translanguaging are complementary, rather than competing, strategies in a language teacher’s repertoire.

Translanguaging stance of preschool teachers in Luxembourg
Keywords: Attitudes and Beliefs, Early Childhood Education, Mixed-method Research, Teacher Professional Development
Presenting Author: Gabrijela Aleksic, University of Luxembourg, Luxembourg

In 2017, the new law declared multilingual education mandatory in Luxembourg where there are 65% of 4-year-old language minority children. To support 40 teachers with the new law requirement that asked teachers to use children’s home languages in the classroom, we offered a 6-month professional development course in translanguaging pedagogy that builds on children’s full linguistic repertoire. Mixed methods were used such as focus groups, questionnaires, and video observations. Through pre- and post-course focus groups we identified three groups of teachers: (1) those with mild monolingual stance who believed that the most important is to develop children’s school language, Luxembourgish, (2) those with mild translanguaging stance who expressed that children’s home languages are important but can hinder children’s Luxembourgish, and (3) those with true translanguaging stance who believed that children’s home languages are necessary for their well-being and development of Luxembourgish. The questionnaires showed that there was a significant increase in teachers’ positive attitudes towards children’s home languages and translanguaging. However, in the video observations we identified both positive and negative examples in teacher-designed activities that, when compared to the focus groups and questionnaires results, seemed paradoxical but portrayed a fuller picture of preschool teachers’ translanguaging stance in Luxembourg.

Sustainable anchoring of assessment literacy in Higher Education
Keywords: Assessment Methods, Higher Education, Lifelong Learning, Teacher Professional Development
Presenting Author: Kyle Van den Langenberg, HAN University Nijmegen, Netherlands; **Presenting Author:**Jeroen van der Linden, HAN University of Applied Sciences / Maastricht University, Netherlands; **Presenting Author:**Kitty Meijer, HU University of Applied Sciences Utrecht; Open University of the Netherlands, Netherlands; **Co-Author:**Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Tamara Schilt-Mol, Hogeschool van Arnhem en Nijmegen, Netherlands

The professional development of assessment literacy of university lecturers has been on the agenda for some time now in the Netherlands. Professionalization in the field of assessment is one of the successes within higher education. Various reasons have led to further developed basic and senior qualification examination courses, the Protocol Graduation 2.0 and the Assessment Literacy Network. The project ‘With Open Eyes’, describing the ‘qualities of the assessment-literate university of applied sciences teacher’ (‘Je Ogen Uitkijken’ in Dutch), examines how the attention generated for assessment literacy can be sustainably anchored within the professional quality culture of universities of applied sciences in the Netherlands. The project includes nine goals, of which the third goal focuses on supporting development, adaptation and use of tools to promote and anchor assessment literacy. Nine universities engaged with an assessment issue in which the process of using the tools and the perceived outcomes were monitored through observation of meetings, logbooks and interviews with staff involved. These qualitative data were examined through thematic analysis using Atlas-Ti. Outcomes were validated through a member check. The results show that the structured professional dialogue, while working on assessment issues in practice, fed and guided by experts in networks, appears to be the best way to work on sustainable assessment literacy. This is in line with recent literature to construe assessment literacy from a sociocultural perspective. Further research can provide insight into whether these developments actually lead to sustainable assessment literacy.

Sustainability of teaching and learning innovations in higher education: a scoping review
Keywords: Higher Education, Instructional Design, Social Aspects of Learning and Teaching, Sustainable Development
Presenting Author: Margaret Bearman, Deakin University, Australia; **Co-Author:**Paige Mahoney, Deakin University, Australia; **Co-Author:**Helen Partridge, Deakin University, Australia; **Co-Author:**Harsha Chandir, Deakin University, Australia

Sustaining innovation and innovation dissemination is a topic of broad concern to higher education, particularly in a pandemic-driven time of challenge to the sector. This scoping review of the literature examines ten studies which have considered the sustainability of teaching and learning innovations within the past two decades. From these ten studies, we derive key drivers, barriers, and longitudinal insights into sustained innovations in higher education. Although there is consensus on the importance of staff engagement, collaboration and institutional funding, some contradictions emerged around the roles of funding, leadership and time. In almost all of the included studies, innovation was framed as an intrinsic benefit, which limited consideration of challenges or innovations that ceased to be useful. Although some conclusions about the sustainability of teaching and learning innovations may be drawn from existing studies, there is scope for further research which extends longitudinal understandings of how and why innovation may be sustained in higher education.

The impact of educational roles on student learning in transdisciplinary challenge-based learning
Keywords: Curriculum Development, Higher Education, Learning Approaches, Sustainable Development
Presenting Author: Gemma O'Sullivan, Eindhoven University of Technology (TU/e), Netherlands; **Co-Author:**Cassandra Tho, Wageningen University and Research Centre, Netherlands; **Co-Author:**Yvette Baggen, Wageningen University and Research Centre, Netherlands; **Co-Author:**Despoina Georgiou, Utrecht University, Netherlands; **Co-Author:**Heleen Pennings, UMC Utrecht, Netherlands; **Co-Author:**Antoine van den Beemt, Eindhoven University of Technology, Netherlands

Recent European, global, and institutional higher education policies call for transdisciplinary challenge-based learning (T-CBL) to develop in students the skills and competencies to deal with complex societal challenges, for example, in support of the United Nations Sustainable Development Goals. T-CBL requires students to work with external stakeholders and multiple disciplines to propose solutions to real-life challenges and to seek out information in non-traditional ways, for example, self-directed learning. This study examines what roles different actors play in T-CBL and how they contribute to student learning. In particular, this paper gives an insight into how students value these roles. Surveys were completed by 18 students taking part in inter-university challenges within a Dutch alliance of four universities. Semi-structured interviews were completed with 15 of these students. The results indicate that students place the highest value on the role of external stakeholders in T-CBL, however, other actors, for example, friends and family and fellow students are also valued. This paper discusses the implications of these findings, for example, how external stakeholders can be supported in T-CBL, how their perspectives can be integrated into curriculum design and student learning, and what role academic and administrative staff play in supporting T-CBL.

Learning to work across boundaries: developing boundary crossing learning trajectories in HE
Keywords: Competencies, Curriculum Development, Sustainable Development, Teacher Professional Development
Presenting Author: Judith Gulikers, Wageningen University, Netherlands; **Co-Author:**Karen Fortuin, Wageningen University, Netherlands; **Co-Author:**Cassandra Tho, Wageningen University & Research, Netherlands; **Co-Author:**Carla Oonk, Wageningen University, Netherlands

The competence to work together and co-create with others outside one's own scientific domain, culture or professional practice is a critical competence for graduates to respond to global challenges and deal with complex problems. In this context, Boundary crossing (BC) competence is crucial. We reflect on a four year university-wide educational innovation project for conceptualising, developing and implementing BC in education, draw lessons learned and identify success factors. In this participatory project, theoretical conceptualisation and practical development and design were ongoingly intertwined. The BC theory and its four learning mechanisms (identification, coordination, reflection, transformation; Akkerman & Bakker, 2011) are introduced. Four bachelor programs, guided by an interdisciplinary project team, used the BC theory and learning mechanisms to identify boundary crossing opportunities in their programs, develop learning goals, activities and learning trajectories. Besides, the project resulted in many other spin-offs in the universities (e.g. in Master programs, profiling new study programs etc.). We argue that the BC theory and learning mechanisms provide a solid foundation for implementing BC competence development in courses, curricula or learning trajectories. We show that BC can relatively easy be implemented in existing education, yet it is crucial to use experiential types of learning to make this rather abstract concept tangible for both teachers and students. A key learning gain of BC education is to see BC competence as a generic competence and boundaries, understood as demarcations of practices, as learning opportunities.

A Mindful Educational Intervention Program to Reduce Anxiety and Promote Self-esteem in Adolescence
Keywords: Anxiety and Stress, Mindsets, Social Sciences and Humanities, Well-being
Presenting Author: Victoria Zaroucha, The American College of Thessaloniki (ACT) - Anatolia College, Greece; **Presenting Author:**EVANGELIA GIANNOULI, The American College of Thessaloniki (ACT), Greece

Abstract Psycho-educational intervention programs including mindfulness in enhancing self-esteem and reducing anxiety have been infrequently studied in adolescence (Shahidi et al., 2017). Positive psychology interventions, though increasing in general, their effectiveness in adolescents is still scarce, especially in the school context (Tejada-Gallardo, et al. 2020). Research revealed that students with reading difficulties had higher anxiety as concerns reading and lower satisfaction and hope than the children without difficulties (Sainio, et al. 2019). Previous studies have shown that positive psychology interventions increase well-being and reduce anxiety and stress symptoms (Tejada-Gallardo, et al. 2020). In order to extent research on positive psychology, twenty-two randomly selected high school students, both male and female, from grades 4^{th} and 5^{th} (age 16-17) participated in a positive psychology intervention named "M.A.M.A.S" (Managing Anxiety Mindfully and Advancing Self-esteem). The students were native Greeks and form the experimental group in which the program was implemented. The study took place in a Model High School in Northern Greece. The experiment will be continued in another school during 2022-23 in order to have a larger sample than the above. So far, the intervention named "M.A.M.A.S" seems to have positive results on students' anxiety, self-esteem, and mindfulness.

Effect of a physical activity lifestyle intervention on mental wellbeing of VET students.
Keywords: Emotion and Affect, Quantitative Methods, Vocational Education and Apprenticeship Training, Well-being
Presenting Author: Mara Kirschner, Open University of the Netherlands, Netherlands; **Co-Author:**Rianne Golsteijn, Open University of the Netherlands, Netherlands; **Co-Author:**Roelina Kikkert, Open University of the Netherlands, Netherlands; **Co-Author:**Hans Savelberg, Maastricht Uiversity, Faculty of Health, Medicine and Life Sciences, Netherlands; **Co-Author:**Renate de Groot, Open University of the Netherlands, Netherlands

Problems regarding student mental wellbeing (SMW) are increasingly reported amongst vocational education and training (VET)-students. Research often shows that changing physical activity behaviour (PAB), i.e., increasing moderate to vigorous physical activity (MVPA) and decreasing sedentary behaviour (SB) is beneficial for SMW. Although especially the VET population is vulnerable for SMW problems, studies in this population are scarce. Therefore, this study aims to evaluate the effect of a physical activity (PA) based lifestyle intervention on PAB and SMW of VET-students. 126 VET-students were non-randomly allocated to a 20-week PA based lifestyle intervention or control group, following education as usual. PAB, subdivided in SB and MVPA, and SMW operationalized as lack of depressive symptoms (CES-D) and presence of self-esteem (Rosenberg self-esteem scale) were measured before and after the intervention. Repeated measures ANOVA revealed a significant time*group effect ($F(1, 89) = 8.40$, $p = .01$) for SB, indicating that SB decreased in the intervention group and increased in the control group. For MVPA only a significant negative main effect of time was found ($F(1, 89) = 5.74$, $p = .02$), thus both groups decreased significantly in MVPA over time. No effects of the intervention were found for depressive symptoms or self-esteem. Thus, the PA based lifestyle intervention only significantly decreased the amount of SB and had no effect on MVPA. Unfortunately, the intervention did not influence any of the concepts within SMW. Future research must investigate whether more intensive PA based lifestyle interventions are more effective in increasing MVPA and SMW.

Active recovery? - Effects of a physical activity break on student's attention and mood
Keywords: Cognitive Skills and Processes, Emotion and Affect, Motivation, Well-being
Presenting Author: Christian Müller, Freie Universität Berlin, Germany; **Co-Author:**Marianne Schuepbach, Freie Universität Berlin, Germany; **Co-Author:**Jil Wolf, Freie Universität Berlin, Germany; **Co-Author:**Sven Lindberg, University of Paderborn, Germany

More and more universities are offering physical activity breaks in seminars for the active recovery of student's learning conditions. However, the effects of physical activity breaks, especially in university classes, on cognitive performance and motivational learning conditions have not been adequately investigated, Therefore, the acute effects of a physical activity break within university seminars were investigated. By an intervention-control group design, the acute effects of a 10-min physical activity break (N = 63, Mage=23.74 years, SD = 4.36) within university seminars on student's attention and mood were investigated. In the physical activity intervention group student's attention (attention-processing speed: $p = < .05$, $\eta 2 = .062$, attention performance: $p = < .05$, $\eta 2 = .806$) and mood improved (feeling calmer: $p = < .05$, $\eta 2 = .071$; feeling more awake: $p = < .05$, $\eta 2 = .060$) compared to the control group. The results point to acute effects of physical activity breaks on student's cognitive and motivational learning conditions and the relevance of breaks in learning settings. At the conference possible moderation effects will be presented and transfer possibilities and limitations will be discussed.

University Students' Descriptions of Behavioral Changes During ACT-based Well-being Course
Keywords: Cognitive Skills and Processes, Engagement, Higher Education, Well-being
Presenting Author: Kristiina Räihä, University of Helsinki, Finland; **Co-Author:**Henna Asikainen, University of Helsinki, Finland; **Co-Author:**Nina Katajavuori, University of Helsinki, Finland

As there is a significant decrease in students' mental health, developing effective ways to enhance students' well-being in higher education is important. To face this need, an eight-week online Acceptance and Commitment Therapy (ACT) -based course for university students was developed. This study aims to produce new and deeper knowledge of the course participating students' described changes by applying the theory of behavioural change and the six processes of psychological flexibility (defusion, acceptance, values, committed action, present moment awareness, and self as concept). The qualitative data consist of course-participating university students (n=101, female 83%, male 15%, other 5%, mean age group = 20-30) written reflective learning reports that are analysed by abductive content analysis. The preliminary results of the data indicate that the most described changing psychological flexibility process was committed action. Students described positive behaviour related to committed action and resources such as social support and useful learning materials and exercises of the online course area to be change-enhancing factors. Correspondingly, the key description of change-preventing factors was students' negative behaviour associated with committed action, time management, and balancing study/ work and leisure time. One central description of change was also the need to change their goal, which students had set at the beginning of the course, thus implying that one key change during the course is the change in students' perspective of what needs to change. The results are further studied and discussed at the conference.

Session K 21

How Fair is my Test?: A Ratio Coefficient to Help Represent Consequential Validity
Keywords: Assessment Methods, Large-scale Assessment, Quantitative Methods, Tool Development
Presenting Author: Denis Dumas, University of Georgia, United States; **Co-Author:**Yixiao Dong, University of Denver, United States; **Co-Author:**Daniel McNeish, Arizona State University, United States

The degree to which test scores can support justified and fair decisions about demographically diverse participants has been an important aspect of educational and psychological testing for millennia. In the last 30 years, this aspect of measurement has come to be known as consequential validity, and it has sparked scholarly debate as to how responsible psychometricians should be for the fairness of the tests they create, and how the field might be able to quantify that fairness and communicate it to applied researchers and other stake-holders of testing programs. Here, we formulate a relatively simple-to-calculate ratio coefficient that is meant to capture how well the scores from a given test can predict a criterion free from the undue influence of student demographics. We posit three example calculations of this Consequential Validity Ratio (CVR): one where the CVR is quite strong, another where the CVR is more moderate, and a third where the CVR is weak. We provide preliminary suggestions for interpreting the CVR, and discuss its utility in instances where new tests are being developed, tests are being adapted to a new population, or the fairness of an established test has become an empirical question.

Does assessors' expertise matter in comparative judgement of argumentative writing?
Keywords: Assessment Methods, Competencies, Quantitative Methods, Writing/Literacy
Presenting Author: Tine van Daal, University of Antwerp, Belgium; **Co-Author:**Marije Lesterhuis, UMC Utrecht, Netherlands

The role of the assessor is pivotal during comparative judgement of argumentative texts. This scoring method requires assessors to compare two texts and choose the best one. The outcomes of many comparative judgements are used to build a rank-order of texts. To make a comparative judgement, assessors must search for construct-relevant differences between the two texts, weigh this evidence, and choose the better text. Despite the claim that expertise is sufficient to make a valid comparative judgement, other studies have pointed out that comparative judgement can become difficult at times. Moreover, assessors are found to differ in their perception of difficulty and in the accuracy of their decisions. Although (lack of) expertise seems a plausible explanation for the latter findings, research on the impact of expertise in the context of comparative judgement of argumentative writing is currently lacking. Therefore, this study examined the impact of expertise on the perceived task difficulty and decision accuracy of comparative judgement. 15 experts and 15 non-experts comparatively judged the same batch of argumentative texts. Each assessor made seven judgements and rated the perceived difficulty of each judgement. The impact of expertise on perceived task difficulty and on decision accuracy was investigated using Bayesian generalized mixed-effect modeling. Results indicate that an expert perceives comparative judgement, on average, as less difficult than a non-expert. There are also indications of a positive impact of expertise on decision accuracy, but the evidence for this is inconclusive.

How can feedback support wellbeing? Suggestions from primary and secondary school teachers
Keywords: Assessment Methods, Feedback, Social Aspects of Learning and Teaching, Well-being
Presenting Author: Alessia Bevilacqua, University of Verona, Italy

A large amount of literature highlights the importance for a teacher to acquire feedback skills. Feedback practices allow for promoting learning by working not only through cognitive processes but also on the emotional dimension. This complex approach to feedback facilitates the promotion of both class and individual well-being of learners. While within Higher Education theories and practices regarding feedback have been widely developed, specific literature on feedback at primary and secondary school is lacking. This paper aims to present the results of a qualitative survey aimed at understanding how feedback practices can help promote well-being in primary and secondary schools. The feedback practices were collected through semi-structured interviews and analysed through inductive content analysis using the teacher and student feedback literacy models as a conceptual framework.Results highlight the feedback practices are aimed not only at promoting students' intrinsic motivation and self-esteem but also autonomy and awareness. In addition to feedback strategies that promote the active involvement of students, teachers pay close attention to the relational dimension of learning. However, these strategies are difficult to implement because the feedback culture is not yet widespread among teachers or students. Still dominating is the culture of grades, which does not promote well-being. Although the feedback literature and practices correlate with school and individual well-being, it is necessary to do more research on the specific role of emotions in feedback processes and focus attention on teachers' emotions so that they do not subconsciously influence the feedback processes.

Bidirectional links between educator-child relationship and children's regulation across preschool
Keywords: Assessment Methods, Quantitative Methods, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching
Presenting Author: Carolina Guedes, Faculty of Psychology and Educational Sciences, University of Porto, Porto, Portugal, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal

Previous studies have suggested that educator-child relationships influence children's regulation and interpersonal skills (Cadima et al., 2016; Jeon et al., 2021). Far fewer studies have examined how children's regulation skills in the classroom influence their relationship with their educators, with mixed evidence (McKinnon et al., 2018; McKinnon & Blair, 2019). The current longitudinal study aims to test the bidirectional interplay between educator-child relationships and children's regulation and interpersonal skills at ages 3 (T1) and 5 (T2). Participants were 89 Portuguese children (57% boys) with an average of 39.9 months (SD = 4.11) and their lead educators at T1 (n = 21) and T2 (n = 8). Relationships with target children were rated in three different domains: closeness, conflict, and dependency (STRS; Pianta, 2001) at each time point by the respective lead educators at that time. Educators also rated children's classroom behavior regulation and interpersonal skills at both time points with the CBRS (Bronson et al., 1990). Results showed that educator-child conflict and dependency at age 3 were negative predictors of children's interpersonal skills by age 5, controlling for child age and sex, previous interpersonal skills, and educator-child conflict and dependency. These findings add to the current discussion about the interplay between educator-child relationships and children's individual characteristics,

emphasizing the importance of relationships for children's interpersonal skills.

Developing Social Skills Universal Screeners for the Greek Elementary School
Keywords: Assessment Methods, Primary Education, Social Aspects of Learning and Teaching, Tool Development
Presenting Author: Lito Eleni Michalopoulou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Constantinos Vouyoukas, Aristotle University of Thessaloniki, Greece

In universal screening processes for socio-emotional and behavioral (SEB) difficulties teachers typically complete brief behavioral Likert-type scales for each of their students in the classroom to determine behavioral risk status. In the international literature, various universal screeners have been developed and validated for use in elementary school settings. Taking into account the positive outcomes of universal screening practices in schools and their role in prevention efforts, the purpose of the current study was to develop, pilot, and evaluate three brief social skills rating scales. First, based on the existing literature and expert input, the researchers developed three teacher-completed brief rating scales measuring different aspects of social skills (Communication Skills, Prosocial Skills, and Social Self-Regulation), an important factor associated with SEB difficulties. After the initial scale development, the scales were piloted in a sample of 154 upper elementary students and 34 teachers. Results from this initial pilot revealed that all three constructed social skills scales had good psychometric properties, that is adequate internal consistency and evidence of content and construct validity. Last, the scales' predictive utility was assessed in predicting students' language achievement. In our presentation, we showcase how these scales can be used as universal screeners within a multi-tiered system of support approach for both socio-emotional and learning outcomes. Moreover, we discuss how these scales could be used as part of an evaluation process to help educators design appropriate social skills interventions based on students' strengths and needs.

A cross-cultural examination of rapid guessing behavior in international large-scale assessments
Keywords: Achievement, Assessment Methods, Large-scale Assessment, Quantitative Methods
Presenting Author: Michalis Michaelides, University of Cyprus, Cyprus; **Co-Author:**Militsa Ivanova, University of Cyprus, Cyprus

When test-takers do not invest adequate effort in low-stakes assessments, test scores underestimate the individual's true ability, and ignoring the impact of test-taking effort may harm the validity of test outcomes. Using item response times, this study examined examinees' rapid guessing behavior and accuracy in the Programme for International Student Assessment (PISA) across countries and different item types. The 2015 PISA computerized assessment was administered in 59 jurisdictions. Behavioral measures of students' test-taking effort were constructed for the Mathematics and Reading assessments by applying a fixed and a normative threshold on item response times to identify rapid guessing. The proportion of rapid guessers on each item was found to be small on average, about 3%, according to the normative and 1% with a fixed five-second threshold. Rapid guessing was about twice as high in human-coded open-response items, compared to simple and complex multiple-choice items, and computer-scored open-response items. Average performance for rapid guessers was on average much lower than for test-takers engaged in solution behavior for all types of items and more pronounced in Reading than in Mathematics. Weighted response time effort indicators by country were very high, and positively correlated with country mean PISA score. When filtering out examinees who were identified as rapid guessers, country mean scores improved, however the impact on country rankings was in general minor, if any. Computerized assessment programs may monitor rapid guessing behavior to identify cross-country differences prior to comparisons of performance and for developing interventions to promote engagement with the assessment.

Gender, multisensory books, and LGBTQ-themed books in ECEC and school: A two-pronged scoping review
Keywords: Emotion and Affect, Gender Issues, Inclusive Education, Reading
Presenting Author: Radel James Gacumo, University of Stavanger, Norway

Inclusion is a relevant aspect of holistic education for children and youth. This is an encompassing notion that includes representation of diverse genders reflective of contemporary society. Gender has been narrowly represented in children's picturebooks. When children can connect and relate to the characters in the books they read, researchers found out that children are more likely to read, value the act of reading, and enjoy reading. In addition, researchers have documented that the strength of sensory memories are associated with potential value in children's experiences. The findings assert that sensory experiences are important to children in terms of meaningful recollection and activation of memories and experiences that impact children's development. Therefore, if the potential value of multisensory experiences activates memories and experiences impactful to children's development and LGBTQ-themed books allow the readers to experience "otherness" and the concept of diversity and inclusion, then it is timely to enquire how gender, multisensory books, and LGBTQ-books interplay with one another to enrich and improve the experiences of children and youth. The two-pronged scoping review aims to understand the overlap, the extent, and types of evidence that depicts notions of gender, gender diverse children's literature, and multisensory books, in ECEC and school contexts. To be included, the literature, which includes quantitative and qualitative study designs and grey literature, must involve children from 0 to 12 years old that report theories, projects, programs, policies, or interventions associated with the three notions that have been published digitally or in print.

Unraveling low-educated adults' motives for learning: a multidimensional perspective
Keywords: At-risk Students, Motivation, Qualitative Methods, Self-determination
Presenting Author: Bea Mertens, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium; **Co-Author:**Vincent Donche, University of Antwerp, Belgium

Adult secondary education (ASE) provides a second chance for adults who did not finalize secondary education, in order to prepare them for a lifelong learning trajectory. Although good-quality motivation is a pivotal component herein, participation rates in adult education among low-educated adults are low and dropout rates are high. As learning in adult education is voluntary, this study aims to gain a comprehensive understanding of motivational drivers of low-educated adults, and in doing so, to understand from a self-determination perspective both their motivation to participate in ASE and motivation to engage in learning every day. Semi-structured interviews were carried out with a purposive sample of high-level (n = 11) and low-level (n = 8) autonomously motivated ASE-learners. Both participation and learning motives were mapped by means of thematic analysis and subsequently deductively located on the self-determination continuum in order to capture the qualitative differences in motivational drivers for both types of motives. Multidimensional scaling and cluster analysis were used to explore the relationship between good- and poor-quality participation and learning motives and to identify homogeneous groups of respondents based on the their unique combination of both motivation types. This study not only adds to theorization by further unraveling the multilayered concept of motivation in adult education through a self-determination lens, but also contributes to educational practice by distinguishing between good- and poor-quality motivational profiles in this specific learning context.

Linguistic Complexity Analysis of English Bilingual Economics Materials from Germany
Keywords: Bilingual Education, Foreign and Second Language Acquisition, Quantitative Methods, Reading
Presenting Author: Luisa Scherzinger, University of Tübingen, Germany; **Co-Author:**Taiga Brahm, University of Tübingen, Germany; **Co-Author:**Detmar

Meurers, University of Tübingen, Germany

Due to globalisation, cooperation between companies and trade became increasingly international and English serves as lingua franca of global transaction processes. Accordingly, it is important to include intercultural and international topics in economic education and to foster students' language competences. Therefore, a bilingual implementation of economic education with English as additional language which enables the use of authentic task-based language teaching shows high potential for students' development of bilingual competences. For the idea of bilingual education to work, it is essential that the language in the textbooks satisfies two simultaneous demands, to be comprehensible to the target audience and to foster students' language development. In this work in progress, we therefore systematically analyse English bilingual economics materials in terms of their linguistic complexity and the language competence they require as expressed in terms of the Common European Framework of Reference for Languages. The materials include all existing English bilingual economics materials from German publishers (n = 25) ranging from textbooks to single lesson plans. We hypothesise that the language level of the materials is too difficult for the respective target group. If our hypothesis is confirmed, this would imply the necessity of a stronger focus on language (level) sensitivity for the development and selection of bilingual economics materials, which is highly relevant because German economic education faces a lack of teaching materials.

Comparative analysis of integrated and non-integrated education for prevocational students
Keywords: At-risk Students, Inclusive Education, Qualitative Methods, Teaching Approaches
Presenting Author: Charlotte Arnou, KU Leuven (BE), Belgium; **Co-Author:**Ingeborg Placklé, Vrije Universiteit Brussel, Belgium; **Co-Author:**Machteld Vandecandelaere, KU Leuven, Belgium

Challenged by the importance of basic literacy for all and teaching low achieving and struggling students, an evolving number of prevocational schools (grades 7-8) choose for integrated education. The underlying assumption is that integrated teaching facilitates transfer of competences and insights across disciplines and contexts. It enhances the chances on real life learning, which is engaging for students. Although integrated teaching is promoted by curriculum developers, teachers lack rationale for designing and implementing integrated teaching. This study aims to explore how integrated education is present in Flemish prevocational schools by comparing the integrated and non-integrated learning environments of 10 high and 10 low added value prevocational schools. The data is collected through videotaped classroom observations of 3 lessons of mathematics and 3 lessons of Dutch or 4 to 6 lessons of project integrated general subjects and semi-structured interviews with the teachers or teacher teams after the last lesson. In preparation of the observations, a random sample of school leaders, teacher leaders and teachers of 36 prevocational schools were interviewed. From these interviews, we can see that integrated education is shaped in different ways. Three approaches emerged from the interviews: thematic approach, project-based approach and the alternation of short-term project with periods of thematic lessons. The comparative analysis aims to provide a comprehensive and in-depth understanding of integrated education and its essential conditions and criteria.

Do 'eye' see it all? Visualizing gazing patterns in a VR to support classroom management development

Keywords: Eye Tracking, Higher Education, Immersive Technologies for Learning, Pre-service Teachers
Interest group: SIG 11 - Teaching and Teacher Education

Please bring your own device if you are attending this ICT demonstration.
Every day teachers make decisions on how to manage their classrooms. However, selecting and applying effective Classroom Management Strategies (CMS) is one of the foremost concerns for teachers, especially when learning is situated in a dynamic kindergarten classroom. Pre-service teachers (PSTs) experience difficulties in deciding between proactive (e.g., eye contact) and reactive (e.g., disciplining) CMS when addressing specific behaviors. We developed an interactive Virtual Reality (VR) kindergarten classroom where PSTs can safely experience a variety of (disruptive) behaviors and experiment with different CMS. We also developed an eye-tracking integration that enables real-time visualizations of PSTs' gazing patterns, making it possible to provide tailored (peer)feedback. Moreover, the eye-tracking integration gives insight into PSTs' (un)conscious perceptions of (disruptive) behaviors, and it could offer a more objective evaluation of the VR environment and over-time CMS development. Our demonstration is open to all who would like to know more about using eye-tracking supported VR for training complex professional competences. We will start with a project overview (including theoretical and educational background, aims, methods, and findings). Participants can then experience the VR-kindergarten classroom and the potential of the eye-tracking integrations themselves. We will showcase different aspects of our classroom management software (i.e., the instructor module and the virtual kindergarten itself) and focus on the added value of two different real-time gazing patterns visualization techniques. Then there will be theopportunity to ask questions, exchange experiences with eye-tracking-supported VR, reflect on dilemma's, and discuss possibilities for applying eye-tracking in VR to participants' own educational and/or research practices.

Virtual Reality and Theatre: Leveraging the Best of Both Worlds for Faculty Professional Development

Keywords: Higher Education, Immersive Technologies for Learning, Inclusive Education, Self-efficacy
Interest group: SIG 14 - Learning and Professional Development

Please bring your own device if you are attending this ICT demonstration.Our proposed ICT demonstration will showcase an innovative application of virtual reality (VR) that combines both artificial intelligence and human conversational intuition through an architecture called a “human in the loop.” The demonstration will involve two volunteers from the audience experiencing the simulation directly. The audience will be able to learn from the experience vicariously. The lead author will facilitate the conversation and show the utility of the tool in professional development specifically for advocating for more just, equitable, and inclusive academic workplaces. This tool has been used successfully with over 1,200 undergraduate and graduate students, and also faculty members in various university departments. The author will also present empirical results showing the development of learners’ self- and collective efficacy to create more just, equitable, and inclusive academic environments over a one-year period. Our demonstration and the presentation of the results of our intervention show a promising way forward in professional development specifically for diversity initiatives using an innovative application of VR. For educational theory, our tool also speaks to Bandura’s (1997) social cognitive theory, and how the four sources of efficacy beliefs can be leveraged and supported to help learners create a more just, equitable, and inclusive workplace climate.

Supporting Teamwork in Technology-Enhanced Adult Learning Contexts

Keywords: Computer-supported Collaborative Learning, Educational Technologies, Lifelong Learning, Problem Solving
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.In recent years, collaborative problem solving (CPS) has been gaining importance in research and policy related to adult learning. There is however a need for tools (a) to design efficient and qualitative CPS activities and (b) to monitor and assess the quality of CPS activities. Furthermore, there is currently a lack of training materials to foster CPS competencies in adults in professional contexts. Within our project focusing on supporting teamwork, we therefore developed a new CPS curriculum for adults, based on principles of productive failure, and a set of tools (e.g. dashboards, virtual moderator) to support the coach and the learner during CPS activities in general. Our research project was a collaboration with two research groups and four Flemish industry partners, funded by imec and the agency Flanders Innovation & Entrepreneurship. During the ICT demonstration, we will give an overview of the tools and the training materials that we designed within the project.

Supporting Teamwork in Technology-Enhanced Adult Learning Contexts
Presenting Author: Siem Buseyne, Faculty of Psychology and Educational Sciences, Centre for Instructional Psychology and Technology, KU Leuven Kulak, Belgium; Itec, imec research group at KU Leuven, Imec; CIREL, Centre Interuniversitaire de Recherche en Education de Lille, France, France; **Presenting Author:**Annelies Raes, KU Leuven, Belgium; **Co-Author:**Robin De Croon, Augment, Department of Computer Science at KU Leuven, Leuven, Belgium, Belgium; **Co-Author:**Fien Depaepe, KU Leuven, Belgium; **Co-Author:**Francisco Gutierrez Hernández, Augment, Department of Computer Science at KU Leuven, Leuven, Belgium, Belgium; **Co-Author:**Kamakshi Rajagopal, Faculty of Psychology and Educational Sciences, Centre for Instructional Psychology and Technology, KU Leuven Kulak, Kortrijk, Belgium; Itec, imec research group at KU Leuven, Imec, Leuven, Belgium, Belgium; **Co-Author:**Tim Van Lier, VRT Sandbox, Vlaamse Radio- en Televisieomroeporganisatie, Brussels, Belgium, Belgium; **Co-Author:**Stéphanie Vanneste, Itec, imec research group at KU Leuven, Imec, Leuven, Belgium, Belgium; **Co-Author:**Katrien Verbert, Augment, Department of Computer Science at KU Leuven, Leuven, Belgium, Belgium; **Co-Author:**Amelie Vrijdags, Hudson Belgium, Brussels, Belgium, Belgium; **Co-Author:**Ine Windey, KU Leuven, Belgium

Please bring your own device if you are attending this ICT demonstration.In recent years, collaborative problem solving (CPS) has been gaining importance in research and policy related to adult learning. There is however a need for tools (a) to design efficient and qualitative CPS activities and (b) to monitor and assess the quality of CPS activities. Furthermore, there is currently a lack of training materials to foster CPS competencies in adults in professional contexts. Within our project focusing on supporting teamwork, we therefore developed a new CPS curriculum for adults, based on principles of productive failure, and a set of tools (e.g. dashboards, virtual moderator) to support the coach and the learner during CPS activities in general. Our research project was a collaboration with two research groups and four Flemish industry partners, funded by imec and the agency Flanders Innovation & Entrepreneurship. During the ICT demonstration, we will give an overview of the tools and the training materials that we designed within the project.

Session L 1

Invited Symposium
Learning and Social Interaction, Teaching and Teacher Education

Creating spaces for children to meet uncertainty through play and playful learning

Keywords: Cognitive Skills and Processes, Competencies, Digital Literacy and Learning, Early Childhood Education, In-service Teachers, Learning Approaches, Peer Interaction, Primary Education, Qualitative Methods, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 28 - Play, Learning and Development
Chairperson: Valeska Grau Cardenas, Pontificia Universidad Católica de Chile, Chile
Discussant: Daniela Jadue Roa, Chile

Play behavior has been related to cognitive development, learning, creativity, and well-being. We are open to new possibilities, interact with others, and become more creative and lighthearted when we play. Therefore, including playful learning (PL) in education seems worthwhile.In educational terms, PL is a child-centered pedagogical approach that stimulates active learning through playful activities. Although early childhood educators tend to agree on the importance of play on children’s learning, this is often not reflected in their practice. Moreover, if we go beyond the early years, there is less agreement on the importance of play for learning. One of the issues relates to the facilitation of play. There isn’t much knowledge available on fostering learning through play at different ages or educational contexts, such as with a large classroom and diverse students. Likewise, the balance between structure and students’ autonomy tends to be a

common struggle among practitioners. The present symposium includes four studies from different parts of the world (Mexico, UK, Chile, and Denmark), including practitioners implementing learning through play at different educational stages, ranging from early childhood to adolescence. Despite the differences, they all dealt with common questions on the adequate type and amount of mediation and guidance provided to children, contextual issues related to implementation, and professional development needs. This collection of studies contributes to understanding the affordances and struggles embedded in implementing playful learning in different contexts across the globe.

Making Learning through Play Contextually Relevant and Effective: Case studies in Mexican ECE
Presenting Author: Dina Daniela Fajardo Tovar, University of Cambridge, UK, United Kingdom; **Co-Author:**Sara Baker, University of Cambridge, UK, United Kingdom

Learning through play (LtP) has gained momentum as a child-centred pedagogical approach that stimulates active learning through playful and developmentally appropriate activities (Parker & Thomsen, 2019). However, what does LtP in preschools imply for educators and their practice? Are educators supported by their context to extensively use LtP? The present study explores rural and urban Mexican educators' experiences of incorporating LtP in practice and the enablers and challenges they face to do so. In short, educators in both urban and rural preschools acknowledge the power of play. However, how they incorporate LtP in practice varies according to their attitudes, skills, knowledge, and other contextual factors. These findings shed light on how the context and its characteristics influence the understanding and practice of LtP in preschool. Furthermore, this study may inform future actions to support more LtP in Mexico and similar Latin-American contexts.

Sociodramatic Play as a learning tool: developing mediation skills in ECE through drama techniques
Presenting Author: Valeska Grau Cardenas, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Fernanda Rufs, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Belen Herrera, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Javiera Gonzalez, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Agustín Ramos, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Carolina Castro, Pontificia Universidad Católica de Chile, Chile

The study aimed to develop and evaluate a professional development program directed to early childhood educators (ECE) to promote SDP in their classrooms. Six classrooms and 18 ECE (3-4 years old) participated in this study. We collected 12 classroom videos (one before and one after the training in each classroom) and two focus groups with ECE. Two types of analysis were carried out with videos. We used the Mature play observation tool (MPOT) to assess sociodramatic play skills in children in the classroom context and a coding scheme constructed to allow the analysis of specific mediation behaviors concerning Play. Results show that ECE improved in several dimensions of both instruments. However, some dimensions did not show improvement, such as cognitive facilitation. Focus groups showed how ECE perceived the professional development programme as helpful for curriculum implementation and to motivate and encourage children to go to early childhood centers after a long period of confinement due to Covid-19. Theoretical and practical relevance for ECE professional development is discussed.

Teachers' views on implementing a playful approach to teaching writing skills
Presenting Author: Antonia Zachariou, Department of Psychology, Neapolis University Pafos, Cyprus / Faculty of Education, University of Cambridge, UK / Research Centre for Learning, Teaching and Human Development, School of Education, University of Roehampton, UK, Cyprus; **Co-Author:**Marisol Basilio, University of Cambridge, United Kingdom; **Co-Author:**David Whitebread, University of Cambridge, United Kingdom

The wider study set out to develop an intervention program with a playful approach to teaching narrative and writing skills. This paper aims to present the teacher's views regarding the intervention. Nine teachers in the UK implemented this guided-play intervention to teach writing skills with the use of LEGO building for an academic year. The teachers were interviewed upon completion of the intervention, through semi-structured interviews. The General Inductive Approach was employed in the analysis of the qualitative evaluation data collected through teachers' interviews. The results reveal the affordances and challenges of the intervention, changes in children's learning, and the intervention's impact on teachers' practice. Regarding the affordances of the intervention, the teachers talked about it enhancing motivation and engagement, creating a playful and relaxed environment, supporting self-regulation and metacognition, children receiving and providing feedback. As challenges, the teachers mentioned practical issues regarding time and space. Some elements of the teachers' responses came up as both affordances and challenges, such as providing choices to the children, collaborative work and skills. Regarding changes in children's learning, the teachers described that children's writing and collaborative skills improved and that the intervention enabled children's individual development in different aspects. Regarding the impact on teachers' practice, teachers' view of learning and teaching was transformed, as was their practice in other areas of the curriculum and their future practice.

Fostering student engagement and technology comprehension through playful teaching and learning
Presenting Author: Hanne Jensen, The LEGO Foundation, Denmark; **Co-Author:**Lisbet Baad Pedersen, University College South Denmark, Denmark; **Co-Author:**Stine Rauff Bommersholdt, Ramboll, Denmark

Abstract. Even before the pandemic, motivation and mental health have been declining among adolescents across Europe, with some links made to their use of social media and digital technologies. To explore solutions, staff and students at 12 schools were supported to experiment with playful learning with and about technologies. Early qualitative findings revealed higher engagement, a sense of flow and deeper learning among students. Staff noted needs for their role and guidance of students to change, balancing student agency and clear framing. Importantly, while more students actively participated in playful lessons, other student types struggled, especially those thriving with structure.

Session L 2

25 August 2023 08:00 - 09:30
AUTH_CH
Invited Symposium
Teaching and Teacher Education

To see the yet unseen – "critical aspects" as a key to developing teaching and students' learning

Keywords: Attitudes and Beliefs, Conceptual Change, Early Childhood Education, Instructional Design, Mathematics/Numeracy, Mindsets, Primary Education, Qualitative Methods, Reading, Synergies between Learning / Teaching and Research, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies, Writing/Literacy
Interest group: SIG 09 - Phenomenography and Variation Theory
Chairperson: Ann-Sofie Jägerskog, Stockholm University, Sweden
Discussant: Camilla Björklund, University of Gothenburg, Sweden

The aim of the symposium is to present and discuss the notion of "critical aspects" as a key concept for developing teaching and thus students' learning. The concept "critical aspects" is central to phenomenography and variation theory, pinpointing what aspects students need to discern in order to develop their understanding of the object of learning in focus for the teaching. In four different presentations, with a focus on different age groups and subjects, the notion of critical aspects is discussed. In the first presentation the authors discuss how critical aspects can be used by teachers in primary school as a point of departure in mathematics teaching – in tasks as well as activities. In the second presentation the authors discuss how teachers can help kindergarteners to discern critical aspects through reading a picture book. In the third presentation the author presents a study focusing on primary teachers' understanding of "growth mindset" and how critical aspects of this concept can be used as a foundation to inform teacher education. The final presentation discusses how teachers and teacher students understand the notion of critical aspects and what needs to be focused upon in teacher training in order for teachers/teacher students to grasp this concept in a qualified way. The symposium has scientific relevance as it opens up for different perspectives of a central concept in phenomenography and variation theory. It also has educational relevance, as the notion of critical aspects can be understood as foundational for developing teaching.

Critical aspects as a foundation for a teaching program for early arithmetic skills

Presenting Author: Angelika Kullberg, University of Gothenburg, Sweden; **Presenting Author:**Anna-Lena Ekdahl, Jönköping University, Sweden

In this paper we discuss the implementation of a one-year teaching program for six-year-old pupils' learning about numbers and addition and subtraction based on teachers' enactment of critical aspects. A goal with the program was that the pupils would learn to structure numbers up to 12 in part-whole relations, and by that develop sustainable strategies for solving addition and subtraction problems in long-term. The paper aims to illustrate how critical aspects were used to communicate what was considered necessary to be brought to the fore in teaching to develop the requested capability. We will show how critical aspects and patterns of variation were used by the teachers in tasks and activities as points of departure for teaching. An important part of the implementation of critical aspects was the iterative process of planning and analysis of video recorded teaching where the critical aspects was discussed. How the program and the critical aspects affected student learning are also shown. The findings have major implications for teaching arithmetic in early grades.

Identifying critical aspects of picture book reading for kindergarteners as hope in uncertain times
Presenting Author: Wai Ming Cheung, The University of Hong Kong, Hong Kong; **Co-Author:**Serene Chan, University of Hong Kong, Hong Kong

Discerning critical aspects in a lesson is a steppingstone to teaching and learning, and is possible even with young children in kindergarten. This presentation will discuss a Learning Study conducted in a kindergarten with a focus on critical aspects about transitioning to primary school. The lessons made use of a picture book called "What does a Primary One Student Do?" written by the first author. The picture book was specifically written to help children learn about life in primary school and be better prepared for the transition. Patterns of variation were already embedded in the sentences in the picture book. Two teachers and 15 children of 5-6 years old participated. After reading the picture book, the teachers helped the children learn key vocabulary about primary school life. Findings from the lesson observations showed that the children were able to discern the critical aspects through a pattern of variation and invariance presented by the teachers. The children could mention key actions done by primary students and they could also identify with characters in the picture book. This study shows the importance of helping young children discern critical aspects of the object of learning through variation in the learning process. This is a key to learning which provides hope in uncertain times of COVID-19 and the unknowns of transitioning to primary school.

Using critical aspects in social science: Teacher conceptions of growth mindset in primary school
Presenting Author: Will Zoppellini, Solent University Southampton, United Kingdom

Growth mindset is the belief that human qualities such as intelligence are malleable and can be improved with the use of learning strategies and effort (Dweck 2008). Previous research indicates that students who develop a growth mindset have higher levels of academic success and resilience (Yeager et al 2019; Paunesku et al 2015). The implementation of growth mindset into education has started to divide opinions amongst teachers and scholars globally, and teachers have begun to express different interpretations of the concept and how to develop it with children (Dweck & Yeager 2019). This study used a phenomenographic approach to examine primary school teachers' conceptions of growth mindset in England, and their related pedagogic approaches. Findings suggest that there are varying conceptions amongst teachers that informs their use of growth mindset in education. Within Phenomenography, critical aspects denote the key differences between conceptions that teachers need to discern to move from a less to more comprehensive way of understanding growth mindset. Within phenomenography research examining social science in teaching has been given less attention than the physical sciences. This presentation uses the findings from the current study to discuss examples of how critical aspects are created in social science research and identifying the issues involved in this process. Furthermore, the presentation includes considerations for turning the critical aspects of the research into teacher education.

Focal points for teaching the notion of critical aspects
Presenting Author: Malin Tväråna, Uppsala University, Sweden, Sweden; **Presenting Author:**Anja Thorsten, Department of Behavioural Sciences and Learning, Sweden

Variation Theory, and especially the concept "critical aspect", is a powerful tool for teachers when designing teaching. When teacher educators teach the notion of critical aspects to teachers/teacher students, their teaching will be improved if the educators know what learners need to discern to understand and use the notion of critical aspects as a pedagogical tool. In this study this is explored by using phenomenography to analyse written material from teachers undergoing an introduction to Variation Theory. The study identifies five qualitatively different conceptions of the notion of critical aspects. By comparing the differences between these conceptions, four aspects were identified that address what the teachers need to discern to perceive the notion of 'critical aspects' in the targeted way. The teachers need to discern that critical aspects address a) the subject content, b) students' understanding, c) different aspects of the object of learning and d) focus in teaching.

Session L 3

Symposium
Cognitive Science

Executive functions in science and mathematics: From cognitive neuroscience to applied research

Keywords: Cognitive Skills and Processes, Educational Neuroscience, Mathematics/Numeracy, Primary Education, Reasoning, Science Education
Interest group: SIG 22 - Neuroscience and Education
Chairperson: Reuven Babai, Tel Aviv University, Israel
Organiser: Reuven Babai, Tel Aviv University, Israel
Organiser: Roland Grabner, University of Graz, Austria
Discussant: Iro Xenidou-Dervou, Loughborough University, United Kingdom

The symposium focuses on executive functions form different viewpoints. Our aim is to combine knowledge obtained by basic research studies in the domains of psychology, neuroscience and neuroeducation, with practical suggestions and education implications obtained mainly by applied research in education. The symposium presentations will relate to executive functions in science and mathematics and to different age groups. The first presentation will relate to the COVID effect on the development of children's math and executive-functioning skills in early ages. The next presentation will relate to domain-specific and domain-general correlates related to conceptual change in mathematics. Another presentation will address the involvement of executive functions in scientific reasoning and shed more light on the variables that may influence the use of and need for such inhibitory control and the potential implications of these findings. The last presentation will describe a general intervention program, aimed at activating students' executive functions, based on recent neuroeducation studies. This presentation will illustrate the effect of such intervention on junior high school students' achievement in science. Overall, the symposium is aimed at bridging basic research findings from studies carried out in recent years and practical educational implications.

Effect of COVID related school closure on kindergarten's math and executive functioning development
Presenting Author: Kerry Lee, The Education University of Hong Kong, Hong Kong; **Co-Author:**Jin Sun, The Education University of Hong Kong, Hong Kong; **Co-Author:**Sum Kwing Cheung, The Education University of Hong Kong, Hong Kong; **Co-Author:**Alfredo Bautista, The Education University of Hong Kong, Hong Kong

The COVID pandemic has resulted in unprecedented disruption to children's schooling worldwide. Hong Kong had prolonged school closures from early 2020 to the first half of 2021. This closure hit the preschool sector particularly hard with teachers scrambling to assemble online teaching material for children who were stuck at home with their caregivers. This study presents data from a naturalistic experiment in which we compared the development of children's math and executive-functioning skills across two cohorts (N = 234, Mage = 53.57 months). Pretest data from the first cohort were collected just before the pandemic while they were in the second year of kindergarten (K2). Posttest was conducted one-year later together with pretest from the second cohort who were also in K2. The latter was administered the posttest one year later. Preliminary analyses showed no differences in executive functioning between the two cohorts either at pretest or posttest. Unexpectedly, children in the second cohort performed better than the first cohort on the math measures even though they had missed the

first year of kindergarten. These differences no longer attained significance at posttest. The importance of home based activities for children's early numearcy development is discussed.

Domain-specific and domain-general correlates of the conceptual interference effect in mathematics
Presenting Author: Roland Grabner, University of Graz, Austria; **Co-Author:**Tim Hohensinn, University of Graz, Austria; **Co-Author:**Katharina Longitsch, University of Graz, Austria; **Co-Author:**Simon Riedl, University of Graz, Austria; **Co-Author:**Johannes Woschizka, University of Graz, Austria; **Co-Author:**Stephan Vogel, University of Graz, Austria

In research on conceptual change, there is increasing evidence that scientific theories do not replace learners' naïve theories but co-exist with them in memory. This has been demonstrated using speeded-reasoning tasks in which participants showed worse performance in evaluating science statements whose truth value differed between naïve and scientific theories (incongruent) compared to those with the same truth value (congruent). This conceptual interference effect (CIE) has been attributed to a cognitive conflict in incongruent statements whose solution requires the active inhibition of the naïve theory. However, the individual strength of the CIE has not been found to be correlated with interference effects in executive function tasks drawing on inhibition, raising the question whether such an association emerges with domain-specific and process-related inhibition tasks. In addition, little is known about associations of the CIE with domain-general and domain-specific ability measures. We investigated these questions using a speeded reasoning task in mathematics. Results from 80 adults revealed strong correlations of the CIE with mathematical competencies and moderate ones with working memory tasks, but null correlations with interference effects from three numerical inhibition tasks. These findings demonstrate the ecological validity of the CIE regarding domain-specific, and to a smaller extent domain-general, abilities, and provide first evidence that domain-specific inhibitory control measures are unrelated to the CIE. This adds further evidence to the open question of the actual type of inhibition (or other executive function) processes in overcoming naïve theories.

Overcoming misconceptions in scientific domains requires inhibitory control: overview and next steps
Presenting Author: Genevieve Allaire-Duquette, Université de Sherbrooke, Canada; **Co-Author:**Lorie-Marlène Brault Foisy, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Patrice Potvin, Université du Québec à Montréal, Canada

An extensive research literature reveals that students hold misconceptions about various phenomena. These misconceptions are important to consider, since they interfere with the learning of scientific concepts and can therefore make formal instruction less efficient. An example of such common misconception could be to believe that bigger or heavier objects sink more, which constitutes an obstacle in learning buoyancy. Furthermore, it has been shown that those misconceptions do not only interfere during learning; they also persist after being given formal instruction and thus make it hard to foster conceptual change. In the last decade, a growing number of studies have suggested that inhibitory control mechanisms would play an important role in science learning, for many scientific domains. Inhibitory control would indeed allow to resist misconceptions in order to select and reason according to the scientific concept, when the situation requires it. Moreover, several tools have been used to detect the mobilization of inhibitory control in the context of scientific reasoning, such as functional magnetic resonance imaging (fMRI), electroencephalography (EEG) and reaction times. The aim of this presentation is twofold: 1- provide an overview of the most recent evidence regarding the involvement of inhibitory control in scientific reasoning and 2- present the initial results of a research project investigating the variables that may influence the use of and need for inhibitory control in science. The potential implications of these results for science education will also be discussed during the presentation as well as future directions of research.

Intuitive interference intervention improves junior high school students' achievement in chemistry
Presenting Author: Reuven Babai, Tel Aviv University, Israel; **Co-Author:**Najla Madback, Tel Aviv University, Israel

Students encounter many difficulties in science and mathematics, some of which are thought to stem from intuitive interference. Such mistakes are influenced by salient irrelevant variables of the task, as in the comparison of perimeter task. This task was studied by cognitive neuroscience methodologies. Accuracy, reaction time, and neural correlates (by fMRI) were measured, while participants compared perimeters in congruent and incongruent conditions. It was found that in the incongruent condition accuracy drops and reaction time is longer. In addition, prefrontal brain regions were activated when answering the incongruent condition correctly, suggesting that inhibitory control mechanisms are activated in order to overcome the interference. An intervention study indicated that giving a warning regarding the irrelevant salient variable increases success rate in incongruent trials and increases reaction time, indicating that students' executive functions were activated by this intervention.The present study examined whether a general intuitive interference intervention would improve junior high school students' achievements in chemistry. Eighty-five eighth and ninth graders were divided into two groups, control and intervention. Students in the intervention group participated in a one-session workshop (90 min) on intuitive reasoning aimed at activating their executive functions. This intervention was inspired by neuro-education studies that suggested that students' awareness of brain activity might influence their thinking patterns. The intervention group outperformed the control group in the posttest science exam, while no difference was observed between the groups in the pretest science exam. Implications of this study will be discussed.

Session L 4

25 August 2023 08:00 - 09:30

Symposium
Instructional Design, Learning and Instructional Technology

Put your hands on the task! The use of finger pointing and tracing to support multimedia learning

Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Educational Technologies, Example-based Learning, Eye Tracking, Instructional Design, Learning Strategies, Meta-analysis, Multimedia Learning, Teaching/Instructional Strategies
Interest group: SIG 02 - Comprehension of Text and Graphics, SIG 06 - Instructional Design, SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Björn de Koning, Erasmus University Rotterdam, Netherlands
Organiser: Shirong Zhang, Netherlands
Organiser: Björn de Koning, Erasmus University Rotterdam, Netherlands
Discussant: Cris Castro, University of Birmingham, United Kingdom

Multimedia learning combines different types of media including text, pictures, video, and sound, enabling a rich and sensory learning experience. In the past decades an enormous amount of research has investigated how to best make use of the visual and auditory modalities during multimedia learning, which has resulted in numerous instructional design principles for effective multimedia learning. This symposium joins a relatively recent and emerging focus in multimedia learning research, namely the involvement of the motor system to foster learning. There is increasing awareness that human movements, particularly hand movements such as gestures, are not just an output of thinking but can also support learners' cognitive processing, thus increasing learning.
All contributions in this symposium investigate the use of hand movements, specifically finger pointing and/or tracing, to support multimedia learning. Three empirical studies investigated pointing (contribution 1), pointing combined with tracing (contribution 2), and a direct comparison between pointing and tracing (contribution3). The contributions cover a variety of paper-based and computer-based learning tasks. Product-oriented measures (learning outcomes and cognitive load) were supplemented with process-oriented measures (eye-tracking/gaze behavior) in two studies enabling insights into underlying mechanisms. Deeper insights are also provided by a meta-analysis about pointing and tracing (contribution 4). A joint discussion will be stimulated by a highly-productive scholar in educational psychology with extensive expertise about human movement in learning. Expected outcomes of the symposium are a better understanding of the effectiveness of pointing and tracing in multimedia learning, the (im)possibilities regarding practical use, and informing design of future studies.

Mouse Pointing to Support Learning From Labeled and Unlabeled Split-Attention Materials
Presenting Author: Shirong Zhang, Delft Univeristy of Technology, Netherlands; **Co-Author:**Björn de Koning, Erasmus University Rotterdam, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam, Netherlands

We investigated the effects of mouse pointing as a strategy performed by learners to support learning from online labeled and unlabeled split-attention materials, in which the mutually referring but spatially separated text and picture needed to be linked. Eye tracking was used to uncover how mouse pointing and labeling affected the learning process. One hundred thirty-two university students were randomly assigned to one of four conditions that resulted from a 2 (Mouse Pointing Instruction: yes vs. no) × 2 (Labeling: yes vs. no) between-subjects design. Participants studied a text and picture about the human nervous system in a split-attention format and after that learning outcomes (i.e., retention, comprehension) and cognitive load were measured. Eye movements indices comprised fixations on the text and picture and transitions between the text and picture during learning. Results showed that neither mouse pointing nor labeling had a significant impact on learning outcomes and cognitive load ratings. However, there was an interaction between mouse pointing and labeling on comprehension test performance, indicating that participants using mouse pointing with labeled materials performed worse than those who used mouse pointing with unlabeled materials. Eye tracking results revealed that both mouse pointing and labeling led to shorter fixation duration and a lower number of fixations on the text and more transitions between text and picture. Labeling led to longer fixation duration and more fixations on the picture. Together, these results suggested that mouse pointing and labeling influence perceptual but not cognitive processing in learning from split-attention materials.

To Trace or Not to Trace: Mimicry in Timed Multimedia Lessons with Pointing and Tracing
Presenting Author: Stoo Sepp, University of New England, Australia, Australia; **Co-Author:**Shirley Agostinho, University of Wollongong, Australia; **Co-Author:**Sharon Tindall-Ford, University of Wollongong, Australia; **Co-Author:**Fred Paas, Erasmus University Rotterdam, Netherlands

Performing hand gestures such as pointing and tracing while learning is an area of increasing focus in educational research. Previous studies have found that when participants performed these gestures while engaging with learning materials on paper or computer screens, they performed better on posttests in multiple learning areas, including health sciences, mathematics, and language learning. In this study, the effects of mimicking pointing and tracing gestures while learning in a guided (timed) multimedia lesson on an iPad were investigated. Participants were asked to perform or mimic pointing and tracing gestures while engaging with timed video lessons presenting worked-examples in geometry. Results showed that participants who performed pointing and tracing gestures achieved lower test scores than those who did not, suggesting that these gestures may not have the same positive effect when compared with learning with materials such as paper worksheets. On top of the auditory and visual information presented, the addition of hand gestures may require more cognitive resources to manage, leading to lower test scores. More research is needed into the complex cognitive processes involved in physically engaging with multimedia learning materials, as well as the role that individual differences may play in such learning environments.

Tracing or Pointing? An eye-tracking study on how learners benefit from using the hands for learning
Presenting Author: Roland Bruenken, Saarland University, Germany; **Co-Author:**Babette Park, University of Education Freiburg, Germany, Germany; **Co-Author:**Andreas Korbach, Saarland University, Germany; **Co-Author:**Paul Ginns, The University of Sydney, Australia

The present study uses eye-tracking in order to test whether learners benefit from pure pointing compared to learners using tracing or no tactile method (pointing vs. tracing vs. no touch). The results replicate previous findings demonstrating benefits of tracing while learning, and provide additional support for the hypothesis that fingers support learning by directing attention. This is due to the fact that the learning group using pure pointing outperformed, especially in comprehension performance, the no-touch learning group and the learning group that used tracing gestures. Eye-movement analysis indicated the pure pointing group profited from a higher focus of visual attention and more intense cognitive activity. The question of why the tracing group did not show this same benefit is discussed by considering previous studies and the limitations of the present study. It seems as if the present study does not replicate a previous study. However, when reflecting on the different control group design, the present study delivers additional information on how using fingers affects learning. Finally, resulting research questions are derived from the present study for further research on gesturing in the frame of embodied cognition.

Multimedia learning through tracing and pointing: A meta-analysis
Presenting Author: Paul Ginns, The University of Sydney, Australia

Cognitive load theory's evolutionary foundations hold that biologically primary knowledge based in the body can be harnessed to support learning complex, biologically secondary topics. This theorising has informed experimental research on effects of advising students to "use your hands to help you learn", including making pointing and tracing actions against the surface of lesson materials with the index finger while studying. The present study meta-analyses findings from both published and unpublished experimental studies using the same pre-lesson instructions to "use your hands to help you learn". Correlation matrices from eight studies ($N = 321$) were synthesised to estimate average correlations between key variables, including prior knowledge, instructions to point and trace (as an independent variable), intrinsic cognitive load, extraneous cognitive load, and post-lesson test scores (Knowledge of specifics, and Comprehension). Instructions to point and trace resulted in lower self-reported intrinsic and extraneous load, with a more substantial average effect on extraneous load. Instructions to point and trace also resulted in higher performance on post-lesson test scores. Moderator analysis focusing on post-lesson test scores indicated studies allowing students to self-pace their study across specific lesson pages generated larger effects than those where student progress was system-paced. In addition, studies using process measures such as eye-tracking and secondary tasks generated smaller effects than studies that did not use such measures. The study's findings stand to inform design of future investigations, and broadly support the use of pre-lesson advice to make pointing and tracing actions while studying as a simple, zero-cost learning strategy.

Symposium
Cognitive Science

Analogy supports individuals in harnessing the uncertain

Keywords: Anxiety and Stress, Cognitive Development, Cognitive Skills and Processes, Early Childhood Education, Educational Neuroscience, Example-based Learning, Mathematics/Numeracy, Primary Education, Problem Solving
Interest group: SIG 05 - Learning and Development in Early Childhood, SIG 18 - Educational Effectiveness and Improvement
Chairperson: Katarzyna Bobrowicz, University of Luxembourg, FLSHASE, Luxembourg
Organiser: Jean-Pierre Thibaut, Université de Bourgogne / Lead - CNRS, France
Discussant: Anke Maria Weber, University of Luxembourg, Luxembourg

Nothing happens twice, at least in precisely the same way. However, analogical situations happen all the time and the ability to identify, map and apply relational structures shared by such situations allows individuals to harness the all-pervading, everyday uncertainty. This makes analogy central to education as a means of boosting students' acquisition and generalization of knowledge and skills, supporting them in solving never-seen situations, and participating in the democratic society. In this symposium, we showcase our research on analogical thinking, reasoning and transfer in preschoolers and primary school students to show why analogy should take centre stage in early childhood and primary education. The symposium will begin with a focus on early childhood and the key ability of disregarding irrelevant information in successful analogy-making. Paper 1, authored by [Blinded], will discuss mechanisms behind early analogy-making, and inhibiting attention to irrelevant information. Paper 2, by [Blinded], will report on an ongoing study wherein preschoolers are tasked with disregarding irrelevant, distracting or misleading, information. Paper 3, by [Blinded], will discuss whether 6-year-olds were sensitive to the quality of analogical explanations, and, finally, Paper 4, by [Blinded], will highlight the importance of analogies in pedagogical practice stimulating higher-order thinking in primary school children. The contributors will be joined by [Blinded], serving as a Discussant. Despite the multi-decade interest in analogy, its mechanisms, function and role in the educational context remains understudied. With this symposium, we hope to jointly discuss our research under the theme of EARLI 2023.

Children and Adults Adapt their Search Strategy to Analogy Task Requirement. An Eyetracking Approach
Presenting Author: Jean-Pierre Thibaut, Université de Bourgogne / Lead - CNRS, France

Analogical reasoning is a common comparison situation in daily life, when adults or children compare and align different semantic domains. According to most

models (Gentner & Forbus, 2011), successful analogical reasoning requires comparisons within and between the conceptual domains in order to uncover shared relations. We compare children's and adults' search strategies underlying analogical mapping with eye-tracking data. We compared two analogy formats and tested whether children follow the same strategies across analogy formats. We compared six-year-old children and adults in scene analogies (finding an item playing the same role in two semantic scenes) and a classical A is to B what C is to … D? format. We hypothesized (1) both groups would first explore the Base then the Target domain (2) that adults would be more focused on the A-B pair in early moments in both conditions, (3) that children would have more gazes at the distractors. Results showed that children and adults followed the same strategy (H1): first exploring the base domain (A&B), later the target domain. H2 and H3 were also confirmed: children were less focused on the Base domain than adults at the beginning and had more gazes or more transitions towards distractors than adults. We confront these results to existing models of analogical reasoning and interpret differences between children and adults in terms of control processes (EF) (e.g. difficulties to inhibit distractors) rather than in terms of a lack of knowledge.

Distracted and Misled, Yet Capable of Transfer: Analogical Transfer in 2.5- to 5.5-Year-Olds
Presenting Author: Katarzyna Bobrowicz, University of Luxembourg, FLSHASE, Luxembourg; **Co-Author:**Anke Maria Weber, University of Luxembourg, Luxembourg; **Co-Author:**Angélica Mendes, University of Luxembourg, Faculty of Language and Literature, Humanities, Arts and Educational Sciences (FLSHASE), Luxembourg; **Co-Author:**Alicja Jamroga, University of Luxembourg, Faculty of Language and Literature, Humanities, Arts and Educational Sciences (FLSHASE), Luxembourg; **Co-Author:**Samuel Greiff, University of Luxembourg, Faculty of Language and Literature, Humanities, Arts and Educational Sciences (FLSHASE), Luxembourg

Analogical transfer, the ability to generalize a solution onto a seemingly different but functionally similar problem, has the potential to boost individual learning beyond similar-looking situations. However, analogical transfer also involves another ability that is key for efficient learning and may be supported early in education: the ability to disregard irrelevant information in favour of relevant information. Supporting this ability in early childhood education has implications not only for learning but also well-informed participation in the democratic society, which heavily relies on evaluating arguments in terms of their relevance for a given subject. To date, analogical transfer was repeatedly investigated in young children, but their ability to prioritise truly relevant over irrelevant, distracting or misleading, information remains understudied. Therefore, in this study, we tested whether children between 2.5 and 5.5 years (N = 41, ongoing) could transfer relevant information despite irrelevant, distracting or misleading, information. Children participated in a play session at day-care facilities, where they attempted to transfer relevant tool-use knowledge across two analogical problems despite a distracting or a misleading problem solved in between. Preliminary results suggested that children younger than 40 months were not capable of disregarding either type of irrelevant information, and the likelihood of disregarding both distracting and misleading information was the highest in 4.5- to 5.5-year-olds. The data collection is ongoing, and, as measures of world knowledge and executive functions are gathered alongside performance on analogical transfer, the study may inform future interventions focused on relevant cognitive capacities beyond child's age.

Explaining with Spontaneous Analogies
Presenting Author: Yang Gao, Tsinghua University, China; **Co-Author:**Kexing Que, Tsinghua Laboratory of Brain and Intelligence, Tsinghua University, China; **Co-Author:**Stella Christie, Department of Psychology, Tsinghua Laboratory of Brain and Intelligence, Tsinghua University, China

Analogy plays a prominent role in classroom learning, but little is known on how analogy is spontaneously generated. Here we fill this critical gap by gathering parents' answers to children's real questions, to examine whether and how parents spontaneously use analogy. Study 1 found that parents did use analogy spontaneously in their explanations to children's questions, despite no prompts nor mentions of analogy. But are these spontaneous analogies any good? Study 2 asked how the common explanation givers (teachers and parents) and explanation receivers (university students) perceived the goodness of analogical explanations. Teachers, parents, and university students alike gave higher satisfaction ratings to analogical explanations than to non-analogical ones. Notably, school teachers are the strictest raters, as they give low ratings overall, while college students are the most generous raters. In Study 3, six-year-olds, unlike their parents, did not rate analogical explanations higher than non-analogical ones. But this is because children were actually sensitive to the quality of analogical explanations—distinguishing between good and bad analogies—while they were not discriminative to the non-analogical explanations (all were highly rated). These results provide new evidence for spontaneous analogy generation and characterize how people (teachers, parents, university students, young children) perceive analogies, with potential implications for instructional settings.

Supporting Students' Mathematical and Analogical Thinking while Under Stress
Presenting Author: Lindsey Richland, University of California, Irvine, United States; **Co-Author:**Almaz Mesghina, Northwestern University, United States; **Co-Author:**Elayne Vollman, Lake Forest College, United States; **Co-Author:**Bella Lerner, University of California, Irvine, United States

Mathematics is a domain in which reasoning analogically about the relationships between problems, procedures, solution strategies, or concepts can help the learner generalize concepts and solve new problems. At the same time, learning through comparing and aligning representations is a cognitively complex endeavor, and requires high cognitive resource availability. In times of stress such as the Covid-19 pandemic, or when students experience high math anxiety, these resources may be already taxed with anxious ideation, which may mean students will have less available resources to conduct higher order thinking about the mathematics. To successfully learn from a comparison between mathematical representations, students must not only notice the relevance of the comparison, but also manipulate and compare a source analog (e.g. a worked example) to a target analog (e.g. transfer problem), evaluate a multi-step solution strategy and map the relevant sequence across the representations (see [Blinded], 2017). We report a series of studies that examined the strategic use of worked examples as visual-spatial cues, and the role of teacher language of higher order thinking (HOT) and to support the reasoning process. We find these are pedagogical practices that can increase the likelihood that children engage in successful higher order thinking during learning, protecting against the effects of math anxiety and situational stress on learning.

Motivational, Social and Affective Processes

The phenomenon of school alienation under the magnifying glass

Keywords: At-risk Students, Emotion and Affect, Mixed-method Research, Motivation, Pandemic, Qualitative Methods, School Effectiveness, Secondary Education, Social Aspects of Learning and Teaching, Teaching/Instructional Strategies
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Julia Morinaj, University of Bern, Switzerland
Chairperson: Tina Hascher, Switzerland
Organiser: Julia Morinaj, University of Bern, Switzerland
Organiser: Tina Hascher, Switzerland
Discussant: Barbara Schober, University of Vienna, Austria

As students progress in grade level, they tend to lose intrinsic motivation and interest in learning and might become alienated from school. Following a recent conceptualization, s*chool alienation* is understood in terms of negative attitudes towards academic and social aspects of schooling that develop over time. Alienated adolescents display decreasing classroom participation, higher levels of perceived injustice, low well-being, declining achievement, school refusal, and higher drop-out rates. Repeated and accumulated negative experiences in school can affect students' educational trajectories and result in alienation from the whole education system.This symposium contributes to the conference theme 'Education as a hope in uncertain times' in providing a common perspective on and a deeper understanding of the phenomenon of school alienation. The first presentation examines the relationship between school alienation and student perception of teacher injustice among Swiss primary and secondary school students. The second presentation identifies factors associated with school

alienation during the transition from lower to upper secondary school in Austria. The third presentation centres on the development of school alienation in lower secondary school in Luxembourg. The fourth presentation explains the development of school refusal using school alienation theory and a systemic integrated cognitive approach. The four studies capture students' attitudes and emotions towards school from primary to upper secondary school and invite a discussion on how school alienation differs between educational systems. Understanding school alienation may contribute to an understanding of the vulnerability of students and knowledge about possibilities in preventing school alienation, especially during the times of uncertainty.

Teacher Justice Perception and School Alienation in Swiss Primary and Secondary Schools
Presenting Author: Julia Morinaj, University of Bern, Switzerland; **Presenting Author:**Angela Rebecca Aegerter, University of Bern, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland

Student perception of teacher behavior can affect student motivation, well-being, and attitudes toward school. More specifically, student perception of teacher injustice can impede well-being and may be correlated with student alienation from school. The aim of the present longitudinal, mixed-method study was to examine the development of student perception of teacher injustice and its association with school alienation. First, questionnaires were administered to n = 564 primary school students during grade 4 to 6 and n = 610 secondary school students during grade 7 to 9. Second,n = 69 sixth graders and n = 65 seventh graders participated in group discussions about subjective causes and experiences of school alienation. Cross-lagged modeling was applied to examine the correlations between teacher injustice perception and three school alienation domains (alienation from learning, from teachers, from peers) at each of the three time points, the temporal stability of teacher injustice perception and school alienation domains, and their cross-lagged effects across time. Results showed that the pattern of relationship varies across school alienation domains and the educational stage, pointing to the complex interplay between student perception of teacher injustice and their alienation from school. Findings from the qualitative analyses of the group discussions indicated that teacher injustice is perceived as related to violations of the principle of equal treatment of all students. This concerns mainly classroom management, assessment, disciplinary measures, and the quality and quantity of learning opportunities. The findings highlight the importance of just and supportive teachers in preventing students' alienation from school.

The risk of school alienation after transition to upper secondary school in Austria
Presenting Author: Claudia Schreiner, University of Innsbruck, Austria; **Co-Author:**Fred Berger, University of Innsbruck, Department of Education, Austria; **Co-Author:**Livia Jesacher-Rössler, Friedrich-Alexander-University Erlangen-Nürnberg, Germany; **Co-Author:**Christian Kraler, Teacher Education and School Research, Austria; **Co-Author:**Wolfgang Hagleitner, University of Innsbruck, Department of Education, Austria; **Co-Author:**Susanne Roßnagl, University of Innsbruck, Department of Education, Austria

School alienation is a risk factor for unsuccessful school careers. Teachers and the shaping of learning processes play a pivotal role in avoiding developments toward such alienation processes. This presentation focuses on the discussion of alienation taking especially into account two perspectives: the transition to upper secondary education, a general phase of uncertainty, and the situation created by the COVID-19 pandemic. The latter can be seen as a looking glass for existing challenges. Regression models based on data from a longitudinal study (t1: Grade 8; t2: Grade 9; N = 144 students) were used to identify factors associated with alienation from learning and from teachers. In addition to structural and sociodemographic variables, measures on students' personal resources, school-related factors, and effects of the pandemic were included. The results point to teachers' diagnostic expertise regarding achievement and social integration in class as support factors to reduce the risk of alienation. Alienation from learning is higher in school tracks which lead to a lower level of formal qualification. Alienation from teachers is associated with lower parental formal education. While coping with the demands of the pandemic is related with alienation from teachers, there are no effects on alienation from learning. Regarding students' personal resources, only learning motivation had an effect on alienation from learning. The analyses show that students with certain tracks to upper secondary education have higher tendencies for alienation, particularly alienation from learning. For teachers, their level of diagnostic expertise regarding achievement contributes to reducing the risk of school alienation.

Conditions for and expressions of alienation from learning in secondary school
Presenting Author: Alyssa Laureen Grecu, Center for Research on Education and School Development, Germany

Alienation from learning determines students' educational trajectories and life course and is associated with educational inequalities. This contribution examines the conditions of the development of alienation from learning and its expressions in lower secondary school using Luxembourg as an example. Using a qualitative approach, five cases of affected students from high and low-achieving school tracks (seventh graders) are analyzed based on interviews and group discussions. As alienation from learning is closely related with a lack of fit between students' individual dispositions and the specific school culture (Helsper, 2008; Kramer & Helsper, 2011), differences between school tracks considering causes and the handling of alienation from learning are identified. Results indicate that alienation from learning is relevant in both academic and low-achieving school tracks, but the specific school cultures constitute different risks for developing alienation from learning. Common expressions in both school tracks comprise both passive and oppositional behaviors. Aspects that enhance alienation from learning in the academic school track are highly theoretical learning content, students' perceptions of likelihood realizing educational promises, overstrain and pressure to perform. In contrast in the preparatory track, aspects that enhance alienation from learning comprise underchallenge, rejection by teachers and disruptive behaviors of classmates.

CANCELLED: Applying school alienation theory and (...)
Presenting Author: Trude Havik, University of Stavanger, Norway

This paper has been cancelled and will not be presented at the EARLI conference.
Attending school is seen as a precondition for youths' academic, social, and emotional learning. However, school absenteeism is a problem in many countries (e.g., Gren-Landell et al., 2015; Heyne et al., 2019a, 2019b). Moreover, there are different types of absences and a myriad of risk- and maintaining factors. One type is school refusal, which is absence related to strong negative emotions while at school or prior to school. The aim of this presentation is to explain how school refusal might emerge and develop, by using two theoretical perspectives: the school alienation theory and a systemic integrated cognitive approach. By using these two theories, identification and interventions might be targeted at an early stage of the development process of school refusal.

Symposium

Understanding and combatting gender differences in student motivational factors in STEM

Keywords: Achievement, Gender Issues, Gifted and Talented Students, Informal Learning, Interest, Mathematics/Numeracy, Meta-analysis, Motivation, Science and STEM
Interest group:
Chairperson: Kaley Lesperance, Technical University of Munich, Germany
Organiser: Kaley Lesperance, Technical University of Munich, Germany
Discussant: Christian Thurn, ETH Zurich, Switzerland

Gender differences in educational contexts are often most prominent in student motivational outcomes, such as interest, self-efficacy, or value beliefs. This can clearly be seen in STEM subjects. In subjects such as science, mathematics and technology, female students in primary and secondary school consistently display lower levels of motivational outcomes than males, even when their performance is almost equal. This is problematic, as these outcomes impact later academic and career choices, which partly explains why many countries have less women in STEM careers than men. This symposium examines two aspects of motivational-affective gender differences in STEM: (1) are there differences in the gender gap across subjects and countries and (2) what can be done to combat them? The first two studies address the development and manifestation of these differences: Study 1 examines gender differences in the development

of students' motivational profiles in math, science and language between 5th and 6th grade, whereas Study 2 uses meta-analytic techniques to examine gender differences in math and science motivation of gifted adolescent students. The final two studies explore potential ideas to combat these differences: Study 3 examines whether teacher support has an effect on gender differences in interest, self-concept and self-efficacy in secondary school mathematics, whereas Study 4 evaluates whether exposure to females working in STEM careers could help reduce gender differences in children's interest and stereotypes in engineering and technology. The multi-facetted nature of this symposium will allow participants to generate valuable discussion relevant to both educational researchers and practitioners alike.

Gender difference in motivation profiles, achievement and STEM aspiration of primary school students
Presenting Author: Kezia Olive, University of Helsinki, Finland; **Co-Author:**Xin Tang, University of Helsinki, Finland; **Co-Author:**Anni Loukomies, University of Helsinki, Finland; **Co-Author:**Kalle Juuti, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

To better understand the development of gender gap in science, technology, engineering and math (STEM) aspiration, we examine domain-specific motivation (i.e., task values and self-concept of ability) of 5th and 6th year students in Helsinki, Finland (~11-12-year-old, *n*= 360, 55% girls). We aimed to (1) derive students' motivational belief profiles regarding *science, mathematics*, and *language* (Finnish), (2) analyze the stability and change in their profiles between 5th and 6th grades, (3) assess the relationship between motivational profiles, achievement and STEM aspiration, and (4) test for gender differences. Four motivational profiles were derived for both years: *high motivation in all subjects* (~21%), *high mathematics motivation* (~46%), *low mathematics motivation* (~11%), and *low motivation in all subjects* (~8%), with most students remaining in the same profile throughout the 2 years. We found evidence for gendered differences in the profile membership and the chance of transitioning between profiles: more girls were characterized by low math motivation, and boys were more likely to transition to higher math motivation in 6th grade. These motivational differences were reflected in their achievement, although not strongly coupled with their STEM aspiration. The findings suggest that at this developmental stage, Finnish students have started developing (gendered) domain-specific motivation which has influenced their achievement but was not associated strongly with their STEM aspiration. These findings offer insights into different risks and opportunities in terms of STEM-related pathways for girls and boys at the end of their elementary school years.

Mathematically talented female and male students: Equally motivated in math and science?
Presenting Author: Lena Keller, University of Potsdam, Germany; **Co-Author:**Franzis Preckel, University of Trier, Germany; **Co-Author:**Jacquelynne S. Eccles, University of California Irvine, United States; **Co-Author:**Martin Brunner, University of Potsdam, Germany

The present study examined gender differences in achievement motivation in math and science among 113,864 top-performing adolescent math students (top 5% in their respective countries). To do this, we conducted an individual participant data (IPD) meta-analysis using data from six cycles of the Programme for International Student Assessment (PISA 2000–2015; 82 countries, 15-year-old students). We found that in the group of top-performing math students, male students were overrepresented (mean female-to-male ratio 1:1.50). Male students had stronger math self-efficacy (d = 0.32) and higher intentions to focus on math (d = 0.27) than female students did. Furthermore, male students reported higher instrumental math motivation (d = 0.16), higher math self-concept (d = 0.15), and greater interest in math (d = 0.10). Female students reported higher self-responsibility for failure in mathematics (d = –0.13), higher math anxiety (d = –0.15), and a higher math work ethic (d = –0.16). Moreover, female students were more interested in organic and medical fields ($0.44 \leq d \leq -0.30$), whereas male students showed greater interest in physics-related topics ($0.39 \leq d \leq 0.54$). Gender equality indicators moderated the proportion of female students in the top 5% in mathematics, but not gender differences in math and science motivation in this group. Results are explained by social role theory and situated expectancy–value theory, and implications for women's underrepresentation in (specific) STEM fields are discussed.

Does teacher support lessen gender differences in motivational outcomes in mathematics?
Presenting Author: Kaley Lesperance, Technical University of Munich, Germany; **Co-Author:**Jasmin Decristan, University of Wuppertal; IDeA-Research Center, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany

Male and female students tend to differ in mathematics in regards to their motivational outcomes, such as self-concept, self-efficacy and interest, with female students often displaying lower levels of these outcomes, especially in secondary school. To understand and lessen these gaps, it is crucial to evaluate what aspects of students' classroom experiences might be involved. Many aspects of instructional quality have strong effects on various student motivational outcomes. Particularly teacher constructive support has been shown to be strongly linked to student motivational factors. As such, teacher constructive support may have also the potential to reduce gender gaps in motivational outcomes. The goal of this study is to investigate whether teacher constructive support could play a moderating role between gender and student motivational outcomes. Using the student questionnaire data from the Teaching and Learning International Survey (TALIS) Germany 2018 Video Study (n = 1,140 students), we used latent moderated structural equation models to evaluate whether student perceptions of teacher constructive support moderated the effect of student gender on self-concept, self-efficacy and interest in mathematics. Preliminary analyses revealed that female students had lower levels of both self-concept and self-efficacy, and teacher constructive support had significant positive effects on all three motivational outcomes for both genders. However, teacher constructive support did not moderate the relationship between student gender and motivational outcomes. These findings contribute to research aiming to reduce the gender gap in mathematics.

Promoting children's interests and ability beliefs in engineering and technology at a science museum
Presenting Author: Fidelia Law, University of Exeter, United Kingdom; **Co-Author:**Luke McGuire, University of Exeter, United Kingdom; **Co-Author:**Manuela Baretto, University of Exeter, United Kingdom; **Co-Author:**Adam Rutland, University of Exeter, United Kingdom

Women's underrepresentation in technology and engineering has been linked to gender stereotypes and interests in these fields. One way to remedy this may be to promote girls' interest and challenge gender stereotypes in STEM from an early age (Shapiro & Williams, 2012). This pre-registered study demonstrated how sharing real-life stories of local STEM workers with children visiting a science museum is related to children's interests and gender stereotypes in STEM. Participants were 230 children (49.5% girls) who either 1) heard the stories and saw pictures of local people working in STEM, 2) heard the same stories and heard a growth mindset message, or 3) did not hear the stories or growth mindsets (controls). After visiting the exhibit, children responded to a survey measuring their interest and gender stereotypes in engineering and technology. Overall, the results demonstrated that younger children showed more interest in technology and engineering than older children. Further, girls in the control group showed lesser interest in engineering than boys, but no difference was observed between boys and girls who heard the STEM stories and the growth mindset message. Further, results also show that after hearing the STEM stories, children showed less gender stereotypes (more equitable ability beliefs) in technology and engineering than the control group. This indicates that the stories of STEM workers cultivated an interest in girls towards engineering, and promoted equitable beliefs in girls' and boys' ability to do well. This has important implications for practice and interventions designed to increase STEM interest among children.

Symposium
Assessment and Evaluation, Teaching and Teacher Education

Assessing scientific reasoning and argumentation skills across disciplines

Keywords: Argumentation, Assessment Methods, Classroom Assessment, Higher Education, Pre-service Teachers, Reasoning, Secondary Education, Simulation-based Learning, Social Sciences and Humanities
Interest group: SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Marleen Evers, KU LEUVEN, Belgium
Organiser: Marleen Evers, KU LEUVEN, Belgium
Discussant: Javier Fernández, Universidad de Leon, Spain

Scientific reasoning and argumentation (SRA) are complex thinking skills and are defined as “the ability to understand and apply scientific concepts, methods and findings appropriately when solving problems in scientific research, professional practice and daily life” (Hetmanek et al., 2018, p. 203). In addition to be an important goal in itself, attention for SRA in education also contributes to other learning goals, such as a profound understanding of a specific scientific discipline (Klahr et al., 2019), and epistemological learning gains (Chinn et al., 2011). In line with other complex thinking skills assessing SRA is challenging (van Merriënboer & Kirschner, 2018). Not only because it concerns complex thinking skills but also diverse epistemic practices and criteria in different scientific disciplines. However, assessing SRA has only recently been a focus of research. In this symposium challenges to assess SRA will be discussed from different perspectives (disciplines: psychology, medicine, education, mathematics; educational levels: secondary education, teacher education; purpose: assessing SRA, assessment as SRA) together with its educational implications. The SRA framework of Fischer and colleagues (2014) provides the overall structure to integrate all contributions. This framework facilitates interdisciplinary research on SRA by integrating existing conceptualizations of SRA from different research strands. SRA is hereby considered a multidimensional construct consisting of various activities: problem identification, questioning, hypothesis generation, construction and redesign of artifacts, evidence generation, evidence evaluation, drawing conclusions, and communicating and scrutinizing. In the different symposium contributions the assessment of at least one SRA activity, and often multiple activities are included.

Impact of teacher’s epistemological beliefs on assessing scientific reasoning tasks in psychology
Presenting Author: Marleen Evers, KU LEUVEN, Belgium; **Co-Author:**Jan Elen, KU Leuven, Belgium; **Co-Author:**Machteld Vandecandelaere, KU Leuven, Belgium

Scientific Reasoning and Argumentation (SRA) can be defined as the ability to understand and appropriately use scientific concepts, methods, and findings when solving or explaining problems in a specific discipline (Fischer et al., 2014). SRA are recognized to be important 21st century skills and their acquisition is among the intended goals of general secondary education around the world. Intensive focus group interviews from a previous study with secondary psychology teachers suggest an impact of teachers’ epistemological beliefs on the determination of assessment criteria, and the actual use of these criteria to assess students’ SRA. Therefore, this study investigates the impact of teachers’ epistemological beliefs on the determination and use of criteria to assess SRA in psychology, a non-paradigmatic and ill-structured domain. In a first phase, teachers receive different written products of students’ SRA and are asked to construct assessment criteria for each product. In a second phase, teachers are asked to actually carry out the assessment by using assessment criteria predefined by the researchers. All learning products reflect students’ SRA as conceptualized by Fischer and colleagues (2014) with focus on ‘Evidence evaluation’ and ‘Drawing conclusions’. Products further relate to the same psychological topic but differ in complexity and quality of student answer. Teachers’ epistemological beliefs are measured by two discipline-focused instruments: DEBQ (Hofer, 2000) and ETA (Barzilei & Weinstock, 2015). Results reveal that the assessment of SRA benefits from more mature and adapted epistemological beliefs, and can therefore be considered functional for the assessment of SRA in psychology education.

Assessing scientific reasoning skills and research competences in teaching-related fields of studies
Presenting Author: Anna Horrer, Institute of Medical Education, LMU Klinikum, Ludwig-Maximilians University Munich, Germany; **Co-Author:**Tolgonai Erkinova, Department of Psychology, LMU Munich, Germany; **Co-Author:**Insa Reichow, Educational Technology Lab, German Research Center for Artificial Intelligence, Berlin, Germany; **Co-Author:**Michael Sailer, LMU Munich, Germany; **Co-Author:**Maximilian Sailer, University of Passau, Germany; **Co-Author:**Moritz Heene, Department of Psychology, LMU Munich, Germany; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Martin Fischer, LMU University Hospital, Institute of Medical Education, Germany; **Co-Author:**Jan Zottmann, Institue of Medical Education, University Hospital, LMU Munich, Germany

Reading and evaluating the quality of scientific texts are daily activities of students and scientists and central for evidence-based decision-making, which comprises *using evidence*. This, in turn, requires scientific reasoning skills and*establishing evidence* that requires research competences. Two crucial scientific reasoning skills, namely *evidence evaluation* and *drawing conclusions*, are essential for decision-making in scientific research, professional practice, and daily life. Research competences include declarative and procedural knowledge of research methods, methodology, and procedures. We assume that students’ scientific reasoning skills as well as their research competences are necessary for evidence-based decision-making and related to students’ empirical research practice within their study program. Empirical research practice reflects the extent of students’ self-experienced empirical research practice during a study program. To operationalize empirical research practice, we compared students from three study programs within the domain of education that differ in the number of ECTS credits allocated to empirical research practice (i.e., n=102 teacher students, n=57 educational sciences students, and n=48 psychology of learning sciences students). MANOVAs revealed that students with higher exposure to empirical research practice outperformed students with medium or low exposure to empirical research practice in evidence evaluation and research competences. However, we found no differences regarding the scientific reasoning skill drawing conclusions. The results of our study imply that empirical research practice fosters evidence evaluation, but students apparently have difficulty applying their skills to come to evidence-based decisions. We conclude that scientific reasoning skills are not tacitly acquired by attending university – instead, they need to be taught explicitly.

Assessing students’ causal historical reasoning ability with the use of writing tasks
Presenting Author: Gerhard Stoel, Radboud University, Nijmegen, Netherlands; **Co-Author:**J.P. van Drie, University of Amsterdam, Netherlands

In history education, students’ ability for scientific reasoning and argumentation (SRA) is often evaluated through writing, based on the analysis of multiple sources. However, scholars have raised questions about the extent to which students are able to show their historical reasoning ability within the context of a historical writing task. These scholars emphasized that writing historical texts is complex because it involves integrating substantive knowledge, knowledge of second-order concepts, epistemological understanding, together with knowledge of historical text structures and a specialized vocabulary. In the current study, we triangulate outcomes from two studies in which we analyzed how 11^{th}-grade pre-university students’ revised their essays about the causes of German involvement in the First World War, after a lesson unit that focused on fostering students’ causal historical reasoning. In the first study we used a scoring rubric and in the second we analyzed students’ revisions qualitatively. Results from the qualitative analysis show that students’ causal writing developed on multiple aspects (i.e. the amount of claims), but students’ initial text structure interacted with the type of revisions students made. Analysis with a scoring rubric failed to capture this development. Our results raise questions about the validity of writing tasks and rubrics to analyze causal historical reasoning.

Measuring assessment skills in simulations: Influence of pre-service teacher characteristics
Presenting Author: Michael Nickl, Technical University of Munich (TUM), Germany; **Co-Author:**Daniel Sommerhoff, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Elias Codreanu, Technische Universität München, Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Tina Seidel, Technische Universität München, Germany

Assessing students’ characteristics requires various scientific reasoning and argumentation skills, such as generating evidence, evaluating evidence and drawing conclusions. As novice teachers oftentimes perceive the assessment of students’ characteristics as challenging, teacher educators strive for appropriate learning environments targeting these skills. In that regard, simulations are effective environments for measuring and learning assessment skills in university-based teacher education. Whereas cognitive and motivational-affective learner characteristics influence teacher judgments in text-based tests, their role in authentic practice representations such as simulations is rather unclear. Therefore, we conducted a study with N = 150 pre-service teachers using an empirically tested video-based simulation for promoting teacher assessment skills. We investigated the role of pre-service teachers’ cognitive and motivational-affective characteristics in the simulation by identifying profiles of these characteristics and relating them to the achieved outcomes of assessment skills. In data analysis, three profiles were identified: a knowledgeable profile, a motivated profile, and a profile with below average knowledge and motivation. Regarding the assessment process and judgment accuracy, the knowledgeable tends to outperform both other profiles. These results substantiate the important role of cognitive learner characteristics for scientific reasoning and argumentation skills. Also, the results underpin that depending on their learner characteristics, pre-service teachers navigate differently through the simulation, as for example, the knowledgeable profile used most time for the assessment process, which may have led to a higher assessment accuracy. This highlights that, by optimizing the profiles’ navigation through the simulation, adaptive support may be promising to further increase learning gains.

Learning and Social Interaction

The Social Nature of Education: A Closer Look at Peer Networks of Students and Teachers

Keywords: Anxiety and Stress, E-learning/ Online Learning, Higher Education, Learning Analytics, Peer Interaction, Quantitative Methods, Secondary Education, Social Aspects of Learning and Teaching, Social Interaction, Teacher Professional Development
Interest group: SIG 17 - Methods in Learning Research
Chairperson: Julia Eberle, Ruhr-Universität Bochum, Germany
Discussant: Julia Eberle, Ruhr-Universität Bochum, Germany

Social distancing as a countermeasure against the COVID-19 pandemic had a tremendous impact on education worldwide. The lack of co-located peer interaction among students and among teachers, due to the move to emergency online teaching, showed that the importance of social relations in education has been drastically underestimated in the past. More research dedicated to peer interaction and collaboration in the educational system is urgently needed. The scarcity of such research can to some extent be explained by the complex nature of relational data that inherently violates core assumptions of traditional statistical methods used in educational research. In this symposium, the contributions share a methodological focus on advances to overcome this methodological problem by bringing together social network analysis with traditional statistical methods.The four studies in this symposium explore peer networks among key stakeholders in the educational systems and investigate how such peer networks are related to core aspects of learning. The first set of papers focusses on student interaction, exploring how the design of online courses shapes the interaction among students and how social interaction as a resource for students' emotional coping with stress evolves over time. The second set of papers sets a focus on teachers, investigating the social nature of teachers' professional development. These papers look at how teachers collaborate, differentiating specific collaborative activities within different groups of teachers' social networks and focusing on the social structure and effective positioning of teachers within school networks.

Examining Academic Diversity in Online Peer Interactions at Scale
Presenting Author: Oleksandra Poquet, TUM, Germany; **Co-Author:**Shane Dawson, University of South Austrialia, Australia; **Co-Author:**Vitomir Kovanovic, University of South Australia, Australia; **Co-Author:**Christopher Brooks, University of Michigan, United States

Studies of university online discussions show that students who have the same level of academic performance end up interacting with one another online. This network-based phenomenon is known as grade-based homophily and signals academic diversity in course discussions. The reasons for this observed grade-based homophily remain inconclusive. Prior work had ruled out social processes and student time management habits as potential reasons for this observed homophily between the students. To further examine potential causes, this study analysed student interaction data from 697 online university courses. We found that the distribution of grade point average (GPA), that describes the student cohort posting into online discussions, can explain over 40% of variance in the grade-based homophily that emerges within the course discussions. This distribution differs from the GPA distribution of all the students enrolled in a course. Different properties of online course discussions were also examined. Academic diversity in online discussions was present in courses where discussions combined participation and interaction activities. That is, lower grade-based homophily was observed in courses that both encouraged students to make independent contributions and to build on peer posts.

The role of social capital in secondary school teachers' work socialization process
Presenting Author: Thibault Coppe, University of Groningen, Netherlands; **Co-Author:**Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:**Laura Thomas, Ghent University, Belgium

Research on teachers' professional development has emphasized the importance of professional interactions for teachers' development (Baker-Doyle & Yoon, 2020). Despite the increased attention to the social nature of teachers' professional development, research focusing on teachers' social position within the school network as a resource for this process is scarce. In the current study, we delved into this relatively unexplored area of research by building on the concept of social capital (Lin, 2008). In particular, (1) we pursued a thorough investigation of the role of social capital in secondary school teachers' professional development, and (2) in the process worked on an innovative method for combining traditional linear statistical models with social network analysis. The latter is related to the challenge of violating the assumption of independence of observations when exploring relational phenomena, preventing researchers from using traditional linear models to explore social network data (Tranmer et al., 2014). Recent developments inspired by the multiple membership model offer a promising avenue for progress in this area (Coppe et al., 2022). The current study built on this progress even further by bringing more advanced statistical routines (i.e., SEM) into the equation. In attaining the two aforementioned objectives, a sample of three whole school social networks was used. Preliminary analyses showed that social capital strongly predicts teachers' development but with differential effects related to different measures of social positioning. Specifically, degree centrality showed the highest prediction coefficient, followed by closeness centrality. We did not find any significant relationship between betweenness centrality and teachers' development.

How is the occurrence of collaborative activities related to teachers' collaborative attitudes?
Presenting Author: Julie Droissart, Ghent University, Belgium; **Co-Author:**Melissa Tuytens, Ghent University, Belgium

To meet society's increasing educational expectations and the needs of a more diverse student population, teacher collaboration in higher education can strengthen individual teachers (Newell & Bain, 2018). Deep-level collaboration (including exchange activities, professional collaboration, and constructive conflict) needs to be stimulated for realizing actual institutional improvement and teacher learning (Plauborg, 2009). Little is known about which collaboration activities occur within the higher education context, just like the advantages of working with different colleagues (i.e. direct colleagues, colleagues from their institution, and external partners) are underexplored (Gast et al., 2017). Furthermore, collaborative attitudes deserve adequate attention. Therefore, this study captures collaborative activities among higher education teachers in Flanders and discovers how their occurrence is related to teachers' collaborative attitudes via an online survey. Results show that lecturers mainly report exchange activities with direct colleagues. Exchange activities with other colleagues and external partners are reported less. Professional collaboration seems to be implemented infrequently. Constructive conflict, in turn, is most often played out with direct colleagues. In addition, university college teachers report significantly more exchange activities and constructive conflict with direct colleagues than university teachers. Also, university college teachers report significantly more professional collaborations with external partners. Finally, teachers' collaborative attitudes appear to be a significant predictor for performing exchange activities and constructive conflict with direct colleagues.

The relationship between stress and perceived social support among university students
Presenting Author: Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:**Jannika Haase, Leibniz University Hannover, Germany; **Co-Author:**Lysann Zander, Leibniz University Hannover, Germany

Peer networks can crucially affect students' experiences in new academic environments. Yet, social networks of students can be highly differentiated. Empirical studies examining how different types of support relate to students' perceived stress in the higher education context remain scarce (for examples see Brouwer et al., 2016; Etcheverry et al., 2001). The present study examines the role of three types of peer support networks (academic and personal support networks, friendship) as they relate to students' stress experiences during the first semester. Students differ in their access to different forms of social capital (Lin, 1999), which may impact their stress experiences. Simultaneously, individual experiences of stress levels may impact the access and mobilization of different forms of peer support. The present research seeks to clarify whether higher levels of stress experiences relate to lower access to peer support networks or, the opposite, higher access to peer support networks. Analyzing the sociometric data of 196 students, we examined the association between stress and students' centrality in these three types of networks. In preliminary descriptive found that student's outdegree in the academic support network was negatively associated with stress 10 weeks later.to elicit peer support at the end of the term. Additionally, we found positive associations between the three types of support networks. To

disentangle social selection from social influence, we will estimate stochastic actor-based models (SAOM) in RSiena to investigate the co-evolution of different forms of support networks and stress (e.g., Snijders, 2001).

Teachers' assessments and students' educational success – insights into a complex relation

Keywords: Achievement, Assessment Methods, At-risk Students, Classroom Assessment, Educational Attainment, Meta-analysis, Motivation, Primary Education, Reading, Secondary Education, Special Education, Synergies between Learning / Teaching and Research, Teacher Effectiveness, Teacher Professional Development
Interest group: SIG 01 - Assessment and Evaluation
Chairperson: Katharina Molitor, Germany
Organiser: Katharina Molitor, Germany
Organiser: Justine Stang-Rabrig, TU Dortmund University, Germany
Organiser: Nele McElvany, TU Dortmund University, Germany
Discussant: Christine M Davies, University of Auckland, New Zealand

Students are assessed in regard to their competencies, behaviour, and participation in class by teachers regularly in their everyday school live. False assessments might lead to maladaptive teaching, unjust grades and wrong decisions, and hence hinder students tapping their full potential. Consequently, teachers' assessments are crucial for students' further life course. This symposium connects here and provides insights into the complex relation between teachers' assessments and students' educational success.
The first presentation investigated the question whether the relation between teachers' judgment accuracy and student achievement is mediated by teaching quality. The second presentation asked if teachers' accuracy of the perception of students' reading fluency can be improved by implementing Reciprocal Teaching for students with and without learning difficulties. The third presentation focuses conditions for success for incorrect teacher assessment on educational paths and examined whether student motivation is relevant in this context. The fourth presentation asked on a meta-analytic level how teachers' assessment accuracy can be improved. The session will be concluded by a discussion from a renowned researcher who will point out strengths, difficulties and further research questions regarding this important topic.
The symposium provides a comprehensive view on this complex relation. It does not only provide information on the state of research but also provides starting points to improve teacher assessment accuracy.

Teachers' judgment accuracy: how is it related to teaching quality and student achievement?
Presenting Author: Dimitra Kolovou, St. Gallen University of Teacher Education (PHSG), Switzerland; **Co-Author:**Jan Hochweber, St. Gallen University of Teacher Education, Switzerland; **Co-Author:**Anna-Katharina Praetorius, University of Zurich, Switzerland

Teachers' judgment accuracy is considered important for high quality teaching and student achievement development. However, there is little empirical evidence regarding this assumption. We therefore examined effects of teachers' accuracy, measured both at student and class/teacher level, on student achievement over a period of three school years and whether these effects were mediated by four teaching quality aspects (individual support, cognitive activation, comprehensibility and clarity, and consolidation) via different pathways (i.e., cross-and unique cluster level mediation and student level mediation). Data from 35 German language teachers (N = 646 students) and their students in German-speaking Switzerland were analyzed using multilevel regression models with small sample correction methods. The results showed that teachers' judgment accuracy at class/teacher level did not predict achievement at the end of 9th grade. However, accurately judged students had higher achievement in German language than underestimated students after three years of teaching by the same teacher. None of the teaching quality aspects mediated the effect of teaching quality. Taken together, these findings do not provide conclusive information about how TJA relates to student achievement. However, they suggest that conceptually different accuracy measures may differ in their predictive power. Finally, the results call for more research, especially in studying effects over different time intervals.

Accuracy of teachers` perceptions on students` reading fluency.
Presenting Author: Maris Juhkam, Tallinn University, Estonia; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland; **Co-Author:**Piret Soodla, Tallin University, Estonia

The aim of the study was to examine the accuracy of Estonian teachers' and support specialists' perceptions of students' reading fluency and to investigate whether and to what extent the implementation of a Reciprocal Teaching (RT), that involved regular monitoring of students' skills, improves the accuracy of teachers' opinions. The sample included 184 third grade students, 34 of whom were students with learning difficulties (LD), 11 classroom teachers and eight support specialists. Teachers assessed reading fluency of all students, support specialists assessed only skills of students with LD. After the RT intervention, seven classroom teachers' thoughts of 114 students' reading fluency were recollected and analyzed. The perceptions were collected using scales, and students' reading fluency were assessed using individual tests. We found that before the RT intervention, the sensitivity of the teachers' was 62% and the specificity was 87%. Comparing the accuracy of teachers' and support specialists' on reading fluency of students with LD, it appeared that the teachers' were somewhat more accurate. We found that after the RT intervention, the sensitivity of the teachers' increased, while the specificity remained the same. The results suggest that teachers as well as support specialists need support in assessing students' reading fluency, and conducting an RT intervention, with systematic monitoring of students' skills, can guide teachers to more accurately assess students' reading fluency.

Attending the academic track without teacher recommendation – predictors of educational attainment
Presenting Author: Katharina Molitor, Center for Research on Education and School Development, TU Dortmund University, Germany; **Co-Author:**Justine Stang-Rabrig, TU Dortmund University, Germany; **Co-Author:**Paul Fabian, CENTER FOR RESEARCH ON EDUCATION AND SCHOOL DEVELOPMENT, Germany; **Co-Author:**Nele McElvany, TU Dortmund University, Germany

Students' educational pathways largely depend on the transition decision at the end of elementary school. In Germany, this decision is mostly based on teachers' enrollment recommendation, which is known to be socially biased. However, there is evidence that students without an academic-track enrollment recommendation (ATER) can be successful on academic-track schools. It is known that students' motivation can buffer against educational inequalities and that students without ATER can be successful on higher school types, but few results exist on the conditions for success for those students. We aimed to close this gap by using longitudinal data from the German National Educational Panel Study starting cohort Grade 5 (SC3) (N = 2,671 students; M = 10.4 years, SD = 0.85, 48.2% female). Descriptively, we compared group means for academic-track students with and without ATER concerning their family background (e.g. parental education, immigrant background) and motivational factors (e.g., expectation of success, value of education and learning stress). Group-comparing structural equation models revealed that parental education predicted obtaining *Abitur* only for students without ATER when considering motivational factors, but not for students with ATER. In both groups motivation promoted educational attainment. For students without ATER, expectation of success and value of education were particularly relevant. However, expectation of success and learning stress were more relevant for students with ATER. Nevertheless, not buffering effect for students without ATER was found. A further understanding of the mechanisms that helps prevailing against incorrect teacher assessments is needed, so students without ATER can tap their full potential.

Lens model studies: Revealing teachers' judgments for teacher education
Presenting Author: Esther Kaufmann, University of Konstanz, Switzerland

Teachers need to judge students accurately to ensure social justice within classrooms. Inaccurate judgments can result in conditions that prevent students from

reaching their full potential and can increase inequality between students' rates of learning and development. Currently, many reviews have estimated how accurately teachers overall judge students, but only a few provided clues about how teachers' accuracy could be improved. To provide insight regarding the sources of teachers' (in)accuracy, we review and synthesize lens model studies concerning the judgment accuracy of teachers. By the lens model equation, the complex relationship between teachers' assessment and students' educational success is break-down into different components (e.g., teacher, environment, and interaction of it) to reveal sources of teachers' inaccuracy. After describing the lens model and the limitations of previous reviews, an individual participant data meta-analysis of lens model studies was performed and compared with non-lens model studies on teachers' judgment accuracy. Finally, we describe how our approach can be utilized to enhance the accuracy of teachers' judgments by distinguishing sources of inaccuracy, particularly among teachers in need of further training, and judgment tasks that need the attention of subject matter experts.

Symposium

Complex dynamical Systems in Educational Research: Diverse Conceptual and Empirical Applications

Keywords: Assessment Methods, Qualitative Methods, Quantitative Methods, Researcher Education
Interest group:
Chairperson: Dimitrios Stamovlasis, Aristotle University of Thessaloniki, Greece
Organiser: Dimitrios Stamovlasis, Aristotle University of Thessaloniki, Greece

Organiser: Matthijs Koopmans, United States
Discussant: Eleftheria Gonida, Aristotle University of Thessaloniki, Greece

Life in the 21st century poses great challenges to education and educational research. Rapid technological changes that transform day-to-day life and work, climate change that threatens living conditions, health risks that quickly develop into global pandemics, and great inequality in the impact of these changes on different communities reflect the increasing complexity, unpredictability, and continuous change of environments and of people's lived experiences. EARLI 2023's theme "Education as Hope in Uncertain Times" charges educational research with informing educational policy and practice about preparing people for success in such uncertain times. Yet, arguably, many current educational theories, and much of the published educational research, describe learning, motivation, and achievement in predictable educational environments and traditional academic tasks. Theories and research that conceptualize and investigate educational phenomena as linear, predictable, and a-contextual may be inadequate for describing the competencies required for adaptive life under uncertainty, and for guiding educational practice to promote these competencies' development in diverse contexts. The current symposium begins to address this challenge by applying the complexity paradigm to educational phenomena. The Complex Dynamical Systems (CDS) perspective offers ontological and epistemological assumptions for theorizing and investigating learning, motivation, achievement, social interactions, and educational environments as inherently complex, dynamic, and not fully predictable. The four symposium's papers include conceptual and empirical examples of applying CDS to learning, motivation, and to grappling with persisting conundrums in educational research regarding causality and nonlinearity in educational phenomena.

A Complexity Perspective on Researching Causality in Educational Phenomena
Presenting Author: Stephen Whitney, University of Missouri/Columbia, United States; **Co-Author:**Avi Kaplan, Temple University, United States; **Co-Author:**Joanna Garner, Old Dominion University, Norfolk, United States

Understanding causal mechanisms is central to the design and implementation of successful educational environments and interventions. Yet, educational research is challenged in delineating causal processes in complex educational phenomena that are contextualized, involve multiple factors, evolve over time, and harbor inherent unpredictability. Particularly in light of the increasing uncertainty of life in the 21st century, current approaches to causal inference in educational research may be inadequate to inform educational policy and practice that strives to support administrators', educators', and students' learning, motivation, and achievement in the complex and uncertain environments within which they live and work. In this paper, we review the current state of casual inference approaches from a complex dynamic systems perspective. We compare non-complex and complexity-informed assumptions and practices for causal inference, interrogate outstanding challenges for causal inference in the complex dynamic systems approach and propose methodological implications for educational research that aims to derive causal inferences and recommendations for policy and practice that are aligned with a view of educational phenomena as complex dynamic systems.

Complexity in Student Learning: An Example from Sign Networks in Learning
Presenting Author: Richard Taylor, University of Oxford, United Kingdom; **Co-Author:**Judith Hillier, University of Oxford, United Kingdom; **Co-Author:**Ann Childs, University of Oxford, United Kingdom

Developing connections between words may be an important catalyst for conceptual development. This research uses a snowball sampling method to measure the structure of word (sign) networks formed by students learning mechanics (physics students) and students who have a more basic understanding of physics (psychology students). Key measures of network structure (e.g., shortest average path length, clustering coefficient) indicate that the networks of physics and psychology students have similar macro structures. Analysis of the network degree distributions suggest all the networks contain highly connected hub-words. Force concept inventory scores indicate that the participants in the physics group have a significantly better conceptual understanding of mechanics than the participants in the psychology group. Despite these differences in conceptual understanding, there are several hub-words that appear frequently in both the physicist and psychologist networks (*force*, *energy*, *time*, *particle*). These hub words are associated with key concepts in mechanics.*Mass* is the only hub-word that appears in most physicist networks but is absent as a hub-word in psychology networks. These findings suggest students need to develop new connections between keywords (e.g., *mass*) to develop their understanding of the concepts they need to understand mechanics. However, the presence of common hub-words in both the physics and psychology networks suggests parts of this sign structure develops before students have a fully coherent conceptual understanding of mechanics.

A Complex Dynamic Systems Perspective on Identity, Motivation, and Learning
Presenting Author: Avi Kaplan, Temple University, United States; **Co-Author:**Joanna Garner, Old Dominion University, United States

The rapid developments of society in the 21st century have revealed the limitations of the mechanistic, linear, and acontextual assumptions that are implicit in much educational research. Our increasingly volatile and uncertain world requires the reconceptualization of educational systems' goals, practices, and intended outcomes so that individuals are equipped to cope with ambiguity and change. In other scientific fields, the principles and methods of complex dynamic systems (CDS) have provided an ontological framework for describing the interdependent and nonlinear relations among system elements. In this presentation, we highlight how these principles are incorporated into a model of identity, motivation and learning called the Dynamic Systems Model of Role Identity (DSMRI). We provide examples from DSMRI informed research that underscores its applicability to 21st century learning contexts, which often require the educator and the learner to negotiate ambiguity, act in agentic ways towards previously undefined solutions, and navigate smoothly between disparate social contexts. We conclude with a call to action for educational researchers, practitioners, and policy makers, to engage in collaborative discussion and collective identity development towards the goal of recognizing and leveraging principles of CDS in the design, implementation, and evaluation of modern learning environments.

Investigating Educational Phenomena with Catastrophe Theory
Presenting Author: Dimitrios Stamovlasis, Aristotle University of Thessaloniki, Greece

Within Complex Dynamical Systems (CDS) perspective, catastrophe theory (CT) has a significant contribution. The CT modeling detects potential nonlinear

changes occurring in social and educational systems. Educational processes involve changes, which sometimes are smooth and gradual, but often are abrupt changes or sudden transitions between states. In this presentation, a lucid appraisal of the empirical research probing discontinuous changes is provided. The content embraces endeavors from various domains, such as cognitive, mental task execution, conceptual change, problem-solving, motivational and achievement goal theories, decision-making, and research probing the role of emotion under certain circumstances. It is demonstrated how the cusp catastrophe model has been applied to various research domains, what has been learned from the paradigm shift, how theory is informed and what are the benefits for the practice. In addition, a brief presentation of the statistical and methodological issues is provided and explained along with the theoretical underpinnings associated with Complex Dynamical Systems. Notions, such as asymmetry, bifurcation, hysteresis effect, bimodality, and behavioral attractors, are elucidated and explained within the new epistemological framework. The application of stochastic catastrophe theory is advantageous because it can be employed with cross-sectional data and model conflicting processes, which are omnipresent in social and educational systems.

Session L 12

Symposium
Motivational, Social and Affective Processes

Causes and effects of mathematics anxiety

Keywords: Achievement, Anxiety and Stress, Attitudes and Beliefs, Emotion and Affect, Gender Issues, In-service Teachers, Mathematics/Numeracy, Science and STEM, Self-efficacy
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Florence Gabriel, University of South Australia, Australia
Discussant: Thomas Hunt, University of Derby, United Kingdom

Anxiety disorders are among the most widespread mental health issues. In educational settings, anxiety expresses itself in many different ways, with mathematics anxiety (MA) being one of the most prevalent forms associated with learning. There is evidence that MA, the experience of fear and nervousness when participating in mathematical tasks, leads to poor performance in and avoidance of mathematics. Yet, being mathematically literate has been linked to greater access to STEM careers, positive life outcomes and well-being in adulthood. Therefore, there is a need to ensure students are engaged with mathematics throughout their schooling to promote interest in the pursuit of mathematics related degrees and careers. This symposium will first explore some of the root causes of MA, including student and teacher gender, and teachers' own MA. This symposium will also uncover the relationships between students' attitudes towards mathematics, self-efficacy, MA and their engagement in STEM subjects.

Math anxiety and math teaching anxiety: Are they independent and do they relate to pupils' outcomes?
Presenting Author: Kinga Morsanyi, Queen's University Belfast, United Kingdom; **Co-Author:**Andy Ash, Loughborough University, United Kingdom

This talk addresses two under-researched topics: the relation between mathematics teaching anxiety and teachers' mathematics anxiety, and their potential role in the development of pupils' mathematics anxiety and mathematics performance. To address these issues, in Study 1, 94 teachers reported their mathematics anxiety, teaching anxiety and general anxiety, together with a number of other variables relating to their teaching experience, job roles and the demographic characteristics of their pupils. In Study 2, 11 primary school teachers and 124 pupils from these teachers' classes participated. In addition to the variables measured in Study 1, pupils' mathematics anxiety, general anxiety and their mathematics performance were also assessed. The results of Study 1 indicated an exceptionally strong link between teachers' mathematics anxiety and their teaching anxiety, although the two constructs showed some divergent validity. This suggests that mathematics anxiety plays a very important role in teachers' confidence in their teaching abilities. Study 2 showed that neither mathematics anxiety nor teaching anxiety were significantly related to pupils' outcomes. Nevertheless, teachers' general anxiety was significantly related to pupils' mathematics anxiety after controlling for the effects of a number of covariates. These results do not lend support to the idea that teachers' anxiety about mathematics or teaching mathematics could be easily transmitted to pupils or that they would have significant effects on pupils' mathematics performance. Nevertheless, teachers' general anxiety (which reflects higher stress levels and could potentially be related to worse work conditions) was associated with an anxiety-provoking classroom climate.

The influence of student and teacher gender on students' maths anxiety : A whole school study
Presenting Author: Rebecca Marrone, University of South Australia, Australia; **Co-Author:**Fernando Marmolejo-Ramos, University of South Australia, Australia; **Co-Author:**Florence Gabriel, University of South Australia, Australia

Many future jobs will require mathematical skills, and despite efforts to promote the study of mathematics in schools, students often perceive it as negative and challenging. Additionally, girls typically experience higher levels of mathematics anxiety than boys. In this study, we examined 794 Australian school students using a whole school approach (K-12). Using a short survey, we observed how male and female students differ in their attitudes towards mathematics and their perceived mathematics anxiety, how these patterns differ by school year and the impact of teacher gender on students' responses. Our results show that girls reported significantly more negative words than boys. Moreover, we were able to identify the first signs of mathematics anxiety in girls in Year 3, with sharp increases in Year 6 and Year 10 (transition years). Finally, our results suggest that female teachers negatively impact female students' emotional response towards mathematics. The implications of the findings are discussed in light of current educational theories and pedagogy.

Mathematics anxiety and positive attitudes towards mathematics are not mutually exclusive
Presenting Author: Krzysztof Cipora, Loughborough University, United Kingdom; **Co-Author:**Serena Rossi, Loughborough University, United Kingdom; **Co-Author:**Hannah Connolly, University of York, United Kingdom; **Co-Author:**Alexander von Bergen, Swiss Federal Institute of Technology ETH Zurich, Switzerland; **Co-Author:**Vera Baumgartner, ETH Zurich, Switzerland; **Co-Author:**Manu Kapur, ETH Zurich, Switzerland; **Co-Author:**Venera Gashaj, University of Bern, Switzerland

Most existing studies on Mathematics Anxiety (MA), attitudes towards mathematics, as well as personality factors potentially related to mathematics performance, focused either on individuals revealing math difficulties or targeting heterogeneous samples not prespecifying their mathematics skills level. Students enrolled in elite STEM programs have been neglected in MA research, presumably because the general (implicit) assumption is that one must have positive attitudes towards mathematics to choose to study math-intense subjects. In this study conducted with STEM students in one of the most prestigious technical universities worldwide (N = 4597), we aimed to fill this research gap. We show that even though lower than in other groups of university students, MA is still present among elite STEM students. It also differs between students involved in programs comprising different amounts of mathematics. In parallel, the correlations between MA and positive feelings towards mathematics (e.g., feeling flow while doing mathematics or seeing beauty in mathematical formulas) were only moderately correlated (rs » -.25), suggesting that positive and negative feelings towards mathematics are not mutually exclusive. Even so, these correlations were considerably higher than correlations with measures of discriminant validity (considering positive emotions towards language / literature). Expectedly, MA correlated also with other types of anxiety (trait, state, test anxiety) and neuroticism, with estimates comparable to those observed in other groups.

Math self-efficacy, and not Math anxiety, steers students away from STEM
Presenting Author: Flávia H. Santos, University College Dublin, Ireland; **Co-Author:**Mariuche Gomides, University College Dublin, Ireland; **Co-Author:**Claire Elliott, University College Dublin, Ireland; **Co-Author:**Sara Caviola, University of Padova, Italy; **Co-Author:**Krzysztof Cipora, Loughborough University, United Kingdom

Math anxiety might prevent students from pursuing careers in STEM. Previous studies indicated that students with high math anxiety are more likely to avoid math-related courses and activities. However, studies controlling the effects of other possible confounding factors (e.g., math ability and attitudes towards math) simultaneously when examining the association between math anxiety and career choice are scarce. The present study aimed to investigate whether math

anxiety contributed to the undergraduates' likelihood of pursuing a career in STEM, their attitudes towards mathematics, and their perceived mathematics abilities. Data from 180 Irish and English undergraduate students were analysed. Regression models indicated that math anxiety was not a significant predictor of undergraduates' likelihood of pursuing a career in STEM after the effects of math fluency, math self-efficacy, trait anxiety, presence of math modules, and gender were controlled. However, math anxiety significantly predicted participants' attitudes towards mathematics and their perceived mathematics abilities. At odds with previous research, math-anxious individuals were not less likely to avoid a career in STEM. In fact, math self-efficacy, which was highly correlated with math anxiety, was the sole significant predictor of career choice. Nonetheless, math anxiety predicted a significant part of the variance of participants' attitudes towards mathematics and their perceived mathematics abilities. These results might indicate that math anxiety might play an indirect role in the association between beliefs and attitudes towards math and career choice.

Reading and writing: The role of home literacy and emergent literacy skills
Keywords: Foreign and Second Language Acquisition, L1/Standard Language Acquisition, Parental Involvement in Learning, Writing/Literacy
Presenting Author:GIULIA VETTORI, University of Florence, Italy; **Co-Author:**Oriana Incognito, University of Florence, Italy; **Co-Author:**Lucia Bigozzi, University of Florence, Italy

This longitudinal study was aimed at investigating a pattern of relations between reading-related and writing-related home practices, kindergartners' emergent literacy skills, and later children's reading and writing skills in primary school. Participants included 115 kindergarten children learning Italian language (Mean age (SD)=4.88 (.36); 43% female). Each child in preschool completed emergent literacy tasks to test the phonological and notational skills. Information concerning home literacy environment and practices was obtained through a questionnaire completed by parents during kindergarten. Later, in primary school, each child completed a standardised dictation task to assess orthographic accuracy and fluency and a reading task to assess reading accuracy and speed. Two major findings of mediational models were that: (1) notational skills totally mediate the relationship between home literacy and reading speed (B=-.17 p

Learning to read: From an umbrella review of reading research to an educator's practice guide
Keywords: L1/Standard Language Acquisition, Meta-analysis, Reading, Synergies between Learning / Teaching and Research
Presenting Author: Jordi Casteleyn, Antwerp University, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Tom Smits, Antwerp University, Belgium

Just a small number of review studies discuss all essential aspects of learning to read in all stages of formal education (from pre-primary to secondary education). Moreover, insights from these review studies have sometimes difficulty finding their way into the classroom. This project aims at answering two research questions: RQ1) What are the features of effective reading education in pre-primary, primary and secondary education? What are the factors that influence it?, and RQ2) How to bridge the gap between research into reading instruction and practice? To answer RQ1, we chose to follow the procedure of an umbrella review, which only uses systematic reviews, with or without a meta-analysis. After identifying studies (N=385) based on relevant keywords, and excluding studies on the basis of title, abstract and full text (n=236), we assessed the methodological quality, which resulted in an additional 52 studies being excluded. Eventually, 99 studies provided the basis to formulate conclusions regarding reading instruction. To answer RQ2, a practice guide about effective reading instruction was created based on the insights of RQ1. We used the method of design-based research, in which both teachers (N=30, 10 per stage of formal education) and expert researchers (N=3) were involved in the process. To our knowledge, this study is one of the few projects that provide a structured empirical basis for the process of learning to read, from pre-primary to secondary education, and align this with practical advice.

The influence of writing medium and gesture modality on the development of early literacy skills
Keywords: Digital Literacy and Learning, Educational Technologies, Game-based Learning, Writing/Literacy
Presenting Author: Theresa Kalchhauser, Faculdade de Psicologia e de Ciências da Educação da Universidade do Porto, Portugal; **Co-Author:**Mariana Silva, Faculdade de Psicologia e de Ciências da Educação da Universidade do Porto, Portugal; **Co-Author:**Rui Alexandre Alves, University of Porto, Portugal

Writing and reading skills are cornerstones in the structure of many education systems. As digitalization is increasingly replacing analogue writing media, its efficiency must likewise be scrutinised. While some findings support the view that writing with keyboards leads to superior letter learning (Mayer et al., 2020), there are also opposing considerations (James, 2017; Longcamp et al. 2008; Seyll & Content, 2022; Wiley & Rapp, 2021) favouring handwriting. Still, hardly any study has systematically manipulated writing medium and gesture modality across an ecologically valid intervention aiming at teaching alphabet letters to kindergarteners. In the current project we address this research gap. We aimed to test which writing media and gesture modalities may work best to foster literacy skills in children. In a planned intervention of eight weeks, we manipulated writing medium [paper vs. tablet] and gesture modality [handwriting vs. tapping], thus adopting a 2 x 2 experimental design. Therefore, we studied four experimental groups (n = 106) and compared them to a non-intervention control group (n = 35). Intervention effects were tested using Generalised Linear Models (GLM). The results show that digital or analogue writing media had limited impact on kindergartners literacy learning. Regarding gesture modality, younger kindergartners profited more from tapping whereas the older ones benefited more from handwriting. In sum, besides offering concrete findings on the efficient use of writing medium and gesture modality for researchers and teachers, this study delivers analogue and digital working materials for preschool and remedial interventions.

Dot-to-dot Practice Enhances Children's Handwriting:
Keywords: Competencies, Educational Neuroscience, Learning Strategies, Primary Education
Presenting Author: Esther Adi-Japha, Bar-Ilan University, Israel; **Co-Author:**Rafat Ghanamah, Oranim Academic College of Education+ The University of Haifa, Israel; **Co-Author:**Hazar Eghbaria-Ghanamah, The University of Haifa, Israel; **Co-Author:**Avi Karni, Haif University, Israel

Handwriting instruction commonly involves the practice of non-linguistic writing-like patterns. In here, we report the effect of practicing the invented letter task (ILT), a dot-to-dot connecting letter-form task, under different scheduling conditions on Arabic sentence-writing. Ninety-seven 7- to 8-year-old Arab Israeli second-graders were assigned to five study groups: three single-session practice groups (6/12/24 blocks), a 24-block multi-session practice group, and an untrained control group, comparing the amount (90/180/360 repetitions) and parsing over time (massed/distributed) of practice. Handwriting was assessed at pre-training, 24-hr, and 4–5 weeks post-training. Although, by 4–5 weeks post-training, the single-session 12-block practice group was the most fluent and accurate in the trained ILT, the 24-block multi-session practice group's handwriting performance proved to be superior to that of the other groups in terms of speed and outperformed the control group in terms of legibility. The findings suggest that practicing simple grapho-motor tasks may enhance handwriting abilities.

Automated, Negative Performance Feedback Harms Students' Emotions (Less when it is Elaborated)
Keywords: Emotion and Affect, Feedback, Instructional Design, Motivation
Presenting Author: Livia Kuklick, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Dr. Marlit Annalena Lindner, IPN - Leibniz Institute for Science and Mathematics Education, Germany

In computer-based assessments, immediate performance feedback risks to negatively influence test-taker emotions and motivation after incorrect responses (i.e., implying task-related failure). Thus, special attention needs to be payed to the design of such negative feedback messages. To find ways to provide negative performance feedback in the least motivationally and emotionally detrimental way, this experimental study compared a no-feedback control group with three groups that either received *Knowledge of Results* (KR), *Knowledge of Correct Response* (KCR), or *Elaborated Feedback* (EF) after incorrect responses paired with KCR feedback after correct responses. As expected, feedback had a beneficial impact on student emotions after correct responses and a detrimental impact on students' emotions after incorrect responses. Moreover, feedback enhanced the success expectancy of higher performers, while it reduced those of lower performers. The content of the negative feedback messages played a secondary role for motivational outcomes. Yet, elaborated feedback content mitigated the detrimental affective impact of error notifications (i.e., "Your response was wrong"). Overall, our data suggest that immediate performance feedback is affectively and motivationally beneficial after correct responses (i.e., confirmative feedback). However, more elaborated feedback messages seem to help mitigate the detrimental impact of error notifications on students' emotions.

The Relationships between Pedagogy, Motivation, and Perception of the Learning Environment
Keywords: Attitudes and Beliefs, Classroom Assessment, Classroom Management, Motivation
Presenting Author: Irit Sasson, Tel-Hai College, Israel; **Co-Author:**NETA GAVISH, Tel-Hai College and Shamir Research Institute, Israel; **Co-Author:**Joy Benatov, University of Haifa, Faculty of Education, Israel

Recent changes in pedagogy design include flexible learning methods, based on the constructivist approach, that address student diversity according to the philosophy of universal design for learning. The implementation of pedagogical practices with these approaches are seen as essential in the development of the 21st century skills. To be well prepared to cope with the modern societal demand for lifelong learning, students need high and sustainable motivation. Research indicates a positive relationship between students' perception of the learning environment and motivation, yet the relationships between these variables and the implementation of best pedagogical practices by teachers have not been sufficiently studied. This study investigated the moderating effect of selected best pedagogical practices on the relationship between students' perception of the learning environment and motivation. Students' intrinsic motivation and perceptions regarding the learning environment were assessed through close-ended questionnaire filled out by 887 4th-6th grade students. In addition, we conducted 704 observations in the classes of these students to assess the expression of selected pedagogical practices: student vs. teacher centered learning; collaborative learning; integrating tasks that encourage choice; integrating tasks that address differences between learners; encouraging students to ask questions; integrating technological tools; providing personal attention; and managing classroom discipline events. A moderate, positive, and significant correlation was found between students' intrinsic motivation and their perceptions regarding the learning environment. Four pedagogical practices were found to significantly moderate this relationship: student centered learning; collaborative learning; integrating tasks that encourage choice; and tasks that address differences between learners.

Making lectures more interesting? - Effects of a Utility Value Intervention
Keywords: Instructional Design, Interest, Motivation, Science and STEM
Presenting Author: Nathalie John, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Franziska Baier, Goethe-Universität Frankfurt, Germany; **Co-Author:**Sebastian Korinth, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Mareike Kunter, DIPF | Leibniz Institute for Research and Information in Education, Germany

Students spend some time during lectures with off-task behaviour (e.g., checking their mobile phones) and therefore missing important parts of the lecture and not being in a state of interest (Risko et al., 2012). Utility-value interventions, which emphasize the usefulness of the learning material to learners' lives, are a promising approach to increase students' situational interest in lectures (Canning & Harackiewicz, 2015). This study uses an experimental pre-post design to examine the effects of a utility-value intervention on students' situational interest and knowledge gain during a short lecture about logarithm. A positive main effect on students' perceived usefulness is shown, but not on enjoyment or knowledge acquired through the lecture. For attention, there is a moderation effect: students with high individual interest in mathematics benefit from the intervention in terms of their attention. The results show that utility-value intervention in which the utility information is already included in the learning material can have an impact on students' attention and perceived usefulness and provide important clues for the design of lectures.

Multimedia Learning with Cartoons: A Test of the Emotional Design Hypothesis
Keywords: Achievement, Emotion and Affect, Instructional Design, Multimedia Learning
Presenting Author: Fangzheng Zhao, University of California, Santa Barbara, United States; **Co-Author:**Richard Mayer, University of California, Santa Barbara, United States

What is the effect on students' learning outcomes and learning experiences of converting a narrated slideshow on lightning formation with black-and-white line drawings (original group) into one in which the key elements are rendered as colorful cartoon-like characters (cartoon group)? We conducted two between-subjects experiments in which participants were randomly assigned to the group. The narrator's voice in both groups was a computer-generated female happy voice in Experiment 1 or a real female happy voice in Experiment 2. The cartoon group scored higher on a transfer posttest than the original group in both experiments. On subsequent questionnaires, the cartoon group reported feeling more positive (i.e., happy and content) during learning than the original group (in Experiment 1 and the combined experiments); and reported that the instructor was more engaging, better at facilitating learning, and more human-like (in Experiment 2 and the combined experiments). The results are consistent with the emotional design hypothesis, which predicts better learning from lessons in which key elements induce positive emotions.

Effects of Computer-Based KCR and AUC Feedback on Affective-Motivational Outcomes
Keywords: Computer-assisted Learning, Emotion and Affect, Feedback, Motivation
Presenting Author: Ute Mertens, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Marlit Annalena Lindner, IPN - Leibniz Institute for Science and Mathematics Education, Germany

Computer-based feedback is on the rise in educational assessments. Research has focused on the impact of feedback on learning, but few studies have examined how different feedback types affect test-takers' affective-motivational states. In this experiment, we employed a within-subject design with a variation of three automated item-level feedback types (i.e., no feedback, *Knowledge of Correct Response* [KCR] feedback, and *Answer-Until-Correct* [AUC] feedback) that were organized in three blocks, each containing 12 items. A final sample of 335 university students solved a total of 36 computerized multiple-choice tasks covering topics regarding the domains of physics, chemistry, and biology. We assessed students' achievement emotions (i.e., enjoyment, pride, anger, and frustration) and motivation (i.e., perceived knowledge acquisition, utility value, and perceived cost) at the item-level across the test. Results of linear mixed effect models indicated that both KCR and AUC feedback positively influenced students' achievement emotions and motivation as compared to no feedback. However, further moderator analyses revealed that the feedback effects are performance-dependent, indicating pronounced positive effects after correct answers as compared to incorrect answers. Furthermore, AUC and KCR feedback did not significantly differ regarding their effects on students' affective-motivational outcomes.

Effects of feedback and cooperative learning on knowledge acquisition in online flipped classrooms
Keywords: Cooperative/Collaborative Learning, Educational Technologies, Feedback, Higher Education
Presenting Author: Ruben Schlag, University of Passau, Germany; **Co-Author:**Karsten Stegmann, University of Passau, Germany; **Co-Author:**Maximilian Sailer, University of Passau, Germany

The (online) flipped classroom approach has increasingly been implemented in higher education. In flipped classrooms, declarative knowledge is acquired individually by learners. This process seeks to foster the subsequent generation of application-oriented knowledge during an in-class lesson. However, it is unclear to which extent the acquisition of declarative knowledge can be supported through different types of feedback in online flipped classrooms, and whether deficits in declarative knowledge can be compensated for with cooperative learning. To test these effects, we employed a 2x2 experimental design in an online flipped classroom course on empirical research methods (N=105) in the social sciences. We investigated the effects of 'type of feedback' (simple vs. elaborated) during a quiz on declarative knowledge and 'social form' during an application-oriented exercise (individual vs. cooperative). Elaborated feedback exerted a significant, medium effect on declarative and application-oriented knowledge. A mediator analysis showed that about half of the effect on application-oriented knowledge was mediated by declarative knowledge. Results suggest that elaborated feedback can foster declarative knowledge acquisition during individual learning phases in online flipped classrooms. Subsequently, this process also positively influenced the formation of application-oriented knowledge during the in-class learning phases. Challenges of this research are discussed, such as low test scores by students or dropouts from the data set.

Friends or Feedback?–Computer Science Students' Goals' and Their Intention to Use a Feedback-Tool
Keywords: Educational Technologies, Feedback, Goal Orientations, Higher Education
Presenting Author: Tugce Özbek, Augsburg University, Germany; **Co-Author:**Tobias Mömke, Augsburg University, Germany; **Co-Author:**Aida Roshany, Augsburg University, Germany; **Co-Author:**Ingo Kollar, Augsburg University, Germany

Digital technologies offer various benefits for student learning. However, a lack of technology acceptance might hinder students from using certain digital tools. The UTAUT-model specifies performance expectancy, effort expectancy and facilitating conditions as relevant factors that influence the intention to use a technology. Yet, little is known about learner characteristics that influence the intention to use a tool. Therefore, we investigated the effects of different achievement goals of N=155 computer science students on their intention to use an online peer feedback tool. More specifically, we examined the effects of learning approach goals, appearance approach goals and relational goals on students' intention to use. The results indicated that learning approach goals significantly predicted the intention to use the feedback tool. No effect was found for appearance approach goals. Surprisingly, a negative effect was observed for relational goals. Learning goals of students might therefore also be associated with a higher intention to use the feedback tool. The missing effect of appearance approach goals might indicate that they may not be very decisive in the context of a digital interaction within the feedback tool. Also, students with this primary goal might not want to help other students in order to perform best themselves. Lastly, the negative association of relational goals raises the question to what extent tools that imply social interactions are related to relational goals.

Learning analytics supporting mathematical thinking
Keywords: Educational Technologies, Feedback, Learning Analytics, Mathematics/Numeracy
Presenting Author: Sanna Oinas, University of Helsinki, Finland; **Co-Author:**Mikko Asikainen, The University of Helsinki, Finland; **Co-Author:**Mari-Pauliina Vainikainen, Tampere University, Finland

Each student's mathematical thinking develops at their own pace. Often in the classroom, it is almost impossible for the teacher to offer materials of a suitable level to each student who learns and progresses at their own pace. Therefore, in this study learning analytics were implemented in order to design an adaptive digital learning environment to support the development of mathematical thinking. A total of 2773 students in lower secondary education participated in study, where data were collected in three time points. In the first data collection time point students solved tasks within 15 minutes. In the second and third times, students had the opportunity to seek feedback and check immediately whether the answer for the mathematical problem was correct or incorrect. Results from longitudinal SEM show that the more students seek feedback the better they performed. There were also 15% of students who did not invest enough time for the tasks in order to show any progress. Overall, a slight development was reached in students mathematical thinking. Results give encouraging evidence for designing adaptive learning environments to support individual learning in the future.

Students' acceptance and confidence in the use of video pedagogy in higher education
Keywords: Attitudes and Beliefs, Educational Technologies, Higher Education, Video-based Learning
Presenting Author: Anja Garone, University College Leuven Limburg, Belgium; **Co-Author:**Greet Fastré, University College Leuven Limburg, Belgium; **Co-Author:**Kiara Billiau, University College Leuven Limburg, Belgium; **Co-Author:**Steven Verjans, University College Leuven Limburg, Belgium; **Co-Author:**An Verburgh, University College Leuven Limburg, Belgium

This study explores the use of video pedagogy in higher education programs. 7 pilot studies were set up in one university college in Belgium. A pre-test

measurement of students' technology acceptance and confidence in the use of video registrations of 137 participating students from 5 of the first pilots shows that students feel strongly about the potential effort expectancy and support required by the method. Students also seem to have strong reservations regarding how and by whom the videos will be used in the classroom. The study concludes that important considerations need to be made to ensure privacy and safe handling of video materials, while communicating clearly the added value of video pedagogy to the students.

The Contribution of Narrative Video production to SEL in Education.
Keywords: Multimedia Learning, Social Aspects of Learning and Teaching, Social Media, Video-based Learning
Presenting Author: Evanna Ratner, Gordon Academic College, Israel

In a course reflecting migrants' characteristics, German and Austrian overseas students in Israel, had to create short narrative videos, to tell a short story using storytelling skills and find a conflict moment in order to resolve it.
It was the first semester of 2022. Few students looked at the refugees fleeing from Ukraine and told their stories,others looked back and created their own story, asking their parents and grandparents about their lives during the Second World War. In this article one story will be presented to emphasize the Contribution of Narrative video making to SEL in Education. Doris, a german student studing in Israel, found out during this course that her great grandfather hid a Jew in the house barn. Years later, her grandmother kept in touch with him, and after many years, he turned to be her second husband. This was new to Doris, , she found out her story only because she asked for a dilemmatic story within her family and produced a short video about it. Stories of a troubled life need to be heard and by giving them a voice, asking questions and coping with different possibilities, there can be redemption to conflicts. In this presentation we will reflect on the method of Empathetic discourse, and what is the contribution of narrative video creation to SEL in education. Only Few studies look into the socio-emotional impact of these experiences on learners , this study is one of them.

Using Video to Support Student-Teachers' Classroom Management During Early Field Placement
Keywords: Classroom Management, Pre-service Teachers, Qualitative Methods, Video-based Learning
Presenting Author: George Olympiou, University of Cyprus, Cyprus

The purpose of this study was to investigate how the use of video enhanced four student teachers' (STs) experimentation with classroom management (CM) practices during early field placement. A combination of CM models was used during early field placement coursework whereas during practice STs were able to videotape and analyze their lessons, reflecting on both theory and practice. The use of video was considered crucial in supporting STs' teaching practice while implementing particular aspects of CM. The four STs were working in pairs and focused on two themes, namely, developing procedures and routines and on effective time management practices. The two themes were selected based on STs' practice which was blended with a structured early field placement coursework on CM. The use of video helped both pairs to identify CM issues on both themes and elaborate on what was discussed during coursework. The cross-case analysis revealed STs' ability to teach and enhance procedures and routines after the early field placement coursework. The use of video enhanced STs' reflection on procedures and routines while also leading them to crucial realizations in developing particular practices for managing time efficiently. Despite challenges related with STs' enactment on routines and time management as well as inconsistencies between planning and enactment, such results enhance the idea of introducing a particular methodology of using video for providing STs' with a place to begin with CM during their (early) field placement.

A review of interactive use of video for learning and assessment in higher education
Keywords: Higher Education, Social Interaction, Teaching/Instructional Strategies, Video-based Learning
Presenting Author: Magnus Hontvedt, University of Southeastern Norway, Norway; **Co-Author:**Charlotte Beal, University of South-Eastern Norway, Norway; **Co-Author:**Thomas de Lange, University of South-Eastern Norway, Norway; **Co-Author:**Marit Skarbø Solem, Faculty of Humanities, Sports and Educational Science, Norway; **Co-Author:**Tonje Stenseth, University of South-Eastern Norway, Norway

Video-based technologies have become increasingly important in higher education, especially concerning online teaching. Interactive uses of video, such as watching a video together with a peer, have proved to increase the effectiveness of videos for learning. The current review focuses on *interactive uses of video*, defined as video usage through which students actively respond to and engage with each other, either by using an online platform or by using video as a shared object of scrutiny in co-located settings. Existing reviews tend to provide a bird's-eye view of the use of video for learning and assessment. We find it pertinent to review explorative studies that investigate such practices in depth. Accordingly, we employ a framework synthesis approach to review research on the interactive use of video technology for learning and assessment in higher education. We found more studies that cover interactive use of video as part of learning designs than of assessment and fewer studies that analyse learning activities and assessment in relation to each other. The studies cover a range of tools, strategies and objectives for configuring video into learning designs and assessment practices in a wide range of subjects. There seems to be a lack of a unified research agenda and a need to gain conceptual clarity. Through the review work, we generated a thorough conceptual framework that provides an overview and a better understanding of this emerging research field.

The role of teacher characteristics for instructional quality: A meta-analysis
Keywords: Instructional Design, Meta-analysis, Teacher Effectiveness, Teacher Efficacy
Presenting Author: Nicoletta Bürger, University of Hildesheim, Germany; **Co-Author:**Katharina Engelmann, Universität Hildesheim, Germany; **Co-Author:**Laura Schultze, Universität Hildesheim, Germany; **Co-Author:**Gabriele Prinz, University of Hildesheim, Germany; **Co-Author:**Marvin Scott Schlamelcher, University of Hildesheim, Germany; **Co-Author:**Jürgen Menthe, University of Hildesheim, Germany; **Co-Author:**Barbara Schmidt-Thieme, University of Hildesheim, Germany; **Co-Author:**Christof Wecker, Universität Hildesheim, Germany

Instructional quality with its sub-dimensions of learning support, classroom management and cognitive activation has been a core topic in research on teaching for several decades. Factors that may influence instructional quality include teacher characteristics such as teachers' professional knowledge and their beliefs and motivational orientations. A systematic overview of empirical evidence concerning relevant teacher characteristics and a critical assessment of their relative importance for instructional quality is currently lacking. The present paper reports on a meta-analysis that investigates to what extent a broad array of cognitive and motivational teacher characteristics is related to instructional quality. A literature search using ERIC, PsycINFO and Psyndex followed by an initial screening based on titles and abstracts and a second selection step based on the full texts has yielded 45 studies so far. Correlation coefficients extracted from the studies are integrated by means of a meta-analytical structural equation model (MASEM). First results indicate that both teachers' self-efficacy and their professional knowledge have a significant small positive association with instructional quality. Subsequent analyses will include relationships of further teacher characteristics instructional quality. The results of this meta-analysis can provide important information for teacher training as to which aspects are particularly relevant as potential targets for teacher training.

Teachers' attributes for academic optimism: understanding its development for equity and excellence
Keywords: Attitudes and Beliefs, Cultural Diversity in School, School Effectiveness, Teacher Efficacy

Presenting Author: Ruud Lelieur, University of Antwerp, Belgium; **Co-Author:**Ruben Vanrusselt, University of Antwerp, Belgium; **Co-Author:**Noel Clycq, University of Antwerp, Belgium; **Co-Author:**Jan Vanhoof, University of Antwerp, Belgium

Teacher academic optimism (TAO) is an important teacher characteristic influencing student achievement, even after controlling for background variables such as SES and migration. Academically optimistic teachers believe they can make a difference, build trusting relationships with students and parents, and focus on learning. This study examines how teachers attribute causes for high or low levels of TAO (RQ1) and the role of the number of disadvantaged students and the level of school academic optimism (SAO) in making these attributions (RQ2). Data were collected through semi-structured interviews with 16 teachers from eight secondary schools differing by the level of SAO and the number of disadvantaged students. Matrix coding queries and cluster analysis show that teachers attribute causes for high degrees of TAO both internally and externally, but mainly stable and controllable. Low levels of TAO are attributed exclusively externally and outside their control, but both stable and unstable. In addition, teachers in academically optimistic schools are more likely to attribute high levels of TAO to positive school characteristics that are stable and controllable. Moreover, they explain low levels of TAO less frequently with causes referring to students' disadvantaged backgrounds, compared to colleagues from less optimistic schools. In conclusion, teachers in academically optimistic schools seem to speak differently about their students, their school, and themselves. In the way they attribute low or high levels for TAO opportunities are seen and responsibilities are recognised. This creates possibilities for increasing academic optimism by addressing teachers' perceptions and attributions. Theoretical and practical implications are presented.

Teacher Training for Whole Child Outcomes: Evidence of the impact of Teach For Nigeria

Keywords: Achievement, In-service Teachers, Primary Education, Teacher Effectiveness

Presenting Author: Kata Mihaly, RAND Corporation, United States; **Co-Author:**Jonathan Schweig, RAND Corporation, United States; **Co-Author:**Elaine Wang, RAND Corporation, United States; **Co-Author:**Sabrina Lee, RAND Corporation, United States

Substantial research has shown that classroom teachers play a critical role in shaping the lives of young people in their classrooms, both academically and in terms of their social and emotional development. Given this, initiatives focused on improving teacher recruitment, training, and development pipelines may be critical to improving schools and the lives of young people. This paper summarizes the results of a mixed-methods quasi-experimental study evaluating the impacts of Teach For Nigeria (TFN) on student development, teaching practice, the quality of the learning environment, and school climate. It is the first rigorous study of a large-scale teacher certification program in Nigeria, and the first of which we are aware to focus on academic and non-academic outcomes. We found evidence that student academic achievement improved more for students of TFN teachers compared to students of non-TFN teachers in both math and reading. We found limited evidence that the TFN program impacted student social and emotional learning, quality of teaching, and the wider school community. Qualitative data from a subsample of TFN schools suggest TFN teachers' classrooms have distinct characteristics that support students' academic and social and emotional development. Implications of results for teacher training programs are discussed.

Adaptive Teaching: What Research on Learning and Instruction Can Learn from Schools

Keywords: Primary Education, Qualitative Methods, Teaching Approaches, Teaching/Instructional Strategies

Presenting Author: Hanna Dumont, University of Potsdam, Germany; **Co-Author:**Jasmin Decristan, University of Wuppertal; IDeA-Research Center, Germany; **Co-Author:**Benjamin Fauth, Institute for Educational Analysis, Germany; **Co-Author:**Nora Fröhlich, Institute for Educational Analysis, Germany; **Co-Author:**Ann-Kathrin Jaekel, University of Tuebingen, Germany; **Co-Author:**Simon Ohl, University of Potsdam, Germany; **Co-Author:**Enkeleta Shtërbani, Bergische Universität Wuppertal, Germany

In recent years, many researchers, practitioners and policy-makers alike call for adapting teaching to student differences in order to better meet the needs of each student. However, we still know little about how such a pedagogical approach of adapting teaching may actually look like in practice. Using a purposive sample of 20 award-winning, innovative schools, the present study aimed to fill this gap by conducting interviews with the school principals of these schools on their pedagogical approach in dealing with student heterogeneity. The results show that the nature of learning and instruction in these schools looks very different from a typical teacher-led classroom instruction. For instance, students follow their own learning path via methods of differentiation and individualization, there is a lot of flexibility in terms of time and space. Further, teachers work together in multi-professional teams. This implies that the typical research tools used to measure teaching quality and teaching effectiveness may need to be adjusted for the study of adaptive teaching in order to account for its complex nature.

What do pre-service teachers' personality scores measure? A longitudinal study on college admission

Keywords: Achievement, Higher Education, Personality, Pre-service Teachers

Presenting Author: Georg Krammer, University College of Teacher Education Styria, Austria; **Co-Author:**Julie Aitken Schermer, The University of Western Ontario, Canada; **Co-Author:**Corinna Koschmieder, University College of Teacher Education Styria, Austria; **Co-Author:**Richard Goffin, The University of Western Ontario, Canada; **Co-Author:**Nhung Hendy, Department of Management, Towson University, United States; **Co-Author:**Michael Biderman, University of Tennessee at Chattanooga, United States

Personality in teacher education is ensnared by an ongoing and recurring debate. Along this debate, countries have instated college admission processes to initial teacher education (ITE). Therein, personality traits play a vital role. This raises the concern whether prospective pre-service teachers – like other applicants – are prone to present themselves more favourably than they would otherwise. To address this concern, we scrutinize if personality assessed in a selection process to ITE retains its predictive validity for academic achievement. Furthermore, we scrutinize if distorting effects of selection processes can be removed from personality responses.
We do so in a four-year long longitudinal study on pre-service teachers' personality traits and their academic achievement. Personality (i.e. Big Five) was assessed in the selection process to ITE and 10 month later in a neutral setting. Academic achievement was assessed by grade point averages over pre-service teachers' entire bachelor's degree.
Results showed that pre-service teachers presented themselves more favourably for selection. However, their rank-order stabilities were as expected (mean r = .503). Predictive utilities were retained, but could be increased by accounting for general and item-specific response distortions. For applicants, the general response distortion even contributed to the predictive utility.
In summary, our results bolster the use of personality assessment for selection to ITE. To sophisticate personality assessment in selection to ITE, we advocate modelling of applicants' general response distortion. Such consideration may increase the effectiveness of educational policies instating selection processes for prospective pre-service teachers.

Teacher emotions and their antecedents in the team-taught classroom from the teachers' perspective

Keywords: Emotion and Affect, In-service Teachers, Qualitative Methods, Secondary Education

Presenting Author: Franziska Muehlbacher, University of Salzburg, Austria; **Co-Author:**Gerda Hagenauer, University of Salzburg, Austria; **Co-Author:**Melanie M. Keller, IPN Leibniz Institute for Science Education, Germany

Teachers experience many emotions during teaching, which influence the teacher-student relationship, teachers' instructional quality and their well-being. This study investigates teacher emotions in the team-teaching setting. During team-teaching lessons, two teachers are responsible for classroom teaching. Based on an appraisal-theoretical understanding of emotions, we assume that one teacher experiences emotions within the social interactions they have with their team partner in the classroom. This study aims to examine which discrete emotions team teachers experience because of their partner teacher and their causes. To this end, we conducted qualitative, semi-structured online interviews with 30 Austrian team teachers in lower secondary education. The interviews were transcribed verbatim and analysed using structuring, qualitative content analysis. Overall, we found that team teaching is highly emotional for teachers. Regarding teachers' discrete emotions, we identified 44 distinct positive and negative emotions (e.g. joy, gratitude, anger, insecurity). Concerning the antecedents of emotions, we found eight major categories. A team's shared understanding of goals and values, the team-teaching setting itself, characteristics of the collaboration (e.g. support), and characteristics of the team partner's lesson (e.g. teaching style) were named as elicitors of emotions. Team teachers furthermore reported that characteristics of the team partner (e.g. approach to mistakes), of oneself (e.g. achievement pressure during team-teaching), of the team partner's relationship with students (e.g. (un)fair treatment) and of the team's interpersonal and professional relationship (e.g. interruptions) can trigger positive and negative emotions in the team-taught classroom. The results will be discussed in relation to high-quality team-teaching practices and teacher professionalisation.

Associations between mentor teachers' motivation and their behavior and enthusiasm in mentoring
Keywords: Mentoring and Coaching, Motivation, Quantitative Methods, Teacher Professional Development
Presenting Author: Clara Kuhn, University of Salzburg, Austria; **Co-Author:**Gerda Hagenauer, University of Salzburg, Austria; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Andreas Bach, University of Salzburg, Austria

The quality of school-based mentoring plays a crucial role in the professional development of students in school placements. The importance of mentor teacher motivation is also considered relevant for the quality of mentoring. Against the background of the expectancy-value-theory (Eccles & Wigfield, 2002), the study examines the extent to which the expectations and values that mentors attach to mentoring are associated with constructivist vs. transmissive mentoring styles and the enthusiasm of mentor teachers. In this study, *N*=189 Austrian mentor teachers were surveyed in an online questionnaire about their mentoring behaviour. The path-analytical results show that high expectations of success and a high attribution of values related to the social utility value of mentoring are associated with higher constructivist behaviour in mentoring. Transmissive behaviour in mentoring, on the other hand, correlates positively with the extrinsic personal utility value of mentoring. With regard to enthusiasm for mentoring, the results show that enthusiasm is high when the mentor teachers have a strong intrinsic motivation and mentoring has a high intrinsic personal utility value for them. From the findings, it can be concluded that the motivation of the mentor teachers contributes to explaining differences in the quality of mentoring.

Beginning teachers' basic psychological needs: a multi-informant to optimize initial guidance
Keywords: Anxiety and Stress, Secondary Education, Teacher Efficacy, Well-being
Presenting Author: Silke Hellebaut, University of Ghent, Belgium; **Co-Author:**Katrien De Cocker, Ghent University, Belgium; **Co-Author:**Leen Haerens, Ghent University, Belgium

Beginning teachers frequently experience difficulties in dealing with many challenges related to teaching (Veenman, 1984).This often results in high dropout among beginning teachers (Borman & Dowling 2008; Fantilli & McDougall, 2009). To avoid this early drop-out, optimal initial guidance is needed (Ingersoll & Strong, 2011). In previous studies the positive impact of initial guidance initiatives have been shown (Ingersoll & Strong, 2011). However, it is still not clear how the initial guidance can be optimally organized to take into account the psychological well-being and degree of self-efficacy of beginning teachers, which are crucial teacher characteristics related to teacher retention. For these reasons, the aim of this study is to investigate (1) which factors influence the psychological well-being among beginning teachers, (2) which factors influence the perceived self-efficacy of beginning teachers, and (3) what does means for the initial guidance of beginning teachers. To answer these research questions, video interviews were conducted in a sample of 33 beginning teachers. We found that especially the administrative tasks and the high workload during the first weeks of teaching negatively influenced the psychological well-being. Further, the lack of classroom management and feeling less competent in the role of a class teacher were the factors that negatively influence self-efficacy. In addition, this study shows the need to develop more teacher-tailored initial guidance. Further implications will be discussed. Key words: initial guidance, teachers well-being, stress, job satisfaction, self-efficacy

BYOD and technology use in class: Does it really have an impact?
Keywords: Computer-assisted Learning, Large-scale Assessment, Quantitative Methods, Secondary Education
Presenting Author: Maria-Luisa Schmitz, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Chiara Antonietti, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Tessa Consoli, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland; **Co-Author:**Philipp Gonon, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland

Although Bring-Your-Own-Device (BYOD) is a widespread approach in upper-secondary schools with many potential advantages, studies on the actual effects of BYOD on digital classroom practices are scarce. The present study aims to examine the effects of BYOD on the frequency of students` technology use in class. In particular, we examine the effects of an official BYOD program, the number of years this official program has been in place, and the number of students indicating that they use their own devices during lessons. In addition, we investigated the influence of teachers` attitudes toward digital technologies ("will"), of their skills in teaching with digital technologies ("skill"), and of their perceived quality of the schools` infrastructure ("tool") on the frequency of students` technology use in class. Multilevel structural equation modeling (MSEM) analyses show that all three aspects of BYOD (official program, years, and percentage of students using their own device) have a significant and positive impact on the frequency of students' technology use in class. Moreover, only will- and skill- but not tool-scores significantly predict the dependent variable. As one of the first larger survey studies, we could show that BYOD has an actual influence on digital practices in class. Furthermore, the study indicates that in a high-tech country like Switzerland, teachers` beliefs and skills are more important for technology use in class than the technical equipment of a school.

Personalized Learning with Digital Technologies – A mixed-methods study in secondary schools
Keywords: Computer-assisted Learning, Educational Technologies, In-service Teachers, Teacher Effectiveness
Presenting Author: Regina Schmid, Schwyz University of Teacher Education, Switzerland; **Co-Author:**Christine Pauli, University of Fribourg, Switzerland; **Co-Author:**Rita Stebler, University of Zurich (retired), Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland

Various schools have been changing their culture of teaching and learning towards personalized learning, and often used digital technologies for support. However, there is a lack of research on how digital technologies are used in schools with personalized learning approaches and how this use relates to quality

features of instruction. As the concept of personalized learning is multilayered and no common definition exists, our study relies on two theoretical dimensions ("Student-centered teaching methods"; "students' choice and voice") to investigate the relationship between technology-supported personalized learning and students' perceived instructional quality. For this purpose, we analyzed survey data of 8th grade students (N = 860) from 31 Swiss schools that have implemented personalized learning and use digital technologies. In addition, based on this data, we selected three schools with the most frequent use of digital technologies, to investigate how teachers implement digital technologies to facilitate and promote personalized learning. Results of the quantitative analysis show that student-centered teaching methods in the context of technology-supported personalized learning stimulate the cognitive activation of the students, and the supportive climate increases slightly with a higher degree of students' voice and choice on the computer. Our qualitative analyses resulted in three different case descriptions in terms of how schools integrate digital technologies into their daily practices. All cases indicate that there is still a lot of potential to support personalized learning through the use of digital technologies.

How do test-takers rate their effort? A comparative analysis of self-report and log file data
Keywords: Assessment Methods, Educational Technologies, Engagement, Problem Solving
Presenting Author:Róbert Csányi, SZTE, Hungary; **Co-Author:**Gyöngyvér Molnár, University of Szeged, MTA-SZTE Digital Learning Technologies Research Group, Hungary

Students' cognitive test performance is not only determined by their actual knowledge and skills, but can be strongly influenced by various affective factors, including partial or total lack of test-taking effort (Wise et al., 2014). The aim of the research is twofold: (1) to comparatively analyse the methods of measuring test-taking effort, and (2) to identify and characterise the profiles of students that can be distinguished on the basis of test-taking behaviour.The research sample consisted of first-year university students (N=1748). Computer-based data collection was carried out using the eDia platform and students were presented with interactive problems that required no prior knowledge. Students' test-taking effort was measured in two ways: (1) by a self-report questionnaire, and (2) by analysing log data (time spent on tasks, number of clicks). We applied k-means cluster analysis, that was successfully used in previous research on test-taking behavior (Goldhammer et al., 2017; Lundgren & Eklöf, 2020). The students' test-taking effort was consistent with their overall test performance. This correlation proved to be weaker based on the self-reported questionnaire data (r = .110) than on their actual test-taking behavior (r = .371). Both the self-report questionnaire and the log data showed a decrease in test-taking effort during the test. Based on the k-means cluster analyses, three groups of students were identified: (1) low effort, (2) high ability with medium effort, and (3) low ability with high effort. Results suggest that self-report questionnaire data are not consistent with students' actual test-taking behavior.

Does frustration of students' needs matter in relation to burnout and engagement?
Keywords: At-risk Students, Burnout, Engagement, Higher Education
Presenting Author: Piermarco Consiglio, University of Groningen, Netherlands; **Co-Author:**Joke Fleer, University of Groningen, Netherlands; **Co-Author:**Ellen Jansen, University of Groningen, Netherlands; **Co-Author:**Marjon Fokkens-Bruinsma, University of Groningen, Netherlands

Burnout is generally considered one of the causes of student dropout. On the contrary, engagement increases student academic performance. Previous research assessed the relationship between satisfaction of the basic psychological needs for autonomy, competence, relatedness and engagement and burnout. However, it remains unclear if university students' frustration of the three needs is related to engagement, primary and secondary symptoms of burnout. Based on the Self-Determination Theory, this work aims to assess the association between the frustration of the basic psychological needs for autonomy competence, relatedness and engagement, primary and secondary symptoms of burnout. Three multiple hierarchical regressions in a sample of 459 university students revealed that need for relatedness is not as crucial as the need for autonomy and competence in predicting student primary burnout symptoms and engagement. Yet, all three psychological needs were associated with the secondary symptoms of burnout. The abstract concludes with directions for future research and the implications of our findings. Keywords: University students; Frustration of basic psychological needs; Burnout; Engagement

Developing and validating a measure for the perceived civic and vocational relevance of studies
Keywords: Assessment Methods, Attitudes and Beliefs, Higher Education, Motivation
Presenting Author: Jonas Breetzke, University of Hamburg, Germany; **Co-Author:**Derya Özbagci, University of Hamburg, Germany; **Co-Author:**Carla Bohndick, University of Hamburg, Germany

In recent years, both the vocational and the civic relevance of higher education programmes have developed into guiding principles of most higher education institutions. Additionally, both factors are vital for study motivation, as most students want a degree program associated with good opportunities in the labour market and a positive impact on society. Despite its importance for both higher education institutions and students, there is a clear lack of validated scales that assess the perceived relevance of higher education studies. To address this, the present study describes the development and validation of two scales measuring how higher education students perceive the vocational and civic relevance of their studies. The scales were developed and validated in three independent studies with a total of N = 1.610 participants. We examined a) the factor structure of the scales, b) their measurement invariance across gender and study subject, c) their correlation with educational outcomes, and d) their development across the semester. Results of the confirmatory factor analyses support the postulated factor structure. Both scales show good reliability, strong measurement invariance across gender and study subject and were stable over the course of a semester. Correlations of both scales with different educational outcomes were in line with prior research and, thus, established further evidence for a valid interpretation of the scales. Different applications in and implications for research on students perceived relevance studies are discussed.

Longitudinal associations between intrinsic study motivation and achievement at university
Keywords: Achievement, Higher Education, Motivation, Quantitative Methods
Presenting Author: Laura Aglaia Sophia Messerer, University of Mannheim, Germany; **Co-Author:**Ronny Scherer, University of Oslo, Norway; **Co-Author:**Stefan Janke, University of Mannheim, Germany

A lack of (intrinsic) study motivation and difficulties to perform well are typically considered the major causes for students to drop out of higher education. However, research on the longitudinal interplay between these two factors is lacking—especially in the context of higher education. The effects in both directions seem plausible: Intrinsic study motivation may affect performance, because motivated students try harder and invest more time. Nevertheless, performance could also affect intrinsic study motivation, because students who perform well may develop a sense of competence, which is in turn crucial for the development of intrinsic study motivation. It is our aim to provide new insights into the temporal associations between intrinsic study motivation and achievement. To achieve this, we conducted a longitudinal study with six time points covering the full duration of a bachelor program for 1349 undergraduate students. Using a random-intercept cross-lagged panel model, we found strong, stable, and positive relations between intrinsic study motivation and study grades on the inter-individual (between) level. Moreover, we found some evidence for temporal trends on the intra-individual (within) level, as intrinsic study motivation was predictive for a positive development in study performance at subsequent time points. This trend emerged within later semesters (but not in the

freshmen year), indicating that an early development of stable intrinsic study motivation may make students more resilient to the challenges they face during their later years at university.

(Help me to) motivate me: Promoting motivation and motivational regulation in higher education
Keywords: E-learning/ Online Learning, Higher Education, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Sophie von der Mülbe, University of Augsburg, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany

Declining motivation to study is a widespread phenomenon among students in higher education, which can have serious consequences for study performance and can often be attributed to a lack of self-regulation of motivation. Because of high dropout rates in the STEM field, a training program combining direct promotion of motivation with promotion of motivational regulation was developed and tested for its effectiveness with STEM students. In addition to proximal effects on expectancy, value, and the use of motivational regulation strategies, distal effects on procrastination, study satisfaction, and dropout intentions were intended. Pretest and posttest data were assessed from 62 students of which 37 were randomly assigned to the training group and participated in nine digital, approximately 30-minute training sessions over the course of the semester. The remaining 25 students were assigned to the control group. For the subjective value of studying, the use of motivational regulation strategies and study satisfaction, the intended training effects proved to be statistically significant. For expectancy of success, procrastination, and dropout intentions, no training effects could be statistically verified. Overall, the results provide evidence that the training has at least partially the intended effects. This indicates that a training that combines direct promotion of motivation with promotion of self-regulation of motivation could be a fundamentally worthwhile approach.

Early career teachers' professional agency and associations with leadership vision and school size
Keywords: In-service Teachers, School Leadership, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Liyuan E, University of Helsinki, Finland; **Co-Author:**Auli Toom, University of Helsinki, Finland; **Co-Author:**Jenni Sullanmaa, Tampere University, Finland; **Co-Author:**Janne Pietarinen, University of Eastern Finland, Finland; **Co-Author:**Tiina Soini-Ikonen, Tampere University, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland

Professional agency plays a crucial role in teachers' professional development, pedagogical innovation, constructing professional identity, and promoting school improvement. Early career teachers' professional agency in the classroom consists of motivation to continuously learn, self-efficacy beliefs for learning, and intentional activities to facilitate and manage learning. This study explores the relationship between early career teachers' professional agency in the classroom, their perceived leadership vision, and school size. A total of 779 Chinese early career teachers, including primary and junior secondary school teachers, completed the questionnaire and the data were analyzed by using structural equation modelling (SEM). The results showed that early career teachers' perception of leadership vision contributes to their sense of professional agency in the classroom. The findings also revealed that school size was related to early career teachers' professional agency in the classroom. This implies that it is important to foster the development of school leadership for promoting early career teachers' active learning in the classroom.

Supporting Teacher Agency During a Collaborative Inquiry-based In-service Teacher Education Course
Keywords: In-service Teachers, Inquiry Learning, Quantitative Methods, Teacher Professional Development
Presenting Author:Äli Leijen, University of Tartu, Estonia; **Co-Author:**Margus Pedaste, University of Tartu, Estonia; **Co-Author:**Liina Lepp, University of Tartu, Estonia

Teacher agency has been explored in many studies in different contexts, however research on supporting agency is somewhat limited. In this study, we aimed to support teacher agency in a collaborative inquiry-based in-service course developed based on the ecological model of teacher agency and earlier empirical studies. We conducted a study among 57 course participants to explore the potential impact of the course on participants' agency and investigated which role the motives to join the course had on participants' agency dynamics. Data were collected with questionnaires from 40 participants. The results showed that participants' agency was supported to some degree during the collaborative inquiry-based in-service training course, teachers' motives to join the course were somewhat related to professional agency dynamics.

Unpacking Relationships Among Teacher Agency, Attribution, and Resilience in an Age of Neoliberalism
Keywords: In-service Teachers, Qualitative Methods, Resilience, Self-concept
Presenting Author: Ji Hong, University of Arizona, United States; **Co-Author:**Dionne Cross Francis, University of North Carolina at Chapel Hill, United States; **Co-Author:**Kelly Chong, Round Rock Children's Therapy Center, United States; **Co-Author:**Laura Lewis, University of Oklahoma, United States; **Co-Author:**Alex Parsons, Salt Lake City School District, United States; **Co-Author:**Crystal Recknagel, J.J. Pearce High School, United States; **Co-Author:**Qian Wang, University of Oklahoma, United States

Despite the growing research on teacher resilience, the ways teachers develop and enact resilience as they manage work-related challenges are understudied. As the effects of neoliberalism seep into schooling, the extent to which teachers believe they can exercise agency to change problematic situations is central to the way they cope with or manage challenges. This study unpacks the relationship between teacher resilience and agency by showcasing teachers from two schools. Although both schools faced significant challenges, these challenges, as well as the coping mechanisms employed, varied across the two schools. We observed that the challenges varied in duration and intensity, and teachers' levels of resilience were associated with their attributional beliefs, which influenced their sense of agentic control. This study shows the role of teachers' attribution beliefs and agency in the ways teachers exercise resilience and how they manage or fail to manage these challenges.

A questionnaire for assessing teacher agency across pre-service and in-service context
Keywords: In-service Teachers, Pre-service Teachers, Quantitative Methods, Teacher Professional Development
Presenting Author:Äli Leijen, University of Tartu, Estonia; **Co-Author:**Margus Pedaste, University of Tartu, Estonia; **Co-Author:**Aleksander Baucal, University of Belgrade, Serbia

Teacher agency is considered a key characteristic describing teacher professional competence; however, there are only limited questionnaires currently available for studying teacher agency. In our study we followed the ecological model of teacher agency and developed a questionnaire that allows to differentiate eight dimensions of agency. Three to four questions were formulated for each dimension in two domains: planning of teaching and learning activities, using information and communication technologies (ICT) in teaching. Data was collected electronically from 354 teachers (76 – pre-service, 278 – in-service) in Estonia. Confirmatory factor analysis showed acceptable fit of the eight factor model in two different domains where teachers often make decisions – planning of teaching and learning activities and using information and communication technologies in teaching. Comparison of configural, metric, and scalar models revealed good invariance of the model across the groups of pre-service and in-service teachers. Therefore, the new questionnaire seems to be suitable and sensitive for monitoring teacher agency throughout teacher career.

School Diversity Models and Relations with Achievement: Does the Domain Matter?
Keywords: Achievement, Migrant / Refugee and Minority students, Multicultural Education, Primary Education
Presenting Author: Roy Konings, KU Leuven (BE), Belgium; **Co-Author:**Orhan Agirdag, KU Leuven / University of Amsterdam, Belgium; **Co-Author:**Jozefien De Leersnyder, KU Leuven / University of Amsterdam, Belgium

Research shows that how schools deal with ethnic-cultural diversity, or the School Diversity Model (SDM) they adopt, is important for students' achievement. For instance, schools could try to reduce (assimilationism), ignore (color-blindness) or embrace diversity (pluralism). However, it is not yet clear whether one and the same approach to diversity may be differently related to achievement depending on the domain in which that approach is applied, such as whether the approach is applied to dealing with linguistic, religious or curricular diversity, or more generally to dealing with diversity in pupils' identities. Therefore, in this study we focus on how the *domain-specific* perceptions of SDMs among 10-12 year old primary school students in Flanders are related to their achievement on a standardized mathematics test. We find that assimilationism is mostly unrelated to achievement across domains, whereas for color-blindness and pluralism it strongly depends on the domain in which the SDM is applied. Particularly paying attention to critical consciousness and the colonial history in the curriculum, as well as paying attention to color-blindness in the curriculum (but not in the linguistic domain) were beneficial for achievement scores.

Sense of belonging of children with and without a migration background in Austria
Keywords: Large-scale Assessment, Migrant / Refugee and Minority students, Primary Education, Social Aspects of Learning and Teaching
Presenting Author: Saranda Shabanhaxhaj, University of Graz, Institute of Education Research and Teacher Education, Austria; **Co-Author:**Heike Wendt, University of Graz, Austria

Respectful interaction is not only the basis for the learning environment, but also for living together in democratic society. Especially for children with a migration background, positive social and respectful relationships are the basis for political socialisation and engagement (Teuscher & Makarova, 2018; Ziemes, 2022). Therefore, the focus of this paper is to identify differences in the sense of belonging of children with and without a migration background in order to gain additional understanding of the students' experience of social relationships. The theoretical framework is mapped using the self-determination theory (Ryan & Deci, 2017). For this purpose, data from the TIMSS study 2019 (Schwippert et al., 2020) are regression analysed using the IEA IDB Analyser. The results show that, on average, students with a migrant background report significantly more frequent a low sense of belonging. Furthermore, it also shows that primary school pupils with a migration background perform better when they feel a high sense of belonging which emphasises the relevance of educational integration work.

Emotion Differentiation Ability & School Belonging among Flemish Multilingual and Monolingual Pupils
Keywords: Cultural Diversity in School, Educational Policy, Emotion and Affect, Migrant / Refugee and Minority students
Presenting Author: Graziela N.M. Dekeyser, KU Leuven (BE), Belgium; **Co-Author:**Orhan Agirdag, KU Leuven / University of Amsterdam, Belgium; **Co-Author:**Jozefien De Leersnyder, KU Leuven (BE), Belgium

In Flanders, significant gaps in sense of school belonging (SSB) exist between majority monolingual Dutch-speaking and minority multilingual pupils speaking Dutch as well as a non-Dutch heritage language (HL). In this study, we investigate the role of emotional competence in explaining these SSB differences. Although multilingual children are expected to have a multilingual advantage in emotional competence and thus SSB, we hypothesize that whether or not this multilingual advantage materializes may critically depend on children's language proficiency profile and the language policy of the school. Multilevel linear regressions are used to investigate our hypotheses among a sample of over 3000 pupils (aged 10 to 12) across 59 schools in Flanders. Preliminary analyses show that emotional competence significantly contributes to pupils' SSB. However, multilingual children do not outperform monolingual children in emotional competence. Moderated mediations of language policy and language proficiency profiles are to be further explored.

Immigrant-Origin Youths' Aspirations – a Cross-National Analysis Comparing the U.S. and Switzerland
Keywords: Attitudes and Beliefs, Cultural Diversity in School, Parents' Beliefs and Affect, Secondary Education
Presenting Author: Anita Caduff, University of California, San Diego, United States

Research has established that student aspirations are associated with educational outcomes. However, a nuanced understanding of how experiences and opportunities inform middle school students' professional aspirations has not yet been established. This examination is particularly interesting for immigrant-origin middle school students as research has shown that they often have higher ambitions than their non-immigrant peers. This cross-national study examines immigrant-origin adolescents' descriptions of why they pursue a specific profession in California (U.S.) and the canton of Bern (Switzerland). Thirty-eight hours of semi-structured interview data with 22 immigrant-origin students were qualitatively analyzed and cross-nationally compared. The findings show how the context of reception, parents, role models, strengths, challenges, and interests, shape immigrant-origin youths' aspirations. Implications for practice are discussed.

Study-Buddy: An educational chatbot for study advice on effective learning strategies
Keywords: Artificial Intelligence, Educational Technologies, Higher Education, Learning Strategies
Presenting Author: Tim Debets, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Martijn van Otterlo, Open Universiteit, Netherlands; **Co-Author:**Tanja Vos, Open Universiteit, Netherlands; **Co-Author:**Desirée Joosten-ten Brinke, Open University of the Netherlands, Netherlands; **Co-Author:**Gino Camp, Open Universiteit, Department of Online Learning and Instruction, Netherlands

During the last decades, research in Educational Sciences has shown that students find it difficult to evaluate the effectiveness of their learning strategies. Self-

study is an important aspect of any educational program and research in cognitive and educational sciences has rendered a good understanding of which study strategies work and which do not. To help students adopt these effective learning strategies instantly, and in a personalized manner, an educational chatbot will be developed. An intelligent chatbot can maintain a conversation with a user, answer questions and respond intelligently. The goal of this chatbot is to advise particular learning strategies based on context (e.g., the student's study program)and dialogue history. To improve the quality of the chatbot, prior dialogues in combination with techniques from the Artificial Intelligence subfield reinforcement learning will be utilized to train the chatbot. Hereafter, the chatbot can decide at each step in the dialogue what the next utterance should be, given the context of the user and the dialogue history. During the roundtable, the advisory aspects of the chatbot will be the centre of attention, what should this advice look like? How do wemeasure the effectiveness of the advice? These and similar questions willbe the main points of discussion.

Evaluating Elementary Student Experiences from Digital Safety Immersion Summer Camp
Keywords: Bullying, Educational Technologies, Ethics, Primary Education
Presenting Author: Florence Martin, North Carolina State University, United States; **Co-Author:**Doreen Mushi, North Carolina State University, United States; **Co-Author:**Julie Bacak, University of North Carolina Charlotte, United States; **Co-Author:**Weichao Wang, University of North Carolina Charlotte, United States

With the increase in technology use by elementary school students, it has become important for them to be educated on digital safety. This study examined learner's knowledge and experiences from participating in a digital safety immersion camp on digital identity and digital footprint, cyberbullying, netiquette and responsible online behavior and digital security and privacy. In addition, data on areas that they will change regarding digital safety, and aspects that they enjoyed the most during the camp were analyzed. Sixty of the 89 elementary school students for whom their parents provided consent to include the evaluation data for research completed the pre- and posttest assessments. The average score on the pretest was 10.93 and on the posttest was 13.43 out of 14 showing a statistically significant increase. Fifty-nine students completed the post camp evaluation survey with all four items rated above 3.4 on a scale of 4.0. Students indicated that the camp taught them how to interact safely and protect their private information online. Students had mentioned various aspects in cyberbullying, digital identity and digital footprint, digital privacy and security, and netiquette and responsible online behavior as areas that they would change. Students enjoyed the various digital safety topics but also mentioned the hands-on project using Pixton, and the instructors and the guest speakers. The findings from this study has implications for school administrators, teachers, technology specialists, parents, and students on the importance of digital safety education.

EU-FairPlay: Educational Equity and Digital Game-Based Learning. Current state of research.
Keywords: E-learning/ Online Learning, Game-based Learning, Inclusive Education, Multimedia Learning
Presenting Author: Zhitian Zhang, Hector Research Institute of Education Sciences and Psychology, University of Tübingen, Germany; **Presenting Author:**Markus Suren, TU Chemnitz, Germany; **Co-Author:**Helge Fischer, TU Dresden, Germany; **Co-Author:**Katerina Tsarava, University of Tübingen, Germany; **Co-Author:**Martina Seemann, TU Chemnitz, Germany; **Co-Author:**Richard Joos, TU Dresden, Germany

"EU-FairPlay" is a network project, currently consisting of seven international partner universities from different European countries and a core organization team from three German universities (University of Tübingen, Dresden University of Technology, Chemnitz University of Technology). The project's goal is to strengthen educational research and practice in the context of Digital Game-Based Learning (DGBL) with a special focus on educational equity. We aim to achieve our goal by bringing together national and international experts from the fields of Educational Technologies, Game Research, and Educational Research. Going forward, we plan regular network meetings and collaborations to generate relevant research output. One method that we are planning to use is Delphi (Scheibe et al., 1975). The aim of the Delphi study is to initiate a consensus-building process among multi-disciplinary experts, in order to identify the important topics and issues regarding DGBL and educational equity. With a three-round Delphi study, we will identify the top priority of the issue in discussion and reach a consensus among experts, leading to experts' group opinions and decisions. As a part of our open research framework practice, the submitted roundtable session in Thessaloniki offers a great opportunity for a more discursive exploration of our findings. In the roundtable session, participants will be invited to contribute to a discussion of the Delphi study output, add further remarks and facilitate consolidating all Delphi rounds' results and findings.

Identifying teachers' needs whilst working with a teacher dashboard: an explorative study
Keywords: Digital Literacy and Learning, Educational Technologies, Learning Analytics, Teacher Professional Development
Presenting Author: Manel van Kessel, Leiden University, Netherlands; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Inge Molenaar, Radboud Universiteit Nijmegen, Netherlands

Teacher dashboards visually display information about students, provided to teachers who may use this information to improve their teaching. An example of this information is students' progress on different tasks during a specific lesson. The use of these teacher dashboards is increasing in primary education. This study aims to better understand the forms of enactment and actions a teacher shows when working with a dashboard before, during and after giving a lesson, and the needs of teachers for effective dashboard use. We expect that complex characteristics, skills and knowledge may be directly related to dashboard use. In order to understand the needs of teachers, we collected data in the form of a logbook, to investigate if and how teachers use a dashboard whilst preparing a lesson. The lesson was observed, and the enactment was coded. An in-depth interview was conducted to better understand the needs of teachers, whilst working with a dashboard and to get an insight into how teachers make use of a dashboard after the lesson. The results from this study can be used to optimize the professionalization of teachers for effective dashboard use. In this Round Table session, we discuss which aspects participants of this session think are also important when effectively implementing a teacher dashboard, besides the earlier mentioned basic and complex characteristics.

ICT Demonstration
Lifelong Learning

Hybrid Human-AI Driven Personalized Education Tool

Keywords: Artificial Intelligence, Computer-assisted Learning, E-learning/ Online Learning, Lifelong Learning
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.Lack of personalization in learning is among the most important issues in the current educational systems. Learning is a personal process that depends on the learners' individual goals (e.g. desired jobs, skills, knowledge), context (e.g. where do they live?), and preferences (e.g. what are their preferred languages or content formats). Therefore, inclusive educational resources, which cover different needs, are required in offering high-quality personalized educational services. In this regard, open and free educational resources can play a role as they are created continuously by people around the world with different languages, preferences, levels of expertise, etc.Although open and free educational resources are extremely useful in offering high-quality learning environments, challenges such as lack of automatic and intelligent quality control processes and property (e.g. title, description, subject) extraction, which are required in building educational services (e.g., search and recommendations) limit the use of these educational resources.Therefore, we have designed an intelligent platform to utilize (open and free) educational resources for lifelong learners receiving personalized learning recommendations. To do this, we developed an open online learning recommender system with two main responsibilities. One component is responsible for the quality assurance of curricula by a hybrid, Human-AI content co-curation mechanism. The second responsibility is offering curated educational resources to the learners through a personalized learning dashboard. On this dashboard, with the help of AI, course and educational resource recommendations are used toward individual learning objectives and contexts.

Hybrid Human-AI Driven Personalized Education Tool
Presenting Author: Mohammadreza Molavi Hajiagha, Technical Information Library (TIB), Germany; **Co-Author:**Mohammadreza Tavakoli, German National LIbrary for Science and Technology (TIB), Germany; **Co-Author:**Gábor Kismihók, Leibniz Information Centre for Science and Technology, Germany

Please bring your own device if you are attending this ICT demonstration.Lack of personalization in learning is among the most important issues in the current

educational systems. Learning is a personal process that depends on the learners' individual goals (e.g. desired jobs, skills, knowledge), context (e.g. where do they live?), and preferences (e.g. what are their preferred languages or content formats). Therefore, inclusive educational resources, which cover different needs, are required in offering high-quality personalized educational services. In this regard, open and free educational resources can play a role as they are created continuously by people around the world with different languages, preferences, levels of expertise, etc.Although open and free educational resources are extremely useful in offering high-quality learning environments, challenges such as lack of automatic and intelligent quality control processes and property (e.g. title, description, subject) extraction, which are required in building educational services (e.g., search and recommendations) limit the use of these educational resources.Therefore, we have designed an intelligent platform to utilize (open and free) educational resources for lifelong learners receiving personalized learning recommendations. ICT Demonstration
Assessment and Evaluation

An R-Based Application to Code Texts Semi-Automatically

Keywords: Assessment Methods, Educational Technologies, Quantitative Methods, Writing/Literacy
Interest group: SIG 01 - Assessment and Evaluation

Please bring your own device if you are attending this ICT demonstration.In this ICT demonstration, I will present an application for semi-automatic coding of text responses. The presentation will begin by explaining the theory and method behind the app (reference blinded for review), and then outline simulation results using different datasets.The app comes as an R-based package and will be presented through detailed hands-on activities. No scripting or programming knowledge is necessary to follow along, as the app provides a graphical R-Shiny user interface. The software makes it possible to manually code a complete data set while being supported by an automatic coding assistant. The assistant, which implements the method, helps the human rater by automatically coding certain responses in the background, lightening the manual coding load. Thus, the assistant saves considerable work and costs. The process is based on word vector representations in a semantic space. Accordingly, responses are represented as vectors, which are subsequently clustered. The assistant explores the clusters systematically and presents responses to the human rater for manual coding. After each manual coding step, the coding assistant estimates the distribution of the remaining responses in the cluster. Suppose, under consideration of statistical confidence, that the cluster can be assumed homogeneous and contains similar responses to the ones coded manually. In this case, those responses are automatically assigned the majority label of manually coded responses. In simulations, depending on the item, manual labor was reduced by 52% on average while keeping miscodings at only 3% on average.

Learning and Instructional Technology

Meet Nearpod: A game-changing tool for student engagement

Keywords: Computer-assisted Learning, E-learning/ Online Learning, Educational Technologies, Game-based Learning
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.In this hands-on, interactive techno-pedagogical demonstration, we will explore *Nearpod*, a teacher-friendly digital platform used in schools and higher education in face-to-face, remote and hybrid learning contexts. I will show how educators at all levels can benefit from a variety of tools for alternative assessment in synchronous and asynchronous lessons. Participants will experience the use of interactive slides, games and collaborative activities, which encourage active learning and engagement for all students. In addition to presenting the tool and its pedagogical possibilities, I will present data from a recent study on pedagogy of care in online settings. Students describe the ways in which *Nearpod* enhanced their engagement and learning during COVID-19 and discuss how the tool motivated them and connected them to the lecturer and course content.

Keynote
Learning and Social Interaction

On the necessity of major and minor synvändor in the educational sciences

Keywords: Critical Thinking, Educational Policy, Social Aspects of Learning and Teaching, Social Interaction
Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Roger Saljo, University of Gothenburg, Sweden

On the necessity of major and minor synvändor in the educational sciences:UN-learning to RE-learn for epistemic-sustainabilityThis keynote aims to contribute to a re-thinking, un-learning and re-learning space that looks at some core ideas and assumptions related to contemporary societal and planetary concerns, including concerns within the research enterprise. Beyond offering an invitation to pause and re-think, this keynote interrogates universalizing vocabularies that fixate our ways of thinking and working in educational practices, including how our scholarship risks becoming complicit in re-cycling and re-creating reductionistic ideas that loop back into educational practices. My overarching argument aligns with an emergent call within research and higher education for going beyond its universalizing monolithic ethos.Marked through the concept synvändor and using a mobile gaze, I draw attention to the need for shifting perspectives in major and minor ways in research and educational work across K-12 and higher education. These synvändor are needed for epistemic-sustainability so that scholarship in areas of relevance to contemporary schooling and teacher-education – such as, communication, culture and diversity – can move beyond ethnocentrically framed biases and connect with challenges of our times. Troubling key taken-for-granted universalizing truths and using the areas of Language Sciences and Identity research as illustrative points of departure, I raise concerns about the outsourcing of important educational agendas to concepts that build on contentious assumptions. It is this default outsourcing that is troubled through a curiosity-driven multiversal and global-centric mobile gaze wherein both northern and southern knowledge-regimes are privileged.In contrast to universalizing hegemonies, global-centric scholarship enables multiversal framings that can contribute to epistemic-sustainability both in educational practices and in how research is produced and consumed. Providing hope, multiversality enables shifting research challenges and societal crisis towards epistemic-sustainability. The ideas presented in this keynote are based on my engagement with both north-centric and south-centric scholarship, including fieldwork and writings in and across northern and southern territories. Explicitly multi/inter/cross/trans-disciplinary, this work is relevant to epistemic-sustainability given its non-allegiance to mono-disciplinarity.

Learning and Social Interaction

Dealing with Disagreement: Coming to Terms with the Social Nature of Knowledge

Keywords: Inquiry Learning, Reasoning, Social Aspects of Learning and Teaching, Social Interaction
Interest group:
Chairperson: Raija Hämäläinen, University of Jyväskylä, Finland

In contemporary networked societies, the controversial nature of knowledge is increasingly in the public eye. When learners go online, they often encounter conflicting knowledge claims about scientific issues, current events, historical events, and more. Sometimes the experts are also in disagreement. Reasonably responding to such disagreements is vital for making wise personal and social decisions. But how can learners make sense of disagreements when their own knowledge of the disputed issues is limited? And how can they reconcile the conflicting perspectives of diverse epistemic authorities? In this talk, we will argue that disagreements in the public sphere are both a pressing educational challenge and a valuable opportunity for developing learners' understanding of the social nature of knowledge, including their own positions as knowers.First, we will present a framework that addresses how learners make sense of disagreements by understanding the nature and causes of the disagreement, evaluating competing sources and claims and, where possible, resolving the disagreement. We will also present empirical findings for each of these components and some of their reciprocal relations. This analysis can extend to understanding expert disagreement as well as disagreement more broadly. Second, we will discuss recent research efforts to foster learners' competence to reason about disagreements. Drawing on insights from these studies, we will illustrate emergent design principles and scaffolds for promoting productive engagement with disagreements. To conclude, we will present open challenges, such as identifying false controversies and understanding how expert consensus develops despite ongoing uncertainties. Learning to deal with disagreements, we propose, is an opportunity for grasping how knowledge is socially constructed through processes of debate and consensus formation, and how learners can manage their dependence on knowledgeable others in times of uncertainty.

Consciousness as a compass for navigating learning in uncertain times

Keywords: Curriculum Development, Educational Neuroscience, Metacognition, Self-efficacy
Interest group:
Chairperson: Maria Platsidou, Greece

Understanding consciousness as an awareness of the mind´s processes and content, this presentation has two main aims. First, to present a theoretical model of the development of consciousness. Based on theories and empirical evidence from developmental psychology and neuroscience, this model supports the argument that Theory of Mind and Metacognition are intertwined core elements of consciousness. We also argue that Theory of Mind and Metacognition are enhanced by underlying mechanisms, such as the efficiency and/or efficacy of executive functions (working memory, attention control and flexibility). Second, to present findings from recent studies conducted in our laboratory, showing that in different developmental phases (infancy, early and late childhood, and adolescence) different facets of consciousness and different aspects of executive functions exert a prominent role in learning. They, thus, differentially influence school performance at successive educational levels. Overall, these results point to the need to develop new curricula and teaching methods aligned to the students' abilities but also enabling individualization of teaching according to the possibilities of each individual student. It is proposed that this alignment between the development of consciousness and educational curricula is important if we are to fully capitalize on students' abilities and available skills, and, hence, foster their ability to meet the demands of a continuously changing society in times of uncertainty.

Invited Symposium
Learning and Social Interaction

Different Perspectives on Momentary Situated Engagement in Classroom Contexts

Keywords: At-risk Students, Classroom Management, Cooperative/Collaborative Learning, Educational Policy, Emotion and Affect, Engagement, Interest, Motivation, Peer Interaction, Primary Education, Problem Solving, Science Education, Social Interaction
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Raven Rinas, Augsburg University, Germany
Organiser: Ricardo Böheim, Technical University of Munich, Germany
Organiser: Jennifer Symonds, University College Dublin, Ireland
Discussant: Anastasia/Natassa Kyriakopoulou, Greece

This symposium brings together research from different disciplines (including self-regulation, motivation, conceptual change, social interaction) to promote cross-disciplinary discussions about the complex process of students' momentary situated engagement in classroom contexts. The four presentations in this symposium reflect contributions from the EARLI funded Integrated Model of Momentary Learning in Context (IMMoLIC) Emerging Field Group. Students' engagement can be studied across different grain sizes ranging from the microlevel (e.g., child learning in the moment) to the macrolevel (e.g., group of children in the class or school); Recently however, there has been a strong call for more fine-grained analyses of student learning. Integrating research from different disciplinary perspectives on students' momentary engagement holds great potential for exploring the context and conditions under which students engage in academic tasks, for identifying what keeps them engaged, and for understanding why their engagement may change from one moment to the next. To measure engagement at different momentary levels, two of the contributions use classroom observations, one contribution analyzes data from online discussions and the final contribution collects self-reported data from experience sampling. Results draw attention to the important role of context (such as class size, peer relations or group dynamics) and the relevance of individual learner characteristics (such as emotions and attitudes) that need to be considered in the process of students' momentary learning in classroom contexts. The discussant will comment on the benefits of integrating different theories and research areas to enhance our understanding of students' momentary situated engagement in classroom contexts.

Optimal Learning Moments in Finnish and US Science Classrooms: A Network Analysis Approach
Presenting Author: Xin Tang, Shanghai Jiao Tong University, China; **Co-Author:**I-Chien Chen, Michigan State University, United States; **Co-Author:**Jari Lavonen, University of Helsinki, Finland; **Co-Author:**Barbara Schneider, Michigan State University, United States; **Co-Author:**Joseph Krajcik, Michigan State University, United States; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

Optimal learning moments (OLM), or being also named as situational engagement (e.g., J. Inkinen et al., 2019), refer to the experienced engagement of an activity that an individual feels interested, be challenged and capable to finish it (Schneider et al., 2016). The present study examined the emotional and motivational correlates of OLM by using the co-occurrence network analysis and by including data: Finland and US. Both samples were from high schools and were measured using the experience sampling method in the science classrooms. The Finnish sample consisted of 282 students (age = 15-16) and the number was 533 for the US sample (age = 15-17). Co-occurrence network analysis showed that feelings of concentration, success, in control, and meeting self and others' expectation appeared frequently as a result of optimal learning moments. These results were highly consistent between Finnish and US science classrooms. However, when considering the mutual influence among the variables, country differences appeared. For Finnish students, optimal learning moments were mutually reinforced with the creative experiences and feelings of competitiveness and pride. In contrast, for US students, optimal learning

moments were closely with the attitudes towards science practices. In sum, this study enriched our understanding of optimal learning moments on its co-occurring experiences and on contextual differences.

Exploring Collaboration and Executive Functions in Open-Ended Problem-Solving in Mathematics
Presenting Author:K. Ann Renninger, Swarthmore College, United States; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Maria Consuelo De Dios, Swarthmore College, United States; **Co-Author:**Maeve R. Hogan, Swarthmore College, United States; **Co-Author:**Moe Htet Kyaw, Swarthmore College, United States; **Co-Author:**Ana G. Michels, Swarthmore College, United States; **Co-Author:**Marina Nakayama, Swarthmore College, United States; **Co-Author:**Pablo E. Torres, University of Cambridge, United Kingdom; **Co-Author:**Helena Werneck de Souza Dias, Swarthmore College, United States

Although momentary engagement has been studied at different levels of granularity, missing is an articulation of the similarities and differences between moments and how representative one moment is of another. In this study, we explore the cognitive and the behavioral engagement of two groups of urban middle school students during the math-related moments of their problem solving in the online Virtual Math Teams (VMT) environment. We used a fine-grained, moment-to-moment analysis to describe the process of students' learning during group work (RQ1) and how their executive functions and collaborative problem solving (CPS) unfolded from moment to moment (RQ2). We found that there were no significant differences in the relative proportion of each phase of problem solving (exploring, constructing, checking) they engaged, and that the students were more likely to engage in discussions when exploring or checking, than when they were constructing. Differences in the two groups' CPS appeared to inform the type of problem solving engaged, but may not, at least by the final session, result in different levels of achievement. To the best of our knowledge, this study is among the first to detail students' cognitive and behavioral engagement in open-ended problem solving. That moment to moment differences were documented, along with similar levels of achievement at the time of the final problems session, extends previous research by pointing to the individual, and equally productive, pathways that may characterize group work. Replication of these findings and study of groups which vary in interest is needed.

Class Size, Momentary Behavioural Engagement, and Low Income Schools: An Irish National Study
Presenting Author: Jennifer Symonds, University College Dublin, Ireland; **Co-Author:**Aisling Davies, University College Dublin, Ireland; **Co-Author:**Seaneen Sloan, University College Dublin, Ireland; **Co-Author:**Dympna Devine, University College Dublin, Ireland; **Co-Author:**Gabriella Martinez Sainz, University College Dublin, Ireland; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Matt Somerville, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Edward Baines, UCL Institute of Education, London, United Kingdom; **Co-Author:**Xin Tang, Shanghai Jiao Tong University, China; **Co-Author:**Niamh Oeri, University of Bern, Switzerland; **Co-Author:**Raven Rinas, Augsburg University, Germany; **Co-Author:**Florian Bühler, University of Bern, Switzerland; **Co-Author:**Gertraud Benke, Klagenfurt University, Austria

This study used systematic observation to test whether children's momentary behavioural engagement was poorer in larger classes, and whether this relationship was impacted by being in a low income school receiving government supports. Data were collected with 632 children (50.5% female) in 121 classrooms in 92 schools recruited into the Children's School Lives nationally representative cohort study of Irish primary schooling. The Observational and Research Classroom Learning Evaluation (ORACLE) systematic observation tool was used to observe individual children's behaviour at 30-seconds intervals across a five minute period in ordinary lessons of English, mathematics, science or Irish. Multilevel mediation analysis tested for the impact of class size and DEIS schooling on ten forms of momentary behavioural engagement and disengagement at the classroom level controlling for children's age, gender, ability, family affluence, and migrant status at the individual level. Results indicated that engagement was more frequent in smaller classes and disengagement was more frequent in larger classes. Being in a low income school receiving government supports promoted less behavioural disengagement, and this association was mediated by smaller classes in low income schools.

Peer Relations, Engagement and Achievement in Primary School Classrooms
Presenting Author: Edward Baines, UCL Institute of Education, London, United Kingdom; **Co-Author:**Matt Somerville, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Yue Zhao, University College London, United Kingdom; **Co-Author:**Jennifer Symonds, University College Dublin, Ireland; **Co-Author:**Aisling Davies, University College Dublin, Ireland; **Co-Author:**Peter Blatchford, UCL Institute of Education, United Kingdom

Previous research suggests connections between peer relationships as expressed both inside and outside of the classroom and children's engagement and learning within the classroom. However only a few studies have explored these connections in detail or considered the possible processes that may begin to explain connections. This study sought to collect systematic data from pupils within primary school classrooms that would help clarify the role of peers in classroom engagement and learning. This multi-method study involved the use of peer-sociometric questionnaires to provide measures of in-class peer relations, informal peer relations such as acceptance and friendships, and social network variables. Self-report questionnaire data provided data on school engagement and disengagement and disaffection. Science attainment data were collected at the start and end of the year. Data on these measures were collected from over 500 pupils based in English primary schools. A subsample of pupils were also observed in class in terms of their momentary behavioural engagement during individual, pupil-pupil and whole class working and were rated by their teachers in terms of their attention and behaviour in class. Findings show moderate associations between multi-method measures of momentary and classroom engagement and small associations between peer relations measures, multiple measures of school and classroom engagement and attainment. Multiple regressions, controlling for class and school level variables, were conducted to examine peer relations measures relative to school/classroom engagement and learning outcomes. Findings are discussed in relation to previous research and theory, focusing on the complex inter-connections between measures and explanatory mechanisms.

Session M 2

25 August 2023 12:00 - 13:30
AUTH_CH
Invited Symposium

Social network tools: Advanced methods to contextualize learning research

Keywords: Achievement, Feedback, Higher Education, Informal Learning, Migrant / Refugee and Minority students, Mixed-method Research, Peer Interaction, Primary Education, Qualitative Methods, Quantitative Methods, Secondary Education, Self-efficacy, Social Aspects of Learning and Teaching, Social Interaction, Tool Development
Interest group: SIG 17 - Methods in Learning Research
Chairperson: Laura Thomas, Ghent University, Belgium
Chairperson: Sylvia Gabel, Universität Augsburg, Germany
Organiser: Jasperina Brouwer, University of Groningen, Netherlands
Discussant: Hanke Korpershoek, University of Groningen, Netherlands

As the overarching conference theme suggests, education is a beacon of hope in the uncertain times we are currently experiencing. The learning of all involved stakeholders in education is particularly hopeful and can help us take on the current societal challenges. This symposium centres around the social nature of learning. Consistent with the aims of SIG 17 to further knowledge on methods in learning research, several scholars present their research on social network methods within the field of learning and education. Together, the presentations show that the social network approach enables an analysis of learning as a social phenomenon. As such, social network studies are increasingly important for informing educational practice and theory formation. The four contributions from Belgium, Germany, the United Kingdom, and the Netherlands present various applications of social network research in different contexts within education or the workplace. Our SIG celebrates its 20th anniversary and invites you to celebrate this with us while discussing the added value of social network tools for learning research based on these contributions.

The social network of teachers guiding newly arrived migrant students: A qualitative study

Presenting Author: Laura Thomas, Ghent University, Belgium; **Co-Author:**Britt Adams, Ghent University, Belgium; **Co-Author:**Melissa Tuytens, University of Ghent, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium

Due to the rapidly increasing number of NAMS, dealing with a growing cultural, linguistic, and socio-economic diversity has become a daily reality in education. While the need for interculturally competent teachers is regularly expressed, many teachers feel inadequately prepared to respond to ethnically diverse classrooms after completing formal teacher training. From a social network perspective, we can assume that the relationships teachers have with actors both inside and outside the school context may include information, advice and support helpful in teaching in multicultural classrooms. The current study maps Flemish primary and secondary school teachers' social networks in relation to supporting NAMS and focuses on both the actors called upon by teachers and the support flowing through the ties between the focal teachers and their colleagues. For this, semi-structured interviews and qualitative social network analysis are conducted. During the conference, the results as well as implications for practice and policy – both local and internationally – are discussed.

The development of peer support networks, self-efficacy, and drop-out intentions
Presenting Author: Julia Eberle, Ruhr-Universität Bochum, Germany; **Co-Author:**Jasperina Brouwer, University of Groningen, Netherlands

The transition from school to higher education is a crucial and challenging step for students. Academic as well as social adjustment is required. On the one hand, experiencing failure during the transition may reduce students' self-efficacy and increase their drop-out intentions. On the other hand, successfully building a peer support network may help cope with academic challenges on the emotional and informational levels. This study aims at investigating the relation between the development of first-year students' social support networks on the informational and emotional level, and the development of their self-efficacy and drop-out intentions. In a longitudinal survey with four-time points over the course of their first semester, a cohort of B. A student is observed regarding the development of their peer networks and psychometric variables. Preliminary results show a significant decrease in self-efficacy and a significant increase in drop-out intentions over time. Both peer networks show a descriptive decrease over the course of the semester with the emotional support network being bigger. These analyses will be followed up by coevolution analyses.

Analysing teacher agency within school social structure: New uses of visual methods
Presenting Author: Natasa Pantic, University of Edinburgh, United Kingdom; **Co-Author:**Marc Sarazin, University of Edinburgh, United Kingdom; **Co-Author:**Thibault Coppe, University of Groningen, Netherlands

Teacher agency has undergone much investigation in recent years. The recognition that teachers are embedded in social networks in schools, which affect teachers' work, has led to calls to jointly analyse teachers' relational agency—teachers' capacity to reach out to others to solve problems—and the social structures that teachers are embedded in. However, disentangling structure and agency is notoriously difficult, both methodologically and conceptually. In the current paper, we present an approach that allows researchers to analyse—and visualise—teachers' relational agency *within* social structure. The approach adapts research tools originally developed to support teachers' reflections, and to visualise the evolution of social networks, to enable a mixed methods social network analysis of structure and agency. It consists in collecting quantitative data on teachers' social networks and qualitative data on concrete cases of teachers exercising their relational agency to support students, and mapping these latter cases onto network visualisations—specifically, onto the network ties involved in each concrete case. This quantitatively-enhanced qualitative analysis, we argue, can be extended to longitudinal and multi-site analyses, and be supplemented by additional qualitative and quantitative work, to produce further insights on the complex relation between structure and agency. Ultimately, we argue, the approach could even be used with other populations entirely (beyond teachers in schools).

A social network perspective on workplace learning and social capital formation in a medical team
Presenting Author: Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:**Bram Jacobs, University of Groningen, Netherlands

Workplace-based learning (WBL) occurs as informal learning through daily clinical practice. Doctors mobilize their social capital in terms of making use of the resources embedded in the team network. Although previous research emphasized that WBL is a social dynamic phenomenon, studies from a longitudinal social network perspective in a medical team are scarce. Therefore, we address the following research questions: To whom do doctors easily provide feedback and whom do they approach when they want to share personal information? This may depend on self-efficacy, years of experience, and hours of employment. Our findings based on stochastic actor-oriented modelling (SAOM) show that doctors provide more easily feedback when they have a personal and work-related advice relationship with someone. The more experienced the doctor is, the more easily he or she provides feedback and someone is less likely to be provided with feedback when someone is more self-officious. Sharing personal information depends on providing feedback and asking for work-related advice. A homophily effect exists for sharing personal information in terms of gender, and employment contract hours. Someone is less likely to be approached for sharing personal information when someone tends to be autonomous.

Invited Symposium
Teaching and Teacher Education

Building a Better Understanding of Teachers' Well-Being

Keywords: Anxiety and Stress, Burnout, Developmental Processes, Educational Technologies, Emotion and Affect, In-service Teachers, School Leadership, Simulation-based Learning, Teacher Effectiveness, Teacher Efficacy, Well-being
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Robert Klassen, University of York, United Kingdom
Chairperson: Sophie Thompson-Lee, University of York, United Kingdom
Discussant: Courtney Bell, United States

Our EARLI Centre for Excellence is focused on understanding personal and environmental factors that lead to effective teachers and teaching. However, research that explores the factors contributing to "good teachers" may overlook some of the costs associated with the drive to increase teacher effectiveness. Teacher shortages, high attrition rates, and the high incidence of stress-related illnesses lead us to consider the role of mental health and well-being in teacher effectiveness. In this symposium we present four perspectives on teachers' well-being. First, Klusman et al. provide a developmental perspective from a 10-year longitudinal study on teachers' well-being in Germany. Opfer and Steiner present findings comparing the well-being of a large, nationally representative sample of US teachers with other working adults. Bardach et al. studied preservice teachers in a virtual reality teaching environment in order to test the links between teacher characteristics and stress. Finally, Dehne and colleagues present findings from two studies that explore the role that school principals play in teachers' well-being and burnout in the Netherlands. Our discussant, Courtney Bell, will integrate the findings from the four papers and highlight commonalities and differences, areas for further research, and implications for research and practice.

The long-term trajectories of teachers' well-being: Results from a 10 year longitudinal study
Presenting Author: Uta Dr. Klusmann, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Thamar Voss, University of Freiburg, Germany; **Co-Author:**Dirk Richter, University of Potsdam, Germany; **Co-Author:**Mareike Kunter, German Institute for International Educational Research (DIPF), Germany

Teachers' occupational well-being is highly relevant for job turnover and professional performance. Therefore, many studies have focused on describing predictors of teacher well-being. However, few studies can describe the development of well-being over a long time and identify risk factors early in the career. In the present study, we draw on data from 250 teachers from their first teaching year to 10 years later. The study includes four measurement points and an additional dairy study. We first describe the developmental trajectories of teachers' emotional exhaustion and job satisfaction. Second, we examined whether symptoms of early stress experience, personality, and self-efficacy can predict teachers' professional well-being after a decade. Our longitudinal analysis

revealed an increase in the mean level of emotional exhaustion and stability in beginning teachers' job satisfaction. Moreover, beginning teachers' early stress experiences predicted teachers' emotional exhaustion ten years later.

Using a Nationally Representative Survey to Understand Post-Pandemic U.S. Teacher Well-Being
Presenting Author:V. Darleen Opfer, RAND Corporation, United States; **Co-Author:**Elizabeth Steiner, RAND, United States

In this paper, we present findings from the 2022 State of the American Teacher (SoT) surveys. These findings are related to teacher well-being, working conditions, and intentions to leave their jobs. We fielded surveys to a nationally representative sample of K–12 teachers. The survey was conducted in January 2022, when K–12 public schools were providing instruction in person and when the omicron variant caused COVID-19 case rates to spike throughout the country. The SoT survey yielded 2,360 complete responses out of 4,400 eligible invitations, for a 54-percent completion rate. The SoT survey was oversampled to allow for nationally representative estimates of teachers who identify as people of color. The SoT was weighted to ensure national representation. To compare teachers' reports with those of the general working adult population, we fielded nearly identical survey questions about well-being, working conditions, and respondents' intentions to leave their current job to a nationally representative sample of working adults in the United States.We found:· Teachers reported worse well-being than other working adults.· Well-being was especially poor among Hispanic/Latinx teachers, mid-career teachers, and female teachers.· Teachers of color reported sources of job-related stress that were similar to those of White teachers but were more likely to experience racial discrimination.· Poor well-being and adverse working conditions were associated with teachers' intentions to leave their jobs, while supportive school environments were linked to better well-being and a decreased likelihood of intentions to leave.

Revisiting Effects of Teacher Characteristics on Stress: A Virtual Reality Study
Presenting Author: Lisa Bardach, University of Tübingen, Germany; **Co-Author:**Yizhen Huang, University of Potsdam, Germany; **Co-Author:**Eric Richter, University of Potsdam, Germany; **Co-Author:**Robert Klassen, University of York, United Kingdom; **Co-Author:**Thilo Kleickmann, Kiel University, Germany; **Co-Author:**Dirk Richter, University of Potsdam, Germany

Identifying personal characteristics that make teachers less prone to experiencing stress is a longstanding research goal with important implications for educational practice. The present work revisited effects of cognitive (intelligence) and non-cognitive (neuroticism, classroom management self-efficacy) teacher characteristics on stress in two studies with German student teachers. We capitalized on a virtual reality (VR) classroom setting, allowing to combine experimental control and authentic teaching situations. In the VR classroom, the level of disruptive behaviors of the (virtual) students was experimentally manipulated, with lower levels of disruptions in Study 1 (lower complexity/less stressful teaching experience) than in Study 2 (higher complexity/more stressful teaching experience). We focused on stress in terms of psychological (i.e., self-reported) stress assessed after the experiments as well as physiological stress (heart rate). In both studies neuroticism positively predicted psychological stress. Classroom management self-efficacy and intelligence were not significantly related to psychological stress. None of the cognitive and non-cognitive characteristics significantly predicted physiological stress. Overall, this work contributes to the current knowledge on teacher characteristics and points towards the promise of adopting a personality psychology perspective to research on stress in challenging teaching situations.

Under Pressure: The Role of the Principal-Teacher Relationship in Teachers' Well-Being
Presenting Author: Mathias Dehne, Friedrich Schiller University Jena, Germany; **Co-Author:**Debora Roorda, University of Amsterdam, Netherlands; **Co-Author:**Helma Koomen, Research Institute of Child Development and Education, Netherlands; **Co-Author:**Marjolein Zee, Erasmus University Rotterdam, Netherlands

The present era of concurrent crises poses challenges to the teaching profession. Providing resources to increase teachers' ability to cope with work pressure therefore seems crucial to finding and retaining qualified teachers amid a lingering shortage and protecting them against burnout. A plethora of studies suggests that school principals' more general behaviors, actions, and interaction styles play a key role in teachers' well–being at work. However, to date, studies have not examined the role of affective principal–teacher relationships (PTRs) at the dyad level. This presentation provides the results of two cross-sectional studies (Study 1: n = 363 primary school teachers; Study 2: n = 419 secondary school teachers), in which we investigated whether PTRs mediated or moderated the association between work pressure and well–being. Teachers reported about their work pressure, well–being, and the degree of closeness and conflict in the relationship with their principal. In both studies, we found evidence for partial mediation for the association of Work Pressure with Emotional Exhaustion and Depersonalization. In study 1, the association between Work Pressure and Personal Accomplishment was fully mediated by Closeness. No evidence was found for the moderating role of PTRs. In sum, the two studies suggest that positive PTRs can act as a protective factor against teacher burnout. In contrast, negative relationships can exacerbate teacher well–being. Future avenues of research for PTRs in terms of theoretical and practical implications will be discussed.

Session M 4

Symposium
Teaching and Teacher Education

Perspectives on Emerging Teacher Learning Research

Keywords: Communities of Learners and/or Practice, Computer-supported Collaborative Learning, Dialogic Pedagogy, In-service Teachers, Learning Approaches, Science Education, Social Aspects of Learning and Teaching, Teacher Efficacy, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies, Tool Development
Interest group:
Chairperson: Susan Yoon, University of Pennsylvania, United States
Discussant: Susan Goldman, University of Illinois at Chicago, United States

Over the past decade, student achievement standards increasingly emphasize knowledge and skills that require pedagogies other than transmission models (Pellegrino & Hilton, 2012; OECD 2021, 2019). Research converges on the importance of students achieving deep understanding of concepts, principles, and practices of traditional and emerging disciplinary content areas. Achieving deep learning requires that students engage in developmentally appropriate forms of authentic disciplinary practices, and that they do so in interaction with others (e.g., Dillenbourg, et al., 2009; Goldman et al. 2016; Danish & Gresalfi, 2018). Facilitating such learning processes changes what teachers teach, but how they teach it, and requires adaptation to in-the-moment interactions of teachers and students. Flexible application of knowledge and practices implies that teachers need to understand what to do, how to do it, and why to do it (e.g., Bereiter, 2014; Brown & Campione, 1995; Darling-Hammond & Bransford, 2007; Zech et al., 2000). Professional learning experiences need to support teachers in confronting these challenges of engaging students in complex problem solving in traditional and emerging disciplines using instructional approaches that address diverse learning needs. The four presentations in this symposium reflect contributions to a recently published volume (September, 2022) on emerging teacher learning research. Three of the presentations address new professional learning experiences that address the pedagogies and knowledge that teachers need; the fourth reports on collaborative design as professional learning and its unique affordances for teacher learning. The discussant will comment on emerging research themes for teacher learning theory and practice.

Engaging teachers in dialogic discourse: PD effectiveness and teachers' individual learning
Presenting Author: Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Ann-Kathrin Schindler, University of Augsburg, Germany; **Co-Author:**Tina Seidel, Technische Universität München, Germany

In dialogic discourse students are seen as active learners who collaboratively construct knowledge through the open exchange of different ideas and perspectives. However, classroom discourse is usually dominated by the teacher while students give short and specific answers that are expected to align with the prespecified flow of instruction. To help teachers shift their discourse practice towards a more dialogic pedagogy, we designed a one-year professional development (PD) program. Nineteen teachers and their 450 high-school students participated in this study. Teachers were videotaped to track their individual

learning trajectories. Video ratings revealed that teachers' discourse practice varied substantially among teachers when entering the program and while some teachers showed considerable changes in their discourse practice other teachers did not show any change during PD participation. Evaluation results suggest that teachers' practice changes were related to changes in student learning. Specifically, students whose teachers changed their discourse practice toward a more dialogic pedagogy perceived stronger increases in their perceived activation, their cognitive engagement and motivation. This study demonstrates that PD is a powerful tool to foster change in teachers' discourse practice and that changes in discourse practice are related to changes in students' learning perceptions. Our results call for more adaptive and customized PD programs that acknowledge teachers' individual learning trajectories and account for teachers' prior experience with the targeted practice.

The Role of Data Analytics Tools for Teachers Learning to Implement Student Collaboration
Presenting Author: Nikol Rummel, Ruhr University Bochum, Germany; **Co-Author:**Anouschka van Leeuwen, Utrecht University, Netherlands

We conceptualize data analytics tools as an additional source for teacher learning in the context of monitoring and supporting student collaboration in the classroom. We discuss what those tools offer teachers and what new types of learning it takes from teachers to use data analytics tools. The first perspective we describe concerns tools that offer data about student activities in order to support teacher learning regarding monitoring of students. The second perspective concerns the development of tools that offer data about teachers themselves, which they may use them to learn about and adjust their own behavior in supporting student collaboration.

Investigating co-design as a professional development model to support teacher efficacy
Presenting Author: Eleni Kyza, Cyprus University of Technology, Cyprus; **Co-Author:**Andria Agesilaou, Cyprus University of Technology, Cyprus; **Co-Author:**Yiannis Georgiou, Cyprus University of Technology, Cyprus; **Co-Author:**Andreas Hadjichambis, Ministry of Education, Culture, Sports and Youth, Cyprus

Many arguments have been voiced in favor of establishing teacher-researcher collaborations in the context of Teacher Professional Development (TPD) and curriculum reform. This study draws from a longitudinal co-design effort with in-service science teachers, and reports data from the process of co-design, and the classroom implementations of the co-design outcomes, to discuss these as contexts for supporting teachers as "transformative intellectuals". We view co-design with teachers as a fertile setting for unsettling established educational practices of passive teaching and learning, in support of moving towards critical praxis and a transformative approach to one's own teaching. This study draws from the second cycle of a TPD which included 27 in-service, science education teachers at the elementary, middle, and high school level, working in disciplinary co-design teams, each guided by a university researcher. The co-design teams developed inquiry modules that integrated Responsible Research and Innovation (RRI) ideas, which advocate a more dynamic and inclusive relationship between scientific advancements and societal involvement. Through qualitative and quantitative analysis of the data, we report on how teachers' efficacy changed and how teachers reflected on their experiences in becoming "intellectual partners" in design. We conclude with a discussion of the role of co-design as a professional development approach to support teacher learning and professional growth.

Teachers' Adaptive Expertise and Impacts on Student Experiences During STEM-Integrated Learning
Presenting Author: Susan Yoon, University of Pennsylvania, United States; **Co-Author:**Amanda Cottone, University of Pennsylvania, United States; **Co-Author:**Jooeun Shim, University of Pennsylvania, United States; **Co-Author:**Chad Evans, University of Pennsylvania, United States; **Co-Author:**Kate Miller, University of Pennsylvania, United States; **Co-Author:**Noora Noushad, University of Pennsylvania, United States; **Co-Author:**Blanca Himes, University of Pennsylvania, United States

This study is motivated by a call for more STEM-integrated teaching and learning in K12 education. One critical issue that has emerged is how teachers will acquire the requisite expertise to accomplish this goal and how this impacts student classroom experiences. We worked with expert biology teachers in a summer professional development workshop and school-year implementation on the evolving topic of bioinformatics–a field that integrates biology, data literacy, and computational approaches. Through an adaptive expertise lens, we reveal challenges teachers faced in adapting STEM-integrated curricula in their practice due to a need for a deeper level grasp of content knowledge. We further investigate relationships between teachers' adaptive expertise measures and student classroom experience measures in five factors that represent learning in core bioinformatics concepts and skills. Our results show that teachers' levels of AE significantly influenced how students experienced the STEM-integrated curriculum in the classroom. We contend that more research is needed on how to support the development of teachers' STEM-integrated content knowledge.

Session M 5

25 August 2023 12:00 - 13:30

Symposium
Motivational, Social and Affective Processes

Enjoying cognitive effort: outcomes and development of Need for Cognition in youth

Keywords: Achievement, Cognitive Development, Developmental Processes, Engagement, Interest, Motivation, Personality, Secondary Education, Well-being
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Jeroen Lavrijsen, KU LEUVEN, Belgium
Discussant: Astrid Poorthuis, Utrecht University, Netherlands

Need for Cognition, as the tendency to seek, engage in, and enjoy effortful cognitive activity, is a key intellectual investment trait that guides how individuals invest their time and effort in their intellect. Whereas the construct has often been investigated in relation to the daily functioning of adults, this symposium examines the relevance of Need for Cognition for educational research and practice. The symposium offers a comprehensive evaluation of how Need for Cognition shapes the academic, motivational and emotional functioning of students. In addition, it considers which factors affect the development of Need for Cognition over time. In particular, the *first study* (N = 3,409; Grade 7; Belgium) examines the association between Need for Cognition and academic performance, controlling for cognitive ability, openness to experience and persistence. The *second study* (N = 1,069; Grades 5-7; Germany) investigates longitudinal associations between Need for Cognition and academic interest, to see whether Need for Cognition predicts changes in interest and whether interest affects the development of Need for Cognition. The *third study* (N = 1,546; 6-19 years; Germany) examines how Need for Cognition affects both the general and school-specific well-being of students. The *fourth study* (N = 3,355; Grades 7-9; Luxembourg) investigates how the development of Need for Cognition over time depends on the learning environment in different school tracks. An expert in educational psychology reflects on how these studies position Need for Cognition as a novel and important construct for educational research and practice.

Need for Cognition Predicts Academic Achievement Beyond Cognitive Ability, Openness and Persistence
Presenting Author: Jeroen Lavrijsen, KU Leuven, Belgium; **Co-Author:**Franzis Preckel, University of Trier, Germany; **Co-Author:**Karine Verschueren, KU Leuven, Belgium

The construct of Need for Cognition reflects individual differences in the tendency to seek, engage in, and enjoy effortful cognitive activities. This study scrutinized the role of Need for Cognition in academic achievement in a large sample of Flemish adolescents (n = 3,409; 49.6% boys; M_{age} = 12.4 years). Using CFA and linear regression models, findings revealed that Need for Cognition uniquely predicted student's academic performance, above and beyond three student characteristics conceptually and empirically related to Need for Cognition, that is, cognitive ability, openness to experience, and persistence. Moreover, two subdimensions of Need for Cognition, capturing students' eagerness to approach cognitive challenges and their preparedness to master them, were incrementally associated with academic performance. Further investigating interactive effects between Need for Cognition and cognitive ability, Need for Cognition was observed to predict school performance independent of ability.

Need for Cognition Predicts Changes in Academic Interest but not the Other Way Round

Presenting Author: Franzis Preckel, University of Trier, Germany; **Co-Author:**Vsevolod Scherrer, Universität Trier, Germany

The personality trait of need for cognition (NFC) describes an individual's tendency to engage in and enjoy thinking. Interest as a motivational variable refers to the psychological state of engaging or the predisposition to reengage with particular content over time. We investigated whether NFC predicts academic interest over time with and without controlling for students' academic achievement. Longitudinal data were collected from *N*=1069 high school students (40% female) in grades 5 to 7 using Rasch-scaled academic achievement tests in three domains (i.e. mathematics, German, English as foreign language), domain-specific interest scales, and a NFC questionnaire (3 to 4 waves of measurement). Autoregressive cross-lagged structural equation models were used for analyses. In all domains, changes in interest were positively predicted by NFC, whereas changes in NFC were not predicted by interest. Findings did not change substantially when controlling for academic achievement. The findings contribute to an increasing body of research supporting NFC as a relevant construct in school contexts.

Need for Cognition as a Resource for Coping with Everyday Challenges in School
Presenting Author: Johanna Bruchmann, Institute of Psychology, Faculty of Behavioural and Social Sciences, Chemnitz University of Technology, Germany; **Co-Author:**Alexander Strobel, Technische Universität Dresden, Germany; **Co-Author:**Antonia Martin, TU Chemnitz, Germany; **Co-Author:**Laura May Legler, TU Dresden, Germany; **Co-Author:**Anja Strobel, TU Chemnitz, Germany

Previous research results demonstrate that the investment trait Need for Cognition (NFC), i.e., the tendency to actively seek, engage in and enjoy effortful cognitive activity, is beneficial for learning behavior and consequently associated with better results in school and university. In our study we were particularly interested in the aspect of enjoying effortful cognitive activity. Current research demonstrates a relation between the joy of thinking and well-being as well as coping with not only intellectually demanding situations for students but also with challenges in everyday life. As everyday school life goes along with many challenges, we investigated how NFC could serve as a resource for general and school-specific well-being in children between 6 and 19 years. We collected survey data from 1546 children in central eastern Germany, stemming from six different schools. To account for the effects of variables already empirically proven to be influential, achievement motivation as well as academic self-concept were considered, too. First results show that higher NFC was associated with more joy of life (correlations between r_S = .21 and r_S = .32) especially in cognitively challenging school environments. Domain-specific correlations between NFC and well-being in school were between r_S = .32 and r_S = .60. Across all studies we found a substantial effect of NFC on school-specific well-being (r = .39) highlighting the potential of NFC as a resource for coping with demanding situations. Further results, ongoing research questions and limitations will be discussed during the presentation.

The Development of Need for Cognition: Longitudinal Differences across Secondary School Tracks
Presenting Author: Franzis Preckel, University of Trier, Germany; **Co-Author:**Joanne Colling, University of Luxembourg, Luxembourg; **Co-Author:**Rachel Wollschläger, University of Luxembourg, Luxembourg; **Co-Author:**Ulrich Keller, University of Luxembourg, Luxembourg; **Co-Author:**Antoine Fischbach, Luxembourg Centre for Educational Testing, Luxembourg

Need for Cognition (NFC), defined as an individual's tendency to engage in and enjoy thinking, receives increasing attention in educational psychological research focusing both on its relation to educational outcomes and its development. Whereas multiple studies identified NFC as an important construct accounting for individual differences in cognitive and academic variables (e.g., intelligence, academic achievement), knowledge about its development remains rather scarce. The present study therefore investigates how NFC develops longitudinally in a full cohort of 7th to 9th graders (N = 3.355, 50.1 % female) in Luxembourg, while focusing in particular on potential differences across school tracks as differential learning environments. Latent difference score models revealed a significant decrease in NFC in both the full cohort and across all school tracks with the decrease being largest in the highest and smallest in the intermediary track. Whereas no track difference was found for the lowest track, the decrease in NFC was significantly larger for highest track students than for intermediary track students (Cohen's d of 0.20). The identified track difference in the development of NFC remained significant when controlling for student background variables (gender, SES, language, and migration background). By generating solid knowledge on the development of NFC in a tracked secondary school system, the study is aiming at paving the way for more longitudinal research on how an individual's tendency to engage in and enjoy thinking develops, how it could be fostered and how existing inequalities across tracks could be reduced.

Session M 6

25 August 2023 12:00 - 13:30
UOM_CR
Symposium
Instructional Design, Learning and Social Interaction, Motivational, Social and Affective Processes

Homework: family involvement and teachers' role

Keywords: Achievement, Educational Attainment, Engagement, Motivation, Parental Involvement in Learning, Primary Education, Secondary Education, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies
Interest group: SIG 06 - Instructional Design, SIG 10 - Social Interaction in Learning and Instruction, SIG 18 - Educational Effectiveness and Improvement
Chairperson: Susana Rodriguez, Spain
Organiser: Lisa Benckwitz, IPN Leibniz Institute for Science Education, Germany
Organiser: Konstantina Falanga, Aristotle University of Thessaloniki, Greece
Organiser: Tania Vieites, Universidad de La Coruña, Spain
Organiser: Jianzhong Xu, United States
Discussant: Carolina Rodríguez Llorente, Universidad de La Coruña, Spain

Homework continues to be one of the most controversial school activities. Although we continue to find those who question its benefits, empirical evidence seems to confirm that homework serves to consolidate knowledge and improve skills and, ultimately, to achieve better performance (Cooper, Robinson & Patall, 2006)*.In this symposium we try to answer the following questions:How does parental help with homework relate to homework effort and time management and student achievement?How does parental involvement in homework affect academic motivation and performance?What conditions of homework prescription favor students' school engagement and self-regulation?How does homework assistance provided by private tutors relate to homework effort and time management and student performance?Two papers focus on parental involvement and help in homework. The contribution 1 (USA) explores how parental help with homework would be associated with homework effort, procrastination, and achievement. The contribution 2 (Greece) studies, from a longitudinal perspective, the association between parental involvement in homework, motivation and academic performance.The other two contributions deal with the prescription of quality homework and the homework assistance provided by private tutors. Developing a quasi-experimental research, presentation 3 (Spain) evaluates the effectiveness in terms of school engagement and self-regulation of a homework prescription method. Finally, opening a line of research on homework assistance by private tutors, presentation 4 (Germany) suggests that the characteristics of this assistance may determine its usefulness depending on age.All papers together underline the complexity of joining the efforts of agents such as parents and teachers to make homework a truly valuable educational resource.

Homework assistance provided by private tutors and students' outcomes – Does students' age matter?
Presenting Author: Lisa Benckwitz, IPN Leibniz Institute for Science Education, Germany; **Co-Author:**Katharina Kohl, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Natalia Suárez-Fernández, University of Oviedo, Spain; **Co-Author:**José Carlos Núñez Pérez, University of Oviedo, Spain; **Co-Author:**Karin Guill, Leibniz Institute for Science and Mathematics Education, Germany

Many students receive private tutoring and completing homework is one of the main instructional foci of private tutoring. However, only little is known about the quality of homework assistance provided by private tutors and its links with students' outcomes. Therefore, we adapted three quality dimensions from prior

research on parental homework assistance to the context of private tutoring, namely responsiveness, structure, and control. Prior research on parental homework assistance has shown that the quality dimensions are related with students' homework behaviour and academic achievement. Moreover, there is first evidence that these links might differ according to students' age. To address the lack of research on homework assistance given by a tutor, we investigated the relationships between the three quality dimensions and students' homework behaviour and achievement in three different age groups at the secondary level. We conducted multi-group analyses based on data from $N = 237$ students at different stages of secondary school. In the youngest age group (Grade 5 and 6) we did not find any significant links between the quality dimensions and students' outcomes. In the two older age groups, students' homework behaviour was positively predicted by structure (Grade 7 and 8), and negatively predicted by control (Grade 9).

Parent homework involvement,student motivation and performance:A person-centered longitudinal study
Presenting Author: Konstantina Falanga, Aristotle University of Thessaloniki, Greece; **Co-Author:**Eleftheria Gonida, Aristotle University of Thessaloniki, Greece; **Co-Author:**Dimitrios Stamovlasis, Aristotle University of Thessaloniki, Greece

Student motivation has been significantly associated with parental involvement in children's education. However, limited longitudinal research has been conducted to date on the relationships between parental homework involvement and children's motivational and academic functioning. The study aimed at investigating longitudinal associations between parental beliefs for the child and types of involvement in math homework (autonomy support, control, interference) and student motivational beliefs (achievement goals and efficacy beliefs) and academic performance via a person-centered approach. A sample of 296 5th and 6th graders completed twice a year self-reports measuring achievement goal orientations (mastery, performance-approach, performance-avoidance) and math self-efficacy, and solved mathematical tasks. Their parents completed questionnaires on their involvement in math homework and their beliefs for their child's efficacy in math. Latent class analysis indicated four profiles based on children's goal orientations and efficacy beliefs which were relatively stable across the four time points. Regarding longitudinal relationships, the following significant results were found: (i) the 'High Mastery' profile was negatively predicted by parental control in all four time points; (ii) the 'Low Mastery and Self-efficacy' profile was positively predicted by interference and negatively by parents' efficacy for the child in time points 2 and 3, respectively; (iii) the 'All High' profile was positively predicted by parental control in three time points; and (iv) math performance was positively associated with the 'Mastery' profile. Findings are discussed in light of current theory and evidence on parents' contribution in children's motivational and academic outcomes, and implications for practice will be pointed out.

MITCA: Homework Implementation Method improving student self-regulation and school engagement
Presenting Author: Tania Vieites, Universidad de La Coruña, Spain; **Co-Author:**Fátima María Díaz Freire, University of A Coruña, Spain; **Co-Author:**Lucía Díaz Pita, University of A Coruña, Spain; **Co-Author:**Susana Rodriguez, University of A Coruña, Spain; **Co-Author:**Antonio Valle Arias, University of A Coruña, Spain

In response to the controversy that still exists regarding the quantity, quality, and effectiveness of homework and after an extensive review of the available evidence about the prescription of quality homework, the MITCA Homework Implementation Method (Valle & Rodríguez, 2020) is designed. To evaluate the effectiveness of this method, an investigation with a quasi-experimental design, with a control group and pre and post measures is proposed. The effectiveness of the homework prescription method is estimated with the participation of a total of 43 teachers and 964 students in the 5th and 6th grades of Primary Education from 20 different schools in the Autonomous Community of Galicia(Spain). The results show differences between the students who participated in the implementation of MITCA and the students in the control group, not only in terms of their involvement in homework but also in relation to their school engagement and student self-regulation. The discussion and conclusions shed light on the object of study and allow us to support the efficacy of the MITCA method as an educational resource. This work sets out future lines of research on the topic of homework; its immediate educational implications for the prescription of quality homework.

Student-Perceived Parental Help with Homework: Identifying Student Profiles
Presenting Author: Carolina Rodríguez Llorente, Universidad de La Coruña, Spain; **Co-Author:**Ruiping Yuan, University of Mississippi, United States; **Co-Author:**Jianzhong Xu, Mississippi State University, United States

This study used a person-center approach to examine student-perceived parental help with homework according to the data from eighth graders. Measures on student-perceived parental help include (a) two measures relating to student-perceived quality of parental help (content support and autonomy support), and (b) one measure concerning student-perceived quantity of parental help. Latent profile analysis produced five different profiles regarding parental help with homework: *Low Perceived Help*, *Medium-Low Perceived Help*, *Predominantly Perceived Autonomy Support*, *Moderate Perceived Help*, and *High Perceived Help*. Furthermore, profile membership was related to homework effort, procrastination, and mathematics achievement after controlling for parent education and prior achievement, with approaching large to large effect sizes. Implications for future studies and educational practices are discussed in light of these findings

Understanding students' perspectives on learning and instruction: A qualitative approach

Keywords: Attitudes and Beliefs, Higher Education, Instructional Design, Learning Strategies, Mixed-method Research, Motivation, Qualitative Methods, Student Drawings
Interest group: SIG 06 - Instructional Design, SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Louise David, Maastricht University, Netherlands
Organiser: Felicitas Biwer, Maastricht University, Netherlands
Organiser: Marloes Broeren, Avans Hogeschool / Avans University of Applied Sciences, Netherlands
Organiser: Morane Stevens, KU Leuven - University of Leuven, Belgium
Discussant: Matthias Nückles, University of Freiburg, Germany

Many learners still struggle to study effectively during self-regulated learning, despite increasing efforts to instruct students how to do so. Especially, in the context of higher education, self-regulated learning is a key component since large portions of learning happen in an instructor-absent environment. To better support students' learning behaviors, it is crucial to understand their perspectives and beliefs on learning and instruction. Qualitative research methods offer a powerful tool to gain in-depth insights into learners' reflections on their behavior and understanding of instruction. This symposium aims to discuss insights into how students in higher education perceive instruction, how they study during their self-regulated learning, and what motivates them to use (in)effective learning strategies. The first contribution used drawings to map students' general and spontaneous views on instruction. The second contribution investigated perspectives of students, who have (not) experienced instruction, on effective learning strategies and how to use them during self-study via focus groups. The third contribution employed focus groups to explore how students typically study and how they experience changing their study habits. The fourth contribution investigated factors that influenced students' motivation to use effective learning strategies during their self-study using focus groups. The four contributions give in-depth insights into students' perspectives and beliefs toward learning and instruction in the context of higher education. Furthermore, they underline the importance of taking students' perspectives into account and the need to build on learners' behaviors and understandings when designing interventions to promote effective learning. Matthias Nückles will act as discussant.

Imagining education: An exploration of students' prototypical ideas of instruction
Presenting Author: Morane Stevens, KU Leuven - University of Leuven, Belgium; **Co-Author:**Jan Elen, KU Leuven, Belgium

This contribution points attention to students' understanding of instruction as a type of domain-independent prior knowledge. This so-called 'instructional knowledge' of students is assumed to have important implications for learning in educational settings. An attempt was made to map this construct by asking 91

students within a Flemish higher education institution to make a drawing representing their spontaneous views on instruction. A thematic analysis of these drawings revealed seven recurring themes. Findings support previous research demonstrating that students hold similar ideas about instruction, which are rather 'classic' in nature. Contrary to previous findings, it was also revealed that a fair amount of participants supplemented their drawings with new elements. This study contributes to understanding instructional knowledge and offers opportunities for further research.

How students apply learning strategies: A qualitative comparison between different strategy users
Presenting Author: Gabriel Taban, Fontys University of Applied Sciences, Netherlands; **Co-Author:**Felicitas Biwer, Maastricht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

While decades of research from cognitive psychology has provided insights into effective learning strategies for long-term learning, there is still a discrepancy between what research recommends and what students do. Past research has investigated the effect of separate training programs on students' knowledge and use of effective learning strategies, however, transition to their self-study remains difficult. As a more sustainable alternative for a separate training program, teachers can use effective principles of learning in their classes and make these explicit to their students. The effects of such a training on the intention and actual use of effective learning strategies are, however, unclear. In this study, we explored how first-year engineering students, who experienced such a training or not, prepare for their exams with a specific focus on desirably difficult learning strategies. Students completed a questionnaire about their knowledge about and use of effective learning strategies. In three focus group discussions with 18 students, we investigated students' perspective on effective learning strategies and about how they use these in the self-study context. Results show great variability between students' perceptions of learning and study goals, learning for the exam versus learning for the long-term, and provide insights into future intervention and teacher instructions.

Students' Habitual Use of Effective Learning Strategies
Presenting Author: Louise David, Maastricht University, Netherlands; **Co-Author:**Felicitas Biwer, Maastricht University, Netherlands; **Co-Author:**Rik Crutzen, Maastricht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

Habits drive a large portion of how we study and can either help or harm long-term academic achievement. More specifically, beneficial study habits relate to increased academic performance and lower motivational conflicts when studying. Nevertheless, many students struggle to form and maintain beneficial habits as they engage in less profitable ones. While the use of effective but effortful learning strategies is essential for academic achievement, students often habitually rely on ineffective learning strategies. Study habits could help students to incorporate these effective but effortful learning strategies consistently. To support students in breaking old, ineffective habits and forming new, effective study habits, we first need to understand what students' study habits look like. Therefore, in this study, we explored university students' (*N*=29) study habits in six focus group discussions. Preliminary results indicate that students have strong study habits when preparing for exams. During a course, students are more flexible in their study behavior. While students continuously update their existing habits based on whether they serve their short-term goals (passing the exam), they experience breaking habits as difficult and effortful.

What factors influence higher education students' motivation to use cognitive learning strategies
Presenting Author: Marloes Broeren, Avans Hogeschool / Avans University of Applied Sciences, Netherlands; **Co-Author:**Peter Verkoeijen, Erasmus University Rotterdam, Netherlands; **Co-Author:**Guus Smeets, Erasmus University Rotterdam, Netherlands; **Co-Author:**Arends Lidia, Erasmus University Rotterdam, Netherlands

Effective cognitive learning strategies have been proven to be beneficial for learning and long-term retention. Still, students in higher education rely heavily on surface-level strategies like re-reading and underlining, and find it difficult to change their study behavior. Interventions that successfully supported cognitive learning strategy use included strategy instructions, metacognitive knowledge and practice opportunities. However, an important aspect of the potential self-regulated use of learning strategies that has remained underexposed is student motivation. The aim of this study was to gain insight into what factors influence students' motivation to use effective cognitive learning strategies during independent self-study. In our mixed-method approach, we used an online learning strategy questionnaire ($N = 217$) and (online) focus group discussions on motivation and willingness to change ($N = 105$). Participants were first-year students of a Dutch university of applied sciences. Result showed that students used a combination of surface-level and cognitive strategies which they developed themselves during prior education. Perceived value of learning strategies - in particular usefulness of a strategy - was essential for student motivation and was related to the goals students wanted to achieve. Future interventions may need to include this student perspective by building upon students' current (cognitive) strategy use and by emphasizing 'what's in it for them?'.

Symposium

Physical activity and executive functions: from kindergarten to secondary school

Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Early Childhood Education, Primary Education, Quantitative Methods, Secondary Education
Interest group:
Chairperson: Kristin Kolloff, University of Bern, Switzerland
Organiser: Christina Heemskerk, University of Bern, Switzerland
Discussant: Ulrich Dettweiler, University of Stavanger, Norway

There is a long-standing interest in whether and what circumstances physical activity during a school day can benefit students' executive functions. This symposium brings together contemporary research on the effects of physical activity (PA) on executive functions (EF). It aims to further the discussion of both the acute and longitudinal benefits of PA for cognition and demonstrate possible practical implementations of increased movement within the school day. The symposium presents studies from a range of school contexts (kindergarten, primary and secondary schools) and includes various forms of PA, such as free-living activities, active breaks, and physical education lessons. A variety of methodologies will target the central research question of the symposium, the nature of the PA – EF link, including a longitudinal study, a microgenetic study and two intervention studies. For one, the results suggest a reciprocal relationship between PA and EF, often overlooked so far, but important to consider for future research. For another, new results will be presented surrounding the nature of the PA, that is its intensity, its quality, and its implementation.
Chair: Michelle Maurer
Discussant: Ulrich Dettweiler

Reciprocal associations between Physical Activity, Motor Skills and Executive Functions
Presenting Author: Anssi Vanhala, University of Helsinki, Finland; **Co-Author:**Anna Widlund, Åbo Akademi University, Finland; **Co-Author:**Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Pirjo Aunio, University of Helsinki, Finland

Previous findings have suggested that physical activity (PA) and fundamental motor skills (FMS) are positively associated with executive functions (EF) in preschoolers. However, the longitudinal studies are scarce and the reciprocal associations have not been studied. Therefore, the aim of this study was to examine whether there are reciprocal longitudinal associations of physical activity (PA) and fundamental motor skills (FMS) with executive functions (EF) over two years in preschoolers.
The participants of this study were 286 children aged 3-5 years. Children's PA, FMS, and EF were measured three times with one year between the measurements. PA was measured using waist-mounted accelerometers. Three components of FMS (locomotor, object control and stability skills) were measured with age-appropriate motor skill tasks. Two components of EF (inhibition and switching, and working memory) were measured using computer-based tests. Reciprocal longitudinal associations between PA, FMS and EF were examined using cross-lagged panel modeling.
Only one reciprocal association was found and that was between vigorous PA (VPA) and working memory: VPA had a negative predictive effect on working

memory, while working memory positively predicted VPA. Moderate PA (MPA) and locomotor skills had a positive predictive effect on working memory. In turn, inhibition/switching positively predicted stability skills. Our findings suggest some specific predictive associations both from PA and FMS to EF and from EF to PA and FMS.

Primary school children's physical activity and executive functioning: An intraindividual study
Presenting Author: Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:**Christina Heemskerk, University of Bern, Switzerland; **Co-Author:**Henry Lo, Oxford University, United Kingdom; **Co-Author:**Patrick Esser, Oxford Brookes University, United Kingdom; **Co-Author:**helen dawes, Oxford Brookes University, United Kingdom; **Co-Author:**Stefan Kodzhabashev, University of Bern, Switzerland; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

We investigated the dynamic relationships between physical activity (PA) and executive functioning (EF, the Hearts and Flowers task) in an intraindividual study. Thirty-nine primary school children (grade 4-6, Mage = 10.0, 21 boys) took part during two weeks at school. They wore an accelerometer wristband throughout and carried out EF tasks (the 'Hears and Flower' task) twice per school day (morning and afternoon). We derived measures to capture acute PA prior to the EF tasks (e.g., walking to school, break time activity): % of time spent in light and moderate to vigorous PA, PA the day before, and total PA during the period. We specified multilevel structural equation models (MSEM, ni = 39, nti = 481). Shifting (ΔRTMixed-RTHearts) and Inhibition (ΔRTFlowers-RTHearts) were equally stable over time. When children exerted more MVPA than usual in the time-window leading up to the EF-task, they performed the inhibition task faster. Relative to girls boys were faster at both inhibition and shifting. The findings provide a

Movement-based learning support in the classroom
Presenting Author: Jennifer Liersch, University of Duisburg-Essen, Germany, Germany; **Co-Author:**Karin Eckenbach, University of Duisburg-Essen, Germany; **Co-Author:**Michael Pfitzner, University of Duisburg-Essen, Germany

The results of several studies show various positive effects of movement on learning: For example, physical activity breaks in the classroom can increase concentration. But exercise also has the potential to promote general cognitive functions. For instance, cognitively demanding movement has a positive effect on the executive functions and school performance of children (Boriss, 2015). Thus, physical activity breaks in the classroom that include a cognitive demand can have a positive impact on executive functions and mathematics achievement (Egger et al., 2019). If the cognitive content of such physical activity breaks is designed mathematically, the effects on mathematics performance can be even higher compared to pure physical activity breaks (Mavilidi & Vazou, 2021). Based on these correlations, an intervention program consisting of cognitively demanding movement games with a subject-didactic orientation was developed. From September 2021 until June 2022, a study was conducted in a controlled pre/post-design in which different types of these cognitively demanding games were implemented in grade 7 (students from 10 to 14 years) at four schools in North Rhine Westphalia (Germany). Subject-oriented content was contrasted with non-subject-oriented content. The concentration and executive-functional performance of the students were assessed. Furthermore, interviews were conducted with the teachers. In addition to general feedback on the implementation of the developed intervention, teachers shared their subjective perceptions of the influences on students and teaching, as well as the opportunities and challenges associated with the content.

Physical activity, behaviour, and executive functions in primary school
Presenting Author: Christina Heemskerk, University of Bern, Switzerland; **Co-Author:**Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

Background: Physical activity (PA) can positively affect various aspects of children's cognition. Both executive functions (EF) and task-related behaviour have been used as outcomes in PA research, yet separately. The use of varying methods and outcome measures makes it difficult to compare results and uncover the mechanisms by which PA affects cognition. Method: The same observation instrument was applied in two studies to examine: (1) acute effects of PA on task-related behaviour, (2) the relationship between behaviour and EF. In study one, 76 children (M age = 9.3y) took part in physical education (PE) lessons. During the classroom lesson before and after PE, participants were observed every 30sec ('on-task', 'passive off-task', or 'active off-task'). In study two, 129 children (M age = 7.9y) were observed using the same protocol as in study one, and completed the Hearts and Flowers task. Observation data were analysed in relation to PA (study 1) and in relation to EF (inhibition, study 2). Results: PA of high intensity led to an increase in on-task behaviour after PE (OR = 1.49, d = 0.22). On-task behaviour correlated weakly with measures of inhibition (r = .19, p = .035), as did passive off-task behaviour (r = -.20, p = .026). Conclusion: PA can improve on-task behaviour and reduce off-task behaviour. As on-task behaviour and inhibition correlated, these currently separately regarded effects of PA should be investigated together.

Symposium
Cognitive Science

Paying attention to (mathematical) relations: Relational reasoning in mathematical development

Keywords: Cognitive Development, Cognitive Skills and Processes, Mathematics/Numeracy, Primary Education, Quantitative Methods
Interest group:
Chairperson: Patricia Alexander, University of Maryland, United States
Organiser: Jake McMullen, University of Turku, Finland
Discussant: Minna Hannula-Sormunen, University of Turku, Finland

This symposium will examine the role of relational reasoning in the development of mathematical knowledge. Both mathematical relations and general relational reasoning are foundational to understanding many topics in mathematics. In many situations in the mathematics classroom, there are multiple relations that must be attended to in order to solve a problem successfully. Thus, examining individual differences in how students pay attention to different relational aspects of mathematical and non-mathematical situations promises valuable insight into potential causes of individual differences in mathematical development. To this end, this symposium aims to take multiple perspectives on this issue by examining different combinations of (non-)mathematical relations in (non-)mathematical contexts. Overall, these presentations provide a multifaceted lens into the nature of relational reasoning in mathematical development and provide the foundation for future work examining the role of (mathematical) relational attention and preferences in students' development in and out of the mathematics classroom. The first contribution examines relational reasoning in non-mathematical contexts in relation to students' mathematics learning. The second contribution examines how students' attention to mathematical relations in non-explicitly relational contexts predicts their mathematical development. The third contribution examines profiles of students' understanding of additive and multiplicative relations in everyday language, word problems, and texts in relation to their mathematical motivation. The final contribution examines young children's relational preferences for solving additive and multiplicative word problems in relation to their performance on these items.

Exploring the Role of Relational Attention in Math Learning
Presenting Author: Lindsey Richland, University of California, Irvine, United States; **Co-Author:**Hongyang Zhao, University of California Irvine, United States

Children in a mathematics classroom must attend to not only objects visible within the problems or concepts being taught (e.g. objects in word problems, the procedural steps of a problem), but also notice how they relate to each other mathematically, or structurally, in order to reason about them like a mathematician and to transfer and generalize what they learn. Despite this, individual differences in children's spontaneous noticing of structural correspondences have not been the focus of many investigations, though attention to specific mathematical relations (e.g., multiplicative versus additive) has been identified as informative (McMullen et al., 2014). The current study broadens this line of research to children's likelihood of reasoning based on relations more broadly, measuring individual differences in spontaneous relational attention in a sample of 218 fifth- and sixth-grade children. The latent class analysis revealed that children could be systematically grouped into four clusters based on how likely they were to attend to relational correspondences, and importantly, these differences predicted

their learning from the lesson. We found that children who preferentially attended to relations systematically learned more mathematics from the same 20-minute math lesson than those who preferentially attended to objects with the same level of prior math knowledge and Executive Functions (EFs). At the same time, the latter group showed greater learning when the teaching during the lesson explicitly highlighted relational correspondences, suggesting this could be an approach to ensuring equity across all students in learning from high-quality lessons.

Multiplicative and analogical reasoning support the learning of fraction arithmetic
Presenting Author: Hilma Halme, University of Turku, Department of Teacher Education, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Department of Teacher Education, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Fraction understanding is based on grasping the multiplicative relation between the numerator and the denominator. Thus, it is understandable that relational reasoning abilities, including multiplicative reasoning and analogical reasoning, support the learning of fraction knowledge. However, previous research has mainly focused on fraction conceptual knowledge and less is known about the relation between relational reasoning abilities and fraction arithmetic knowledge. Students' struggles with fraction arithmetic are well-documented, and part of their problems arise from a lack of understanding of the relation nature of fractions and the arithmetic with them. Thus, the current study examines how individual differences in relational reasoning predict the development of fraction arithmetic knowledge over three time points within a school year, during and after instructional periods. The 360 fifth and sixth grade students (i.e. 11-12 years old) completed measures of multiplicative and analogical reasoning, and fraction arithmetic and conceptual knowledge. The results show that fraction arithmetic knowledge improves during instruction, from time point 1 to 2, and decreases after instruction, from time point 2 to 3. Relational reasoning predicts both the learning and retention of fraction arithmetic knowledge, even after controlling for fraction conceptual knowledge. Thus, individual differences in relational reasoning abilities appear related to the development of fraction arithmetic knowledge. These results further confirm that relational reasoning may be a crucial support for the development of mathematical skills, including fraction arithmetic.

Profiles of mathematical relational reasoning and students' motivation in fifth grade
Presenting Author: Kaja Mädamürk, Tallinn University, Estonia; **Presenting Author:**Jüri Kurvits, Tallinn University, Estonia; **Co-Author:**Eve Kikas, Tallinn University, Estonia

The current study aimed to investigate what type of mathematical relational reasoning profiles emerge from fifth grade sample including students' whole number calculation skills, comprehension of sentences containing additive and multiplicative relations, complex word-problem solving skills also requiring understanding of additive and multiplicative relations, and comprehension of an expository text regarding relations between different types of numbers (e.g., whole numbers, integers, rational numbers). Furthermore, we examined how these profiles are related to expectancy for success, intrinsic value, and cost, as well as task-persistence and tendency to re-check the expository text while answering the questions about the text. The sample included 345 Estonian students (51% girls). The students filled in an online math test and questionnaires. Based on the latent profile analysis, a four-profile solution was chosen including high and low skill groups but as well two groups having good calculation skills and understanding of the sentences but lower word-problem solving skills and/or low text comprehension. The high skills profile group tended to have better motivational outcomes than all other profiles showing the importance of motivation to reach very good math skill level. The study provides further understanding of how mathematical relational reasoning skills in different contexts are interrelated within different groups of students which in turn can help to develop math education further.

How a relational preference predicts 6-7-year olds' performance on word problems
Presenting Author: Wim Van Dooren, KU Leuven, Belgium; **Co-Author:**Elien Vanluydt, KU Leuven - University of Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium

The literature on proportional reasoning shows that children often erroneously use additive strategies. However, they also use proportional strategies in additive word problems. Recent studies showed the role of children's "relational preference": in tasks where additive and multiplicative reasoning are equally appropriate, some upper primary school children strongly tend to reason additively on the relations, while others reason as if the relations are multiplicative. This relational preference offers a unique explanation for erroneous word-problem solving in 8- to 12-year-olds, over and above computation and discrimination skills. However, it is still unclear whether relational preference is also associated with word-problem solving at an earlier age, before the start of formal instruction in word-problem solving. In this study, the relational preference of 343 children aged 6-7 was measured, and three additive and three proportional word problems were administered. Results show that already at this young age, relational preference is associated with word-problem-solving behaviour. Having an additive preference is related to better performance on additive word problems but also to additive errors in proportional word problems. Similarly, a multiplicative preference is related with better performance on proportional word problems, but erroneous proportional reasoning in additive word problems remained scarce at this young age. The implications of for research and educational practice are discussed.

Symposium

Identifying and assessing Computational Thinking

Keywords: Assessment Methods, Classroom Assessment, Computational Thinking, Early Childhood Education, Instructional Design, Primary Education, Qualitative Methods, Social Aspects of Learning and Teaching, Social Interaction
Interest group: SIG 25 - Educational Theory
Chairperson: Niels Dohn, Aarhus University, Denmark
Organiser: Nina Bonderup Dohn, University of Southern Denmark, Denmark
Discussant: Crina Damsa, University of Oslo, Norway

Computational Thinking (CT) is currently being implemented in most European curricula (Bocconi et al., 2022). There is, however, no single accepted definition of CT and, in consequence, "accurately assessing CT remains a major weakness in this area" (Shute et al., 2017). The present symposium contributes to remedying this major weakness. Drawing on sociocultural understandings of agency, skills, and their use in practice (Säljö, 2000), the four papers discuss how to reconceptualize CT as situated in social practice and corresponding methodological issues of identifying and assessing CT. Three of the papers present empirical examples of situated CT in early childhood education and in compulsory school contexts to discuss different ways CT can be distinguished and assessed. The first discusses the identification of CT as structuring resources in ongoing practice. The second investigates how fiber craft sewing can be conceptualized as algorithmic processes, allowing for novel assessment formats. The third focuses on the complexities of assessing CT skills when CT is integrated in situated teaching of other disciplines, specifically mother tongue language teaching. The last paper presents a theoretical framework, which develops a sociocultural articulation of CT-activities and related assessment criteria. Together, the papers contribute a broadened and differentiated understanding of assessing CT in context.Bocconi, S. et al. 2022. Reviewing Computational Thinking in Compulsory Education. A holistic approach to identifying computational thinking in preschool settings
Presenting Author: Ane Bjerre Odgaard, University College South Denmark, Denmark

The introduction of computational thinking (CT) in 3-5-year-old children's educational settings informs a growing research field (Bers, Strawhacker, & Sullivan, 2022). Despite explicit valorizations of children's agency and play within this field, activities most often comprise structured CT tasks (McCormick & Hall, 2022), and empirical studies point to tensions between such tasks and children's emergent play practices (Odgaard, 2022). This paper employs a socioculturally informed and design-based approach to examine how CT can be meaningfully implemented in sound alignment with local practices in Danish preschools. This

ambition implies a holistic approach where CT is not assumed *per se* to be central to examined practices, only to the degree that participants make it relevant in mediated action. This approach makes it possible to identify CT across institutionally situated social situations: In child- and educator-initiated play- and learning activities, as well as in institutional routine activities. The paper identifies CT across social situations and points to its relevance and limitations as a structuring resource for children and professionals in preschools. Bers, M. Computational thinking through sewing: Translating across approaches to algorithms
Presenting Author: Anna Keune, Technical University of Munich, Germany

To work toward more inclusive gender representation in computing, researchers and educators are designing instructional materials that are associated with the socio-material practices of those underrepresented in computing. Building on constructionist approaches to learning and research on electronic textiles for broadening computing culture, this research investigated how computational conceptual thinking could be captured in the context of sewing patterns into fabric. The qualitative study analyzed material inquiry sessions with computer science experts who analyzed sewn projects that were made by middle school youth for algorithmic approaches. Iterative and thematic analysis of the material inquiry sessions found that youth have to engage and translate across three approaches to algorithms while creating sewn artifacts. This presents promising inroads for assessing computational thinking in fiber crafts with implications for the utility of the soft context in educational settings.

Identifying and assessing Computational Thinking in three Danish L1 classrooms
Presenting Author: Roland Hachmann, University College South Denmark, Denmark

This paper addresses how to identify and assess computational thinking (Tang et al., 2020; Denning & Tedre, 2019) in primary schools within L1 (mother tongue language) classrooms. Reporting on three conducted Design-Based Research experiments in three different school classes, examples illustrate how a pedagogical design is applied and assessed in a teaching CT skills activity where pupils author interactive stories in the open-source application, Twine. Classroom observations and pupils' Twine stories were analyzed and assessed based on eight criteria, reflecting both the national goals for the subject and CT skills. Although findings suggest that the pupils attained the goals of the design, it is challenging to perform assessments in the cross-section between the L1 subject and CT skills (Weintrop et al., 2021) in the sense that assessing both content knowledge within and outside the subject can blur what is being assessed, and how this can support pupils in their continuous learning process. This challenge needs to be further investigated and discussed. Denning, P. J., & Tedre, M. (2019). *Computational thinking*. The MIT Press. Tang, X., Yin, Y., Lin, Q., Hadad, R., & Zhai, X. (2020). Developing a sociocultural framework for identifying and assessing Computational Thinking
Presenting Author: Nina Bonderup Dohn, University of Southern Denmark, Denmark; **Co-Author:**Stig Børsen Hansen, University of Southern Denmark, Denmark

The aim of this conceptual paper is to develop a socioculturally informed theoretical framework for identifying and assessing Computational Thinking (CT); with the purpose of providing guidance for educational practice as regards developing specific assessment tasks. CT has increasingly gained the attention of policy makers, educators, and researchers alike for its prime significance for citizens in the 21st century (Shute et al., 2017). There is, however, as yet no common, accepted definition of CT. Instead, a plethora of understandings of CT prevails, rendering the identification of CT in practice ambiguous and the foci for assessing CT unclear.The framework developed here encompasses activities promoted by the different understandings of CT. We explicate an *engagement condition* for CT-activities: for an activity to be a CT activity, it must require learners to engage with algorithmic processes. This points to two crucial questions. 1) What ontologically is understood to constitute "engagement with algorithms"? 2) What epistemologically counts as "demonstrating engagement"? In answering these questions, we draw on Greeno's (2011) sociocultural reconceptualization of "cognitive phenomena", identified at four different levels. We further provide examples of assessment tasks at each level. Greeno, J. G. 2011. A Situative Perspective on Cognition and Learning in Interaction. *In:* KOSCHMANN, T. (ed.) *Theories of Learning and Studies of Instructional Practice.* New York: Springer. Shute, V. J., Sun, C. & Asbell-Clarke, J. 2017. Empirical Research on the Effectiveness of Team Teaching: Conceptual and Methodological Essentials
Keywords: Conceptual Change, Educational Policy, Teacher Effectiveness, Teaching/Instructional Strategies
Presenting Author: Dries De Weerdt, University of Antwerp, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Elke Struyf, University of Antwerp, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium

Team teaching is regarded as a promising educational strategy for teachers' professional development and enhancing students' outcomes. Although its promising character, the research field on team teaching remains conceptually scattered and without clear insight into the methodological quality of single studies. Furthermore, researchers and policy makers worldwide are calling for a more transparent overview of the effectiveness of team teaching in current teaching practices in order to provide evidence-informed decision-making. Assuming that experimental research designs are most appropriate for examining the effectiveness of educational interventions, a synthesis of these types of studies may advance current research practices to further demonstrate the impact of team teaching. For this reason, the aim of this paper is to explore how team teaching is conceptualized in experimental studies and to what extent these studies comply with methodological quality requirements. Using a systematic review protocol, an extensive search was conducted of three widely used databases in education research. As a result, 31 experimental studies were included in this review, and examined according to a conceptual framework and critically assessed using a methodological quality appraisal tool. The findings of this review clearly demonstrate the urgent need for more well-defined rigorous experimental research to make convincing claims about the effectiveness of team teaching. Therefore, we conclude with directions for future research on how experimental studies should be conceptually and methodologically implemented in research on the effectiveness of team teaching.

Effective Teaching Behaviour: a Comparison between Individual Teaching and Team Teaching
Keywords: In-service Teachers, Quantitative Methods, Teacher Effectiveness, Teaching/Instructional Strategies
Presenting Author: Aron Decuyper, Ghent University, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium

Although effective teaching behaviour is central for student learning outcomes, the extent to which teachers behave effectively in the classroom during team teaching remains unanswered. In the literature there is a general assumption that teachers who team teach manage to teach more effectively than teachers who teach individually. However, there exists no research that empirically proves this to be true. The present paper aims to provide a clear picture of the differences in effective teaching behaviour during individual and team teaching. To achieve this goal, a large-scale cross-sectional survey study (n = 542) was performed among team teachers in compulsory education. The results show that teachers report that they perceive their teaching behaviour to be more effective during team teaching compared to individual teaching. In addition, multilevel analyses were carried out in order to examine whether demographic and team teaching variables have an impact on these perceptions. These analyses show that both education type (i.e., pre-primary, primary and secondary education) and the frequency of team teaching (i.e., percentage of team teaching in the teaching assignment) explain the differences in perceptions of effective teaching behaviour during individual and team teaching.

Collaboration and Shared Responsibility in Team Teaching: Development of an Instrument
Keywords: In-service Teachers, Quantitative Methods, Teacher Effectiveness, Teaching/Instructional Strategies
Presenting Author: Aron Decuyper, Ghent University, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium

This paper reports on the development and validation of the Collaboration and Shared Responsibility in Team Teaching (CSTT) scale. This instrument can be used to empirically assess two important dimensions of the practice of team teaching (i.e., collaboration and shared responsibility). The practice of team teaching refers to how team teachers deliver team teaching in the classroom. The purpose of this paper is threefold: (1) development and validation of the instrument, (2) tests of measurement invariance, and (3) descriptive statistics about collaboration and shared responsibility in team teaching. The development and validation of the CSTT proceeded along four different phases. First, items were generated based on the research literature on team teaching. Second, experts were consulted to review the preliminary items. Third, a pilot study (n = 20) was set out and finally, a large-scale validation study with 555 participants was performed using exploratory and confirmatory factor analyses. Results suggest a two-factor structure of key dimensions of the practice of team teaching: collaboration (10 items, $\alpha = 0.949$), and shared responsibility (5 items, $\alpha = 0.879$). Subsequently, differences in teachers' practice of team teaching across several subgroups of team teachers (i.e., teaching experience, education type and frequency of team teaching) were explored using tests of measurement invariance based on multigroup confirmatory factor analyses. Results indicate that teachers across the studied groups interpret the developed measurement instrument in a consistent manner. Lastly, empirical insights are given using descriptive statistics. Results demonstrate that team teachers report high scores on collaboration and shared responsibility.

Student teachers' peer team teaching experiences: perceptions, profiles and transition probabilities
Keywords: Attitudes and Beliefs, Higher Education, Pre-service Teachers, Quantitative Methods
Presenting Author: Loan De Backer, University of Antwerp, Belgium; **Co-Author:**Wouter Schelfhout, University of Antwerp, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Ellen Vandervieren, University of Antwerp, Belgium

Collaborative learning within teacher education has gained importance, with student teachers teaming up with each other to support their professional growth. Team teaching implies more than group composition: the challenge is to work collaboratively in the planning, implementation and evaluation of a course. By doing so, student teachers gain a variety of experiences which shape their perceptions of team teaching. Recent qualitative studies have provided promising guidelines and recommendations on this topic for teacher education, but specific information on the dynamics of student teachers' perceptions during workplace learning from a quantitative perspective is lacking. The current study aims to fill this gap by exploring student teachers' perceptions of peer team teaching and the extent to which these perceptions change during collaborative workplace learning. Accordingly, the main objective was to identify profiles of student teachers based on their team teaching perceptions and the transition probabilities – staying in or moving to a certain profile – over time, in an authentic context. To this end, the Student Teachers' Team Teaching Perceptions Questionnaire was administered twice to 181 student teachers who applied team teaching. The overall results reveal that student teachers varied in their perceptions. More specifically, latent profile analysis shows that three distinct team teaching profiles emerged at both time points: (1) *overall negative perceptions*, (2) *positive perceptions mediated by complexity* and (3) *overall positive perceptions*. Moreover, for the vast majority of student teachers in each of these profiles the initial perceptions of team teaching remained the same over time.

Motivational and Metacognitive Beliefs in Self-Regulated Learning

Keywords: Attitudes and Beliefs, Cooperative/Collaborative Learning, Feedback, Metacognition, Misconceptions, Mixed-method Research, Parents' Beliefs and Affect, Problem Solving, Problem-based Learning, Secondary Education, Self-efficacy, Self-regulated Learning and Behaviour, Social Interaction
Interest group: SIG 08 - Motivation and Emotion, SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Michael Weinstock, Ben-Gurion University of the Negev, Israel

When high confidence in the group and your peers negatively impacts group performance
Keywords: Cooperative/Collaborative Learning, Problem-based Learning, Secondary Education, Self-efficacy
Presenting Author: Jose Hanham, Western Sydney University, Australia; **Co-Author:**Adam Hendry, Parramatta Marist High School, Australia

Background/Aims. In project-based learning groups, students develop shared beliefs about the capabilities of the group (*collective efficacy*), and beliefs about the capabilities of other group members (*proxy efficacy)*. According to Social Cognitive Theory, stronger efficacy beliefs should correlate positively with higher achievement. The aim of this study was to investigate an emerging line of thinking which suggests that in group learning settings, high efficacy beliefs can develop prematurely and negatively impact group performance.Design/Method. A longitudinal design was employed, involving a survey administered at weeks 1, 3 and 5. The sample comprised 168 male students in Grade 8 from a Catholic Boys High School, located in the Sydney, Australia. The participants were randomly assigned to one of 42 groups (4 students per group), who were undertaking a 5-week project in science. Within each group, participants were randomly assigned to one of four roles: coordinator, fixer, checker, communicator. A final group summative task was used as the performance measure. Data were analysed using multilevel modelling.
Results. Collective efficacy for group processing and proxy-efficacy for the coordinator at the mid-point (week 3) of the project were negatively associated with achievement on the summative task. Collective efficacy for group performance at the mid-point of the project was positively associated with achievement on the summative task.
Conclusion. Theoretical perspectives emphasizing the importance of wholesale development of efficacy beliefs in groups should be reconsidered. From a practical perspective, it might be advantageous for teachers to temper the development of some types of efficacy beliefs.

Effects of Feedback Valence and Self-Efficacy on Students' Challenge-Threat Responses
Keywords: Feedback, Problem Solving, Self-efficacy, Self-regulated Learning and Behaviour
Presenting Author: Florence Lucas, Utrecht University, Netherlands; **Co-Author:**Eva Janssen, Utrecht University, Netherlands; **Co-Author:**Maaike Taheij, Utrecht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Feedback effectiveness varies widely across learners. One potential explanation for this could be that the valence of performance feedback affects participants' affective responses differently. According to the biopsychosocial model, whether students experience feedback as challenge or threat might affect their learning from it. However, not much is known about how feedback valence affects learners' challenge-threat responses, and what variables can explain individual differences in these responses to feedback. Therefore, we investigated whether the valence of performance feedback (positive or negative) affected students'

challenge-threat responses towards a problem-solving task, and, additionally, whether this effect was moderated by their self-efficacy. Participants completed a series of problem-solving tasks on which they received manipulated performance feedback, being either predominantly positive (n=74) or negative (n=72). Prior to the tasks, they rated their self-efficacy. Afterwards, they reported their challenge-threat states towards an anticipated second cycle of similar tasks. Regression models showed that negative feedback lowered feelings of challenge and heightened feelings of threat (i.e., fear of not possessing sufficient resources, and intimidation towards the upcoming tasks), compared to positive feedback. Moreover, students with lower levels of self-efficacy reported lowered feelings of challenge and heightened fear of not possessing sufficient resources. In contrast to our expectations, there was no interaction between feedback valence and self-efficacy, suggesting that self-efficacy did not explain individual differences in affective responses to (negative) feedback. Overall, our findings demonstrate that feedback valence affects students' challenge-threat responses. Future research should investigate whether this would indeed affect students' learning from feedback.

Patterns of social interaction and regulation in CL: The role of groups' metacognitive evaluations
Keywords: Cooperative/Collaborative Learning, Mixed-method Research, Self-regulated Learning and Behaviour, Social Interaction
Presenting Author: Eija Vuorenmaa, University of Oulu, Finland, Finland; **Co-Author:**Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

This study explored the patterns of social interaction and group-level regulation of learning (co- and socially shared regulation) in relation to collaborative learning groups' metacognitive evaluations of collaborative learning tasks and to learning performance. The participants were secondary school students (N=72, 24 groups of three learners) performing collaborative science tasks in physics over four 90-minute sessions. Situated self-reports about learners' perceived task difficulty and task understanding (i.e., metacognitive evaluations) were collected before and after each collaborative session to understand learners' internal conditions that shape how learners approach a task. In addition, after each session learners completed an individual quiz, which provided insight into learning performance. The collaborative sessions were videotaped and analyzed regarding social interaction, group's participation, and group-level regulation. By analyzing groups' metacognitive evaluations of the collaborative task before and after each session, four different types of clusters were distinguished from the collaborative sessions. Descriptive statistics were calculated for each cluster and learning performance was investigated with percentage distribution. In addition, each cluster's collaborative learning process was investigated further with time-related process model analyses to demonstrate patterns of social interaction and regulation in collaborative learning. The results showed that patterns of social interaction and group-level regulation as well as learning performance differ between the identified clusters. The results indicate that metacognitive evaluations shape and are shaped by groups' social interactions that are intertwined with group-level regulation. The results highlight the role of social interaction and regulation in shaping learners' internal conditions for learning and for learning performance.

Educational Findings = Common Sense? The Interplay of Hindsight Bias and Educational Misconceptions
Keywords: Attitudes and Beliefs, Metacognition, Misconceptions, Parents' Beliefs and Affect
Presenting Author: Stephanie Pieschl, Technical University of Darmstadt, Germany; **Co-Author:**Emma L. Goldstein, Technical University of Darmstadt, Germany; **Co-Author:**Leon Scholz, Technical University of Darmstadt, Germany

People often consider findings of educational research "common sense". This is problematic for science communication as well as for studying educational sciences. Many factors contribute to this problem, for example, general cognitive biases such as hindsight and metacognitive overestimation. But content-related misconceptions might exacerbate this issue. To disentangle these effects, we conducted two studies that partially and/or conceptually replicate Langfeldt (1989), a study about hindsight bias in education. In Study 1, n = 150 students of educational sciences judged the predictability of presented research reports that did or did not contain misconceptions in a 2x2 mixed design with the factors *report* (*true vs. falsified*) and *intervention* (*t1* before vs. *t2* after). In Study 2, n = 147 parents judged the predictability of research reports containing misconceptions about raising children in a 2x2 between-subject design with the factors *reports* (*true vs. falsified*) and *prior intervention* (*yes vs. no*). Preliminary results confirm that without prior interventions, participants suffer from the hindsight bias. Interventions seem to make participants more cautious, resulting in lower judged predictability of research reports, but not better at discriminating between true and falsified research reports. Furthermore, participants also seem to suffer from popular psychological misconceptions; these were not systematically affected by the implemented minimal interventions and might need more explicit debunking. We will discuss theoretical and practical implications at the conference.

University students' engagement during the pandemic: The role of organization-based self-esteem
Keywords: Engagement, Higher Education, Pandemic, Social Aspects of Learning and Teaching
Presenting Author: Jannika Haase, Leibniz University Hannover, Germany; **Co-Author:**Elisabeth Höhne, Leibniz Universität Hannover, Germany; **Co-Author:**Lysann Zander, Leibniz University Hannover, Germany

During the COVID-19 pandemic semesters, higher education students have experienced drastic academic and social changes. While adapting to remote learning, students reported challenges of maintaining motivation and engagement. Research has shown that students are engaged when they can draw on different individual (e.g., self-efficacy) and social study resources (e.g., social relationships). We investigated the role of students' organization-based self-esteem (OBSE) as a psychological state mediating the relationship between university students' perceived individual as well as social study resources and their engagement at two time points during the pandemic: in summer term 2020 when students found themselves in exclusive remote learning contexts (T1; N_1 = 850) and in winter term 2021/22 (T2; N_2 = 384) after universities had returned to face-to-face teaching. OBSE significantly mediated the relationship between students' individual (academic self-efficacy) as well as social study resources (instructors' support, low peer exclusion) and students' engagement at both time points. Our findings show that feeling valued and important is a crucial determinant for university students' sustained engagement in challenging remote and face-to-face learning environments.

COVID-19-related school closures and mathematical performance of grade 3 students in Germany
Keywords: Achievement, Mathematics/Numeracy, Pandemic, Primary Education
Presenting Author: Hedwig Gasteiger, Osnabrück University, Germany; **Co-Author:**Karoline M. Sachse, Institut für Qualitätsentwicklung im Bildungswesen, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Kristoph Schumann, Institut für Qualitätsentwicklung im Bildungswesen, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Mona Gerve, Osnabrück University, Germany; **Co-Author:**Axel Schulz, University of Bielefeld, Germany; **Co-Author:**Maria Engelbert-Kocher, Institut für Qualitätsentwicklung im Bildungswesen, Humboldt-Universität zu Berlin, Germany

Due to the COVID-19 pandemic, measures were taken, which had a considerable impact on the school situation. In Germany, these measures lasted more than a year and ranged from school closures and distance learning to alternating teaching phases with small groups. To date, numerous surveys were carried out

with students, teachers, and parents that reveal the stresses of teaching and learning during this time. However, there are few comparative studies on mathematical performance before and after the period of school closures. In the present study, we examined whether third-grade students' mathematics performance changed in different content domains before and after the COVID-19-related changes in school. In a repeated cross-sectional design, we compared two cohorts of third graders (2019: *N*=1,905; 2021: *N*=3,203) on standardized mathematics tests, constructed according to the German National Educational Standards, which allow a differential competence diagnostic for five content domains. There was a significant drop in performance overall. While the drop in the content domain Numbers and Operations was comparable to the overall drop in performance, the content domains Space and Form and Data and Probability were more affected. Also, tasks with a higher requirement level appeared to be more difficult in 2021 than in 2019. Results of the numerous surveys revealed that much time during distance learning was spent on exercises and reproductive tasks, which could explain the results.

Disabled students' educational and psycho-social experiences during the COVID-19 pandemic crisis
Keywords: Attitudes and Beliefs, Pandemic, Qualitative Methods, Special Education
Presenting Author: Filippos Papazis, National and Kapodistrian University of Athens, Greece; **Co-Author:**Anastasia Toulia, Department of Special Education, University of Thessaly, Greece; **Co-Author:**Anastasia Vlachou, Department of Educational Studies, National and Kapodistrian University of Athens, Greece; **Co-Author:**Theodora Papazoglou, Department of Educational Studies, National and Kapodistrian University of Athens, Greece; **Co-Author:**Aristea Fyssa, Department of Educational Sciences and Early Childhood Education, University of Patras, Greece; **Co-Author:**Lia Tsermidou, Department of Educational Studies, National and Kapodistrian University of Athens, Greece; **Co-Author:**Stavroula Kalaitzi, Department of Educational Studies, National and Kapodistrian University of Athens, Greece

The COVID-19 outbreak has high and virtually deleterious effects on all aspects of disabled pupils' lives, affecting also their developmental progress, school learning and wellbeing. Due to the pandemic sealing off, and other social distancing measures, disabled learners faced significant challenges amplifying their ongoing segregation and discrimination from educational structures and services. In the light of the above, this study aims to explore the lived experiences of primary and secondary school-aged disabled students as they are transitioning from quarantine and distance education back to their schools during the pandemic crisis. In particular, this qualitative study aims at addressing disabled students' voices through the use of semi-structured interviews about the impact of COVID-19 policy decisions in Greece on their educational life, psychology, and social relationships with others. The analysis unfolds around five main thematic axes: 1) educational experience(s) during the implementation of remote learning (accessibility, structure and organization of learning), 2) challenges (educational domain, social domain, lack of services and accommodations, specific needs related to remote learning, changes in everyday life), 3) positive experiences during the implementation of remote learning, 4) support (educational, psycho-social), and 5)returning to school-emerging from lockdown (educational support, psycho-social support). In most cases of students there was an evident absence of psychological support offered to them while those who attended general schools highlighted, the inability of their special education teachers to adopt their role and offer support to the remote learning.

Catching up after Covid-19: Do school programs for remediating pandemic-related learning loss work?
Keywords: Achievement, Educational Policy, Learning Analytics, Pandemic
Presenting Author: Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands

Worldwide, COVID-19 has had a major impact on education, with school closures leading to steep learning losses. In the Netherlands, learning gains were found to be lower across the board after an eight-week school closure period in the spring of 2020 than they would otherwise have been. This was true for both primary and secondary education, and learning losses were particularly pronounced for students whose parents had enjoyed less education.
A government subsidy was set up that allowed schools to create a catch-up program for their most vulnerable students. Schools could set up these programs early in the pandemic (from September 2020 on) and had near total freedom in their design: They chose the target domain, the methods, the staff, and the criteria on which they selected participants. This raises the question of whether such programs achieved their goals, and whether lessons can be drawn on what types of programs, or what characteristics of programs, are associated with better remediation.
Here, sixteen programs from eight secondary schools were analyzed. Results were aggregated using meta-regression. No effects were found for general skills programs or homework guidance, but positive effects of small-to-medium size were found for subject-specific tutoring programs. There was large heterogeneity between schools, which can be interpreted using qualitative data gathered from the same schools.

The Effectiveness of Feuerstein's Instrumental Enrichment Programme: A Systematic Review
Keywords: Achievement, At-risk Students, Cognitive Skills and Processes, Meta-analysis
Presenting Author: Jo Van Herwegen, UCL Institute of Education, United Kingdom; **Presenting Author:**Petri Partanen, Mid Sweden University, France

Background: Feuerstein's Instrumental Enrichment (FIE) programme is designed to improve cognitive functions thus raising academic achievement and improving related behaviours, especially for those with special educational needs. The evidence as to the effectiveness of FIE is mixed and therefore a systematic review was undertaken to present an updated evaluation of the existing research and the efficacy of FIE, with regards to three domains: cognitive, affective and academic achievement.Methods and Procedures: In total 57 studies from 55 papers were identified via the search process of a systematic review following PRISMA guidance. The protocol of which was preregistered: https://osf.io/g9x5b.Results: Overall, the most beneficial effect was found in the cognitive domain, both on general cognitive ability and cognitive specific measures such as reasoning and spatial abilities with effects ranging from small to substantial. The effects of FIE on academic achievement and affective measures was less pronounced and more inconsistent. Mathematical ability proved more susceptible to improvement than other academic areas, whilst impulsivity was substantially reduced in a number of studies. However, several methodological issues were identified in the body of research that made it difficult to fully evaluate both the effectiveness of FIE and the determination of moderator variables, particularly in the affective and achievement domains.Conclusion: FIE appears to be effective to raise cognitive abilities. However, there is a need for more robust research to fully determine its effect on academic achievement and affective domains. We will discuss improvements for intervention research for pupils with special educational needs.

The use of ICT in Special Needs Education – a systematic review
Keywords: Digital Literacy and Learning, Inclusive Education, Motivation, Special Education
Presenting Author: Daniela Nussbaumer, University of Applied Sciences of Special Needs Education, Switzerland

The use of Information and Communication Technologies (ICT) is an important topic for school education worldwide, not least because of Covid-19. In the field of special education, ICT is also of central importance for the participation and academic achievement of the students as well as the multi-professional cooperation of the teachers. However, there are currently only a few studies on the use of ICT in special education. The aim of the present work was therefore to identify and summarize studies on the use of ICT in special education from the past 10 years. A systematic database search identified 18 articles, which could be categorized into 4 groups: "ICT usage, attitude, and knowledge" (8), "ICT interventions" (4), "reviews" (3), and "satisfaction with ICT-supported learning" (2). Support for reading and writing is identified as the most common type of use. The knowledge of special education teachers is named as the central challenge. At

the same time, the few intervention studies indicate evidence-based of approach. A major challenge for research is the use of terminology and thus findability in the context of ICT.

The Good Behavior Game for children with Special Educational Needs: A scoping review
Keywords: At-risk Students, Classroom Management, Inclusive Education, Self-regulated Learning and Behaviour
Presenting Author: Maria Jornevald, Stockholm University, Department of Special Education, Sweden; **Co-Author:**Hanna Ginner Hau, Stockholm University, Sweden; **Co-Author:**Lise Roll-Pettersson, Stockholm University, Department of Special Education, Sweden

The aim of this scoping review was to map peer reviewed research on the classroom management strategy the Good Behavior Game (GBG) for children with Special Educational Needs (SEN) in mainstream education settings, and to identify any evidence gaps that need to be addressed by future research. Following a systematic search-and selection procedure 30 studies were included, of which 26 were effect-studies and four used a qualitative/mixed-methods design. SEN participants in the studies were mainly subgroups of children identified through baseline assessments of emotional-behavioral or academic difficulties. Overall, there was substantial clinical and methodological heterogeneity across studies, which precludes cross-comparisons and generalization to larger populations of children with SEN.
Integrative findings from quantitative and qualitative studies indicate that the GBG can support the behavior, peer relations and academic performance for children with SEN in mainstream settings. This is important given the long-term educational, social and health benefits previously associated with the model. However, small- groups or individual children with more severe difficulties may struggle to benefit from the intervention, and this appears to pose a challenge for teachers. Schools implementing the GBG should be aware that some children may need individual adaptations to participate in the GBG, and that teacher may need additional support to implement these adaptations. This Scoping review identified a paucity of research on children with pre-existing conditions such as ADHD or ASD, on challenges associated with the GBG for children with severe risk and on the perspectives of SEN participants and their teachers in mainstream education

A large-scale Check in Check out study in Finnish PBS schools: Intervention response and moderators
Keywords: At-risk Students, Learning and Developmental Disabilities, Self-regulated Learning and Behaviour, Special Education
Presenting Author: Mika Paananen, University of Jyväskylä, Finland; **Co-Author:**Anne Karhu, University of Eastern Finland, Finland; **Co-Author:**Asko Tolvanen, University of Jyväskylä, Finland

Check in Check out (CICO) is widely used intervention in Positive Behaviour Support (PBS) schools for pupils who do not benefit enough from universal level support and need individualised behaviour support. Evidence from previous research suggest that CICO is effective for pupils demonstrating problem behaviour, however, a large-scale study of effectiveness of the CICO intervention is lacking. In this presentation we describe outcomes of the CICO intervention in Finnish PBS schools. We also scrutinize the possible effects of different moderators on behaviour change. Fifty-one pupils participated the study. Behaviour of the participating pupils were followed before, during and after the CICO support using two data collection methods, School Situation Questionnaire and Daily Report Card. Moderating variables were individual level factors. The results revealed that CICO was delivered mostly for boys and large number of pupils (56%) were identified with special education needs (tiers 2 or 3 support) and thirty-four percent of pupils had neuropsychiatric diagnosis (ADHD or ASD). At the group level, during the CICO intervention a large change in pupils' behaviours was detected. Individual level factors were not connected to the change in behaviours. In sum, the results of this study support the effectiveness of CICO, and it seems to be effective in all grade levels and regardless of if pupil has specific need for pedagogical support or behaviour related diagnose.

The Effect of Goal-Setting on Work Environment, Transfer Motivation and Transfer of Training
Keywords: Goal Orientations, Lifelong Learning, Motivation, Self-efficacy
Presenting Author: Bastian de Jong, University of Amsterdam, Netherlands; **Co-Author:**Frank Cornelissen, University of Amsterdam, Netherlands; **Co-Author:**Joost Jansen in de Wal, University of Amsterdam, Netherlands; **Co-Author:**Thea Peetsma, University of Amsterdam, Netherlands

Abstract Despite large investments of companies in employee training, transfer of training content to the work practice remains low. One important component influencing transfer of training is transfer motivation, which in turn can be influenced via personal and contextual motivational antecedents of transfer motivation. Previous research has shown the potential to raise transfer of training with a goal-setting intervention. However, it is unknown via which mechanisms goal-setting influences personal and contextual antecedents and transfer motivation. This study investigated these mechanisms through the lens of the Unified Model of Task-Specific Motivation. Data were collected among 359 participants (38 trainings). Participants were randomly assigned to either the goal-setting intervention group or the control group. Both groups were asked to fill in a questionnaire directly after the training and after six weeks. Preliminary analyses were conducted using independent sample t-tests and regression analyses. Results indicated that the intervention group scored more positive on contextual antecedents and transfer motivation than the control group. Moreover, the influence of the contextual antecedents on transfer motivation was lower for the intervention group than the control group. On the other hand, we found no differences for the personal antecedents, nor for transfer of training between both groups. These outcomes provide more insight in the mechanisms as to how goal-setting can influence transfer of training. Moreover, it underlines the utility for trainers and policy makers to integrate a goal-setting element in trainings.

Socially shared regulation of learning in workplace teams – When and how does it appear?
Keywords: Cooperative/Collaborative Learning, Lifelong Learning, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Niina Palmu, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Piet Van den Bossche, University of Antwerp, Belgium

The aim of this study is to understand how socially shared regulation of learning (SSRL) appear during authentic team meetings of professionals. SSRL refers to a team's joint attempt to manage the changes and adapt to challenges through negotiated, iterative fine-tuning of cognitive, behavioral, motivational, and emotional conditions. While SSRL have been found to contribute to collaborative learning, it has not been studied in the context of professional collaboration. The research data was collected from 10 workplace teams (4-15 team members). A total of 30 one-hour team meetings were video recorded. The participants were from small to medium-sized companies in creative and ICT-industry. The data was analyzed in two stages: First locating episodes of SSRL from the interaction taking place in the team meetings and then identifying the phases (reflection, task definition, goal setting and planning, task enactment and adaptation) in each SSRL episode. The preliminary analysis shows that the frequency of SSRL episodes was 0-4 per team meeting and the duration varied between 5min30s and 26min30s. While SSRL was found to occur in most of the team meetings, the preliminary findings indicate that professional teams rarely attain the adaptation phase, although other phases of SSRL are recognized in the team meetings. The significance of this study is connected to the lack of research on SSRL in the workplace context and unpacking the learning and collaboration skills needed as rapid transformations take place in the labor market.

Academic teams – a space for individual and cooperative competence development
Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, Higher Education, Informal Learning
Presenting Author: Franziska Zellweger, Zurich University of Teacher Education, Switzerland; **Presenting Author:**Mirjam Kocher, University of Education Zurich, Switzerland

This contribution focuses on the competence development of scientific staff in the context of teamwork "on the job" at Swiss universities of teacher education and universities of applied sciences. So far, competence development has been considered from an individual perspective. In recent literature, a dual competence profile of the scientific staff is assumed, which recognise the scientific and practical professional competencies as equally important (Biedermann et al., 2020). The development of a such a comprehensive competence profile of all faculty poses high expectations on individuals. In addition, this claim cannot be limited to the beginning of a professional career. Rather, competence development is a permanent task and thus a central topic of team development, team collaboration and team learning (Edmondson & Harvey, 2018; Robbins, 2021). The following question is in focus: How does scientific staff perceive the collaboration in teams as a space for competence development in the dual orientation toward research and practice? By the time of the presentation, results of a questionnaire survey and qualitative content analysis of 30 interviews are available. First findings indicate that the scientific staff perceives the development of competencies more as an individual than a team process. Although highly engaged routines of team learning can be observed, some visible tensions are rooted in the academic context. Detailed results will also be put up for discussion regarding team interventions.

Exploring qualitative differences in motivation and learning among low-educated adults
Keywords: Learning Strategies, Lifelong Learning, Self-determination, Self-regulated Learning and Behaviour
Presenting Author: Bea Mertens, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium; **Co-Author:**Vincent Donche, University of Antwerp, Belgium

Adult secondary education (ASE) provides a second chance for adults who did not finalize secondary education, in order to prepare them for lifelong learning (LLL). Although good-quality motivation and good-quality learning strategies are crucial components herein, the quality of learning processes in adult education in general are an understudied terrain. This study examined the extent to which these key components are developed in low-educated adults and whether qualitatively different learning profiles can be distinguished by relating three crucial learning components: motivation, regulation and processing strategies. In this study participated 304 adult learners from five ASE-institutions. Learning profiles were mapped using latent profile analysis, a number of variance analyses and crosstabs. We found qualitatively different profiles within the three separate learning components, as well as relationships between the good-quality profiles on the one hand and the poor-quality profiles on the other. When integrating the three components into motivational-learning profiles, we found a good- versus a poor-quality motivational-learning profile, but also an ‘amotivation’ profile, in which poor-quality motivation is related to a moderate quality of regulation and processing strategies used. This study adds to existing theorization of adult learning and provides a pivotal knowledge base for educational practice, as the distinction between good- and poor-quality learners enables instruction to better support and stimulate learning processes, to also prepare low-educated adult learners for a qualitative LLL-trajectory.

Perspective-taking and -getting’s impact on learning and attitudes in a text-based context
Keywords: Argumentation, Attitudes and Beliefs, Citizenship Education, Informal Learning
Presenting Author: Paulo Jose Medeiros dos Santos, Saarland University, Germany; **Co-Author:**Armin Weinberger, Saarland University, Germany

Scenarios of argumentative knowledge construction often challenge learners to argue for perspectives dissonant to their own and are geared to prepare learners for debating divisive topics on text-based social media. Perspective-related approaches that aim to evoke empathy for the other side of the debate have a potential impact on learning and on attitudes in such scenarios. With this 2×2-study (n = 431), we investigate the impact and interaction of perspective-getting (with vs. without) and perspective-taking (consonant vs. dissonant) on knowledge acquisition, subjective learning gains, attitude change, and behaviour change intention in a text-based medium. Results show significant main effects of perspective-taking on learning and attitudes.

Promoting Knowledge Acquisition through Argumentation
Keywords: Argumentation, Learning Approaches, Reading, Reasoning
Presenting Author: Kalypso Iordanou, University of Central Lancashire, Cyprus

In the present work we examined whether engagement in argumentation practice can promote knowledge acquisition while simultaneously supporting argument skill development. We examine the effectiveness of a dialog-based argument curriculum in fostering 112 middle-school students' knowledge acquisition as well as written argument skill with respect to the topic of tackling climate change. Results showed a single intervention could meet both objectives. The method of providing evidence in the form of question-and-answer was found superior to a traditional one in promoting acquisition of knowledge on the topic. The Q&A condition was similarly superior in gains in argument skills, in using evidence to support their own position and weakening others position. In a second study, we extend the findings to a humanistic topic, the topic of immigration.

The impact of inductive reasoning on school achievements
Keywords: Cognitive Development, Developmental Processes, Large-scale Assessment, Reasoning
Presenting Author: Benö Csapó, University of Szeged, Hungary; **Co-Author:**Edit Tóth, SZTE Institute of Education, Hungary

Inductive reasoning (IR) is one of the most intensively researched cognitive abilities. It is related to intelligence and problem solving, and it is essential in the learning processes, thus, its developmental level determines academic achievements. Former research exploring the role of IR in school learning mostly used data collected in one measurement point and correlational analyses which do not allow establishing causal relationships. The present study utilizes data from the Hungarian Educational Longitudinal Program (HELP) and examines how the performances in inductive reasoning predict academic achievements in the following years. Participants of the study were representatively selected form the Hungarian primary schools; the sample sizes vary between ca. 4000 and 7000. Data of three cohorts are used in the present analyses. Beyond IR, reading, mathematics, science, foreign languages and problem solving were assessed at several points of students’ school career. The explored relationships span from the first to the eight grade of schooling. The results indicate the strong predictive power of IR on each school subjects included in the study; even IR measured at Grade 1 correlates well with the achievements at the end of the primary school. By the upper primary years, the development of IR consolidates and its correlations are getting stronger. Furthermore, IR plays a more important role in learning English than in German, and at the upper grades, its impact is more visible in the mathematics than in the reading achievements.

Microblogging and classroom talk
Keywords: Computer-supported Collaborative Learning, Dialogic Pedagogy, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Anja Amundrud, University of Oslo, Norway; **Presenting Author:**Maren Omland, Oslo Metropolitan University, Norway; **Co-Author:**Ingvill

Rasmussen, University of Oslo, Norway

Digital technologies, such as iPads, mobile phones, laptops, and interactive whiteboards, are now used in most Norwegian classrooms and have, in various ways, changed how teachers and students work and interact. However, despite technology-induced change, language remains our most important tool for learning. Research shows that teaching students in primary and secondary education how they can use their language productively in educational dialogue to learn through interactions is beneficial. Today, explicit teaching of the dialogue skills needed for learning is sparse, and the increased use of digital technology shows a tendency to more individualised activities, leaving less time for interacting in educational dialogue. In this paper, we focus on these challenges and report the findings from a project with teachers from four different schools in Norway. The project aimed to incorporate dialogic pedagogy while using a digital microblogging technology, Talkwall, which is designed to help teachers engage their students in educational dialogue. In Talkwall, students talk together in small groups and write short messages that can be displayed, arranged and distributed across students' devices and digital whiteboards for discussion in the whole class. The study explored the use of Talkwall in the classroom, specifically the teachers' practices when combining an explicit focus on educational dialogue and microblogging, and the ways in which microblogging can enhance students' participation in educational dialogue.

Deepening and Broadening the Dialogue of Collaborative Learners with Conversational Agents
Keywords: Argumentation, Computer-supported Collaborative Learning, Educational Technologies, Peer Interaction
Presenting Author: Armin Weinberger, Saarland University, Germany; **Co-Author:**Birk Thierfelder, Universität des Saarlandes, Germany

Abstract. Conversational Agents (CAs) can adaptively scaffold online discourse of learners. CAs can either monitor and react to the concepts that learners bring up, aiming to deepen the conversation, or activate when a pertinent concept is not used for a prolonged time span and suggest broadening the conversation towards the concepts that have not been talked about. Respectively in this 1×3 study on CAs (without, deepening, and broadening), learners were prompted to further develop an idea they are already familiar with or to pay attention to a subject they have not yet studied. We look at how these CAs help online learners cover conceptual ground during a problem-solving activity. In terms of supporting how students cover the domain collectively, the Broadening CA performed better than the Deepening CA. The discussants rated their learning gains similarly between conditions, while the acceptance of the agents' performance was somewhat negative. Support for Children from Low-Income Families by Promoting Effective Learning Strategy Use
Keywords: Inclusive Education, Learning Approaches, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Yuri Uesaka, The University of Tokyo, Japan

Children from low-income families tend to have low academic achievement and low motivation to learn. Support for economic and social independence is necessary to break the negative cycle that is passed down from generation to generation, but conventional support tends to focus on providing a place to stay and teaching individuals what they do not know; in many cases, this is not the support necessary for independence. To address this problem, using research into learning strategies to provide students with opportunities to promote learning skills may be important. However, a prior study has shown that supporters in low-income areas do not always welcome support from this perspective. Therefore, it is necessary not only to elucidate appropriate methods for cultivating effective learning strategy use in children from low-income families, but also how best to convey the importance of such cultivation to staff who are supporting them. This presentation will introduce a practice at a facility that helps children from welfare-receiving families; the practice was developed to include training sessions for staff and a course with six programs to promote students' learning strategies. Through interviews with facility staff, we will demonstrate how the supporting staff for children from low-income families gradually started to share the concept of facilitating learning strategies. We also used questionnaires and interviews to examine the impact of a learning strategies promotion program on students from low-income families.

How can schools protect immigrant students from depressive symptoms?
Keywords: At-risk Students, Cultural Diversity in School, Migrant / Refugee and Minority students, Well-being
Presenting Author: Rekar Abdulhamed, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Reija Klemetti, Finnish Institute for Health and Welfare, Finland

Children and youth from immigrant families may face several obstacles in their developmental paths compared to their native counterparts. For example, the demands of acculturation and identity development in intercultural contexts (home vs. host nation), discrimination and lack of sense of belonging, and learning via second language may pose challenges (Suárez-Orozco et al., 2018). There is a growing literature demonstrating that immigrant origin children and youth demonstrate a higher prevalence in mental health i.e., depressive, and generalized anxiety symptoms (Abdulhamed et al., 2022). This may risk their academic achievement (Owend et al., 2012), as there is evidence that depression reduces cognitive functions among children and youth (Wagner et al., 2015). However, less is known about school related factors, which protect immigrant children and youth from mental health symptoms, and what kind of a role could the school environment and school related factors play in diminishing the risk of depressive symptoms. This question is in the focus of the present study. We assessed whole population samples of children attending 4th and 5th grades of lower-level comprehensive school from three time points (2017, 2019 and 2021) in Finland. Children from immigrant families in (N = 14 930) were grouped to first- and second-generation migrant groups, and to forced (i.e., refugee background) and voluntary (i.e., migration due to employment) migrant groups. We also assessed estimate differences of immigrant origin youth to host national youth by means of moderation analyses (N = 259 382).

A New Instrument to Assess Trauma-related Components of Teachers' Competencies
Keywords: Assessment Methods, Attitudes and Beliefs, Competencies, Teacher Professional Development
Presenting Author: Friedrich Linderkamp, University of Wuppertal, School of Education, Germany; **Co-Author:**Bodo Przibilla, University of Wuppertal, School of Education, Germany; **Co-Author:**Gino Casale, University of Wuppertal, Germany

Trauma-informed work in schools is increasingly important due to global migration dynamics of children with high risk for traumatization. Dealing with trauma-related behavior is challenging for teachers because (subclinical) symptoms are extremely heterogeneous. Teachers are likely to misinterpret problem behaviors promoting unfavorable support decisions. Additionally, trauma-related work requires high emotional resilience, e.g., to process information about threatening incidents students experienced or to self-regulate after relapses. Beyond professional knowledge (e. g. pedagogical content knowledge), teachers competencies comprise cognitive and affective-motivational dimensions (e. g. motivational orientations, the ability to self-regulate, teachers' beliefs, and attitudes). Although attitudes, knowledge, and self-efficacy beliefs of teachers are highlighted in research on trauma-informed schools, there is a lack of internationally comparable instruments to assess these dimensions, particularly regarding trauma-related challenges. This study presents the intercultural adaption and validation of the Attitudes Related to Trauma Informed Care scale (ARTIC) for German teachers. 725 teachers completed a survey including a pretested German ARTIC version and several validity measures (attitudes, knowledge, job-related stress, self-efficacy). After missing data, outlier, and item analyses, 29 items and 505 cases

were used for EFA and CFA with two randomly drawn subsets of the data. We found a 4-dimensional bifactor model fitting the data best, expected correlations with the validity measures as well acceptable to high reliabilities. Although we could not reproduce the original ARTIC structure, the scale appears to be interpretable, reliable, and valid for German contexts. Implications for further studies on measurement invariance and teachers' competencies are discussed.

Pedagogy of hope in prison? The case of emotional education in a prison – a therapeutic community
Keywords: Inclusive Education, Migrant / Refugee and Minority students, Qualitative Methods, Social Sciences and Humanities
Presenting Author: Sergio Grossi, Researcher (Marie Curie Fellow) - Complutense University of Madrid, Spain

Prison in Europe is increasingly becoming a multicultural environment due to the high presence of migrants. Education aimed at the reintegration of convicted persons – one of the objectives of the sentence according to international law – is described as bureaucratic marketing in sociological and criminological studies. Pedagogy has developed several theoretical proposals to rethink education for convicts and several studies have analysed concrete model proposals that have been implemented in projects for the social reintegration of convicts. In particular, different model experiences in England, USA, Italy, and Norway will be analysed and compared with the experiences already analysed in Spain, Brazil, Uruguay, and Argentina. Discourses describing these experiences will be analysed through their self-presentation. In order to analyse the practices in the model units, a three-month short ethnography will then be conducted which will include the writing of a field diary and 40 open-ended and semi-structured interviews with staff and convicts. Data obtained in these analyses will be used to compare different experiences, allowing an assessment of the current situation in terms of best practice in education and reintegration for the social inclusion of convicted people. In this presentation, the proposal of Grendon Prison, one of the best practices in England, will be analysed. This prison is run as a therapeutic community and, according to the interviews conducted there, it is an educational opportunity for various subjects to recognise and discuss their emotions. Thus, this study fills a gap in education and prison sociology by interconnecting these disciplines.

Teacher professionalization in integrating literacy and science education: A design-based research
Keywords: Primary Education, Reading, Science and STEM, Teacher Professional Development
Presenting Author: Hilde Kooiker, Utrecht University/HZ University of Applied Sciences, Netherlands; **Co-Author:**Ted Sanders, Utrecht University, Netherlands; **Co-Author:**Jacqueline Evers-Vermeul, Utrecht University, Netherlands

Abstract (244 words)Despite promising results in research on effective reading instruction, many countries still face a lack of improvement in literacy outcomes, partly due to a research-practice gap. The collaboration between researchers and practitioners in design-based research (DBR) seems a promising approach to close this gap; it can offer solutions to educational practice and serve as a vehicle for teacher professionalization. In our study we took two evidence-based recommendations for reading education that are often neglected in Dutch primary education 1) embed reading instruction in content-area subjects and 2) teach children about text structures, and applicated them in science education. Four design principles were formulated. Two research questions guided our research: 1) How viable are the design principles in educational practice? 2) What level and type of support do teachers need to successfully apply the design principles in the design of their lessons and in educational practice? Two researchers and nine teachers developed four science projects. All projects went through two cycles of testing and evaluation. A variety of data was collected including surveys, logbooks, audio recordings of group meetings and notes from lesson observations. The DPs turned out to be viable to a large extent, but finetuning of the lessons was necessary. The design task appeared to be too complex and time-consuming for the teachers involved, partly due to teachers' lack of pedagogical content knowledge although testing the materials and providing feedback contributed to their professionalization. This calls for long-term collaborations in design-based research projects.

Does using real-world contexts in science teaching improve learning? A field study on electricity
Keywords: Instructional Design, Interest, Science and STEM, Secondary Education
Presenting Author: Benedikt Gottschlich, University of Tübingen, Germany; **Co-Author:**Jan-Philipp Burde, University of Tuebingen, Germany; **Co-Author:**Thomas Wilhelm, Goethe University Frankfurt, Germany; **Co-Author:**Liza Dopatka, TU Darmstadt, Germany; **Co-Author:**Verena Spatz, TU Darmstadt, Germany; **Co-Author:**Thomas Schubatzky, University of Innsbruck, Austria; **Co-Author:**Claudia Haagen-Schützenhöfer, University of Graz, Austria; **Co-Author:**Lana Ivanjek, TU Dresden, Germany; **Co-Author:**Martin Hopf, University of Vienna, Austria

During recent decades, many countries observed a diversification of instructional approaches in science teaching in secondary education to foster learning achievement and interest. An example of such a teaching strategy is the use of teaching resources that teach science using illustrative and motivating real-life applications. Researchers agree that such a context-based approach is beneficial for affective factors such as interest but are divided concerning its effects on learning achievements. In a field study, we investigate the effects of context-based teaching with regard to simple electric circuits in physics, which is a topic that is often perceived as abstract and unappealing by learners. We therefore developed a context-based teaching concept for a unit on simple electric circuits for students of year 8. The context-based concept is currently empirically evaluated as part of a field study in order to investigate the effects of context-based teaching on students' learning achievement, interest, and physics-related self-concept. Preliminary results indicate that compared to conventional instruction, the context-based approach leads to higher students' interest and self-concept, with no differences in terms of learning achievements.

Developing and Validating Representational Competence Test to Assess Multiple Representations
Keywords: Assessment Methods, Comprehension of Text and Graphics, Quantitative Methods, Science Education
Presenting Author: Fitria Arifiyanti, University of Szeged, Doctoral School of Education, Hungary; **Co-Author:**Soeharto Soeharto, University of Szeged, Doctoral School of Education, Hungary

Representational competence refers to skills related to generating and using multiple representations and making connections across multiple representations. However, studies related to instrument development to assess representational competence are rarely found in science education. 13 items that measure four different representations, pictorial representation (PR), science representation (SR), mathematics representation (MR), and verbal representation (VR), were developed and named representational competence test (RCT). 584 pre-service science teachers, 279 (47.8%) males and 305 (52.2%), participated randomly from Indonesian universities via the online platform. Rasch measurement was used in the data analysis to perform Rasch modeling using joint maximum likelihood estimation (JMLE). The result showed that RCT is valid and reliable based on Rasch parameters. The mean of Infit and outfit mean square (MNSQ) for the item and person range from 1.00 to 1.01 logits, indicating acceptable fit. For reliability, Cronbach's alpha (α) achieved 0.73, and the item and person reliability for the Rasch model are 0.69 and 0.97 logits, achieving acceptable criteria. No bias issues, all items in the negligible category (DIF A), were found based on DIF analysis regarding gender. The mean logit score of pre-service science teachers' is -0.81 logits, confirming that participants' abilities are under average level (0 logits). Based on gender, there is a significant difference based on t-test statistics where males are better than females. Pre-service science teachers above 25 years old have better mean logits (-0.19) than the two other cohorts, under 21 years old (-0.86) and 21-25 years old (-0.77).

The Use of Formative Peer Assessment as a Scaffold during Inquiry Learning in STEM Education

Keywords: Feedback, Inquiry Learning, Peer Interaction, Science and STEM
Presenting Author: Amber Van Hoe, Ghent University, Belgium; **Co-Author:**Tijs Rotsaert, Ghent University, Belgium; **Co-Author:**Tammy Schellens, Ghent University, Belgium

The inquiry-based learning research field has been investigating the concept of scaffolding for the last fifteen years. However, the potential of formative assessment as a specific form of guidance during inquiry has remained underexplored. The aim of this intervention study was to investigate how peers can be engaged to provide formative assessment to one another during inquiry. In total 524 students of the ninth and tenth grade participated. These students went in pairs through a lesson series of four lesson periods in which they had to investigate climate change. Their investigation was structured by the means of an inquiry cycle. In total three experimental conditions were created. In the first no PA condition, no PA was given. In the second PA condition, quantitative and qualitative peer feedback was given. In the third PA and dialogue condition, the quantitative and qualitative peer feedback was supplemented by a peer dialogue. Our preliminary results indicate a significant positive effect of peer assessment on the quality of the inquiry products of students. During the presentation, an in-depth analysis of the results will be presented. Additionally, the implications of this study for theory and practice will be addressed.

Do we all have the same understanding of subject-specificity in research on teaching quality?
Keywords: Classroom Management, Quantitative Methods, Science Education, Teacher Effectiveness
Presenting Author: Armin Jentsch, University of Oslo, Norway

In current papers on learning and instruction, it is often demanded that research on teaching quality should also take into account the specifics of the school subjects that are investigated. In particular, scholars often discuss to what extent interdisciplinary (generic) models or measures can benefit from a subject-specific enrichment (e.g., through subject matter didactics). From these reflections various conceptions of subject specificity emerge, which have hardly been discussed so far. However, they might have consequences for interdisciplinary research programs on teaching quality. In the presentation, this desideratum will be addressed. First, examples from the literature will show that educational researchers use different conceptions of subject specificity in their respective studies. The term subject specificity can refer equally to theoretical models, operationalization, measurement, or to the effects of teaching quality on student learning. Secondly, we discuss some open research questions that future interdisciplinary research programs on teaching quality could address. In the presentation, we will examine various ideas how research on teaching quality might be informed by subject matter didactics, and at the same time foster interdisciplinary collaborative projects.

Social-emotional competencies of Austrian primary school teachers
Keywords: At-risk Students, In-service Teachers, Inclusive Education, Primary Education
Presenting Author: Barbara Gasteiger-Klicpera, University of Graz, Austria; **Co-Author:**Christina Oswald, University of Graz, Austria; **Co-Author:**Lisa Paleczek, University of Graz, Austria

Since students with social, emotional or behavioural difficulties (SEBD) are often rejected by their classmates, it is important to promote their social relationships and their participation at school. The ability of enhancing social relationships in class may depend on teachers' emotional competence, mindfulness and relational skills. The aim of the present study was to investigate the interaction between these abilities of teachers and their strategies to foster the social participation of students with SEBD. We collected data on 148 Austrian primary school teachers' mindfulness in teaching, emotional self-efficacy, and relational competence using an online survey. To build a bridge between teachers' competencies and the implementation of inclusive education of students with disabilities in primary school, teachers were also asked about strategies they apply to promote the social participation of students with SEBD. To that end, the research team translated standardised scales from English to German. Respondents were predominantly female (95.9%), with a mean age of 45.52 years (*SD* = 11.39, range = 20–64 years). Results show that teachers rated their mindfulness in teaching, their emotional self-efficacy, and their relational competence as good. To promote the social participation of students with SEBD, teachers reported using more direct than indirect strategies. Preliminary findings indicate a relationship between teachers' interpersonal mindfulness, their relational competence and the number of direct strategies used to foster the social participation of students with SEBD. In summary, our findings highlight the impact that teachers´ social-emotional competencies can have on students' development.

Implicit theories of intelligence in German student teachers
Keywords: Higher Education, Mindsets, Self-concept, Teacher Professional Development
Presenting Author: Franziska Frohberg, Universität Leipzig, Germany; **Co-Author:**Christin Lotz, University Leipzig, Germany; **Co-Author:**Anne Deiglmayr, University of Leipzig, Germany

Learners´ implicit beliefs about intelligence (i.e., learners´mindset) affect motivation and learning (Blackwell et al., 2007). In addition, teachers' implicit beliefs about their students' intelligence (student-related mindset) have an important impact on student learning (Yeager et al., 2021). The research project presented here aims to capture German student teachers' implicit theories of intelligence (both in general, and towards their students) and to analyze their relationship to wider teaching-related attitudes and beliefs. In an online survey, 523 student teachers across all school types and subjects answered questions addressing their general and student-related mindsets, as well as other teaching-related beliefs and attitudes. Moreover, we compared the direct translation of intelligence ("Intelligenz") to a more open term ("grundlegende Fähigkeiten"; basic skills) in a between-subject and within-subject experimental design. Although results showed no between-subject mean differences in the mindset scores between the two translation variants, the within-subject intercorrelation between the translation variants was of only medium size (r = .42), indicating that they do indeed tap into different connotations. Additionally, general mindset and student-related mindset were highly and positively correlated (r = .78). We found different patterns of correlations between general and student-related mindset scores with other teaching-related beliefs and attitudes. However, all correlations were of small size ($r \leq .20$).

Changes in student teachers' self-efficacy and relations to emotion words in written reflections
Keywords: Emotion and Affect, Pre-service Teachers, Self-efficacy, Teacher Efficacy
Presenting Author: Anja Henke, University of Potsdam, Germany; **Co-Author:**Andrea Westphal, Universität Greifswald, Germany; **Co-Author:**Isabell Hußner, University of Potsdam, Germany; **Co-Author:**Rebecca Lazarides, University of Potsdam, Germany

Positive relations between positive emotions, learning outcomes and self-efficacy beliefs – as suggested by Control-Value Theory – have been shown in school children. It is unclear, however, if this relationship generalizes to the field of teacher education. Analyzing N = 239 written reflections from N = 146 student teachers, this study aims to examine relations between student teachers' teaching-related self-efficacy beliefs (TRSEB) and their use of emotion words when reflecting on positive and challenging situations of a microteaching experience. We hypothesized that student teachers' emotion word use differs between reflections on positive and challenging situations. We further hypothesized that their use of positive emotion words would be positively associated with their TRSEB whereas the use of negative emotion words would negatively relate to TRSEB. Wald-Tests showed that student teachers generally use more positive

than negative emotion words. Moreover, they used more positive emotion words when reflecting on a positive situation and more negative emotion words when reflecting on a challenging situation. Path models indicated that student teachers who used more negative emotion words in reflections on positive teaching situations reported lower TRSEB. We found no significant associations between TRSEB and positive emotion word use when reflecting on challenging situation nor between TRSEB and negative emotion word use. Thus, our results suggest that assumptions of Control-Value Theory are transferable to teacher education. Furthermore, they emphasize the necessity to consider emotions in learning contexts and underline their potential for pedagogical diagnosis and designing systematic interventions improving student teachers' TRSEB by accurately perceiving mastery experience.

Perceptions of classroom disruptions among (prospective) teachers: a mixed methods approach
Keywords: Classroom Management, Eye Tracking, Mixed-method Research, Teacher Professional Development
Presenting Author: Ann-Sophie Grub, Saarland University, Germany; **Co-Author:**Roland Bruenken, Saarland University, Germany; **Co-Author:**Doris Lewalter, Technical University of Munich (TUM), Germany; **Co-Author:**Antje Biermann, Saarland University, Germany

Teachers' professional vision is characterized by noticing relevant events in the classroom. Previous studies demonstrated differences in gaze behavior between prospective and experienced teachers under certain conditions. Most study results are based exclusively on eye-tracking data, the sole validity of which is limited by the eye-mind hypothesis. A direct triangulation of eye-tracking data and corresponding verbal data has been done by Wyss et al. (2021). As in this study, we used a mixed-methods approach to student and experienced teachers' (N=52) perception of classroom situations, whereby eye-tracking data and qualitative verbal data were linked in the sense of triangulation. We investigated whether critical incidents (CI) that were deemed relevant while watching the videos were also mentioned in verbal data. Results show a discrepancy between eye-tracking and verbal data: CIs were significantly more likely to be mentioned in the retrospective think-aloud than to be responded to with a keypress. Furthermore, we investigated whether there were differences in terms of expertise as well as between individuals who perceived the CI in the videos (respondents) and those who did not (non-respondents). Expertise differences were not revealed, but respondents were found to have more pronounced monitoring gaze behavior than non-respondents. The study thus highlights the relevance of triangulation in the use of eye-tracking, as it allows supplementation and possible correction by verbal data. Furthermore, the results show that teaching experience is not the sole determinant of professional vision, but that student teachers also appear to be able to monitor effectively when watching classroom videos.

Teachers' stress influences the effect of visual focus of attention on child-centred practices
Keywords: Eye Tracking, Quantitative Methods, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Anna-Liisa Jõgi, Tallinn University, Estonia; **Presenting Author:**Saswati Chaudhuri, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

Teachers' visual attention on students and its distribution are related to their implementation of child-centred teaching practices in the classroom. Additionally, teacher's stress also affects teaching practices. The aim of the present study was to investigate the effect of teachers' stress on the relationship between teacher's visual focus of attention and teaching practices in Grade 1 classrooms. The measures included eye-tracking video recordings from classroom teachers (N = 48) during one lesson; physiological stress using salivary cortisol levels, psychological stress using self-reported questionnaire, and observed teaching practices during one school day. Results showed that, firstly, teacher's visual focus of attention on students (fixation counts and Gini coefficient) were related to using more child-centred than teacher-directed practices. Secondly, only lower self-reported psychological stress was related to the child-centred practices, while high psychological stress did not show direct effect on teaching practices. Thirdly, interaction analyses showed that both psychological and physiological stress moderated the relation between teachers' visual focus of attention and teaching practices. More specifically, relationship between teachers' visual focus of attention on students and implementing child-centred practices appeared only for less stressed teachers. Higher stressed teachers used less child-centred teaching practices irrespective of the amount of visual focus of attention towards the students. The results suggest that for low stressed teachers the visual focus of attention reflects in their child-centred teaching practice. Practical implications of this study suggest that teachers should receive support to reduce stress, encourage more child-centred teaching practices, and provide individualized attention to students.

Pipelines and initial reports from machine learning classification of teacher gaze in the classroom
Keywords: Eye Tracking, Quantitative Methods, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Nora McIntyre, University of Southampton, United Kingdom

Mobile eye-tracking studies have the potential to provide contextually relevant insights into the practice of classroom instruction. However, the most insightful data involves long recording durations across multiple individuals (i.e., teachers) — and preferably with the teacher interacting with students during the classroom scenario. A hindrance to implementing research with this angle is the sheer volume of labour that it requires. With automated techniques and tools becoming available, this study subjected pre-existing mobile eye-tracking data to such automated analytic tools with a focus on the role of culture-specific expertise on teachers' gaze sequences (RQ1), as well as the role of teacher cognition in mutual gaze shared by teachers and students. In accordance with existing, related analyses (McIntyre & Foulsham, 2018) differences in communicative teacher gaze sequences are expected to depend on the combination of culture with expertise, whereas differences in attentional teacher gaze sequences will depend on expertise alone as well as that culture combined with it.

A Meta-Analytic Review of Eye-Tracking Studies to Investigate Teachers' Professional Vision
Keywords: Eye Tracking, Meta-analysis, Reasoning, Teacher Professional Development
Presenting Author:Özün Keskin, University of Augsburg, Germany; **Co-Author:**Andreas Gegenfurtner, University of Augsburg, Germany; **Co-Author:**Tina Seidel, Technische Universität München, Germany; **Co-Author:**Kathleen Stürmer, Univerity of Tübingen, Germany

A key skill for successful teaching is teacher professional vision, defined as the ability of teachers to notice and reason about relevant classroom situations. In the last few years, past research explored teacher professional vision with eye tracking to record teachers' eye movements during teaching events and make them accessible for further analyses. However, previous studies show a massive heterogeneity in terms of theory, methodology, and results. Therefore, we aimed to conduct a systematic literature review for creating an overview of eye tracking-studies examining teacher professional vision. A total of 65 studies were included in our review. We analyzed the studies descriptively by screening for theoretical, methodological, and outcome related characteristics. Our findings indicate heterogeneity in all three characteristics. Furthermore, our results may allow for better characterization of expertise development in classroom situations and provide a framework for future eye-tracking research of teachers' professional vision. The outcomes of this review add to the examining of teacher professional vision. Implications for future research on teacher professional vision are to develop the fundamental theory with the aim to imply further development in teacher education and be useful in teacher professional development.

Adapting the Technological Pedagogical and Content Knowledge (TPACK) survey for higher education
Keywords: Educational Technologies, Higher Education, Quantitative Methods, Teacher Professional Development
Presenting Author: Ha Nguyen, University of Groningen, Netherlands; **Co-Author:**Jolien Mouw, University of Groningen, Netherlands; **Co-Author:**Angeliki Mali, University of Crete, Greece; **Co-Author:**Hanke Korpershoek, University of Groningen, Netherlands; **Co-Author:**Jan-Willem Strijbos, University of Groningen, Netherlands

Measuring and monitoring teachers' competencies in teaching with technology is essential for higher education institutions to provide appropriate support and professional development activities, on the way to achieve effective online/blended/hybrid education. The Technological Pedagogical and Content Knowledge (TPACK) model distinguishes seven key factors: technological knowledge (TK), technological pedagogical knowledge (TPK), pedagogical knowledge (PK), pedagogical content knowledge (PCK), content knowledge (CK), technological content knowledge (TCK), and technological pedagogical and content knowledge (TPCK). Although frequently used to measure teachers' competencies in teaching with technology, existing TPACK surveys have mostly been used for pre-service or K-12 teachers. Few of the existing TPACK surveys have specifically been developed for university teachers. Hence, this study set out to construct a TPACK survey for higher education in the context of online/blended/hybrid education. Through reviewing the existing surveys and systematically scrutinizing their subscales and items, as well as adaptation and contextualization, we developed a TPACK survey adapted to higher education. Our adapted TPACK survey consists of 31 items distributed across 7 subscales. Each item is rated on a 5-point Likert-scale ranging from 1 (strongly disagree) to 5 (strongly agree). Results from our study indicate that (a) the subscales are sufficiently internally consistent and (b) the items fit the TPACK constructs as operationalized in the seven-factor model.

TPACK and the design of teaching against misinformation in five school subjects
Keywords: Critical Thinking, Digital Literacy and Learning, Mixed-method Research, Teaching/Instructional Strategies
Presenting Author: Thomas Nygren, Uppsala University, Sweden; **Co-Author:**Malin Tväråna, Uppsala University, Sweden, Sweden; **Co-Author:**Carl-Anton Werner Axelsson, Uppsala University, Sweden

We investigate how teaching in practice can stimulate students to become better at handling digital information critically and constructively, in different contexts. In the form of a design study where professional teachers and researchers together develop and test different arrangements in teaching, we examine the question of how varying materials and teaching methods can support students' digital source criticism in five different school subjects, namely, history, civics, art, psychology and biology. Teachers technological pedagogical content knowledge (Mishra & Koehler, 2006) is at the core of the design iterations aimed at investigating educational innovative designs with a positive impact in ordinary messy classrooms. The results highlight how TPACK reflections in relation to design iterations may promote students' abilities to identify, evaluate and use digital information in critical and constructive ways in different school subjects. We also present and discuss what students learn and struggle to learn in the five subject specific settings in light of research highlighting the importance of digital civic literacy.

The Interplay Between Technology-Enhanced Item Formats and Test-Taker Cognition
Keywords: Assessment Methods, Cognitive Skills and Processes, Large-scale Assessment, Reading
Presenting Author: Burcu Arslan, ETS Global, Netherlands; **Co-Author:**Blair Lehman, ETS, United States; **Co-Author:**Madeleine Keehner, ETS, United States; **Co-Author:**Marlit Annalena Lindner, IWM - Leibniz-Institut für Wissensmedien, Universität Tübingen, Germany

Computer-based assessments frequently use technology-enhanced item formats (e.g., drag-and-drop, inline-choice) for item types, such as ordering (sequencing), due to their potential to better represent knowledge, skills, and abilities of test-takers in a more authentic way compared to multiple-choice items. Currently, decisions about choosing an item format are based on experts' judgments rather than empirical evidence and theory about the effects of different item formats on test-taker performance and cognition. Lack of evidence-based and theoretically-grounded decisions threaten the validity of the interpretation of student knowledge, skills, and abilities. To provide theoretically-grounded empirical evidence on the appropriate use of item formats, we conducted a within-subject, randomized, controlled experimental study in which 535 eighth-grade students were tested with three reading comprehension items. We present the findings of the study together with their implications.

Both quantity and quality of technology integration matter
Keywords: Educational Technologies, Engagement, Quantitative Methods, Self-efficacy
Presenting Author: Tessa Consoli, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Maria-Luisa Schmitz, Institute of Education, University of Zurich, Switzerland; **Co-Author:**Chiara Antonietti, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland; **Co-Author:**Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland; **Co-Author:**Philipp Gonon, Institute of Education, University of Zurich, Switzerland

In this study, we developed a short survey instrument to assess the perceived quality of teaching with technology from the students' perspective based on the Three basic dimensions of teaching quality framework. According to this framework, cognitive activation, classroom management, and student support are three essential and indispensable dimensions of teaching quality. Several empirical studies demonstrated that these dimensions positively impact students' learning outcomes. Based on survey data from N = 8'915 students of 108 upper secondary schools in Switzerland, we investigated whether the frequency and quality of technology use (i. e., the use of technology to sustain the three dimensions of teaching quality) affect students' academic engagement and students' self-efficacy toward learning with technology. Hierarchical multiple regression analyses found a statistically significant small positive effect of the quality of technology use on students' learning engagement and statistically significant small positive effects of both frequency and quality of technology use on student self-efficacy toward learning with technology. The results emphasize the importance of considering the quality and quantity of technology integration and different learning outputs. In addition, the newly developed short survey instrument for assessing the quality of technology use in classrooms in large-scale survey studies can be considered a valid instrument and an important step in further investigating these issues.

How to become an enthusiastic teacher?–Motivational antecedents in early stages of teacher education
Keywords: Higher Education, Motivation, Pre-service Teachers, Teacher Professional Development
Presenting Author: Christin Lotz, University Leipzig, Germany; **Co-Author:**Patrick Hawlitschek, Institute for Educational Quality Improvement (IQB), Germany; **Co-Author:**Anne Deiglmayr, University of Leipzig, Germany

Teacher enthusiasm is the enjoyment, excitement, and pleasure (a) experienced during *teaching* and (b) for the *subject* taught. It is a highly relevant aspect of teachers' professional competences (Kunter et al., 2011). Whereas most prior studies showed the importance of teacher enthusiasm for effective teaching (e.g., Kunter et al., 2013), only little is known about the factors that shape teacher enthusiasm, especially during the early stages of teacher education. Thus, this longitudinal study investigated (1) how motivational aspects for choosing to study teacher education relate to teacher enthusiasm and (2) whether teacher self-concept explains the motivation-enthusiasm relations.A sample of *N*=671 second-semester teacher education students provided data at two measurement points: Motivation for choosing to pursue a teaching degree at the beginning of the semester and teacher self-concept as well as teacher enthusiasm after completing a mandatory internship in school about six months later. Results of structural equation models indicated that particularly intrinsic motives predicted later teacher enthusiasm. Specifically, educational interest showed a closer connection to teaching enthusiasm, whereas subject interest predicted subject enthusiasm more pronouncedly. Latent mediation models revealed different paths from students' motives to teacher enthusiasm: (a) The relation between educational interest and teaching enthusiasm was explained by education-specific self-concept but not by subject-specific self-concept; (b) the relation between subject interest and subject enthusiasm was explained by subject-specific self-concept but not by education-specific self-concept. Thus, it appears as if different mechanisms are involved in the relation between motivational antecedent and teaching as well as subject enthusiasm.

Influence of students' performance and teachers' enthusiasm on teachers' use of engaging messages
Keywords: Assessment Methods, In-service Teachers, Secondary Education, Teacher Professional Development
Presenting Author: Samuel Falcón, University of Las Palmas de Gran Canaria, Spain; **Co-Author:**Jaime Leon, University of Las Palmas de Gran Canaria, Spain; **Co-Author:**Wilfried Admiraal, Oslo Metropolitan University, Centre for the Study of Professions, Norway

The current study examined how students' performance and teachers' enthusiasm influence teachers' use of engaging messages in class. These messages can focus on benefits or disadvantages of being engaged in a school task, and appeal to external (i.e., extrinsic, or introjected) or internal (i.e., identified, or intrinsic) incentives to get students to engage. Engaging messages were gathered through audio-recorded lessons of 39 teachers in 59 student groups during the second term of the academic year. Results showed that both students' performance and teachers' enthusiasm influence teacher's use of engaging messages. The better the students' performance and the higher the teachers' enthusiasm, the larger the number of messages used. Moreover, the better the students' performance, the greater the likelihood of using messages that appeal to extrinsic incentives. By assessing engaging messages through objective observations, we discovered relationships that can help us better understand teachers' use of engaging messages. The findings also provide the insights for the design of future interventions aimed at modifying teachers' use of engaging messages. Aiming interventions at teachers instead of students has already proven to be efficient, as a single teacher may teach hundreds of students. An effective way to change teachers' behaviour is through interventions aimed at self-awareness of their practices. Therefore, providing them with feedback on their use of engaging messages may be a satisfactory option, as it is objective and simple for teachers to understand.

Promoting student enthusiasm: The role of teacher enthusiasm, teaching methods and time schedule
Keywords: Emotion and Affect, Engagement, Mathematics/Numeracy, Secondary Education
Presenting Author: Eline Camerman, KU Leuven, Belgium; **Co-Author:**Jeroen Lavrijsen, KU Leuven, Belgium; **Co-Author:**Peter Kuppens, KU Leuven, Belgium; **Co-Author:**Karine Verschueren, KU Leuven, Belgium

Students' enthusiasm at school constitutes an important facet of their school engagement, which has consistently been related to higher academic achievement and better socio-emotional adjustment. According to crossover theory (Härtel & Page, 2009) and empirical findings on emotional crossover in academic settings, students' enthusiasm in class may directly or indirectly result from the enthusiasm of their teachers. In addition, time schedule and teaching characteristics such as teaching methods have been suggested to play a significant role in students' emotional experiences in school. In the present study, we aimed to examine whether momentary levels of student and teacher enthusiasm in real-life classes are interrelated over time. Furthermore, we explored the role of teaching methods (i.e., oral instruction, group work, independent work or classroom discussion) in students' in-class enthusiasm and whether student enthusiasm depends on the day of the week or time of the day. To address these aims, an experience sampling study was conducted, in which both teachers and students reported on their momentary levels of enthusiasm and teaching methods twice during mathematics classes for a two-week period. Although the sample is currently being expanded, findings indicate positive relations between student and teacher enthusiasm over time and show higher levels of student enthusiasm during group work, independent work and at the end of the week. The present examination sheds light on the importance of promoting positive emotions in teachers as these may not only contribute to teachers' overall well-being, but also relate to students' emotional experiences and engagement in school.

The Changing Demands on Diverse Faculty's Digital Competence in Hybrid Learning Environments
Keywords: Digital Literacy and Learning, Higher Education, Inclusive Education, Teaching/Instructional Strategies
Presenting Author: Natalia Auer, Malmö University, Sweden; **Co-Author:**Katherine Doerr, Faculty of Education and Society, Malmö University, Sweden

The aim of this study is to examine the enduring impact of digital competence on university educators' practices. The COVID-19 pandemic accelerated higher education's shift to digitization as universities adopted emergency remote teaching. While educators digitized their teaching in only few days, there is a significant difference between the quality of instruction of a well-designed online course and courses offered online in response to the health crisis. In the aftermath of this crisis, is important to characterize educators' digital competences for several reasons. These include to empower their use of learning technology, to support their teaching in innovative ways, and to ensure accessibility to learning resources and activities to all learners, including those with special needs. To do this, we turn to the research-based European Framework for the Digital Competence of Educators (DigCompEdu). DigCompEdu's purpose is to develop teacher digital competences and take advantage of learning technology to improve and innovate education. DigCompEdu provides the framework for qualitative analysis of data collected from lesson observations and interviews with university educators (n= ~30). The study participants, faculty at one university in Scandinavia, represent a diverse range of disciplines, genders, and other social categories. The significance of this research is both theoretical and applied. It increases knowledge of how educators develop their digital competences and take advantage of learning technologies to innovate. In addition, it supports inclusive education, as students' need to become digitally competent depends on educators' development of their own digital competence.

What happens when the Novelty wears off? An empirical investigation of learning with Virtual Reality
Keywords: Digital Literacy and Learning, Educational Technologies, Immersive Technologies for Learning, Multimedia Learning
Presenting Author: Sara Klingenberg, University of Copenhagen, Denmark; **Co-Author:**Guido Makransky, University of Copenhagen, Denmark

What happens when the novelty wears off? Does immersive Virtual Reality (VR) fundamentally transform the way learners experience educational content, or are previous results supporting the use of this technology simply a reflection of novelty and framing effects? To investigate, we conducted a 2 x 3 between-subjects VR experiment with first-year university students on the topic of biochemistry. We manipulated novelty by allowing half of the students to use VR before the lesson, and we manipulated framing by introducing students to either positive, neutral, or negative evidence of the value of using VR in science education prior to the lesson. Results showed an increase in knowledge from pre- to post-test across groups, but the differences between conditions were not significant. Compared to the novice groups, students familiar with VR had significantly better in-game performance, perceived the lesson as more difficult and reported higher intrinsic cognitive load, but there were no differences between the groups on perceived effort, usability, satisfaction, or other cognitive load variables. There were no differences between the framing conditions on any of the outcome variables. This suggests that learning outcomes may not be directly affected by novelty nor framing effects, and that an attempt to predispose students to taking a particular stand on the use of immersive learning was overshadowed by the actual embodied learning experience, although familiarity with VR may influence other variables related to learning.

(How) can word processors improve writing in secondary classes? Results of an Intervention Study.
Keywords: Digital Literacy and Learning, Instructional Design, Secondary Education, Writing/Literacy
Presenting Author: Viktoria Michels, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Till Woerfel, Mercator Institute for Language and Literacy Education, Germany; **Co-Author:**Michael Becker-Mrotzek, Mercator Institute for Language and Literacy Education, Germany

The international assessment ICILS 2018 shows that word processors are among the most frequently used digital tools in German classrooms. Empirical studies show, however, that the use of writing software in classroom only has a positive impact on text production if it has previously been taught to learners in a suitable learning environment, which integrates writing and revision processes. This paper presents an ongoing non-randomized controlled interventional study with pre-post-follow-up-design, which aims to find out how students' digital texts in secondary schools are affected by word processor tools (spell check, synonym dictionary, speech synthesis) being part of a comprehensive learning environment. The paper will discuss preliminary findings in the different writing conditions: paper-pencil and tablet and keyboard.

Visual behavior of students differing in justification beliefs when reading conflicting reports
Keywords: Critical Thinking, Digital Literacy and Learning, Eye Tracking, Learning Analytics
Presenting Author: Meng-Jung Tsai, National Taiwan Normal University, Taiwan; **Co-Author:**Ching-Yeh Wang, National Kaohsiung University of Hospitality and Tourism, Taiwan; **Co-Author:**An-Hsuan Wu, National Taiwan Normal University, Taiwan; **Co-Author:**Ivar Bråten, University of Oslo, Norway

This study explored the role of students' justification beliefs when reading two conflicting socio-scientific reports. Forty-six university students volunteered to complete the reading task while their eye movements were tracked and recorded. A pre- post-test design was used to examine students' justification beliefs, critical reading strategies, and reading performance in terms of recall and critical reflection. Cluster analysis was used to classify participants into three groups (Personal-Multiple, Authority-Multiple, Multiple) based on their scores on three dimensions of justification beliefs (Personal Justification, Justification by Authority, Justification by Multiple Sources). Then, lag sequential analysis was conducted to explore visual transitions between the conflicting texts for each group. The results indicated that only the Multiple group displayed a visual pattern consistent with linking information across the two conflicting reports. Except for the Authority-Multiple group, all participants reportedly used an upper to medium level of critical reading strategies during the reading task and critical reflection was observed in all three groups. However, only the Multiple group recalled information from the two conflicting reports in a balanced way. The results of this study uncovered relations between students' justification beliefs and their processing of conflicting information and, as such, they may suggest scaffolds to improve critical thinking during online reading.

Regular media use and learning effects on the ability to critically reason with digital media
Keywords: Critical Thinking, Digital Literacy and Learning, Higher Education, Reasoning
Presenting Author: Dominik Braunheim, Johannes Gutenberg-Universitaet, Germany

While the need of being able to differentiate reliable from unreliable information vastly precedes our contemporary society, the scope of avaiable information is continously increasing, making this task more difficult (Lewandowsky et al., 2012). The internet is becoming a necessity not online during day to day information acquisition, but also for the purposes of learning in higher education (HE), where student's seem to struggle with both source and content evaluation on the medium (McGrew et al., 2018). The reliance on faulty, vague or even manipulative sources not only bears risks to the formation of opinions, but also on the quality of HE learning and especially its outcomes (Maurer et al., 2018). This pitfall raises the need for a better undertanding of how students can increase their ability to navigate and appraise digital media content correctly on their own. This paper addresses how previous experiences in media use, in a professional setting, are connected to the ability to navigate digital media content and form consise arugments based on the respective findings. In a two-step process both the patterns in regular media use and their influence on the ability to critically reason with online media (COR) (Molerov et al., 2020) will be described based on an empirical sample of young professionals at the intersection between HE and their first years of practice (N = 144).

Designing for learning in the digital transformation: a design-based research
Keywords: Digital Literacy and Learning, Lifelong Learning, Mixed-method Research, Teaching Approaches
Presenting Author: Monique Docter, University of Twente, Netherlands; **Co-Author:**Maaike Endedijk, University of Twente, Netherlands

As Digital Transformation can be considered as a fundamental change process in organizations, the fast technological developments ask for a broad range of formal and informal learning activities to keep employees employable. This poster describes the outcomes of a design-based research project to transform a traditional teacher-led formal course on Digital Transformation to a learning solution in which more self-directed formal and informal learning is integrated. This research project was a co-creation between three public and private organizations and a University with the ambition to accelerate the development of large groups of employees along the digital transformation, making knowledge and skills of business & IT, data science, ethics and cyber security as their core competencies. The course was redesigned based on three design requirements: 1) accommodating great diversity in the group of participants, 2) integrating the theory and the organizational practice, and 3) stimulating learning as a continuous process. The course was designed in three iterations and results now in a flip the classroom approach with a focus on the personal learning path of the learner, and the application of what is learned in their daily work. Data collection reveals insights in how the new design is perceived by the learners, as well as the learning outcomes of the course on the individual learners and the organization as a whole.

Supporting knowledge transfer in early childhood education – a longitudinal evaluation study
Keywords: Early Childhood Education, Mixed-method Research, School Leadership, Teacher Professional Development
Presenting Author: Daniela Ulber, HAW Hamburg, Germany; **Co-Author:**Nina Hogrebe, University of Applied Sciences Hamburg, Germany; **Co-Author:**Valerie Bergmann, HAW Hamburg, Germany

The sustainable transfer of new knowledge and competences into daycare centers is central for organizational development in early education, but research indicates that organizational development is not a task daycare center leader consider as their explicit responsibility (Timmermann et al., 2021) and is often not sufficiently supported by higher levels of the system (Hogrebe et al., 2012). Understandings of leadership that take team members into account, i.e. transformational leadership, empowerment and shared leadership, (e.g. Kangas et al., 2016; Siraj-Blatchford & Hallet, 2014; Rodd, 2015, Talan et al., 2014, Wang et al., 2014) as well as holistic approaches like the "whole systems approach" in Denmark (Hansen, 2018) seem especially promising but are quite demanding.The central aim of the study is to evaluate the implementation and effectiveness of an intervention that has been developed by a German Foundation to support knowledge transfer into daycare centers and foster organizational development. We use a mixed-method research design in which quantitative and qualitative methods are combined. First, we conduct quantitative online-surveys with early educators that participated in a professional development training and their center leaders at three measurement points (n=23). Second, we conduct expert interviews with these educators and leaders as well as additional team members (t 4). On the basis of the evaluation findings we can derive useful insights on how to support staff in early education in team transfer processes and organizational development more general.

Cross-cultural differences in preschool teachers' perceptions of teacher-child emotional dependency
Keywords: Attitudes and Beliefs, Early Childhood Education, In-service Teachers, Quantitative Methods
Presenting Author: Sofie Hendrix, KU Leuven, Belgium; **Co-Author:**Jantine Spilt, KU Leuven, Belgium; **Co-Author:**Joana Cadima, University of Porto, Portugal; **Co-Author:**Ana Camacho, University of Porto, Portugal; **Co-Author:**Tiago Ferreira, University of Porto, Portugal; **Co-Author:**Athanasios Gregoriadis, Aristotle University of Thessaloniki, Greece; **Co-Author:**Helma Koomen, Research Institute of Child Development and Education, Netherlands; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Andrea Eva Otero Mayer, National Distance Education University, Spain; **Co-Author:**Iwona Omelanczuk, Faculty of Education, University of Warsaw, Poland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Jochem Thijs, University Utrecht, Netherlands; **Co-Author:**Olga Wysłowska, Faculty of Education, University of Warsaw, Poland; **Co-Author:**Karine Verschueren, KU Leuven, Belgium

Previous research often indicates that teacher-student dependency is a negative dimension of the teacher-student relationship. However, most of this research has been conducted in cultures described as individualistic (or independent). The scant research in more collectivistic (or interdependent) countries suggests that dependency may be a more positive relationship quality. Although these cross-country differences have been attributed to differences in cultural values, this hypothesis has not been tested directly. Additionally, some scholars hypothesize that dependency has different subdimensions. Specifically, two subtypes of emotional dependency – the type of dependency that is mostly measured - have been distinguished. No research to date has studied whether the perceptions of teachers differ for these subtypes. To address these gaps, the present study examines (a) the association between teachers' perceptions of teacher-student emotional dependency and cultural values and (b) if the perceptions of teachers differ for the two subtypes of dependency. Participants will be recruited in seven European countries that differ in the degree of independence/interdependence (i.e., Belgium, Poland, Greece, Portugal, Netherlands, Finland and Spain). The study will use a within-participant vignette design, with one vignette for each subtype of emotional dependency. First findings will be presented at the EARLI conference. In this study we try to provide explanations for cross-country differences in teacher perceptions of emotional dependency to understand under what conditions dependency can be either a developmental risk factor or a facilitative factor in this development.

Effect of childcare teachers' positions on their attribution of responsibility for problems.
Keywords: Early Childhood Education, In-service Teachers, Quantitative Methods, School Leadership
Presenting Author: Maori Urakawa, Nagasaki Junshin Catholic University, Japan

Early resignation of childcare teachers is an important problem in early childhood education in Japan. One of the reasons is the problem of human relations in the workplace. The directors who manage the organization must create an environment in which childcare teachers can work comfortably. Therefore, this study aims to clarify how childcare teachers think about the attribution of responsibility in situations where they have problems with children, and how they differ from chiefs and directors.Methods: Subjects: 102 childcare teachers in various positions. Questionnaire survey by position (director/chief teacher/assistant chief/teacher). A case study of a child with developmental disorder was presented to determine whether the attribution of responsibility to the teacher in charge varied by position.RESULTS AND DISCUSSION: Compared to the directors and chief teachers, assistant chiefs and childcare teachers felt that the childcare teachers were more responsible ((F(2,94)=6.751 p

The Relationship between Educator-Child-Ratio and Pedagogical Quality in ECEC Explained
Keywords: Classroom Assessment, Early Childhood Education, Meta-analysis, School Effectiveness
Presenting Author: Kristina Hausladen, Otto-Friedrich-University Bamberg, Germany; **Co-Author:**Katrin Wolf, Otto-Friedrich-University of Bamberg, Germany

It is important to provide children in Early Childhood Education with good starting conditions through favorable structural aspects, like the educator-child ratio, in order to guarantee the basis for good pedagogical practices. Even though the educator-child ratio is often used as a structural indicator in ECEC research, evidence on its relationship with the process quality, meaning the pedagogical practices and interactions inside the group, is less than clear. This study contributes to this research by looking at a variety of moderating factors in the association between the educator-child ratio and the process quality. A systematic literature review identified 187 studies, published between the years 2000 and 2021, of which 47 were ultimately eligible for coding. Preliminary evidence of more than half of these studies shows, that there is substantial empirical evidence on this association that goes further than only correlations, but more than half of these analyses could not prove that the ratio is predictive of the process quality. Concerning the role of the moderators, the group composition is only included in a small part of the analyses, while the qualification of the educators is a common moderator. In the majority of the studies, the information on the ratios is collected through questionnaires rather than observations and mostly established global quality scales are used to operationalize the process quality.

E-assessment instrument for assessing children's development and the feedback it offers
Keywords: Assessment Methods, Early Childhood Education, Feedback, Tool Development
Presenting Author: Anne-Mai Meesak, Tallinn University, Institute of Educational Sciences, Estonia

E-assessment has been increasingly used to assess young children's skills. Studies have shown that young children can participate in e-assessments, solving tasks on a tablet with little or no help from teachers. In addition to assessing academic skills, researchers have increasingly noted the importance of social-emotional and self-regulation skills and started using the advantages of e-assessment in their favour. While e-assessment has been used to gather data from children and to identify the areas where children might need help, less attention has been put on the delivery of feedback given to teachers. For the assessment to have value for the teachers, the feedback must be clear and meaningful as well.Estonian Education and Youth Board together with Tallinn University have been developing an e-assessment instrument for assessing five-year-old children's development in five areas: cognitive processes, language, mathematics, learning and social skills. The instrument is standardized, norm-referenced and includes three tests. The tests include specially developed items with child-friendly features such as illustrations, animations, and audio instructions and are entirely computer-assessed. The tests will be free to use for all kindergarten teachers and specialists in Estonia and will include formative written feedback on each child and group of children. The poster will present the principles of the tests, with the emphasis on the written formative feedback provided to teachers. This will be presented together with examples of the items children solved and the constructs assessed.

'A story a day': a study on implicit learning of syntactic structures
Keywords: Curriculum Development, Developmental Processes, Early Childhood Education, Instructional Design

Author: Usha M N, The Promise Foundation, India; **Co-Author:**Sanjana Nagendra, The Promise Foundation, India; **Co-Author:**Kala B., Promise Foundation, India; **Co-Author:**Chandana S., Promise Foundation, India; **Co-Author:**Gideon Arulmani, Promise Foundation, India; **Co-Author:**Sonali Nag, University of Oxford, United Kingdom

We carry out a 10-session oral language intervention with 14 groups of 5- and 6-year-old multilingual children in South India aiming to examine effects of exposure to and practice with specific sentence structures embedded in stories. Focusing on micro-structure elements, specifically the syntactically complex temporal clauses (e.g. '*When Manu heard the thunder, he jumped with joy.*'), we ask whether children being primed with those structures will use them in their story retelling. We further ask which home and school level variables related to language use account for children's performance. Children's narrative expression is tested pre-intervention and thrice more: after the first five intervention sessions, the final five sessions and approximately a month after the intervention. All stories are rich in target subordinate clauses. Additionally, there are questions asked after each story in five of the 10 sessions that aim to elicit the target structures and there is subsequent modelling of the target structure by the teacher. In this poster, we will present the first analyses from this intervention to consider implications for children's implicit learning from the language of storybooks.

E-learning and Online Learning in Studying Metacognition, Emotion and Behaviour

Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, Curriculum Development, E-learning/ Online Learning, Educational Technologies, Emotion and Affect, Higher Education, Instructional Design, Lifelong Learning, Metacognition, Motivation, Self-regulated Learning and Behaviour, Social Interaction, Teacher Professional Development
Interest group: SIG 06 - Instructional Design, SIG 07 - Technology-Enhanced Learning And Instruction, SIG 08 - Motivation and Emotion, SIG 14 - Learning and Professional Development, SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Joni Lämsä, University of Oulu, Finland

Fostering self-regulated learning with metacognitive prompts in an online learning environment
Keywords: E-learning/ Online Learning, Educational Technologies, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Rebecca Pape, Catholic University of Eichstätt-Ingolstadt, Germany

Students must self-regulate in online learning environments. Many students, especially younger students, however, struggle to do so. Previous research presents evidence that metacognitive prompts are effective to foster self-regulated learning in online learning environments. Therefore, this study, firstly, investigates the students' metacognitive activities in an online learning environment and secondly, aims to examine the students' use of metacognitive prompts as a means to support self-regulated learning. To assess the students' metacognitive activities and their use of the metacognitive prompts, the participants (*N*=34) completed a 30-min learning phase in the online learning environment while thinking aloud. Preliminary results show that planning seems to be a frequent activity in the online environment and that students using metacognitive prompts refer more frequently to the overall learning process than the control group.

Sparking enjoyment in online synchronous education: The function of emotional mimicry
Keywords: E-learning/ Online Learning, Educational Technologies, Emotion and Affect, Social Interaction
Presenting Author: Muhterem Dindar, Tampere University, Finland; **Co-Author:**Anne Christiane Frenzel, Ludwig-Maximilians-Universität München, Germany

Nowadays, it is common for higher education institutions to organize online courses in which teachers and students participate in live lectures through web-conferencing technologies. This is coined as online synchronous education (OSE) in the literature. A growing body of research has explored ways to facilitate high quality interactions between teachers and students in OSE. The current study contributes to such ongoing efforts by focusing on an underexplored phenomenon, emotional mimicry (i.e., direct emotional transmission between the individuals). Specifically, the study aims to investigate the extent of emotional mimicry between teachers and students in OSE, and its impact on lesson enjoyment. For this aim, around 20 higher education teachers and 180 of their students were invited to participate in a naturalistic OSE lecture. Data collection includes video recording of teachers' and students' facial expressions during the live online lecture, and measurement of their self-reported lesson enjoyment. Data collection is in process. Machine learning will be applied on the video recordings to classify the momentary facial emotions of teachers and students under the happy, sad, neutral, surprised, and scared categories. Recurrence quantification analysis will be applied on the classified emotions to detect the extent of emotional mimicry between the teachers and students. Following, correlational analyses will be conducted to investigate whether emotional mimicry relates to the self-reported lesson enjoyment by teachers and students. This study will provide valuable insights regarding the dynamic interactions between the teachers' and students' emotions in OSE.

Self or System – Who regulates? The Effects of Prompts in Adaptive Learning
Keywords: E-learning/ Online Learning, Higher Education, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Patrick Albus, Ulm University, Germany; **Co-Author:**Aileen Schlichting, Universität Ulm / Institute of Psychology and Education, Germany; **Co-Author:**Tina Seufert, Ulm University, Germany

Adaptive learning (AL) approaches in computer-based systems may be used to provide individualized support to the learner. Systems often perform regulatory tasks for the learner (e.g., planning the next steps). However, whether this is profitable for self-regulated learning (SRL) is ambiguous. Empirical research shows that learners tend to have problems with SRL, so support should start with promoting self-regulation. Metacognitive prompting is a way to improve learners' SRL competencies by suggesting to learners how to proceed with learning in a self-regulated manner. In this way, traceability is increased, and the regulatory tasks that the system performs in the background also become visible. Therefore, we want to investigate the influence of system or self-regulation and the presence or absence of prompts on learning performance and motivation. We predict higher learning performance and motivation in prompt groups and differences between groups receiving system or self-regulation. We assume synergetic effects between the agency of regulation (self or system) and the presence of prompts. Whereas the effect of system or self-regulation on learning performance, depending on the presence of prompts, is moderated by metacognitive strategies. Hence, in our 2x2 design study, we vary the agency of regulation (system or self) and the prompting (with or without prompts). We examine learning performance, motivation, and the actual learning path as dependent variables. Data analyses are conducted through two-factorial ANOVAs. The poster contribution will discuss the results of the research.

Improving students' Life Skills to seed for the future. An Italian Faculty Development program
Keywords: Curriculum Development, E-learning/ Online Learning, Higher Education, Lifelong Learning
Presenting Author: Roberta Silva, University of Verona, Italy; **Co-Author:**Luigina Mortari, University of Verona, Italy; **Co-Author:**Alessia Bevilacqua, University of Verona, Italy

Life Skills, which are the subject of in-depth study in numerous international documents, represent a combination of different capabilities that enable individuals to face everyday life's demands and challenges effectively. Promoting them to younger generations is a priority as they allow them to face the challenges of a present and, above all, of a future characterized by increasing uncertainty and complexity. This paper aims to present the results of evaluation research carried out concerning the second year of the "Transversal Skills" Program realized by the University of Verona (Italy) to promote student development from a personal, professional, and civic point of view. 57.6% of the participants in the second run of the Program participated in the survey, including open and closed questions. Specific attention of the Teaching and Learning Center is given to the answers to the open questions as they allow researchers to approach evaluation research with a transformative perspective. The results of the framework analysis, which is still ongoing, confirm the students' positive evaluation of the initiative and

stress the desire to connect topical issues with the development of life skills. On the other hand, bureaucratic-organizational difficulties seem to emerge concerning managing a very complex Program. Overall, the students' words attest to the effectiveness of the Program, also in light of its theoretical framework. It is considered an opportunity for enrichment because it allows the development of the necessary skills and a greater awareness of the complexities of a world in constant, critical change.

The facilitators and barriers of online-delivered teacher training
Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, E-learning/ Online Learning, Teacher Professional Development
Presenting Author: Catalina Lomos, LISER - Luxembourg Institute for Socio Economic Research, Luxembourg; **Co-Author:**Hans Luyten, University of Twente, Netherlands; **Co-Author:**Filipe Lima da Cunha, SCRIPT (Service de Coordination de la Recherche et de l'Innovation pédagogiques et technologiques), Luxembourg; **Co-Author:**Frauke Kesting, SCRIPT (Service de Coordination de la Recherche et de l'Innovation pédagogiques et technologiques), Luxembourg

The integration of ICT in classroom practice is a complex process supported and hindered by specific facilitators and barriers. Many authors have identified barriers as institutional and personal, and facilitators as professional development and collaboration around the adoption ICT. For this study, we designed and implemented a professional development training as a professional learning community centered on the integration of a digital learning platform for mathematics in teaching practice in primary schools. Fifty teachers from ten schools in Luxembourg implemented the training for six months, following it online but as a team meeting physically in their school. Using content analysis, we analyzed teachers' perceptions of the barriers and facilitators of this online-delivered training, as reported across the six sessions. Teachers reported barriers related to the format and the delivery in the first sessions of the training. The most relevant facilitator was the collaborative character of the training, the fact that teachers had to attend the training together as a team in their school. This study identifies the barriers and facilitators of a professional development program focused on integrating ICT in teaching practice, the training itself being delivered online. Knowing how teachers perceive an online training and what conditions could improve its outcomes for teacher learning is an important contribution, considering the recent diversification of formats of teacher training.

Anthropomorphism and Emotional Valence in Instructional Images
Keywords: E-learning/ Online Learning, Emotion and Affect, Instructional Design, Motivation
Presenting Author: Sascha Schneider, University of Zurich, Switzerland; **Co-Author:**Nadine Scheller, Technische Universität Chemnitz, Germany; **Co-Author:**Sebastian Jansen, Technische Universität Chemnitz, Germany

When emotional valence is graphically represented (e.g., in anthropomorphized learning material), an attribution of human attributes automatically takes place. Therefore, anthropomorphism and emotional valence should be considered together. Previous studies on anthropomorphization of learning materials show improvement in learning performance while using graphical learning materials or decorative pictures. Moreover, studies on emotional valence of graphical learning materials predominantly show learning-enhancing effects of positive emotions. To our knowledge there is only one study with contradictory findings. Additionally, studies on the interaction between anthropomorphization and valence show better learning outcomes with positive valence and an anthropomorphized learning environment. In this submission, we present a study, focusing on the interaction of the anthropomorphization and emotional valence in instructional images. Therefore, 161 students were randomly assigned to a 2 (anthropomorphization: high vs. low) x 2 (valence: positive vs. negative) factorial between-subjects design with an additional control group. The results confirm the previous findings as the group with the anthropomorphized learning material including positive valence achieved the best results in the learning test. Furthermore, a higher intrinsic motivation leads to better learning outcomes for anthropomorphized learning material especially with a higher degree of anthropomorphization.

Analysis of high-arousal teaching episodes through video-recorded data

Keywords: Higher Education, Teaching Approaches, Video-based Learning, Well-being
Interest group: SIG 04 - Higher Education

This workshop focuses on analysing higher education (HE) teaching through various kinds of data (video-recorded segments of teaching, smart ring measurement data). In this collaborative session, participants are provided with an opportunity to analyse synchronized video- and EDA-data as well as to discuss the opportunities and obstacles surrounding this kind of analysis. The collaboration is supported by presenting the participants with some background data and theoretical considerations, but participants are also encouraged to discuss the possibilities of combining various data sources and utilizing such data in examining the relations between teaching processes and wellbeing of HE teachers. In addition, discussion related to ethical perspectives is promoted during the workshop.

Learning and Instructional Technology

Wikadoe:a dutch website to monitor and increase the self-regulated learning of primary school pupils

Keywords: Learning Strategies, Lifelong Learning, Primary Education, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning

Please bring your own device if you are attending this ICT demonstration.The overall objective of this research is to monitor and increase the self-regulated learning of school pupils from 10 – 12 years. SRL is a multidimensional concept of which several definitions can be found in the international literature. So an in-depth literature review is very important. We decided to blend the definitions of Zimmerman (2009) and Panadero (2014):
"SRL is an interplay of cognitive, metacognitive, motivational and emotional processes that a learner deploys to achieve learning goals. It's an active process in which learners take control of their own learning."
In the current study, we describe how we've created and validated a measuring instrument to monitor students' self-regulation skills. Our research question is: "How can we map self-regulation of primary school pupils by a dashboard and how can we gain insight into the relationship between the teacher's approach and

students' self-regulation skills?"
The measuring tool is implemented on a website which provides schools an instrument to measure and monitor students' self-regulated learning. The website incorporates a dashboard function for teachers, the results are displayed automatically and shown in graphs at school, class and student-level.

Invited Symposium

Avenues to improve students' learning with multiple documents

Keywords: Comprehension of Text and Graphics, Digital Literacy and Learning, E-learning/ Online Learning, Feedback, Higher Education, Metacognition, Reading, Secondary Education
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Carolin Hahnel, Germany
Chairperson: Cornelia Schoor, Leibniz Institute for Educational Trajectories (LIfBi), Germany
Organiser: Carolin Hahnel, Germany
Organiser: Cornelia Schoor, Leibniz Institute for Educational Trajectories (LIfBi), Germany
Discussant: Ladislao Salmerón, University of Valencia, Spain

Nowadays, learning in academic contexts often requires multiple documents, for example, when teachers assign students more than one text to study on a specific topic or when students use the Internet as a source of information. However, multiple document reading is demanding, as it requires students to build a coherent understanding of their reading of different texts that integrates different perspectives, theories, and ideas about the chosen topic. The contributions of the symposium shed light on cognitive and metacognitive challenges imposed on learners, highlighting avenues for overcoming them. The first talk by Hämäläinen and Kiili spotlights different facets of school students' integration of text and source information, demonstrating their specific problems to meet multiple document requirements. The next two talks broaden the perspective on why problems may arise by drawing attention to metacognitive aspects when working on multiple-document comprehension tasks. Schoor et al. focus on students' task model development (before vs. after the tasks), addressing aspects of plan development, while Tabbers et al. examine the role of monitoring accuracy, shedding light on how accurately students assess their own level of comprehension and whether their performance is related to over- and underestimation. Finally, Hahnel et al. present data on how a little nudge may support students in studying with multiple documents. They report on the effects of both group-based and personalized dashboard feedback in a one-semester Moodle course on students' behavior of integrating information and sourcing.

Students Engaging in Multiple Texts Literacy Task: Investigation of Integration
Presenting Author: Elina Hämäläinen, University of Jyväskylä, Finland; **Co-Author:**Carita Kiili, Tampere University, Finland

When readers integrate information from multiple texts, they select, organize, and connect ideas and sources within and across texts. This study investigated how upper secondary school students (*N*=87) integrated multiple online texts when they engaged in a multiple texts literacy task and whether behavioral

engagement and reading fluency were associated with their performance. Students read and evaluated two more and two less credible texts about vitamin supplements, after which they were tasked to use the online texts to write an article for a student magazine. Students' articles were analyzed to determine whether they included the main claims from the more credible texts and whether the article contained false claims or uncritical use of the less credible texts. In addition, five integration types were identified: intratextual integration, intertextual integration, textual-prior knowledge integration, source-content integration, and source-source integration. The results revealed that only 14% of the students included all three main claims in their articles. Furthermore, 40% of the students presented at least partially false claims, and 28% used less credible texts uncritically. The fourth of the students included neither intratextual nor intertextual integration in their articles. Besides, as much as 45% of the students did not integrate any source information in their articles. Moreover, the students, who were more engaged in the task, used more accurate main claims and integrated information more frequently. Finally, students' reading fluency was positively associated with the inclusion of accurate main claims. In the presentation, instructional implications of the results will be discussed.

Students' task model before and after working on a multiple-document task
Presenting Author: Cornelia Schoor, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Jean Francois Rouet, University of Poitiers, Center for Research on Cognition and Learning, France; **Co-Author:**MaryAnne Britt, Northern Illinois University, United States

Students' understanding of task instructions (i.e. their task model) is supposed to be updated continuously during work on the task. Yet, research on change of the task model is scarce. Since a multiple-document comprehension task requires strategies that go beyond single-text reading, the readers' task model of this kind of tasks is especially interesting. Thus, it was the aim of the present study to explore task model development between beginning and end of a multiple-document comprehension task. N=158 students were asked to report their task model before and after working on a multiple-document task. Their answers were coded in the number of single-document, multiple-document, and management strategies that they mentioned to be necessary for the task. After the task, students reported more multiple-document strategies, the same amount of single-document strategies, and less management strategies than before starting the task. This result confirms the assumption of a task model development during work on the task.

Seems like a difficult task! Monitoring accuracy in multiple document comprehension
Presenting Author: Huib Tabbers, Erasmus University Rotterdam, Netherlands; **Co-Author:**Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Daniel Schiffner, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Cornelia Schoor, Leibniz Institute for Educational Trajectories (LIfBi), Germany

How accurately can students in higher education estimate their comprehension of multiple documents? And is their estimate based on the same predictors as with single text comprehension monitoring? University students were given a multiple document comprehension assessment, estimated their performance, and rated their interest, effort and task difficulty. Preliminary results (n=153) show that in line with single text comprehension, monitoring accuracy is not very high, low comprehenders seem to overestimate their performance, and high comprehenders seem to underestimate it. In contrast to single-text comprehension findings however, the estimate was only predicted by performance and perceived task difficulty, and not by interest and effort. So multiple document comprehension monitoring is a metacognitive task that is at least in some aspects different from single text comprehension monitoring, and thus requires more research on which cues students (might) use when estimating their performance.

Does individualized feedback promote favorable behaviors in multiple document reading?
Presenting Author: Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Daniel Bengs, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Daniel Biedermann, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**George-Petru Ciordas-Hertel, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Beate Eichmann, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Ilka Wolter, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Cordula Artelt, Leibniz Institute for Educational Trajectories, Germany; **Co-Author:**Frank Goldhammer, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany

We explored the effects of process-based individualized feedback on students' processing of multiple documents when learning in a digital environment. For this purpose, we investigated how 452 teacher students engaged with multiple documents in four learning units of a one-semester Moodle course on the use of digital media in the classroom. For each learning unit, the students could access a feedback dashboard. At the beginning of the course, they were randomly assigned to one of two feedback conditions. Students either received general and peer-based feedback for each learning unit (control group) or individualized feedback based on their behavior in engaging with the provided documents in a learning unit (treatment group). We found that students started the course with little or rare indication of engaging in processes specific to multiple document reading. However, the treatment group showed a statistically significant increase in information integration and sourcing behaviors over time, while the control group showed no change or even a mild decline. We discuss these and other findings in terms of ways to promote students' multiple document literacy in higher education.

Invited Symposium

Spontaneous mathematical focusing tendencies in early childhood

Keywords: Cognitive Development, Early Childhood Education, Mathematics/Numeracy, Parental Involvement in Learning, Quantitative Methods
Interest group:
Chairperson: Minna Hannula-Sormunen, University of Turku, Finland
Organiser: Jake McMullen, University of Turku, Finland
Discussant: Riikka Mononen, University of Oulu, Finland

Typically, examinations of individual differences in mathematical development have used overtly mathematical tasks. However, recent research using non-explicitly mathematical tasks has revealed crucial individual differences in how children focus on mathematical aspects when not guided to do so. This research has found, for instance, that children's tendency of Spontaneous Focusing On Numerosity (SFON) predicts individual differences in early numeracy and mathematical development throughout primary school. A higher SFON tendency is thought to lead to more self-initiated practice with numerical skills in children's everyday lives, which should support learning mathematics. As a part of this EARLI Centre for Excellence in Research, this symposium includes four empirical studies at the forefront of research on SFON tendency and other spontaneous mathematical focusing tendencies.
The first contribution investigates the relation between young children's SFON tendency and their attention to numerical features during parent-child interactions. Next, the second contribution examines the relation between spontaneous focusing on approximate quantities and arithmetic achievement in young children and adults. The third contribution extends this general line of research to examine the developmental patterns associated with spontaneous attention to number when it is highly salient versus when it is low. These patterns will be examined in relation to their emerging mathematical knowledge and domain-general processes. Finally, the fourth contribution introduces a new spontaneous mathematical focusing tendency by examining spontaneous focusing on numerical order in young children. Overall, this collection of studies furthers evidence that these kinds of spontaneous mathematical focusing tendencies are relevant, multi-faceted aspects of early mathematical development.

Spontaneous focusing on number in parent-child interactions
Presenting Author: Alex Silver, University of Pittsburgh, United States; **Co-Author:**Melissa Libertus, University of Pittsburgh, United States

Parental support of children's early math learning can occur through encouraging conversations about math (e.g., Levine et al., 2010), although little work examines how children shape their own math learning environment. We previously found that children who use more frequent number elicitations (questions and prompts about numerical concepts) to seek out numerical information from their parents during parent-child interactions tend to perform better in math. Here, we

explored predictors of children's use of number elicitations and hypothesized that more frequent number elicitations might reflect increased attention to numerical information. To this end, we assessed children's (N=66; *M* age=4;2 years) spontaneous focusing on number (SFON) tendency, which measures unprompted attention to numerical information in the environment, via imitation tasks where children were instructed to imitate a series of actions performed by the experimenter without specifically mentioning what part of the action to focus on (Hannula & Lehtinen, 2005). We predicted that children with higher SFON tendency would also attend to numerical information during parent-child interactions and seek out additional numerical discussion from their parents by using more frequent number elicitations. We found that children's SFON predicted their use of number elicitations two months later, β=.28, *p*=.004, even when controlling for children's overall elicitations, parents' overall and number-specific elicitations, and children's prior numeracy skills. These findings suggest that children's spontaneous focusing on number when imitating others' actions may also manifest in seeking out additional opportunities to discuss numerical concepts when playing with their parents, which in turn relates to their math abilities.

Spontaneous Focusing on Magnitudes and the development of numerical abilities and arithmetic
Presenting Author: Arnaud Viarouge, Paris Cité University CNRS UMR 8240, France; **Co-Author:**Nydia Vurdah, Paris Cité University, France

When studying the relation between early numerical abilities and arithmetic, several studies have highlighted the importance of children's ability to process numerical information in the face of conflicting non-numerical dimensions of magnitude. While studies investigating the link between spontaneous mathematical focusing tendencies and arithmetic have so far been centred on exact number, spontaneous focusing on approximate quantity and other, non-numerical dimensions of magnitude could shed light on the relation between non-symbolic and arithmetic abilities. We collected data in kindergartners, first graders, and adults, on a spontaneous focusing on magnitudes (SFOM) task, a non-symbolic quantity comparison task, and arithmetic achievement. Our preliminary analyses show relatively stable SFOM tendencies across our three age groups. However, in the younger groups, we observe associations between children's SFOM tendencies for non-numerical dimensions of magnitude and their ability to handle the conflict between these dimensions and number in a quantity comparison task. In kindergartners, while SFOM tendencies were not directly related to arithmetic abilities, we observed a trend towards a significant interaction between performance during quantity comparison and SFOM tendencies in predicting arithmetic abilities, with a stronger relation between non-symbolic and arithmetic abilities for higher levels of SFOM tendencies. These results confirm the role of SFOM tendencies in the development of numerical and arithmetic abilities and suggest that these tendencies reflect individual differences in strategy use when solving arithmetic problems.

Longitudinal assessment of attention to numerosity
Presenting Author: Michele Mazzocco, University of Minnesota, United States; **Co-Author:**Jeffrey Bye, University of Minnesota, United States

Previous studies with the Attention to Number (AtN) task (Chan & Mazzocco, 2017; Mazzocco et al., 2020) revealed contextual effects in children's focus on numerosity compared to other features, with children (and adults) making more numerosity-based matches when competing features had relatively low salience (e.g., pattern, location) compared to high salience (e.g., color, shape). Interestingly, children (and adults) also make more numerosity-based matches overall when trial blocks pitting number against lower salience features appeared first, compared to trials pitting number against higher salience features. However, children made notably fewer numerosity-based matches than adults in these studies regardless of trial order, perhaps due to their developing understanding of number concepts. Although cross-sectional data fail to reveal marked developmental differences in attention to numerosity from ages 5 to 8 years, this question has not been examined longitudinally. Here we report longitudinal results from an ethnically- and socioeconomically-diverse sample of 207 4- to 8-year-old children who completed the attention to numerosity task annually, over two (n = 207) or three years (n = 60). We examined AtN performance over time, and its relation to children's performance on measures of number knowledge. Our goals are to identify (a) whether overall frequency in numerosity-based matches and the contextual influences on such frequency change during the early school age years, (b) whether changes over time are associated with emerging number concepts or mathematics achievement and (c) whether individual differences in executive function skills moderate these relations.

SFON and Spontaneous Focusing On Numerical Order as predictors of early numerical development
Presenting Author: Minna Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Jo Van Hoof, University of Turku, Finland; **Co-Author:**Heidi Harju, University of Turku, Finland; **Co-Author:**Cristina Nanu, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Understanding both the cardinal and the ordinal properties of numbers are crucial for children's early and later mathematical development (Fuson, 1988). Moreover, children's tendency to spontaneously focus and use mathematical aspects in their surroundings supports their mathematical development. Especially relevant for cardinality recognition skills of young children is their tendency to spontaneously focus on numerosity (SFON) (Hannula & Lehtinen, 2005). The current longitudinal research aims to investigate whether children have individual differences in SFON and spontaneous focusing on numerical order (SFONO), and how these individual differences are associated with their concurrent and later cardinality and ordinality related numerical skills. The participants of the 6-month follow-up study were 3.5 – 4.5 -year-old children (*N* = 152). In both measurement points children's SFONO was assessed by three novel play situations that offered possibilities to spontaneously (i.e. self-initiated way) recognize and produce a numerical order from sets of items. Apart from SFONO, children's SFON, cardinality recognition, numerical ordering, ordinal number word understanding, and number sequence production were in.
Preliminary results show that children had substantial individual differences in their SFON and SFONO tendencies. Correlations to other numerical skills were stronger for SFONO than for SFON. Developmental relations between SFON, SFONO and other numerical skills will be further analyzed. Overall our findings suggest that SFONO is a relevant, distinguishable component of early numerical development.

Opportunities & challenges of learning and assessment in democratic citizenship education in schools

Keywords: Assessment Methods, Attitudes and Beliefs, Citizenship Education, Cooperative/Collaborative Learning, In-service Teachers, Large-scale Assessment, Learning Strategies, Qualitative Methods, Quantitative Methods, Secondary Education, Self-efficacy
Interest group: SIG 13 - Moral and Democratic Education
Chairperson: Lihong Huang, Norway
Organiser: Lihong Huang, Norway
Discussant: Jens Bruun, Aarhus University, Denmark

This panel brings together ongoing research focusing on the perspectives of both students and teachers in learning citizenship competencies in school. In many European countries, citizenship education is an integral element in the education systems and students have had high achievement in citizenship knowledge, but this does not necessarily result in their active participation in democracy. However, active participation is essential for the sustainable development of our democratic societies. Previous research evidence has shown that learning and knowing democratic systems and principles constitute only a small part of the citizenship competencies that our future citizens need. Meanwhile, the political efficacy of the student is instrumental for active citizenship, which can only be acquired through active participation. The panel presents four studies bringing results from Belgium (paper 1) and Norway (paper 2 & paper 3), and together with six other European countries (paper 4). Paper 1 presents an analysis of the quantitative data on the comparison of institutional trust between two age groups of younger adolescents and adolescents from Flanders, Belgium. Paper 2 presents a study of developing political efficacy in school social science classrooms in Norway which reveals that the school environment as a democratic arena is important. Paper 3 presents a formative intervention study in a social studies classroom in Norway which suggests that cooperative learning enhances student political efficacy to some extent. Paper 4 presents a study on teachers' perspectives on using formative assessment to promote democratic citizenship competence in eight European countries.

Generational differences in Institutional Trust among Adolescents in Flanders
Presenting Author: Ellen Claes, KU Leuven, Belgium; **Co-Author:**Maria Magdalena Isac, University of Groningen, Netherlands; **Co-Author:**Linde Stals, KU

LEUVEN, Belgium

The paper compares cohort differences in political/institutional trust attitudes among Flemish adolescents by studying the following age groups: young adolescents (14-year-olds, N=2,880) and adolescents (18-year-olds, N=4,380). The study draws on data from two surveys on adolescents' citizenship competencies, which were the Flemish data and the National Assessment on Civic and Citizenship Education (NACCE 2016) in 2016. We find no significant differences between the two age groups. As context matters in trust evaluations (van der Meer & Dekker, 2011), this design kept context (time and country) stable. The main analyses are performed in a structural equations modelling (SEM) framework. The study indicated that political trust in adolescence can be considered more as a personal disposition.

"We just try to learn as much as possible" in Norwegian Social Science Classrooms
Presenting Author: Anders Kjøstvedt, Oslo Metropolitan University, Norway; **Co-Author:**Evy Jøsok, Oslo Metropolitan University, Norway

This paper explores how citizenship education in general and the school subject of Social Science, in particular, may contribute to students' political efficacy. It discusses opportunities for and challenges against the development of political efficacy among the students along two axes: the school environment as a democratic arena and the classroom as an "open classroom climate". The research is based on interviews with 9th Grade students in four Norwegian lower-secondary schools. The study suggests that the school environment seems important for how the students see themselves as democratic participants, especially, since the students are receptive to democratic school processes that lead to concrete results or actions and are meanwhile disillusioned by absent and distant school leadership. The study also finds the obstacles to a well-functioning "open classroom climate" identified by the students.Our research questions: - How do the students conceptualize democratic participation, and in what ways do they see themselves as participants in democracy?- In what ways do the students understand their school as a democratic arena, and what are their experiences of democratic interaction with teachers and school leadership? - What are the students' experiences of their classroom as an "open classroom climate" preparing them for democratic participation through classroom discussions? What do the students think to limit an open exchange of personal opinions as well as professional perspectives?

The effect of cooperative learning on student political efficacy: A formative intervention study
Presenting Author: Eva Kosberg, OsloMet, Norway

This presentation investigates how political efficacy can be supported in schools by exploring the connection between the use of cooperative learning techniques in social studies and students' political efficacy. The exploration was done as a formative intervention research project in the tradition of cultural-historical activity theory. The data underlying the research have been analyzed using the constant-comparative method of analysis and consist of observations of and interviews with 14-year-old Norwegian students. The main implication of the study is that cooperative learning has the possibility to enhance student political efficacy, mainly through providing students with opportunities to practice democratic skills such as discussion, cooperation, and constructive social interaction. However, the students' responses point towards tensions within the student group and between the classroom as a unit of learning and the expectations of the classroom as a unit of evaluation as key contradictions that may hinder the realization of a cooperative learning classroom.

Challenges & possibilities teachers face when assessing to promote democratic citizenship competence
Presenting Author: Nanna Paaske, OsloMet, Norway; **Co-Author:**Siri Mohammad-Roe, Oslo Metropolitan University, Norway; **Co-Author:**Wouter Smets, Karel de Grote University college, Belgium; **Co-Author:**Ama Amitai, Karel de Grote Hogeshoo, Belgium; **Co-Author:**Naomi Alexia Randazzo, Centro Iniziative Ricerche e Programmazione economica, Italy; **Co-Author:**Lihong Huang, Oslo Metropolitan University, Norway

The purpose of this article is to understand what challenges and possibilities teachers face when assessing to promote democratic citizenship competence. As background data, preliminary analysis of the International Civic and Citizenship Education Study (ICCS 2016) indicates that oral examination and written tests are the two most used methods of assessment for CE teachers. Peer assessment, student observations, and project work are the three less-used methods. We draw on data material from focus group interviews with teachers from Italy, Belgium, The Czech Republic, Slovenia, Lithuania, Italy, Norway, and Portugal in spring 2022. We investigate the underlying reasons for teachers' choices of using certain forms of assessment methods while excluding other methods. The teacher's responses uncover a need for teachers to be better equipped with relevant tools and approaches to practice formative assessment to develop students' CE. Assessment to promote student CE seems to be challenged by an understanding of the summative assessment of knowledge as easier to operationalize for the teacher, more motivating for students, and more desired feedback by parents.

Symposium
Motivational, Social and Affective Processes

Adolescents' motivational profiles in different learning areas. Relations with student outcomes

Keywords: Achievement, Engagement, Learning Strategies, Mathematics/Numeracy, Metacognition, Motivation, Science and STEM, Well-being
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Eve Kikas, Tallinn University, Estonia
Discussant: Anastasia Efklides, Aristotle University of Thessaloniki, Greece

Adaptive learning motivation is especially valuable when learning tasks are difficult and challenging for learners. It is well-known that learning tasks become successively more difficult and several aspects of learning motivation tend to decline over middle school years. Person-oriented analyses that allow finding subgroups of students who may need different learning support due to their different motivational profiles have considerable practical value, yet are still less used than variable-oriented methods. The studies presented in the symposium are carried out in three countries and different, but challenging learning areas – school math (Paper 1; Greece and Paper 2; Finland), language arts (Paper 1, Finland), science (biology and physics; Paper 2; Estonia), and using effective but complex learning strategies (Paper 4; Estonia). All studies focus on students at the end of higher middle school. The studies draw on situational expectancy-value-cost motivational framework and make use of person-oriented latent profile (or latent class) analyses. Moreover, as motivation is not only related to academic success, the presentations examine between-profile differences in a variety of student outcomes including academic achievement (Papers 1-3), persistence (Papers 2-3), knowledge and application of learning strategies (Paper 3) as well as well-being (Paper 4), perceived emotions and metacognition (Paper 1), perceptions of need satisfaction, dissatisfaction, and frustration (Paper 3). All presentations give practical implications.

Adolescents' motivational profiles in Math and relations with metacognition, emotions & achievement
Presenting Author: Dimitrios Moustakas, Aristotle University of Thessaloniki, Greece; **Co-Author:**Eleftheria Gonida, Aristotle University of Thessaloniki, Greece; **Co-Author:**Dimitrios Stamovlasis, Aristotle University of Thessaloniki, Greece

The recent focus of educational policies in STEM subjects has strengthened the scientific interest in motivation, being a key factor of mathematics achievement. In this context, our research follows a person-centered approach to investigate students' motivational profiles in the subject of Mathematics under the SEVT framework, along with their associations with affective and metacognitive variables. The sample of the study consisted of 297 ninth-graders, attending regular public schools in Greece. Students' performance in Mathematics was measured with 7 ad-hoc mathematical tasks, covering a range of the grade's curriculum. Three self-report measures were used to assess: i) students' motivational beliefs (Expectancy-Value-Cost scale), ii) six achievement emotions (Achievement Emotions Questionnaire) and iii) students' metacognitive knowledge and regulation of cognition (jr Metacognitive Awareness Inventory). Participants also reported their feelings of difficulty and certainty for the provided solution while solving the mathematical tasks, so that their metacognitive experiences would be considered as well. Latent class analysis revealed 3 distinct motivational profiles, two with overall increased motivational beliefs and one with lower ones, mostly characterized by a prominent perceived cost of dealing with Mathematics. The three profiles differed significantly in terms of mathematics performance and affective and metacognitive variables as well, with the profiles showing enhanced motivation standing out as more adaptive. Neither gender nor parents'

educational level effect was found. The results are discussed in light of the recent literature in the fields of student motivation and affect, and educational implications are considered.

Expectancy-value-cost profiles in math and language arts, behavioral engagement, and achievement
Presenting Author: Kukka-Maaria Polso, University of Helsinki, Finland; **Co-Author:**Heta Tuominen, University of Eastern Finland, Finland; **Co-Author:**Petri Ihantola, University of Helsinki, Finland; **Co-Author:**Markku Niemivirta, University of Eastern Finland, Finland

Behavioral engagement - task-related actions - can be seen as something that transmits internal perceptions into educational outcomes. While empirical findings show the benefits of motivation and behavioral engagement for learning and achievement, surprisingly few studies have focused on their mutual connections considering the subject-specificity of motivation and using several indicators of behavior. Thus, the present study investigated a) what kinds of cross-domain expectancy-value-cost profiles in math and language arts can be identified among lower secondary school students, and b) how the profiles are associated with behavioral engagement and academic achievement. A nationally representative sample of Finnish 7th-, 8th-, and 9th-graders (N = 7745) were classified into groups according to their subject-specific self-concepts, task values, and perceived costs using latent profile analysis. Next, profile differences in achievement (grades, test scores) and both self-reported and non-self-reported behavioral engagement (e.g., persistence, time-on-task) were investigated. A five-profile solution described the data best. More than half of the students reported intermediate or high motivation towards both subjects, whereas a fifth had an overall low motivation. The rest showed differentiated patterns with high motivation in one and low for the other subject. As in prior studies, boys were overrepresented and girls underrepresented in the predominantly math-motivated group. Motivational profiles were meaningfully related to behavioral engagement with the more positive groups appearing most engaged. Profile differences were more pronounced in math than language arts achievement. Further research is needed on how various indicators of engaged behavior relate to motivation in different contexts and time spans.

Motivational profiles in biology and physics, relations with learning and need satisfaction
Presenting Author: Kati Aus, Institute of Educational Sciences, Estonia; **Co-Author:**Ita Puusepp, University of Helsinki, Finland; **Co-Author:**Eve Kikas, Tallinn University, Estonia

Due to the mismatch between the low popularity of STEM subjects among students and the high need for skilled professionals in the society, many studies have examined students' STEM-related motivation. This study contributes to the field by using person-oriented analysis to examine motivational profiles in biology and physics. The first aim was to identify groups of students with different expectancy, value (intrinsic, utility), and cost profiles in biology and physics. Our second aim was to examine group differences in various student outcomes: academic learning behavior (persistence), knowledge of and application of effective learning strategies, grades, as well as students' perceptions of their psychological needs satisfaction, dissatisfaction, and frustration by their biology and physics teachers. The participants (1504 eight and ninth grade students) completed web-based questionnaires and reported their grades. We identified four general profiles with *Indifferent*, *Low*, *Average*, and *High* motivation, as well as two subject-specific profiles with *High biology/Low physics* and *High physics/Low biology* motivation. ANOVAs showed between-group differences in all studied variables. Regarding the two subject-specific profiles, groups differed in their grades in physics (but not in biology and math) and task-persistence, but not in knowledge and application of effective learning strategies. These subject-specific profiles also differed in students' perceptions of their need satisfaction in respective subject classes, while generally students with more adaptive motivational profiles experienced more need satisfaction from their teachers. *High biology / Low physics* motivation group included more girls and *High physics / Low biology* group more boys. Theoretical and practical conclusions are discussed.

Profiles of learning motivation and strategies related to grades and psychological well-being
Presenting Author: Eliis Härma, Tallinn University, Estonia; **Co-Author:**Aleksander Pulver, Tallinn University, Estonia; **Co-Author:**Eve Kikas, Tallinn University, Estonia

This study applied a person-oriented approach to differentiate middle school students' academic achievement and psychological well-being among subgroups by employing latent profile analysis. The subgroups were identified according to their learning-related motivational beliefs (indicating how motivated they are to learn effectively based on expectancy-value-cost theory) and the perceived effectiveness of learning strategies (about how students evaluate deep and surface learning strategies). Further, we explored how these profiles relate to academic achievement and psychological well-being. Participants (N = 1356; 50.2% boys, Grade 8) completed three questionnaires assessing the perceived effectiveness of learning strategies, learning-related motivational beliefs, and psychological well-being. Math, Science, and Estonian language Grade Point Averages (GPA) from Grade 7 and reading comprehension scores were used as academic achievement measures. Combining students' motivational components and perceived effectiveness of learning strategies, four profiles were identified. The results showed significant between-profile differences in academic achievement and psychological well-being indicators. Results, as well as their implications, are discussed.

Motivational, Social and Affective Processes

Measuring emotions in education – possibilities and limits of new approaches

Keywords: Cooperative/Collaborative Learning, Developmental Processes, Emotion and Affect, In-service Teachers, Interest, Motivation, Primary Education, Quantitative Methods, Secondary Education, Teacher Efficacy, Well-being
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Matthias Huber, Austria
Organiser: Kerstin Helker, Eindhoven University of Technology, Netherlands
Discussant: Julia Morinaj, University of Bern, Switzerland

Emotions are crucial for students' motivation, learning, achievement, and overall well-being; moreover, emotions are also essential for teachers' motivation, professional performance, job satisfaction, and health. Therefore, theoretical grounded measurement instruments are needed, that allow both, the analyzation of the function and origin of emotions as well as the possibility to access these emotions in educational practice (Pekrun et. al 2011, p. 36). In the last decade many questionnaires and scales were developed (or adapted), to fulfill this research demand (Niedenthal & Ric 2017, p. 35f.). Nevertheless, there is still a lack of valid instruments especially for specific settings or particular target groups; but the conception of new instruments for the measurement of emotion in education comes along with several methodological difficulties: e.g. Do the participants understand items about emotions in the same way as the researchers? (How) is it possible to consider culture, language or the socio-economic background? And is it generally conceivable to quantify emotional qualities?etc.To discuss these questions critically, four approaches will highlight their novel and innovative instruments, starting with a new beliefs about emotion scale for primary school students in Italy (n=1420), followed by a new questionnaire for the feeling of security and comfort for primary and secondary school students in Austria (n=1462). In the third presentation from Germany a new measure for the educational context to investigate dealing with emotions in (professional) teams will be presented (n=706), whereas the last study focusses on a new adaption of a questionnaire for teachers' intrinsic motivation in China (n=179/2982).

The robust implicit beliefs about emotions scale (R-IBES) for primary school students
Presenting Author: Daniela Raccanello, University of Verona, Italy; **Presenting Author:**Giada Vicentini, University of Verona, Italy; **Co-Author:**Angelica Moè, University of Padova, Italy; **Co-Author:**Stephanie Lichtenfeld, Universität Hamburg, Germany; **Co-Author:**Roberto Burro, University of Verona, Italy

Beliefs on malleability are related to a wide range of emotional, motivational, and cognitive constructs. Endorsing an incremental mindset has been revealed beneficial and it is associated with a better adaptation to external challenges, also in the learning contexts. Concerning beliefs about emotions, empirical research has predominantly focused on adults. Less is known about mindsets of emotions in children, partly because instruments measuring them are largely lacking. The present study evaluated beliefs about malleability of emotions in primary school students, by adapting and validating the child version of the Robust

Implicit Beliefs about Emotions Scale (R-IBES). We involved a sample of 1,420 second and fourth-graders. We applied a combined approach using exploratory factor analysis (EFA), confirmatory factor analysis (CFA), and Rasch modelling. EFA and CFA supported the bidimensional structure of the scale, distinguishing beliefs for positive and negative emotions. A measurement invariance analysis indicated that the scale was invariant across class level and gender. The Rasch model permitted to transform the scale into an instrument respecting the properties of fundamental measurement. In consecutive analyses discriminant and predictive validity of the scale were determined by investigating the relation of beliefs about malleability with emotion regulation and well-being. Moreover, a linear mixed model revealed that beliefs about malleability were higher for positive compared to negative emotions. Limitations and suggestions for future research, together with implications for utilizing the R-IBES scale to inform interventions to foster an incremental mindset, are discussed.

The sense of security and comfort in the classroom – validation of a new questionnaire
Presenting Author: Matthias Huber, University College for Teacher Education Carinthia, Austria; **Presenting Author:**Markus Herrmann, University College of Teacher Education Carinthia, Austria

The sense of security and comfort is a basic need consisting of the experience of emotional warmth, trust, and safety. In education, a sense of security and comfort increases the students' overall well-being, self-confidence, curiosity, and willingness to learn, underlining the importance of this topic from a student's perspective. Current social and political conditions, like the pandemic or the war in Europe, emphasize the relevance of this emotion in general. However, there are hardly any studies in the context of teaching and learning, that investigate this complex, self-conscious emotion. Therefore, the present study aims to explore the possibilities of measuring the sense of security and comfort in schools. Based on theoretical models, a questionnaire for primary and lower secondary school was developed. The item construction went through different stages of qualitative and quantitative pre-tests. The main survey (consisting of eight scales) aims to explore the content and construct validity, the model fit, and the mediation effect by exploratory factor analysis, measurement models and structural equation modelling. The sample of the present study includes 1462 pupils from 17 schools and 87 classes. The first results show the primary four-factor inventory is consistent with the theoretical framework and shows great validities. Therefore, further single-item analyses will be discussed by methods of measurement models and structural equation modelling. By means of cluster analysis, four clusters — the sheltered pupils, teachers' darlings, peers' favourites, insecure pupils — were found and allow the plausibility verification and description of the sample.

The development of a measure to investigate dealing with emotions in teams
Presenting Author: Sebastian Gerbeth, University Regensburg, Germany; **Co-Author:**Elena Stamouli, University of Regensburg, Faculty of Human Sciences, Germany; **Co-Author:**Regina Mulder, University of Regensburg, Germany

Teamwork shapes learning and work processes and are of great importance in all kinds of organisations, including education. Emotions are prerequisites, companions and results of learning and work processes and are therefore also emergent in teams (e.g. team-teaching, special interest groups, preservice teachers etc.). When seeking to understand the role of emotions in teams, previous research addressed that emotions in teams and the dealing with emotions in teams are complex and multilevel phenomena. While there are measurement instruments on emotional competence at the individual level, suitable measurement instruments at team level are lacking. This is mainly because at team-level emotions and the dealing with emotions are addressed based on the multi-level theory with the help of compilation models (team level is a complex combination of diverse individual level contributions) and, therefore, often are examined by aggregating individual level data. Recent research shows that on the other hand composition models of emotional constructs (team level is the coalescence of identical lower-level properties) can also explain variance in outcomes such as performance, beyond the individual level. In this contribution we develop a measure by describing the design, the requirements for a good measure and the different steps that were taken, considering the team level on the basis of multilevel theory, that can be used for investigating the dealing with emotions in teams.

Teachers' intrinsic orientation for the profession: Scale development and validation
Presenting Author: Xiangyuan Feng, University of Groningen, Netherlands; **Co-Author:**Michelle Helms-Lorenz, University of Groningen, Netherlands; **Co-Author:**Ridwan Maulana, GION - University of Groningen, Netherlands

Teachers' intrinsic orientation for the profession (TIOP) refers to the degree to which teachers experience positive emotions and high meaningfulness in their profession. Compared to other teacher psychological factors, the knowledge about TIOP is underrepresented in the literature. To date, only three empirical studies have been conducted to construct its operational framework and explore its characteristics in the Dutch context. Considering the theoretical significance and methodological limitations of these studies, the present study aims to enrich the knowledge base of TIOP and refine its measurement by investigating its relevance in the Chinese context. A mixed method was employed, following the procedures of domain and item generation, theoretical analysis, and psychometric analysis, to develop an enriched TIOP scale. 179 secondary school teachers and 2982 students participated in the study. Results suggest the enriched scale can validly and invariantly measure TIOP across gender, age, and subject groups in the Chinese context. It consists of five dimensions: positive emotions for teaching activities and the subject, intrinsic value for self and others, and future-time goals. Research results suggest that TIOP is strongly correlated with teacher well-being and student-perceived teaching quality. The present study adds to the knowledge base of teacher emotion and motivation.

Symposium
Teaching and Teacher Education

Tackling polarization in education: teacher practices, interventions and paradigms

Keywords: Argumentation, Citizenship Education, Critical Thinking, Dialogic Pedagogy, Game-based Learning, Reasoning, Teaching Approaches
Interest group: SIG 13 - Moral and Democratic Education
Chairperson: Geerte Savenije, University of Amsterdam, Netherlands
Chairperson: Bjorn Wansink, Utrecht University, Netherlands
Organiser: Lee Jerome, Middlesex University, United Kingdom
Discussant: Geerte Savenije, University of Amsterdam, Netherlands

Responding to polarization in educational settings is an important aspect of cultivating inclusive education for the 21st century. This session brings together research that analyses situations of conflict and controversy in educational contexts in three countries (the US, Northern Ireland and the Netherlands). It asks how we can take more advantage of friction between perspectives in educational contexts. The first paper focuses on how teachers in Northern Ireland are prepared to teach controversial history, while grappling with the tension between avoidance and risk-taking in their school placements. The second paper focuses on what type of questions Dutch teachers ask during 'hot' discussions. The third papers explores how an online political simulation game in the VS engages students in developing epistemic cognition for informed citizenship. The last paper takes a meta perspective from a review study that asks the question; 'what effective interventions counter polarization in educational settings?' During the plenary discussion we will explore how the teacher practices (i.e., study 1 and 2) and the online game (study 3) are related with the theoretical paradigms that are found in the review study (study 4). In line with the EARLI theme of 2023 this discussion will focus on how educational interventions countering polarization and conflict "can bring hope in uncertain times." In an era marked by the impact of fake news, mainstreaming of far-right ideas, and increasing impact of extremism, addressing the challenges posed by polarization in educational settings and how these can work for positive societal transformations gains new urgency.

From "Flat" to "Deep" Multiperspectivity: Discussing Controversial Issues in Classrooms
Presenting Author: Bjorn Wansink, Utrecht University, Netherlands; **Co-Author:**Sanne Akkerman, Utrecht University, Netherlands; **Co-Author:**Saro Lozano Parra, Utrecht University, Netherlands

Discussing controversial topics in the classroom is known to be challenging for teachers, although such topics also represent valuable opportunities for teaching

students about multiperspectivity and how to engage in constructive discussions in an increasingly polarized society. A framework of multiperspectivity is presented and used to identify how ten Dutch teachers ask students to (a) explore different positions (i.e., making, taking or contrasting perspectives), (b) make various types of claims (i.e., knowledge, value or reality statements) and, potentially, (c) explain and reflect upon the underlying logics (i.e., epistemological, axiological or ontological) of statements. The lessons were observed and video-recorded and the teachers were interviewed immediately afterwards. The findings show that teachers focus mostly on explicating students different opinions and paid much less attention to explicating the different logics of their claims. We have conceptualized this distinction as a focus on flat-multiperspectivity versus deep-multiperspectivity. Our findings indicate how lessons often miss the potential residing in discussions of controversial issues.

Avoidance and risk-taking in teaching controversial history: Competing voices
Presenting Author: Judith Pace, University of San Francisco, United States

How do student teachers in Northern Ireland, prepared to teach controversial history, grapple with the tension between avoidance and risk-taking in their school placements? How is this tension embodied in their emerging teacher identities? This paper analyzes interview data from a larger study on preparation of preservice teachers for teaching controversial issues in history, social studies, and citizenship. It uses Dialogical Self Theory (DST) to examine competing voices as pedagogical lessons from university coursework bump up against culturally ingrained and institutional positions. The paper aims to deepen understanding of the voices that animate young teachers' avoidance or risk-taking when teaching controversial history and the dilemmas produced by dialogue among these voices. Identifying these voices provides levers for teacher educators to foster conscious and productive grappling with dilemmas experienced by teachers, particularly in divided societies. In doing so, both teacher educators and student teachers can lean into a hopeful stance toward education as a powerful vehicle for dialogue, mutual understanding, and critical thought in these uncertain times.

The Impact of a Political Simulation Game on Informed Citizenship (and Against Polarization)
Presenting Author: Jeremy Stoddard, University of Wisconsin - Madison, United States

This paper explores how a political simulation, an online game with the name Persuade, engages students in developing epistemic cognition for informed citizenship. The framework of informed citizenship aligns with the ability to resist the effects of partisanship and polarizing messages. Persuade is based on epistemic games and communities of practice as models for learning and places students in the role of interns at a political communications firm. Tasks in the simulation engage participants in using real data and information sources to design a media campaign on a U.S. state policy issue. Throughout the simulation students are asked to analyze, reason with, and communicate using evidence with a particular focus on the relationship between evidence, context and audience.
Engaging in local and state policy issues using local information and data sources, as well as the focus on multiple perspectives, are also shown to support the likelihood of a decrease in the impact of partisanship and polarization. Persuade also focuses on the nature of the political information environment and asks participants to consider their role within it. This paper examines the experiences of two Wisconsin? explain classes, part of a larger pilot study, to explore how the design engages students in developing as informed citizenship and its likely impact on partisanship and polarization.

Education for peace and hope: review of interventions to counter polarization
Presenting Author: Semiha Sözeri, Utrecht University, Netherlands; **Co-Author:**Maria De Haan, Utrecht University, Netherlands

In response to societal polarization in many Western countries schools have developed transformative pedagogies based on hope and empathy, next to pedagogies that teach students to deal with 'difference', learning to negotiate disagreement. This study systematizes and analyzes recent research asking what effective interventions in educational settings exist that deal with what is considered 'undesirable' polarization. A systematic literature search was conducted in Web of Science that was restricted to original and peer-reviewed research in English, published from January 2014 onwards. Our analysis focuses on 1) the paradigms that underlie interventions addressing polarization, contrasting, for instance, interventions focused on remediation and reconciliation with those that focus on peacebuilding, an ethos of hope and transformative action, 2) the role of context, nature and severity of the group conflict and how intervention approaches and their underlying paradigms can be linked to the particularity of the conflict or tension, and 3) how the answers to these questions translate into suggestions for practitioners working with diverse student populations, and provide them with suggestions for achieving more inclusive, socially cohesive and democratic classrooms. Our findings indicate that underlying paradigms for intervening, as well as their effectivity, are related to the nature of the conflict at hand. This study has the potential to guide the design of effective interventions in polarized educational settings. Its focus on transferability to other contexts and populations, attention to understanding effects within the historical, social, geographical, interethnic, socio-economic setting enhances its potential value across national and local contexts.

Symposium

Identifying digital reading strategies in order to facilitate digital reading

Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Digital Literacy and Learning, Eye Tracking, Learning Strategies, Multimedia Learning, Reading, Social Media
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Aurora Troncoso-Ruiz, Behavioural Science Institute, Radboud University Nijmegen, Netherlands
Discussant: Carita Kiili, Finland

Although digital reading has become the norm, digital texts are still often more challenging for readers than print texts (Delgado et al., 2018; Singer & Alexander, 2016). Text complexity could explain this difference: digital texts provide the reader with a non-linear structure, offering numerous paths to access information (Salmerón et al., 2018; Wiley et al., 2018). In order to understand digital reading, it is crucial that we identify how different reading strategies contribute to text comprehension in digital contexts. This symposium, involving participants from four different countries, includes four studies identifying reading strategies in digital contexts and factors that facilitate or hinder digital reading. First, Lisa Ziernwald (Technische Universität München, Germany) will present a research synthesis on the operationalization of reading strategies and their effects on reading comprehension. Carolien Knoop-van Campen (Radboud University Nijmegen, Netherlands) will present work combining eye-tracking and log-files to investigate whether audio-support can lead to more efficient reading strategies and improve reading comprehension. The other two contributions focus on factors hindering digital reading. Bertram Opitz (University of Surrey, England) will present results showing how the hypertext structure and the presence of hyperlinks can trigger mind-wandering and hinder reading comprehension. Aurora Troncoso-Ruiz (Radboud University Nijmegen, Netherlands) will present how digital media exposure and attention can predict reading strategies when readers deal with contradictory information varying in reliability. The conclusions from this symposium are relevant for our understanding of how digitalization impacts society. Moreover, these results are crucial for the development of educational materials to improve digital reading.

Operationalization and Effectiveness of Reading Strategies in Digital Reading – A research synthesis
Presenting Author: Lisa Ziernwald, Technical University of Munich, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany

Although digital reading has become an essential skill in the last years, research syntheses repeatedly found a disadvantage of digital compared to paper-based reading regarding students' reading comprehension. As digital reading is an indispensable part of future education, getting more profound insights into how certain reading behaviors (i.e., reading strategies) can improve students' reading comprehension in digital reading environments is highly important. Therefore, the present research synthesis investigates (a) how reading strategies are operationalized in digital reading environments and (b) the effect of reading strategies

in digital reading environments on students' reading comprehension (i.e., K-12 students and university students). Overall, *N* = 436 studies were found through an initial literature search. After the first screening, *N* = 103 studies were included for the fine coding, which will be conducted shortly. Results will provide a detailed description of the various reading strategies investigated in a digital reading environment. Furthermore, results will give insights into whether and which reading strategies benefit students' reading comprehension in digital environments.

The impact of audio support on reading strategies in students with dyslexia
Presenting Author: Eliane Segers, Radboud University, Netherlands; **Co-Author:**Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands

The use of adequate reading comprehension strategies is important to read efficiently. Students with dyslexia not only read slower and less accurately, they also use fewer reading comprehension strategies. To compensate for their decoding problems, they often receive audio-support (narration written text). However, audio-support linearly guides readers from beginning to end through texts, possibly hindering the use of reading comprehension strategies in expository texts and negatively impacting reading time and reading comprehension performance. We examined to what extent audio-support affects reading comprehension strategies, reading times, and reading comprehension performance in 21 secondary school students with dyslexia and 22 typically developing controls. Participants were provided with three types of assignments (summarizing, open-ended questions, statement questions) in each condition (written text with and without audio-support). SMI RED500 eye-tracker captured eye movements during reading. Readers' attention allocation within the text was indicative for their reading strategy. Following a discrimination based on experts' reading behavior and hand-coded validation, these scores visualized whether students used the intensive reading strategy (reading whole text) or selective reading strategy (focusing on part of the text). In open-ended assignments, students divided their attention more over the whole text instead of focusing on one specific part when audio was added. In addition, audio-support increased reading time in students with and without dyslexia in most tasks, while in neither of the task's audio-support affected reading comprehension performance. Audio-support impacts reading comprehension strategy and reading time in all students.

Hyperlink structures is crucial for attention and comprehension during hypertext reading
Presenting Author: Bertram Opitz, Brandenburg Medical School, Germany

Online reading is becoming more and more popular in learning and teaching environments. However, attention failures also referred to as mind wandering (MW) seem to be more common when reading online compared to an offline reading situation. In this talk I will discuss some characteristics of hypertexts that potentially influence MW and reading comprehension. I will report results of recent studies exploring characteristics like text difficulty based on text cohesiveness but will focus on hyperlink structure. Typically, hyperlinks enable different types of hypertext organization, such as hierarchically organized and networked hypertexts. While hierarchical hyperlinks support the organisation of hypertexts by structuring these texts in semantically related units, networked hyperlinks connect units that have a content overlap to each other without an overall hierarchical structure being apparent. Crucially the latter hyperlink structure seem to induce more task-unrelated thoughts (TUTs) suggestive of MW and lead to poorer reading comprehension, suggesting that hyperlinks can be considered new cohesive devices when creating educational online texts. In addition, these findings are modulated by the difficulty of the hypertext but also by the working memory capacity (WMC) of the reader. These results will be discussed in light of a recent model, suggesting that MW occurs if available cognitive resources do not match with task demands.

Explaining individual differences in digital reading: digital media, attention and print exposure
Presenting Author: Aurora Troncoso-Ruiz, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Naomi van Bergen, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Anouk Bakker, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Liesbeth Craje, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Marco Van de Ven, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Eliane Segers, Behavioural Science Institute, Radboud University Nijmegen, Netherlands

The current study analyzes individual differences in how readers deal with multiple digital texts varying in reliability and position defended. In particular, we investigate whether differences in *digital media exposure*, *attention*, and *print exposure* predict reading strategies and reading comprehension of multiple digital texts. In an experiment, 134 participants read four texts about the consumption of milk, differing in stance (whether the text was for or against the consumption of milk) and reliability (whether the source of information was a reliable or unreliable logo). Participants' reading behavior was tracked using log-files, and their comprehension of the texts was evaluated with questions. Results show that the class of digital media user (learner, gamer or social media user) predicted the reading behavior. Learners and gamers, but not social media users, visited reliable sources more often than unreliable sources. In addition, learners and social media users spent more time on texts against the use of milk. Moreover, attention capacity predicted reading behavior and the reading comprehension, but the latter effect disappeared when controlling for the reading behavior. Finally, participants with higher print exposure had higher comprehension scores, regardless of the reading behavior or the characteristics of the texts (reliability or stance). In conclusion, this study shows that digital reading can be dependent on the print exposure and that high levels of digital media use could hinder the ability to select reliable sources.

Can Educational Apps Support Early Learning? Current Evidence on App Design and Evaluation

Keywords: Early Childhood Education, Educational Technologies, Game-based Learning, Mathematics/Numeracy, Writing/Literacy
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Jo Van Herwegen, United Kingdom
Discussant: Laura Outhwaite, University College London, IOE, United Kingdom

Over 55% of children around the world do not have the minimum proficiency levels in foundational maths and literacy skills (UNESCO, 2017). Educational applications (apps) have been identified as a potential solution for raising attainment because of their potential to offer personalised learning opportunities (Sabatini et al., 2022). However, with a vast range of educational apps available to parents, teachers, and policy makers, it remains a significant challenge to determine whether or what kinds of apps will provide a high-quality learning experience. While some specific educational apps have been evaluated with young children (Griffith et al., 2020; Outhwaite et al., 2022), more research is needed to examine how app design features, learning content, and dosage (i.e., time on task) may influence children's outcomes. In response, this symposium brings together current international evidence on the design and evaluation of educational apps for young children in maths, reading, and spelling. Specifically, this symposium will present converging evidence on the importance of in-app feedback, varied content curriculums, and optimal dosage for learning from varied methods, including meta-analyses, content analyses, qualitative comparative analyses, randomised control trials, and analyses of large-scale educational app data. The presenters and discussant will highlight how the current evidence contributes to our understandings of app-based learning and how this can inform evidence-based recommendations for parents, teachers, and other stakeholders. Priorities and directions for future research will also be discussed. This symposium is a collaboration between four early career researchers and PhD students from three countries (Belgium, France, UK).

Understanding How Educational Maths Apps Can Enhance Learning: A Content Analysis and QCA
Presenting Author: Laura Outhwaite, University College London, IOE, United Kingdom; **Co-Author:**Erin Early, QUB, United Kingdom; **Co-Author:**Christothea Herodotou, Open University, United Kingdom; **Co-Author:**Jo Van Herwegen, UCL Institute of Education, United Kingdom

Educational applications (apps) are ubiquitous within children's learning environments and emerging evidence has demonstrated their efficacy. However, it remains unclear what the active ingredients (i.e., mechanisms), or combination of ingredients, of successful maths apps are. The current study developed a

new, open-access, three-step framework for assessing the educational value of maths apps, comprised of: type of app, mathematical content, and app design features. When applied to the maths apps previously evaluated with children in the first three years of school (n=23), results showed that practice-based apps were the most common app type tested (n=15). Basic number skills, such as number representation and relationships, were the most common area of mathematics targeted by apps (n=21). A follow-up Qualitative Comparative Analysis showed observed learning outcomes with maths apps were enhanced when apps combined the following: a scaffolded and personalised learning journey (Programmatic levelling) and explanations of why answers were right or wrong (Explanatory feedback), as well as praise, such as “Great job!” (Motivational feedback). This novel evidence stresses the significance of feedback and levelling design features that teaching practitioners and other stakeholders should consider when deciding which apps to use with young children. Directions for future research are discussed.

Evaluation of Digital Interventions Fostering Early Reading Skills: A Meta-Analysis
Presenting Author: Fien Depaepe, KU Leuven, Belgium; **Co-Author:**Stefanie Vanbecelaere, KU Leuven, Belgium; **Co-Author:**Sameh Said-Metwaly, KU LEUVEN, Belgium; **Co-Author:**Wim Van den Noortgate, KU LEUVEN, Belgium; **Co-Author:**Bert Reynvoet, KU LEUVEN, Belgium

The development of reading skills is an important goal of primary education. Given the importance of reading for later academic performance, teachers aim to offer varied and intensive practice of (early) reading skills to all primary school children (Melby-Lervåg et al., 2012). To this end, digital technologies are increasingly being used in educational settings because they can provide affordances such as interactivity, game features, immediate feedback, and adaptivity. To justify their use, it is important to investigate the effectiveness of digital technologies. So far, meta-analyses have mainly focused on the effectiveness of digital interventions for cognitive outcomes (Cheung & Slavin, 2012; Van Daal et al., 2019). This study takes a broader perspective by examining the effectiveness of digital interventions to promote early reading in terms of near and far transfer cognitive and noncognitive outcomes. Study and intervention characteristics were also examined as potential moderator variables. In total, 72 studies, including 60,890 participants, were analyzed, yielding a mean Hedges’ g effect size of 0.37, which indicates that digital technologies are slightly more effective than traditional teaching methods. Moderator analyses suggest that this effect is consistent across cognitive and noncognitive outcomes but different by sample age, study quality, and the nature of the intervention (targeted versus multicomponent). The results of this study have implications for the design and evaluation of future interventions investigating the effectiveness of digital technologies for reading education.

Understanding Early Mathematical Development using Large Scale Educational App Data
Presenting Author: Zahra Siddiqui, UCL, United Kingdom; **Co-Author:**Laura Outhwaite, University College London, IOE, United Kingdom; **Co-Author:**Jo Van Herwegen, UCL Institute of Education, United Kingdom

Training of symbolic and non-symbolic comparison skills contributes to mathematical development (Van Herwegen et al., 2018). However, dosages used across intervention studies targeting these skills is varied and often inconsistent and infrequently reported (Dietrich et al., 2015). The vast quantities of data that are passively collected from educational maths apps used by young children can provide insights into the optimal dosage for different age groups for these domain-specific skills. The present study used existing data from the maths app developed by Funexpected. Data from children aged 3-7-years-old was analysed using Generalised Additive Modeling (GAMs) to understand the rate of development for symbolic (n = 557) and non-symbolic comparison skills (n= 1,791). Children’s improvement in each domain was indicated as number of trials to achieve zero errors. Results showed younger children required more trials to achieve zero errors, compared to their older peers across both symbolic and non-symbolic skills. A subset analysis of children who had played both games (n = 214) showed that the number of trials needed to achieve zero errors in each domain-specific skill decreased, relative to the number of trials needed when only one of the games was played. This is consistent with a mutualistic theoretical perspective of mathematical development (De Smedt, 2022). Overall, this study has important implications for the design of educational maths apps. It highlights the importance of differentiating dosage of app-based learning, depending on the age of the child, and the inclusion of complimentary mathematical skills, which could be implemented via programmatic levelling.

Evaluating the Effectiveness and Design of an Educational Spelling Application for First Graders
Presenting Author: Cynthia Boggio, Grenoble Alpes University, France; **Co-Author:**Ahmed Zaher, Université Grenoble Alpes, France; **Co-Author:**Marie-Line Bosse, Université Grenoble Alpes, France

While digital tablets are gaining popularity in classrooms, there is little evidence of the specific effectiveness of educational apps compared to the same activity without a tablet. Moreover, educational applications are often gamified, yet the effects of gamification are mixed and rarely tested with children. In response, we tested the efficiency of ECRIMO (first version of an application for spelling training) with 311 first graders (6-7 years). A randomised control trial (RCT) design was implemented with four training groups: no training, paper training, the ECRIMO app with gamification features, and the ECRIMO app without gamification. Spelling, reading and phonological awareness abilities was measured at pre-test and post-test. The training was conducted over a 7-week period (4.40 hours in total). The experimental RCT design allowed us to answer three questions: 1) Is spelling training effective regardless of the medium used? 2) Is training through the app as efficient as paper-based training? 3) Does gamification impact students' learning performance? Mixed model analyses revealed 1) a spelling training positive effect dependent on the initial level of participants, 2) a comparable efficiency between ECRIMO, used on a tablet independently by children, and the same training done with the teacher on paper, and 3) a gamification positive effect, but only for struggling students. This study proposes an original and relevant experimental design to test educational applications. It also highlights the importance of careful consideration of the design of the application, which can have a differential impact on students' learning depending on their initial skill level.

Blended Learning Quality as Crucial Factor for an Effective Flexible Learning Study Program
Keywords: E-learning/ Online Learning, Educational Technologies, Higher Education, Instructional Design
Presenting Author: Claude Müller, Zurich University of Applied Sciences, Switzerland; **Co-Author:**Thoralf Mildenberger, Zurich University of Applied Sciences, Switzerland; **Co-Author:**Daniel Steingruber, stid@zhaw.ch, Switzerland

Flexible learning addresses students’ needs for more flexibility and autonomy in shaping their learning process, and is often realised through online technologies. While higher education institutions are increasingly considering replacing classroom time and offering more blended learning, current research is limited regarding its effectiveness and modifying design factors. This study analysed a flexible study programme with 133 courses in different disciplines over more than four years with a mixed-methods approach. In the analysed flexible study programme (*N* students = 278), classroom instruction time was reduced by 51% and replaced with an online learning environment in a blended learning design. Student achievement was compared to the conventional study format (*N* students = 1068). The estimated summary effect size for the 133 flexible courses analysed was close to, but not significantly different from, zero (d = -0.0562, p = 0.3684). Although overall effectiveness was equivalent to the conventional study format, considerable variance in the effect sizes between the courses was observed. Based on the relative effect sizes of the courses and data from detailed analyses and surveys, heterogeneity can be explained by differences in the implementation quality of the educational design factors. Our results indicate that when implementing flexible study programmes in a blended learning format,

particular attention should be paid to the following educational design principles: adequate course structure and guidance for students, activating learning tasks, stimulating interaction and social presence of teachers, and timely feedback on learning process and outcomes.

Students' sidetalk in parallel to co-occuring teaching. Changing participation in hybrid classrooms
Keywords: Digital Literacy and Learning, Peer Interaction, Social Interaction, Social Media
Presenting Author: Fritjof Sahlström, University of Helsinki, Finland; **Co-Author:**Marie Nilsberth, Karlstad University, Sweden

This study takes an interest in how a new hybrid sociality changes classrooms as teaching and learning spaces, but also as social spaces where young people come together and engage in relations with peers.The aim is to analyze and contrast students' side-talk in classrooms at two different points of time, comparing data from non-digital classrooms in Sweden from the 1990's and more recent data from 2015/16 in Finland and Sweden when students had access to screen-mediated communication on their phones and laptops. The on-going digitalisation has reconstituted formerly analog classrooms as hybrid interactional spaces, where previously well understood and studied patterns of participation intertwine with massively present but less understood distributed sociality. The results indicate that the presence of screen-mediated sociality in classrooms fundamentally changes the character of student side-activities, where spoken student-student interaction in parallel to teaching seems in part to have been replaced by screen-mediated student interaction. These findings are in line with other current classroom studies. Our empirical finding supports the need for a theoretical reconceptualization of classroom participation patterns both for teachers and students, going beyond simplistic binary positions on banning or not banning students screens in schools. This reconceptualization has the potential for quite substantial practical implications for teaching and learning.

Reducing motivational costs of STEM students – a blended learning program in higher education
Keywords: Higher Education, Motivation, Science and STEM, Well-being
Presenting Author: Lena Sofie Kegel, Educational Psychology, University of Münster, Germany; **Co-Author:**Derya Turhan, Educational Psychology, University of Münster, Germany; **Co-Author:**Carola Grunschel, Educational Psychology, University of Münster, Germany

Several students report motivational challenges during their studies, wherefore interventions to support their motivation are relevant (Rosenzweig et al., 2022). Particularly, it requires interventions for reducing motivational costs (effort, emotional, and opportunity costs). Such costs negatively affect students' academic success and positive value interventions do not buffer these effects significantly (Kim et al., 2021). Therefore, we evaluated a nine-week intervention for motivational costs with a randomized control group design. Second-semester physics and mathematics students participated in this study. As high-performing students are typically those to seek counseling services (Falk & Marschall, 2011), we first examined whether participation in the study was subject to self-selection. Subsequently, we assessed whether the intervention group reported lower costs, higher expectations, positive value, and more study satisfaction after participation than the control group. Based on previous studies (Rosenzweig et al., 2020), we hypothesized that lower-performing students would benefit more from the intervention than higher-performing students. Results indicated that students with complete participation (n = 55) reported higher high school GPA, opportunity costs, effort, and study satisfaction in the pre-test compared to students with incomplete participation (n = 207). Repeated measures ANOVA based on pre- and post-test (n = 55) and pre- and follow-up-test (n = 45) revealed no differences in motivation or study satisfaction between the intervention and control groups. Moderation analyses showed no benefit of the intervention for lower-performing students. Future studies should aim to reach higher participation rates of lower-performing students to examine whether lower-performing students could benefit from the present intervention.

Hybrid learning as a tool to ensure education: a long-term perspective from German pilot schools
Keywords: Computer-assisted Learning, Qualitative Methods, Self-regulated Learning and Behaviour, Teaching Approaches
Presenting Author: Can Küplüce, Ruhr-University Bochum, Germany; **Presenting Author:**Denise Demski, Ruhr-University Bochum, Institute of Educational Sciences, Germany; **Co-Author:**Philipp Matthes, Ruhr-University Bochum, Institute of Educational Sciences, Germany; **Co-Author:**Grit Im Brahm, Ruhr-University Bochum, Institute of Educational Sciences, Germany; **Co-Author:**Gabriele Bellenberg, Ruhr-University Bochum, Institute of Educational Sciences, Germany

Recent events like the COVID-19 pandemic have led to drastic increases in online and hybrid learning environments. There is some evidence concerning the factors fostering or hindering the implementation and success of hybrid and online learning (e.g., Raccanello et al 2022; Tang et al., 2020). However, the significance and range of these findings for K-12 education may yet be limited, as data was often collected during times of crisis („emergency remote teaching") (Hodges et al. 2020) and/or specifically in higher education. We aim to fill this gap by analysing teaching and learning in three German project schools that implemented hybrid learning environments twenty years ago. To better understand the different factors expert teachers deem especially important for the long-term success of hybrid learning arrangements in schools we conducted think-alouds and semi-structured interviews with 16 educators working in the pilot project. A comprehensive Qualitative Content Analysis of the material shows that interviewees consistently experienced the long-term benefits of greater flexibility compared to regular in-class teaching, which enabled a larger number of students to achieve their educational goals. However, the expert teachers identify several core challenges beyond the initial implementation of the hybrid learning environment. These include a need for comprehensive changes in curricula, a stronger focus on self-regulated learning competencies and the need for flexible and personalised advanced training opportunities for teachers. Based on these findings we outline guidelines for a sustainable implementation of hybrid learning in times of crisis – and beyond.

Teachers' online readiness in times of crises: Experience from Norway and US
Keywords: Digital Literacy and Learning, Educational Technologies, In-service Teachers, Teacher Professional Development
Presenting Author: Greta Björk Gudmundsdottir, University of Oslo, Faculty of Education. Department of Teacher Education and School Research., Norway; **Co-Author:**Dawn Hathaway, Georg Mason University, Division of Learning Technologies, School of Education, United States

The closing of schools world-wide in March 2020 due to the COVID-19 pandemic resulted in a rapid and unexpected shift from predominantly in-person teaching to online teaching practices. As teacher educators in the field of educational technology, we wondered about the readiness of teachers for making the transition to fully online environments. Through an internationally distributed survey consisting of predominantly open-ended questions, we captured teachers' perceptions of this transition. We aimed to inform our practice and that of other teacher educators about the strengths and weaknesses of professional development designed to develop teachers' digital competence. In this presentation we focus on data from Norwegian (n= 574) and US (n=239) teachers related to their elaborations on readiness. We qualitatively examined data for evidence of extent of preparedness and alignment to the pedagogical, ethical, attitudinal, and technical dimensions of digital competence. Findings indicated themes related to level of preparedness, influences on level of preparedness, digital tools, students' preparedness, teacher agency, lack of autonomy, collaboration/networks, and work-school-life balance. Findings informed implications and recommendations for the professional development of teachers' digital competence at the teacher education, schools, and school policy/leadership levels are presented.Keywords: Digital competence, teacher education, K-12 schools, online teaching, Nordic context, US context

Online Faculty Mentoring: Creating a holding environment in times of crisis

Keywords: Developmental Processes, E-learning/ Online Learning, Higher Education, Mentoring and Coaching
Presenting Author: Helga Dorner, Eötvös Loránd University, Hungary; **Co-Author:**Kinga Kaplar-Kodacsy, Eötvös Loránd University, Hungary

The paper explores online faculty mentoring grounded in a competency-based in-person mentoring model piloted in Hungary and encompassing a set of non-traditional relationships of professional peer, reverse and group mentoring (Káplár-Kodácsy & Dorner, 2020). The online mentoring aimed to increase the micro- and meso-level professional support provided for and by faculty members who wanted to better manage their instructional strategies and transfer lessons learned in teaching and learning to the post-covid era (Hannah & Lester, 2009). The aim of the study is to map the nature and experience of participation in online faculty mentoring, and to see how far this approach functions as a holding environment (Kahn, 2001) for the participating faculty members in their interpersonal or group-based relationships at work. Stakeholders of the mentoring system were involved from three levels of the organization in the individual semi-structured interviews: 1) leadership (n = 3), 2) mentor coordinators (n = 7), 3) mentors (n = 9) and mentees (n = 8) level. Twenty-seven interviews were coded by using thematic content analysis. As found, conditions for the establishment of a holding environment were primarily facilitated by task-focused roles, experiential inquiry, acceptance of the other, self-validation, and self-reflection. The organizational structure for vertical and horizontal transparency within the online network, clarification of roles as part of the mentoring process, and peer relationships among faculty members functioned as enabling factors to limit the risk of relationships of lacking holding and receiving interchange or to mitigate the complexity of instructionally overwhelming situations.

Teaching Practicum During Pandemic
Keywords: E-learning/ Online Learning, Early Childhood Education, Pandemic, Pre-service Teachers
Presenting Author: Seda Saraç, Bahcesehir University, Turkiye; **Co-Author:**Betül Tarhan, University of Georgia, United States; **Co-Author:**Hülya Gülay Ogelman, Sinop University, Turkiye

This study intends to shed light on the pandemic's effects on prospective preschool teachers' online practicum experiences. While the children were in-person with their class teachers, the prospective preschool teachers connected to preschool classes online. The participants in this phenomenological study were 18 prospective preschool teachers from Turkey who were enrolled in a public university. Individual interviews, microteaching observations, and portfolios were used to gather the data. Thematic content analysis was used for data analysis. The findings demonstrated that although prospective teachers encountered some technical difficulties, they nevertheless gained experience in teaching young children online and enhanced their digital literacy and understanding of technological pedagogical content. They were unable to grow their confidence as teachers for face-to-face instruction. Particularly, prospective preschool teachers voiced their worries about bonding with children and managing the classroom.

New methods; new insights: Making sense of teachers' experiences with online education
Keywords: E-learning/ Online Learning, Educational Technologies, Mixed-method Research, Pandemic
Presenting Author: Fazilat Siddiq, University of South-Eastern Norway, Norway; **Co-Author:**Jo Tondeur, Vrije Universiteit Brussel, Belgium; **Co-Author:**Sarah Howard, University of Wollongong, Australia; **Co-Author:**Ronny Scherer, University of Oslo, Norway

The Covid-19 pandemic provided a unique opportunity to understand school teachers' perceptions of and experiences with online practices on a large scale. However, there is a need for a more detailed understanding of the multiple associations among teachers' perceptions and experiences in change processes. Therefore, the main goal of the current study is to untangle the complexity of teachers' experiences and perceptions during this great online transition. Based on the data of 222 teachers' responses to open-ended questions, we used a combined method of thematic and network analysis. To illustrate this novel method, we will focus on the strongest associations between the categories "learning design for online teaching" and "Student learning". The results indicated for instance a strong association between 'Self-paced', which was a dimension of 'learning design', and 'Flexibility', which was discussed in relation to 'student experience'. During the presentation the authors will provide more examples of the associations between teachers' online experiences and perceptions. They will also demonstrate how the network model together with the thematic analysis can be used as a 'roadmap' towards a more integrated approach of online and blended learning in schools and to guide future professional development efforts and school policies.

Linguistic, affective, and educational contributions to bicultural identity in minority adolescents
Keywords: Attitudes and Beliefs, Developmental Processes, Multicultural Education, Social Development
Presenting Author: Elisavet Chrysochoou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Aleksandra Laketa, South East European Research Center (SEERC), Greece; **Co-Author:**Arvesa Studenica, South East European Research Center (SEERC), Greece; **Co-Author:**Ana B. Vivas, CITY College, University of York Europe Campus, Greece

The present study investigated linguistic, affective, and educational contributions to bicultural identity in two samples of younger (13- and 14-year-old; N = 95) and older (16- and 17-year-old; N = 67) bilingual adolescents, who are immigrants or belong to ethnic minority communities in the Balkans. While bicultural identity formation was not differentiated as a function of age group, there was an age-related shift in its predictors. Bicultural identity formation was significantly predicted by perceived educators' attitudes toward linguistic/cultural diversity in the younger group, and by personal affective states (motivation and attitudes) toward the mainstream language among the older adolescents. Implications of the findings are discussed within a positive youth development (psychological and social) framework, stressing the need for developmentally appropriate educational - besides family - practices that would support biculturalism among bilingual minority adolescents.

Beyond the Binary Classification– Testing a Disparity-Weighted Indicator of Cultural Diversity
Keywords: Achievement, Classroom Assessment, Cultural Diversity in School, Quantitative Methods
Presenting Author: Merle-Sophie Thielmann, University of Mannheim, Germany; **Co-Author:**Karina Karst, University of Mannheim, Germany; **Co-Author:**Benedict C. O. F. Fehringer, University of Mannheim, Germany

Theoretical predictions regarding the effects of cultural classroom diversity focus on various aspects of diversity. Beyond the proportion of students with a migrant background, the number of different origin countries, their relative proportions in the classroom and the cultural similarity of countries might affect student achievement through different mediating processes (Rjosk et al., 2017). However, currently established measures of diversity do not fully capture this complexity. This study tests a weighted indicator of cultural diversity that includes the similarity of origin countries on two cultural dimensions. Using a dataset of N=1614 fifth-graders, we compare this indicator to established diversity measures like minority proportion, number of origin countries and Simpson'sD and test it as a predictor of individual students' reading achievement using multilevel models. The weighted indicator shows comparatively small correlations to established diversity measures ($0.23 \leq r \leq 0.79$). We found a significant composition effect of diversity on reading achievement using both established diversity measures ($-0.11 \leq \beta \leq -0.06$) and the weighted index ($\beta = -.07$, $p < .05$). We discuss the potential of weighted diversity indices in further exploring current mixed empirical and theoretical findings.

Conditions for the implementation of intercultural practices in educational settings in Portugal

Keywords: Cultural Diversity in School, Educational Policy, Multicultural Education, Social Aspects of Learning and Teaching
Presenting Author: Rui Maio, Faculty of Psychology and Educational Sciences of the University of Porto, Portugal; **Co-Author:**Sofia Guichard, University of Porto - Faculty of Psychology and Educational Sciences, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal

Although intercultural practices are believed to be extremely relevant to combat educational disadvantages, evidence on the factors that are related to their implementation is not yet well established. This study aimed to deepen the understanding regarding the implementation of intercultural practices by professionals working in disadvantaged and culturally diverse contexts in Portugal, examining its association with the institution's socioeconomic and cultural diversity, organizational climate and professionals' self-efficacy and job satisfaction. Participants were 78 professionals (95.3% female, with an age average of 42.52, 64.1% primary school teachers). Self-efficacy was positively associated with the use of intercultural practices, while higher concentration of Roma and low-income children were negatively associated with the implementation of intercultural practices, self-efficacy, and job satisfaction. A supportive organizational climate was positively associated with professionals' sense of efficacy and job satisfaction. Findings highlight the importance of promoting a positive organizational climate and helping professionals to effectively handle diversity, namely by providing conditions to improve their levels of self-efficacy.

Multiply Marginalized and Underrepresented Teachers' Intersecting Identities
Keywords: Cultural Diversity in School, In-service Teachers, Self-concept, Social Aspects of Learning and Teaching
Presenting Author: Ji Hong, University of Arizona, United States; **Presenting Author:**Dionne Cross Francis, University of North Carolina at Chapel Hill, United States; **Co-Author:**Faqryza Ab Latif, University of Arizona, United States; **Co-Author:**Taylor Roloff, University of Arizona, United States; **Co-Author:**Kelly Chong, Round Rock Children's Therapy Center, United States; **Co-Author:**Paul Schutz, University of Arizona, United States

Multiply marginalized and underrepresented (MMU) teachers often face significant challenges due to the social inequities that plague our educational landscape. Our research explores how MMU teachers configure and negotiate their intersecting identities of race, gender, and sexuality as they navigate complex school and societal contexts. Using a narrative inquiry framework, nine MMU teachers were interviewed in depth to generate narrative threads composed of emerging meaning units that highlighted their nuanced experiences. Three major themes emerged: (1) Normalization of dominant racial identities (e.g., white) in intersections with marginalized identities (e.g., lesbian) (2) Microaggressions as tools for undermining minoritized identities, and (3) Exercising agency, persistence, and resistance to claim identity spaces. This study reveals the hidden challenges of MMU teachers, provide insights into the nature of intersecting identities, and make visible the agency MMU teachers employ to create equitable spaces for marginalized identities. By deepening our understanding of the experiences of MMU teachers, these findings can inform approaches designed to support and empower MMU teachers as they navigate school and societal contexts, ultimately increasing MMU teacher retention.

Who becomes a teacher and why?
Keywords: Attitudes and Beliefs, Educational Policy, In-service Teachers, Pre-service Teachers
Presenting Author: Elaine Munthe, University of Stavanger, Norway; **Co-Author:**Beng Huat See, Durham University, School of Education, United Kingdom; **Co-Author:**Sarah Ross, Durham University, United Kingdom; **Co-Author:**Loraine Hitt, Durham University, School of Education, United Kingdom; **Co-Author:**Nada El Soufi, Durham University, School of Education, United Kingdom

This paper reports on a comprehensive review of international evidence, synthesising the findings of some of the strongest empirical work on the main factors influencing people's decisions to be teachers or not. Four search engines, including Google and Google Scholar and five electronic databases identified 517 studies of which 212 were included in this narrative synthesis. These studies highlighted three main motivating factors: intrinsic, altruistic and extrinsic, although the order of the ranking varies with subjects, phase of education and gender of teachers. In general, these studies reported that women are more likely to report being motivated by intrinsic and altruistic reasons, while men are more likely to cite extrinsic reasons. Across all cultures, men are reported to be more strongly influenced by social norms and expectations and were less likely to choose primary and early years teaching. Women are also more likely to experience higher levels of career satisfaction and less social dissuasion than men. Research on motivation to teach is also often focused only on those who have already made the decision to teach. Therefore, policies based on these studies might only be attracting those who are already persuaded. This paper argues that to improve recruitment of under-represented groups (e.g. males and STEM subject graduates), attention should instead be on those who might otherwise have gone into teaching, but have not. For this group, the review found that it is the status of the profession, the working environment and salary over the long-term that are important.

Do student teachers' FIT-Choice motives explain how they study during teacher education?
Keywords: Learning Approaches, Motivation, Pre-service Teachers, Teacher Professional Development
Presenting Author: Michael Goller, University of Kassel, Germany; **Co-Author:**Carina Caruso, University of Paderborn, Germany; **Co-Author:**Heidi Hyytinen, University of Helsinki, Finland; **Co-Author:**Jani Ursin, University of Jyväskylä, Finland; **Co-Author:**Katja Vähäsantanen, Häme University of Applied Sciences, Finland

Aim of this study is to investigate whether student teachers' career-choice motivations explain differences in their learning processes and strategies during teacher education at university. For this purpose, a study with two measurement points was conducted (T1 measured FIT-Choice motives and three months later T2 included measures on study behaviours to avoid common method bias). The final data consist of 234 bachelor students' survey responses from a single German university that took part in both measurement points. A Latent Profile Analysis (LPA) resulted in two profiles that differ in why students chose to enrol in their teacher education programme and to become teachers (students in profile 1 indicate mostly higher social utility values than students in profile 2). Further findings suggest that students in profile 1 exhibit more often certain learning strategies than students in profile 2. Implications for practice and research will be discussed.

Investigating the Impact of a Year-Long Internship on Candidates' Perceptions of Preparedness
Keywords: Attitudes and Beliefs, Communities of Learners and/or Practice, Pre-service Teachers, Primary Education
Presenting Author: Michael Putman, University of North Carolina Charlotte, United States

As educator preparation programs seek to develop professionally competent teachers, an essential component within this process is the field experience. This research reports on a three year project involving the implementation of a coordinated, year-long internship founded on principles associated with situated learning theory and effective educator preparation. Research questions focused on the extent the organisational facets of the field experiences influenced candidates' perceptions of their preparation and how these perceptions were associated with elements of a community of practice. Notably, the three years of implementation encompassed those before (2018-2019), during (2019-2020), and immediately following (2020-2021) circumstances associated within COVID-19 pandemic and the related modifications to instructional delivery in K-12 schools and universities. Overall, findings demonstrated the importance of candidates building relationships with supervising teachers and peers, with elements of the community of practice inherently demonstrated within these relationships, and

the impact of opportunities for the direct teaching practice in authentic contexts, regardless of instructional modality, as dictated by conditions associated with the pandemic. The findings of this research project are of critical importance to the field as universities seek to ensure post-pandemic opportunities for teacher education candidates to create field experiences that positively impact candidates, regardless of instructional modality or the capacity of candidates to participate in in-school experiences.

Future Vision of Teacher Education Students
Keywords: Pre-service Teachers, Qualitative Methods, Sustainable Development, Teacher Professional Development
Presenting Author: Christian Kraler, Teacher Education and School Research, Austria; **Presenting Author:**Sabrina Bacher, University of Innsbruck, Austria, Austria; **Presenting Author:**Claudia Schreiner, University of Innsbruck, Austria

Teachers are a glimmer of hope in the current time of uncertainty. There is a long tradition in arguing the importance of teachers for society and its development. With regard to the urging global societal and environmental challenges (Steger 2020, Beck 2000, De Haas et al. 2019, Barry 2005, Rosa 2015) but also ideas to tackle them (e.g., Sustainable Development Goals), the importance of future visions of teachers becomes apparent. Teachers' beliefs have a high influence on their teaching, independently from curriculum directives. (Positive) Future visions can create hope (Ginevra, Sgaramella et al. 2017) and activate people to develop and implement solutions (Jørgensen, Grosu 2007) to current challenges. In the presented study, we reconstruct teacher education students' visions of the future in general as well as their future visions of learning and teaching. The study involves 100 teacher education students on the master's level. We chose an open, explanatory freewriting approach (micro-articles) to provide room for emotional expression and creativity. Preliminary analyses of students' texts show a wide variety of themes, approaches, and dispositions in describing their future visions. Recurring themes are technology, digitalization, and climate change, but also the need for social relationships and schools as a social space.

On noticing and framing of student mathematical thinking
Keywords: Mathematics/Numeracy, Pre-service Teachers, Secondary Education, Teacher Professional Development
Presenting Author: Thorsten Scheiner, Institute for Learning Sciences and Teacher Education, Australia

Noticing students' mathematical thinking is a complex skill that prospective teachers need to learn. To this end, a teacher education course was designed to engage prospective mathematics teachers in critically reflecting on their individual and collectively shared framings of students' mathematical thinking, thereby effecting a change in their orientations in noticing. This study identifies teachers' framings of students' thinking and examines the nature and development of teachers' noticing of students' thinking. Specifically, the study identifies a typology of deficit-oriented and strength-oriented framings in noticing students' mathematical thinking and demonstrates how shifts in framings promote changes in prospective teachers' attention, interpretation, and response to students' thinking.

Eliciting and Attending to Students' Mathematical Thinking in Clinical Interviews
Keywords: In-service Teachers, Mathematics/Numeracy, Qualitative Methods, Teacher Professional Development
Presenting Author: Nicora Placa, Hunter College, City University of New York, United States

Understanding how to elicit and attend to student thinking is a critical component of ambitious mathematics teaching. Clinical interviews are one professional development tool that can support teachers in developing these practices. Using cross-case study methodology, this study analyzed transcripts of three educators' clinical interviews and their reflections to explore the ways in which they elicited and attended to student thinking when conducting clinical interviews. Findings show that while the educators were successful in asking probing questions and engaging in observational listening, they also faced challenges in moving toward responsive listening, particularly when students struggled with providing justification for a task. Implications for teacher educators suggest that teachers may need support in developing more nuanced and specific prompts to elicit conceptual understanding as they engage in clinical interviews. They may also consider providing teachers with suggestions on how to provide students with tools to justify their thinking as they engage in clinical interviews.

Is the correlation between fraction and algebra knowledge based more on concepts than procedures?
Keywords: Assessment Methods, Cognitive Skills and Processes, Mathematics/Numeracy, Secondary Education
Presenting Author: Claire Forsmann, University of Trier, Germany; **Co-Author:**Michael D'Erchie, Technichal University of Munich, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Michael Schneider, University of Trier, Germany

Studies suggest that high-school students' fraction knowledge predicts their algebra (e.g., equation solving) knowledge. However, it is not well understood specifically how conceptual and procedural knowledge of fractions and conceptual and procedural knowledge of algebra are related to each other and how this relationship develops over time. We have designed a study (1) to develop test instruments that assess each of these four knowledge facets validly, reliably, and independently of each other and (2) to investigate the underlying factor structure using these instruments. We hypothesized that this is a four-factor structure with inter-correlated latent factors for fraction concepts (FC) and fraction procedural knowledge (FP) and equation-solving concepts (EC) and equation-solving procedural knowledge (EP). The final sample will consist of 200 German ninth graders. The data collection is ongoing. The preliminary results showed that item characteristics were acceptable for most items, although some items needed revision due to ceiling effects. A confirmatory factor analysis (CFA) indicated an acceptable fit of the presumed four-factor model, which aligns with previous findings for a two-factor model for fractions and a two-factor model for equation solving. Conceptual knowledge of fractions and algebra was more strongly intercorrelated (r = .88) than procedural knowledge of fractions and algebra (r = .35). The results from this study will be used to improve measures for conceptual and procedural knowledge of fractions and equation solving to be used in future longitudinal studies on the mediators between fraction and algebra concepts and procedures.

The trade-off between complexity and accuracy in computer-based adaptive instruction on fractions
Keywords: Computer-assisted Learning, Educational Technologies, Mathematics/Numeracy, Problem Solving
Presenting Author: Timo Leuders, University of Education Freiburg, Germany; **Co-Author:**Antje Boomgaarden, University of Education Freiburg, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany

PS-I learning approaches with an initial problem-solving phase (PS) followed by an instruction phase (I) can be optimised by providing adaptive (individualised) instruction that builds on students' problem-solving products. A computer-based implementation of both phases offers the possibility of adaptivity at the transition from the problem-solving to the instruction phase. However, it also poses two challenges for the problem-solving phase, which should allow for (1) complex problem-solving processes (process validity) and (2) accurate diagnosis of problem-solving products. Increased openness of the learning environment can increase the process validity and decrease diagnostic accuracy and vice-versa (complexity-accuracy trade-off). Using two variants of a computer-based learning environment for fraction comparison with different extent of openness (O+ and O-), we investigate whether both requirements (complex problem-solving processes and accurate diagnosis of the problem-solving products) can be met simultaneously. To check process validity (complexity of problem-solving processes), we compare the problem-solving products with those from previous research on an analogous paper-based version. Our results show that valid and

comparable problem-solving processes can be achieved in both computer-based learning environments (O+ and O-). Moreover, only the learning environment O- enables an accurate computer-based interpretation of students' products and thus resolving the complexity-accuracy trade-off.

A Systematic Review on Sustainable Educational Innovations: The Role of (Distributed) Leadership
Keywords: Primary Education, School Leadership, Secondary Education, Sustainable Development
Presenting Author: Christa Krijgsman, Fontys Hogeschool/Kenniscentrum Youth Education for Society, Netherlands; **Co-Author:**Marco Snoek, Hogeschool van Amsterdam, Netherlands; **Co-Author:**Marieke Thurlings, Eindhoven University of Technology, Netherlands

Using the lens of the conceptual model of sustainable innovation (Rikkerink et al., 2016), the present systematic literature review addresses the following research question: How does (distributed) leadership, in interplay with contextual, relational and individual conditions at the micro, meso and macro level, influence the sustainability of educational innovations at the primary process in primary and secondary education? A meta-aggregative approach to Qualitative Evidence Synthesis (QES) was deployed. Based on 43 selected studies, findings show that the role of (distributed) leadership at the school, district and national level is to support teachers as key actors in creating sustainable educational innovations. Leaders play an important role regarding contextual, relational and individual conditions at the meso (e.g., collaborative learning) and macro (e.g., alignment district and school vision and methods) level. As the micro level focuses on teachers in classrooms, original articles did not report conditions related to (distributed) leadership. Other contextual, relational and individual conditions not linked to leadership, such as teachers experiencing growth in their own competencies that are relevant for the innovation (i.e., individual condition, micro level), are presented. The results of the present QES show that a systemic perspective on sustaining educational innovations is in place: it is not about fragmented conditions that are shown to promote sustained innovations, but it is about balancing the various conditions that are linked to each other and that are the sum of their parts. Six recommendations for educational leaders are provided.

Sustainability and STEM Education: STEM Teachers' contextualization of sustainable development goals
Keywords: Instructional Design, Science and STEM, Sustainable Development, Teacher Professional Development
Presenting Author: Zerrin Doganca Kucuk, Maynooth University, Ireland; **Co-Author:**Defne Yabas, Bahcesehir University, Turkiye; **Co-Author:**Gaye Defne Ceyhan, Bogazici University, Turkiye; **Co-Author:**Mehmet Sencer Corlu, Oslo Metropolitan University, Norway

Sustainable development goals (SDGs) present major global challenges, including complexity and uncertainty. From an educational point of view, the SDGs present a rich context for meaningful learning experiences. An integrated STEM approach can be proposed to teach and achieve SDGs. In this research, we investigated the implemented lesson plans of teachers who participated in a STEM professional development program, considering the context of their designs and which SDGs they focused on. SDG11 (Sustainable cities and communities) and SDG 12 (Responsible consumption & production) were the most frequently addressed SDGs. Regarding how the STEM teachers integrated SDGs into their LPs, they mostly contextualized SDGs at the individual level. The teachers also designed their LPs around more local issues to present more familiar contexts for students.

Pedagogical Pattern Navigator in Education for Sustainable Development
Keywords: Higher Education, Instructional Design, Qualitative Methods, Sustainable Development
Presenting Author: Bernadette Dilger, University of St.Gallen, Switzerland

The Pedagogical Pattern Navigator in Education for Sustainable Development (ESD) is a support for faculty to enhance their teaching and students learning. Faculty can make use of pedagogical patterns in ESD to guide and further develop their own teaching. Using the Pedagogical Pattern approach in ESD, faculty is enabled to address ESD specific learning objectives in constructive alignment to pedagogical methodologies and assessments. The Pedagogical Pattern Navigator is developed in a design based research approach and tested with faculty in a business and economics university. It is organized around specific categories of needs in ESD (for example fostering value discussions and ambivalence in dilemma situations). Faculty can choose their prioritized access (through specified needs, classes of learning objectives, prioritized pedagogical methodologies or assessment criteria). Following their first choice, the Pedagogical Pattern Navigator suggest the aligned pedagogical design decisions (e.g., the appropriate pedagogical method and applicable assessment criteria). The proposed patterns are explained by typical descriptions, critical incidents, and ideas for variations.

The Necessity of Utopia for Education for Sustainable Development
Keywords: Environmental Education, Learning Approaches, Self-regulated Learning and Behaviour, Sustainable Development
Presenting Author: Yves Mühlematter, PHBern, University of Teacher Education; University of Zürich, Switzerland

The presentation discusses the entanglements between neoliberalism, democracy and education for sustainable development. It shows that the ESD discourse, despite the post-growth debate, is essentially shaped by neoliberalist growth discourses. The paper outlines these lines of discourse and identifies in them two currents running in opposite directions. This serves as a starting point for a meta-discussion on ideas of the future and their role in ESD. Starting from an approach that understands "utopia as method" (Levitas, 2013), different alternatives will be discussed and it will be worked out why ESD cannot do without "utopia". This will be followed by considerations of what this could mean for ESD didactics.

Teachers' closeness of professional relationships and learning in reciprocal peer observation
Keywords: In-service Teachers, Mixed-method Research, Peer Interaction, Teacher Professional Development
Presenting Author: Jesús Ribosa, UAB Universitat Autònoma de Barcelona, Spain; **Co-Author:**Ingrid Noguera, UAB Universitat Autònoma de Barcelona, Spain; **Co-Author:**Meritxell Monguillot, UB Universitat de Barcelona, Spain; **Co-Author:**Begoña De la Iglesia Mayol, Universitat de les Illes Balears, Spain

In education, the closeness of relationships has been addressed in research on teacher-student relationships, but it is scarce when it comes to teacher-teacher

relationships. This study analyses: 1) whether a collaborative teaching practice (i.e., reciprocal peer observation) helps teachers increase their perceived closeness of professional relationship with their partner, and 2) whether initial and final levels of closeness influence teachers' professional learning perception after reciprocal peer observation. 370 primary and secondary education teachers took part in the intervention. Pretest-posttest results show that participants significantly increased the closeness of professional relationship, with strong effects for those with low or medium initial levels. Following a participatory research method, a random sample of participants was invited to take part in group interviews to interpret these findings. A total of 63 teachers divided into four group interviews participated. Content analysis of the recordings resulted into five relevant factors to increasing teachers' closeness of professional relationships, namely knowledge sharing, feedback, personal bond, mutual help, and commitment. Teachers' professional learning perception was gathered through a final questionnaire. The scores of professional learning perception between low-, medium- and high-level groups of initial and final closeness were compared. As for initial closeness, the low-level group showed a lower learning perception. As for final closeness, differences were significant between the three groups: the higher the final closeness, the higher the learning perception. Future studies will have to analyse what happens in the reciprocal peer observation process to help understand the factors that promote teacher closeness and learning.

Impact of Reciprocal Peer Observation on teacher perception of collaboration among teachers
Keywords: Attitudes and Beliefs, In-service Teachers, Peer Interaction, Teacher Professional Development
Presenting Author: Ester Miquel, Universitat Autonoma de Barcelona, Spain; **Co-Author:**Mariona Corcelles, Universitat Ramon Llull, Spain; **Co-Author:**Íngrid Sala, Universitat Ramon Llull, Spain; **Co-Author:**Mireia Soler, Universitat Autònoma de Barcelona, Spain; **Co-Author:**David Duran Gisbert, Universitat Autònoma de Barcelona, Spain

One of the main educational challenges today is to improve teacher collaboration at schools. The present study aims to analyze the impact of one of the forms of teacher professional collaboration—reciprocal peer observation (RPO)—on reducing teachers' resistance to peer observation and improving teachers' perception of collaboration among teachers at the school context. An intervention design with pre-post measures was applied to 400 in-service teachers from 123 Spanish schools. All participants had been trained in the peer observation protocol and implemented RPO at least twice: in one round performing the role of observee and in another round performing the role of observer. The Teachers' Resistance to Peer Observation Scale and Teacher Collaboration Questionnaire were applied before and after the RPO intervention. Results show a significant reduction in teachers' resistance to the observer and observee role, and a significant improvement in teachers' perception of collaborative collegiality, teachers' willingness to work collaboratively and teachers' agency through collaboration after RPO. No changes were found in teachers' resistance to collaboration and in their perceived relevance of collaborative professional practices. Overall, the study shows that RPO has a significant impact on teachers' perception of collaboration among teachers. Therefore, promoting this form of collaborative professional practice at school can be a mechanism for increasing teachers' willingness to collaborative work, which has been reported in literature to benefit not only student achievement but also overall school performance.

Professional development: Teachers' reasons for peer selection for classroom observations
Keywords: Higher Education, Mixed-method Research, Peer Interaction, Teacher Professional Development
Presenting Author: Irene Douwes-van Ark, University of Groningen, Netherlands; **Co-Author:**Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:**Ine Noben, University of Groningen, Netherlands

Teachers observing each other's class was part of a professional development programme for university teachers in the Netherlands. A side-effect of such development programmes is that teachers establish their social capital referring to social resources within a network, which can be used to obtain individual goals. The current study focuses on teachers' social capital development and teachers' reasons for peer selection before participating in classroom observations. The sample consisted of 15 language teachers from a research university in the Netherlands. They participated in a social network survey study combined with in-depth interviews. The social network results show that the density increases from the first semester to the second semester. This implies that teachers establish more connections with their colleagues over time. Reciprocity and transitivity also increase, implying that teachers have more mutual relationships and that the relationships become more clustered ("a friend of a friend is a friend"). The interviews show that teachers mention epistemic reasons to select their peers for observation, such as sharing expertise, but are hampered by organizational factors (i.e., a mismatch with the planning and work pressure). These results provide a better understanding of the personal drivers for and organizational obstacles of participating in peer observation.

The teaching behaviour of beginning team teachers at the beginning of a team teaching intervention
Keywords: In-service Teachers, Primary Education, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Dries Mariën, University of Antwerp, Belgium; **Co-Author:**Elke Struyf, University of Antwerp, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium

Team teaching is considered a promising professional development strategy in which teachers are committed to collaborating, sharing expertise, supporting each other, learning collaboratively, and enhancing their competences to deal with students' different needs. However, little is known regarding the changes in their teaching behaviour compared to teaching solo previously, especially when experienced teachers are beginners in a team teaching context. Consequently, the present study aims to advance insight in the initial teaching behaviour of beginning team teachers in primary education at the beginning of a team teaching intervention. A mixed-method research design is used by combining video-observation and team interviews by 16 beginning team teaching teams, consisting of 33 primary teachers. Results show that team teaching is mainly used for more complex skills such as activating teaching and differentiated instruction. The more basic skills, such as, learning climate, classroom organisation, clarity of instruction, are more embedded during traditional lessons.

Understanding and supporting writing processes with trace data
Keywords: Educational Technologies, Learning Analytics, Self-regulated Learning and Behaviour, Writing/Literacy
Presenting Author: Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Sehrish Iqbal, Monash University, Australia; **Co-Author:**Tongguang Li, Monash University, Australia; **Co-Author:**Yizhou Fan, Peking University, China; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Surya Surendrannair, Monash University, Australia; **Co-Author:**Jonathan Kilgour, Edinburgh University, United Kingdom; **Co-Author:**Joep van der Graaf, Radboud University Nijmegen, Netherlands; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Johanna Moore, Edinburgh University, United Kingdom; **Co-Author:**Dragan Gasevic, Monash University, Australia

Writing from multiple sources is a popular learning task across different disciplines and writing genres. However, many students find this task challenging as they struggle to self-regulate multiple cognitive and metacognitive processes in this task. This often leads to low performance in essay writing tasks. To help students improve their self-regulation and performance in multi-source writing, educators may tailor their feedback focusing on (1) characteristics of self-regulatory processes students enacted during the task, and (2) characteristics of texts students wrote when engaged in those processes. For this reason, understanding both writing processes and products may help educators set a stage for a more comprehensive feedback on writing. Methods in learning

analytics that allow for tracing student learning behaviors in online platforms and for analysing educational texts can be harnessed to advance understanding of writing processes and products, and to inform at-scale formative feedback to students. We are conducting an LA study observing students' cognitive and metacognitive processes and written products as they worked on an essay writing task. We report on our progress in this extended summary. We collected multimodal trace data that students generated in an online learning platform, including timestamped navigational logs, keystrokes, and mouse clicks. Informed by prior theoretical and empirical works, we identified a set of process- and product-related features, and used those features to develop the Random Forest machine learning model. This model correctly detected around 77% of low-performing essays. We further examined process and product features that were important predictors of essay performance.

Evaluating the Effectiveness of Personalized Scaffoldings on SRL using Ordered Network Analysis
Keywords: Educational Technologies, Learning Analytics, Self-regulated Learning and Behaviour, Writing/Literacy
Presenting Author: Yizhou Fan, Peking University, China; **Co-Author:**Tongguang Li, Monash University, Australia; **Co-Author:**Yuanru Tan, University of Wisconsin-Madison, United States; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Joep van der Graaf, Radboud University Nijmegen, Netherlands; **Co-Author:**Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Johanna Moore, University of Edinburgh, United Kingdom; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Dragan Gasevic, Monash University, Australia

Self-regulated learning (SRL) describes learners' ability to regulate their cognitive, metacognitive, motivational, and emotional factors in learning, and is posited to be a strong predictor of academic success. It is therefore important to provide learners with effective instruction to improve more meaningful and effective SRL activities. One way to implement SRL instruction is through providing realtime personalized scaffolding while learners engage in the task. However, the effectiveness of personalized scaffolding, in the current literature, has primarily been examined and explained in terms of associations with academic performance, while insufficient studies have addressed the effectiveness in relation to changes in SRL processes either at the the coarse-grained level (i.e. the task level) or fine-grained level (i.e. the segmented task level). To address these gaps, this study designed and developed a multi-source writing task, and used a cutting-edge analytic method – ordered network analysis (ONA) – to model, visualize, and explain how learners' SRL processes changed in relation to the scaffolds at both task level and segmented task level. The study results showed that personalized scaffolds are effective in 1) encouraging learners to adopt diverse SRL processes, 2) facilitating meaningful reading and writing tactics, and 3) urging and facilitating early engagement in SRL processes. This study demonstrates a significant novelty in not only deepening our understanding of the effects of scaffolding at the segmented task level, but also in using a contemporary network analysis technique in evaluating the effects of personalized scaffolding on learners' SRL processes.

Promoting effective use of domain information in simulation-based scientific inquiry learning
Keywords: Educational Technologies, Inquiry Learning, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Mari Fukuda, Simon Fraser University, Canada; **Co-Author:**John Nesbit, Simon Fraser University, Canada; **Co-Author:**Philip Winne, Simon Fraser University, Canada

For inquiry learning to be effective, appropriate support is crucial. Although providing supplementary text about the domain is a common means of support, research shows learners often do not use that information effectively. This ongoing study investigates effects of two interventions (just-in-time inquiry prompts, P+; pretask and posttask directions to explain domain concepts, E+) on learners' frequency of accessing, selecting, and processing domain information. Thirty-four undergraduates were randomly assigned to four groups: (1) P+E+, (2) P+E-, (3) P-E+, or (4) P-E-. In a one-on-one online experiment, participants engaged in inquiry learning with a website providing a DC circuit simulation, information text, and text answer fields. Analysis of their information access behaviour, traced as log data, revealed that explanation directions increased learners' text access and reading durations. Process mining indicated the groups receiving explanation directions showed more transitions between conceptual texts that needed to be referenced together for better understanding, such as the texts about electrons and current. Consequently, acquisition of domain-specific concepts and laws assessed by the posttest was higher in both explanation direction groups than groups without such support. Future analytical possibilities are discussed.

Developmental Differences in Students' Self-Regulated Learning with Game-based Learning Environments
Keywords: Developmental Processes, Game-based Learning, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Saerok Park, University of Central Florida, United States; **Co-Author:**Daryn Dever, University of Central Florida, United States; **Co-Author:**Megan Wiedbusch, University of Central Florida, United States; **Co-Author:**Roger Azevedo, University of Central Florida, United States

Learners develop their self-regulated learning (SRL) abilities over time and use different SRL skills in game-based learning environments (GBLEs). To explore SRL based on learners' developmental levels in GBLEs, 26 high school and 26 undergraduate students participated in learning microbiology with Crystal Island. Pre-test scores, post-test scores, and log-file data were collected and analyzed to identify differences on learning outcomes and SRL skills in GBLEs based on developmental levels. Results show that undergraduates were more likely to solve a mystery than high school students in Crystal Island despite no significant differences in learning gains measured by normalized change scores. Furthermore, the frequency and duration of SRL strategies were larger for undergraduate students compared to high school students. Our findings make a significant theoretical contribution by showing how SRL models should take developmental differences into account when making monitoring or strategy-use assumptions. Additionally, this work highlights instructional implications for GBLEs by showing the positive aspects of providing scaffoldings based on learners' developmental levels.

Physics and Engineering Students' Teamwork: Examining Boundary Processes
Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, Higher Education, Science and STEM
Presenting Author: Canan Mesutoglu, Erasmus University Rotterdam, Netherlands; **Co-Author:**Dury Bayram-Jacobs, Eindhoven University of Technology, Netherlands; **Co-Author:**Annemieke Vennix, Eindhoven University of Technology, Netherlands; **Co-Author:**Jan van der Veen, Eindhoven University of Technology, Netherlands

One of the features of innovative learning environments is student collaboration in designing solutions to complex, real-life problems. Teamwork of science and engineering students enhance their vision in understanding and appreciating multiple disciplinary perspectives. Prior research addresses a need to better understand how and when students successfully connect their disciplinary perspectives during teamwork. This research undertook a case-study approach and used Communities of Practice theory to explore how applied physics and mechanical engineering students communicated and coordinated their disciplines in a nine-weeks challenge-based learning course. The methods of data collection were: journals, individual interviews, and observations of team meetings. Results indicated that the students discussed and connected their disciplinary competences through organizing discussions during meetings and through working in mini-teams. Physics and engineering students' unique approaches to project planning and to problem solving were successfully incorporated during teamwork.

The study has implications for design and delivery of similar course contexts regarding improved communication across disciplines.

Using interaction dynamics to study intra- and inter-team processes of team learning
Keywords: Cooperative/Collaborative Learning, Lifelong Learning, Quantitative Methods, Resilience
Presenting Author: Lida Zoi David, University of Twente, Netherlands; **Co-Author:**Marcella Hoogeboom, University of Twente, Netherlands; **Co-Author:**Maaike Endedijk, University of Twente, Netherlands; **Co-Author:**Jan Maarten Schraagen, Netherlands Organisation for Applied Scientific Research (TNO), Netherlands

As team members interact, they learn to adjust their process and adapt to the demands of the situation over time. However, this collaborative learning in teams has been mostly studied through linear, static approaches to assess how teams learn. Such an approach fails to provide insight into the emergent nature of moment-by-moment changes in the team learning process. In this study, nonlinear, dynamic approaches will be applied to overcome this limitation, aiming to understand learning through team interaction dynamics. We recorded student teams training to perform cardiopulmonary resuscitation within the course of a two-month training period, and coded coordination behaviours (e.g. giving commands, requesting information) of each team throughout all training rounds, to investigate how the dynamics of interaction patterns formed from these behaviours emerge and change. Our analysis focuses on investigating intra- and inter-team differences in learning trajectory as reflected in interaction dynamics, and how it relates to team performance.

From decoration to documentantion: a collaborative action research at a Greek kindergarten.

The culture of contemporary design is moving towards looking less at general rules and more at the relationships, creating a dynamic system that is flexible and adaptable. Reggio Emilia educators have long recognized the importance of the design and the use of the structured environment to the promotion of learning and they acknowledge the complex set of relationships that exist between the environment, the student and the teacher.At the Greek kindergarten the space and the decoration are considered and function in a stereotypical way. Also, collaborative learning is applied in a restricted and a perfunctory way. In our research program we intended to create a “relational space”, a space that gives priority to subject’s interactions and to the construction of knowledge through the pedagogical utilization of classroom’s decoration transforming it into documentation. We have chosen the ‘collaborative action research in education’ because we wanted to intervene on the agents of the educational environment so as to gain collaborative features that would lead to children’s active participation and learning. The first findings have shown that the pedagogical utilization of classroom’s decoration, created by the children, can function as a stimulus for exploration, expressions of emotions, views and experiences and acquisition of new knowledge. It provoked children’s imagination and created a positive psychological climate where all the children’s works were acceptable and were used as a resource of constructing new activities. It, also, functioned as documentation reinforcing teacher’s work.

The Importance of a Homogeneous Problem Perception for Successful Problem Regulation in CSCL
Keywords: Computer-supported Collaborative Learning, E-learning/ Online Learning, Higher Education, Self-regulated Learning and Behaviour
Presenting Author: Laura Spang, University of Augsburg, Germany; **Co-Author:**Martin Greisel, University of Augsburg, Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany

Even though collaborative learning has repeatedly been shown to be an effective form of learning, students often fail to benefit from it. One reason for this might be that small group members may have different perceptions of what current problems make their learning difficult (e.g., low motivation of some learners; differences in their understanding of to-be-learnt concepts). Such heterogeneous problem perceptions may be difficult to sort out. A homogenous problem perception, in contrast, should help groups to regulate the problem collectively and effectively. Yet, these assumptions have hardly been investigated empirically in the past. Therefore, we had *N*=316 pre-service teachers collaborate online in small learning groups in a problem-based learning scenario on psychological development theories. After the learning session, we presented 33 problems to the participants and asked them to estimate the extent to which each problem appeared during their collaboration. We used the negative deviation of the individual problem ratings of each single group member from the rest of the group as a measure of homogeneous problem perception. As a second measure, we asked participants whether they believed that their problem perception differed from the problem perception of the rest of the group. As hypothesized, homogeneous problem perception was associated with different measures of subjective regulation success such as satisfaction, group coping and subjective knowledge acquisition. Support options to achieve a homogenous problem perception are discussed.

Teachers’ classroom management competences at their entry into the teaching profession
Keywords: Classroom Management, In-service Teachers, Pre-service Teachers, Teacher Professional Development
Presenting Author: Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Christian Bruehwiler, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**MANUELA HALDIMANN, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Doreen Holtsch, University of Teacher Education St.Gallen, Switzerland

Studies have consistently shown that classroom management issues (e.g. dealing with disturbing behaviour) are one of the most challenging for teachers during the transition into the profession (Terhart, 1994; Zingg, & Grob, 2002). While pre-service teachers acquire a lot of knowledge about classroom management during their initial teacher training, they do not necessarily acquire classroom management skills (Jones, 2006; Stough et al., 2015). Situation-specific skills appear to be particularly significant in relation to classroom management (Jones, 2006). It can be assumed that classroom management competences build up and develop during the first years of teaching profession due to various formal and informal learning opportunities (König et al., 2017; Schmidt et al., 2011). However, research on the transition from pre-service teacher to in-service teacher is quite rare. In this paper, the development of classroom management competences will be examined during the first years of teaching. The following questions are investigated: 1. How do classroom management competences of in-service teachers develop during their first three years of teaching? 2. Which opportunities to learn (OTL) in classroom management during initial teacher education do in-service teachers perceive as particularly relevant for the development of their classroom management competences? 3. How are OTL related classroom management competences? The results will be discussed regarding the importance of OTL for the development of teachers’ classroom management skills during early career teaching. Furthermore, the insights will also be used to consider how to improve the measurement of teachers' professional competences for effective classroom management.

Preservice Teachers’ Lesson Planning Competence and Teaching Quality Regarding Classroom Management
Keywords: Classroom Management, Competencies, Pre-service Teachers, Quantitative Methods

Presenting Author: Madeleine Müller, University Erfurt, Germany; **Presenting Author:**Isabell Tucholka, TU Dortmund University, Germany

Effective classroom management is an essential dimension of teaching quality and requires preventive planning of according (re)actions and measures to ensure a positive learning environment without disruptions. While there has been some investigation regarding lesson planning competence, this research has not explicitly taken aspects of classroom management into account so far. In this study, we modelled classroom-management-specific lesson planning as a competence of preservice teachers because both lesson planning and classroom management are central topics of teacher education. Based on authentic planning documents of 105 preservice teachers, we investigated whether classroom-specific lesson planning competence could be modelled and reliably measured based on different criteria. Moreover, we examined how this competence relates to the preservice teachers' classroom management performance as perceived by themselves and their students (n = 1503) according to rating items.
The results revealed that preservice teachers' classroom-specific planning competence can be assessed reliably through authentic lesson plans: the interrater reliability of two coders regarding all coded criteria was sufficiently high and a confirmatory factor analysis confirmed a unidimensional competence model. Against our assumptions, however, correlation and regression analyses revealed no (predictive) connection between classroom-management-specific planning competence and the participants' perceived performance in class. Further investigation will have to show whether this competence is indeed not relevant for practical teaching or whether long-term implementation or increasing practical experience are necessary to unearth the potential relationship.

Professional Vision in the Classroom: Teachers' Knowledge-Based Reasoning and Visual Attention
Keywords: Classroom Management, Eye Tracking, Mixed-method Research, Teaching/Instructional Strategies
Presenting Author: Heli Muhonen, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

As a concept, teachers' professional vision includes two main domains: *noticing* and *knowledge-based reasoning* (Seidel & Stürmer, 2014). Eye-tracking methodology has been increasingly utilized to study teachers' noticing in terms of their visual focus of attention, but there is a lack of mixed-method studies that have also considered the domain of knowledge-based reasoning. This study examined teachers' professional vision in terms of the extent to which teachers' knowledge-based reasoning explains their visual focus of attention to their whole class and individual students. A mixed-method study approach was utilized to investigate Grade 2 teachers' professional vision in an authentic classroom setting through eye-tracking methodology and retrospective think-aloud (RTA) interviews. In the RTA interviews, the teachers were given an opportunity to recall what they were thinking during their teaching in the recording and to explain the reasons for their actions. The findings showed that teachers' descriptions of students' social relations and emotions associated positively with teachers' visual focus of attention to the whole class. Teachers' descriptions of teacher-related information/elaboration and pedagogy linked negatively with teachers' visual focus of attention to individual students. The findings suggest that paying attention to the social relations and emotions of the class requires teachers to invest more attention among the whole class, while focusing on teaching and pedagogy-related aspects may allow less time for visual attention to the individual students.

Under Which Conditions Do Teachers Label Students as Having Behavior Problems?
Keywords: Classroom Management, Quantitative Methods, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Boris Eckstein, University of Teacher Education Zurich, Switzerland; **Co-Author:**Urs W. Grob, University of Zurich, Switzerland; **Co-Author:**Kurt Reusser, University of Zurich, Switzerland; **Co-Author:**Alexander Wettstein, PHBern / University of Bern, Switzerland

Some students who display behaviors that deviate from classroom norms become labeled by their teacher as having "behavior problems". Previous research has not sufficiently clarified the extent to which such labels can be explained by the students' actual behavior, and to which extent they are due to other factors such as personality traits of the labeling teacher or contextual factors like the class composition. Adressing this research gap, the present paper explores the question: *Under which conditions do teachers label their students as having behavior problems?* 85 primary school teachers and their 1'412 students answered a survey. The teachers reported which students of their class have behavior problems according to their personal view (dependent variable). The students reported the frequency with which four randomly assigned classmates displayed undisciplined behaviors (first predictor). Furthermore, the teachers reported their general personal sensitivity to disturbances (second predictor). Using logistic regression analysis, the students' probability of becoming labeled by the teacher was estimated under the condition of their indiscipline frequency and the teachers' sensitivity. The results indicate that the teachers' labeling can be explained largely by the students' actual behavior – but not exclusively. The teachers' general sensitivity also has a significant impact, even when controlling for indiscipline. At the conference, these findings will be discussed reflecting the study's strength and limitations. Furthermore, upcoming analyses with additional predictors will be presented, e.g. focusing on classroom level effects.

How Language Shapes Our Views: A Study of Work with Language Awareness in a Year 7 Class
Keywords: Classroom Management, Communication Skills, Critical Thinking, Social Interaction
Presenting Author: Ingvill Rasmussen, University of Oslo, Norway; **Co-Author:**Kari Anne Rødnes, University of Oslo, Norway

In uncertain times, rhetoric about conflicts, parties and people often become pointed. Students encounter biased rhetoric in many channels; therefore, attending to language use is an essential part of education. This paper investigates how a teacher guides her year 7 class through a lesson addressing the topic of how language can express and shape our opinions of other people. The core data consists of video recordings and transcripts of the lesson. We take a dialogic, sociocultural approach, and our analytical procedures draw on socioculturally informed interaction analysis. Our findings show that the teacher provides tasks that allow students time and space to explore the topic of biased language use by discussing everyday words and utterances from public speeches and by creating their own speeches. The teacher firmly leads the class' work through her talk that repeatedly and explicitly addresses the lesson aim and ways of talking together in the classroom. She models respectful ways of talking, she reminds the students of attending to the utterances of others, and she regulates the work pace in the groups securing that they work together as a class. Through her explicit talk about language use and her distribution of talk between many participants, coherence is created between exploratory activities, ways of talking to learn and the subject-specific aim. This way of working with language promotes students' development of skills to relate critically to the utterances of others, as well as skills to use language to learn and collaborate with others.

Do achievement goals and self-efficacy matter for students' perception and use of feedback?
Keywords: Feedback, Goal Orientations, Higher Education, Motivation
Presenting Author: Melanie V. Keller, University of Augsburg, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany; **Co-Author:**Martin Daumiller, University of Augsburg, Germany

Feedback is considered as a key element for successful learning processes and can greatly impact achievement, but only if it is used adequately by its recipients. The question about which factors matter for how students perceive feedback, i.e., how they react to it in terms of emotions and perceived usefulness, and how they eventually use it, is important but still little understood. Investigating motivational antecedents of perception and use of feedback could contribute

to answering this question. From a theoretical perspective, students' achievement goals and self-efficacy should influence how they perceive and use feedback. To elucidate these connections, we conducted a longitudinal field study in a higher education course with 204 students who received tutor feedback on weekly assignments. We assessed (1) achievement goals for the assignment at the beginning of the semester and (2) self-efficacy for revision, achievement emotions, and attitudes towards the feedback together with the feedback, and (3) subjective and objective feedback use (via Jaccard-similarity). Self-efficacy, learning and appearance approach goals were associated with emotions and perceived helpfulness. Appearance goals and perceived helpfulness were associated with feedback use, all effects of goals, however, faded over time in later measurement points. These results illustrate that students' self-efficacy and achievement goals are important for how they perceive and implement feedback, emphasizing the theoretical notion that motivation is crucial in feedback processes. From a practical perspective, our results imply that fostering learning goals in students can improve their perception and implementation of tutor feedback.

The Effects of Free-Selection Peer Feedback Activities on Self-Efficacy of University Students
Keywords: Feedback, Higher Education, Peer Interaction, Self-efficacy
Presenting Author: Natasha Dmoshinskaia, University of Twente, Netherlands; **Co-Author:**Hannie Gijlers, University of Twente, Netherlands; **Co-Author:**Pantelis M. Papadopoulos, University of Twente, Netherlands; **Co-Author:**Alieke M. van Dijk, University of Twente, Netherlands

This study investigated how a free-selection, double-blind peer feedback activity affected the self-efficacy of bachelor's students. Specifically, 56 students of Psychology volunteered to participate in the study involving measuring their self-efficacy and completing course activities such as drafting an essay, reviewing peers' essays, and integrating peer feedback and own insights into the final essay. The study followed a hybrid free-selection approach according to which one peer's draft was assigned by the teacher, while the students were free to select and review *at least* one more draft from a pool of four that were randomly offered to them. Students' self-efficacy was recorded using the OPASS instrument before and after the peer feedback activity. Analysis of the OPASS scale and its three subscales (self-evaluation, receiving peer feedback, and reacting to peer feedback) showed a statistically significant improvement for two subscales (self-evaluation and reacting), and the whole scale, while a trend of improvement was recorded for the receiving subscale. Further analysis of the peer feedback metrics showed that the quality of the submitted reviews was a significant predictor for the receiving subscale, while the number of submitted reviews was a significant predictor for the whole scale. Even though the increase in self-efficacy did not affect the quality of the final essay, we argue that cognitive and more affective elements of peer feedback should be analysed in tandem to study the factors that influence translating feedback into one's performance.

Unpacking Emotional and cognitive responses to feedback in teams
Keywords: Cooperative/Collaborative Learning, Emotion and Affect, Feedback, Higher Education
Presenting Author: Catherine Gabelica, IESEG School of Management, France; **Co-Author:**Vitaliy Popov, University of Michigan, United States

Research on feedback in teams acknowledges the importance of feedback mechanisms to team success. However, although processing performance feedback in teams is seen as an important prerequisite to its effectiveness, the processes emerging after feedback reception have been overlooked in past research. This paper provides insights into the emotional and cognitive reflective responses of graduate students (N=111) to team-level feedback. The results of our explorative study reveal that (a) students from high-performing teams generally report positive activating emotions and generally reflect on feedback when prompted to do so, (b) many students from low performing teams were able to show adaptive emotional responses to team-level feedback, and (c) there is a complex interplay between feedback valence and affective and cognitive reactions to team feedback as evidenced and visualized by Epistemic Network Analysis model.

What changed my mind – Impact of feedback in online-self-assessments for study choice orientation
Keywords: Attitudes and Beliefs, Educational Technologies, Feedback, Higher Education
Presenting Author: Belinda Merkle, University of Mannheim, Germany; **Co-Author:**Hanna Buerkle, University of Mannheim, Germany; **Co-Author:**Karina Karst, University of Mannheim, Germany; **Co-Author:**Stefan Janke, University of Mannheim, Germany

Online self-assessments (OSAs) are supportive tools in the study choice process. After assessing prospective students' expectations regarding attractive fields of studies they provide feedback on prospective students' expectation discrepancies from study reality. Past research showed that higher expectation discrepancies in a particular field of study are related to larger changes in prospective students' cognitions about (choosing) the respective field of study. However, the significance of the feedback component has not been adequately investigated yet. Based on cognitive dissonance theory, we hypothesize that feedback moderates the relationship between expectation discrepancies and changes of cognitions about (choosing) the respective field of study. The positive relationship should be stronger when feedback is provided (vs. no feedback).
To test this research question, we used an experimental design in which 234 prospective students were randomly assigned to one of two groups (OSA with vs. without feedback) and assessed their cognitions before and after completing the OSA.
Multivariate hierarchical moderated regression analysis showed that higher absolute expectation discrepancies were related to larger absolute changes in values and expectancies for success. As hypothesized, we additionally found moderation effects of the feedback-condition. The positive associations between absolute expectation discrepancies and absolute changes in expectancies for success and study choice certainty were stronger when prospective students received feedback (vs. no feedback).
The findings suggest that both the development of effective feedback procedures and the selection of valid items adequately reflecting study contents and requirements are central to the intended effectiveness of OSAs in the context of study choice.

Technology use in vocational education: Teachers' competence and beliefs, and school-related factors
Keywords: Attitudes and Beliefs, Competencies, In-service Teachers, Teacher Professional Development
Presenting Author: Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland; **Co-Author:**Chiara Antonietti, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland

When studying technology integration in education, many models agree in attributing a prominent role to the teachers' beliefs, in particular their perceived usefulness (PU) of educational technologies and their self-efficacy beliefs on using technologies in their practice, which sometimes is measured recurring to teachers' self-assessed digital competence (TDC). However, most studies consider the teachers' intention to use technology, rather than their actual use and only few of them investigate variables at teacher and school levels in the same model. Finally, very few studies deal with vocational education (VET). The current study aims at exploring the role VET teachers' beliefs (in terms of PU and TDC) play on the use of technology in instructional practices (USE), adopting a multilevel approach applied to a self-reported questionnaire filled in by 1925 Swiss VET teachers. Results show that the variance in USE could be attributed more to difference within schools (44%) than to the difference between schools (5%), and that both TDC and PU have a significant and positive effect on USE. Additionally, when testing the direct and indirect effects of TDC on USE mediated by PU, both effects are significant (p

Stress-related psycho-physiological activation in emergency simulations using a 360° Video
Keywords: Anxiety and Stress, Educational Neuroscience, Immersive Technologies for Learning, Vocational Education and Apprenticeship Training
Presenting Author: Rita Cosoli, The Swiss Federal University for Vocational Education and Training (SFUVET), Switzerland; **Co-Author:**Francesca Amenduni, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland; **Co-Author:**Vito Candido, SFUVET, Switzerland; **Co-Author:**Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland

Emergency contexts are emotionally demanding, especially for novices. In this study, we aimed to compare a direct simulation condition in which the students simulate a road rescue in practice and an indirect simulation, in which the students observe a similar scenario through a 360° interactive video in immersive modality. The aim is to highlight whether psycho-physiological activation in a direct simulation is comparable to the one of an indirect simulation. The investigation was carried out by comparing psycho-physiological activation before and after the direct and the indirect simulations and using a multi-modal approach, which includes psycho-physiological measurements (Heart Rate and salivary cortisol sampling) and self-reported measurements. Preliminary results indicates that the psycho-physiological activation is higher before the direct simulation than after, probably due to the perceived relevance of the rescue task.

Fostering Virtual Teamwork – Shedding Light on Apprentices in VET using PLS-SEM
Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Quantitative Methods, Vocational Education and Apprenticeship Training
Presenting Author: Frank Hiller, LMU Munich School of Management, Germany; **Presenting Author:**Stefanie Zarnow, LMU Munich, Germany

Not just since the Covid-19-pandemic, collaboration and cooperation among employees has changed significantly. When working from home, other ways of working together need to be applied to work across homes and borders. That is especially true for apprentices in VET: With both schools and companies closed during the pandemic and a ‘new normal’ in place, virtual teamwork (VTW) drastically gained in significance. A higher degree of VTW seems to be necessary to prepare apprentices for the labor market. However, there is little research on the current situation of apprentices regarding VTW. Therefore, we analyze a sample of N=207 German apprentices using Partial Least Squares Structural Equation Modelling (PLS-SEM) to examine interrelationships of Input-Process-Outcome variables with Satisfaction and Innovative Learning in virtual teams (VT) as desired targets of VET-activities. The results indicate that Organizational Factors have the most significant influence concerning the relationship between Input and Process factors. Surprisingly, Technical Affinity of individuals has only a minor influence. Regarding the relationship between Process and Outcome factors, Motivation & Responsibility have the highest impact on Innovative Learning whilst Communication Culture severely affects perceived Satisfaction in VTW. The findings lead to valuable insights on factors influencing VTW in apprenticeships and can help to design a learning program for apprentices’ preparation to new ways of collaboration and cooperation in their present and future working environment.

Key factors of effective professionalisation programmes for school leaders
Keywords: Developmental Processes, Lifelong Learning, School Leadership, Teacher Professional Development
Presenting Author: Els Tanghe, University of Antwerp, Belgium; **Presenting Author:**Wouter Schelfhout, University of Antwerp, Belgium

Through educational leadership, the school leader contributes to school development, with an indirect impact on pupils’ learning. Attention to professional needs of school leaders in relation to required competences and a training programme that is oriented to development is opportune. This mixed-method research focuses on the perceived effects and underlying explanatory processes of school leaders' participation in a two-year innovative professionalisation programme aimed at combining key factors and approaches to effective professionalisation. First analyses show the impact of specific combinations of key factors and approaches on the school leaders’ learning process and on its transfer to specific actions in the school context.

Leading the School Change: Leadership Patterns and Implementation of Best Pedagogical Practices
Keywords: Assessment Methods, Classroom Assessment, School Effectiveness, School Leadership
Presenting Author: Irit Sasson, Tel-Hai College, Israel; **Co-Author:**Yael Grinshtain, Tel-Hai Academic College, Israel; **Co-Author:**Tamir Ayali, Tel-Hai Academic College, Israel; **Co-Author:**Itamar Yehuda, Tel Hai Academic College, Israel

In recent years there has been growing need to adopt pedagogical changes and design new learning environments. A sustainable school change is challenging to achieve and depends on a variety of factors. This study aimed to explore the factors that predict the application of best pedagogical practices by focusing on the relationship between distributed leadership, the level of assimilation of the pedagogical school vision, and the variables that moderate this relationship. A questionnaire was completed by 221 teachers from ten schools undergoing pedagogical change. A significant positive correlation was found between distributed leadership and the level of assimilation of the pedagogical school vision. Three sub-dimensions moderated this relationship significantly. Extensive application of formative assessment and inquiry learning by teachers strengthened the relationship; personal characteristics related to resistance to change demonstrated in short-term discomfort weakened it. The results contribute to an understanding of the process of leading a school change. The research demonstrates an important new methodological tool to assess the application of best pedagogical practices, which can contribute to research linking organizational, personal, and pedagogical characteristics in educational change.

Teachers’ and principals’ use of results from nationwide achievement tests: A mediation analysis
Keywords: In-service Teachers, School Effectiveness, School Leadership, Secondary Education
Presenting Author: Patrick Hawlitschek, Institute for Educational Quality Improvement (IQB), Germany; **Co-Author:**Sofie Henschel, Institute for Educational Quality Improvement (IQB), Germany; **Co-Author:**Dirk Richter, University of Potsdam, Germany; **Co-Author:**Petra Stanat, Institute for Educational Quality Improvement (IQB), Germany

In many countries, educational policy increasingly expects teachers to use results from nationwide achievement tests for data-based decision-making. Theoretical models suggest that teachers’ data use for instruction are not only related to their attitudes and the organizational culture of data use in their schools but also to the use of data by their school principals. However, the relationship between teachers’ and principals’ data use has rarely been tested in quantitative analyses and existing studies only provide limited evidence. In addition, there is some evidence that teacher attitudes and the culture of data use in school serve as mediators. This study therefore examined these relationships using data from two large-scale samples ($N_{mathematics\ teachers}$ = 796 and $N_{German\ teachers}$ = 693), with self-reports from teachers and principals. Results of structural equation models show that data use by secondary school teachers is significantly associated with data use by principals. Moreover, teacher-perceived culture of data use fully mediates this relationship, but teacher attitudes do not. We were able to replicate our results for two large-scale samples, providing evidence for the generalizability of our findings. This study points to the importance of principals shaping a school’s data use culture beyond individual teacher attitudes. Thus, supporting principals to develop a positive data use culture to improve educational quality seems promising for future professional development.

Emotional intelligence as game changer in school leadership: Notes from the Covid-19 pandemic.
Keywords: Pandemic, Qualitative Methods, School Leadership, Well-being
Presenting Author: Stella Jackman-Ryan, North Carolina State University, United States; **Co-Author:**Lisa Bass, North Carolina State University, United States; **Co-Author:**Mario Jackson, North Carolina State University, United States

The COVID-19 pandemic prompted rapid disruptions and spontaneous shifts in education. In the interest of public health, and in adherence to CDC guidelines, school leaders across the United States and the rest of the world made strategic decisions to close schools or transition to remote learning during that time. These decisions presented a critical repositioning of school principals' work and they were challenged to rely on additional socioemotional skills to navigate the experience. Emotional intelligence is well documented in the literature as a key predictor of leadership effectiveness. To this end, we conducted a multiple case study to learn about how principals with varying strengths in emotional intelligence leveraged their leadership skills during the pandemic. Our sample was selected from a larger sample of principals who participated in a study on school leadership in a southeastern state in the United States. In that study, principals were required to complete an emotional intelligence instrument among other surveys. Our sample consists of a total of 10 principals —five principals who scored the highest, and 5 principals who scored the lowest on the emotional intelligence measure. Data was collected via semi-structured interviews and we utilized Goleman's emotional intelligence model to frame our analysis of the principals' leadership. Four coders analyzed the interviews through a series of open coding followed by axial coding. Preliminary findings suggest that principals with higher self-ratings on emotional intelligence were more attuned to their teachers' needs, and prioritized relationship management during the pandemic.

Brilliance Beliefs of German Pre-Service Teachers: A longitudinal analysis
Keywords: Attitudes and Beliefs, Mindsets, Motivation, Pre-service Teachers
Presenting Author: Katharina Asbury, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Bastian Carstensen, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Uta Dr. Klusmann, Leibniz Institute for Science and Mathematics Education (IPN), Germany

Teacher mindsets about students' capabilities have been shown to be relevant for students' motivation and achievement. However, research on structure and correlates of teacher mindsets with aspects of teachers' professional competence is still in its infancy. Most findings on teacher mindsets and their correlates are merely cross-sectional. The present study sought to address these issues by examining pre-service teachers' fixed mindsets about intelligence as well as field-specific mindsets, so called *brilliance beliefs*. The brilliance belief construct is a conceptual extension of the classical mindset construct, adding the aspect of subject specificity. We investigated longitudinal data of $N = 326$ German pre-service to answer questions about (1) the stability of brilliance beliefs over two years; (2) differential changes between STEM- and non-STEM students; and (3) associations between fixed mindsets and brilliance beliefs with aspects of professional competence. We found brilliance beliefs in pre-service teachers to be stable over a two-year period. Like prior research (e.g. Leslie et al., 2015, Deiglmayr et al. 2019) we found differences in pre-service teachers' brilliance beliefs relating to their subject areas. Students with STEM subjects (science, technology, engineering, mathematics) had stronger brilliance beliefs than students in other subjects. Moreover, in line with prior research in this field, fixed mindset was negatively related to important motivational factors of teachers, enthusiasm and pedagogical interest. Brilliance belief was found to be a negative predictor for enthusiasm, but not for pedagogical interest. Results indicate a construct stability of brilliance beliefs as well as a STEM/Non-STEM divide.

Finnish pre-service science and primary teachers' motivations and perceptions of teaching
Keywords: Motivation, Pre-service Teachers, Primary Education, Science Education
Presenting Author: Antti Lehtinen, University of Jyvaskyla, Finland; **Co-Author:**Tomi Jaakkola, Tampere University, Finland; **Co-Author:**Koen Veermans, University of Turku, Finland

In Finland, primary teacher education is very popular, but science teacher education is not. Finland might face a shortage of science teachers in the future. The aim of this study is to analyze Finnish pre-service primary and subject teachers' motivation to become a teacher and their perceptions of teaching as and whether there are differences between the two teacher education tracks.The FIT-Choice scale was used for data collection. It is an internationally validated scale aimed at measuring pre-service teachers' motivations to become a teacher and perceptions of teaching. Data came from 169 pre-service primary teachers' and 46 pre-service science (physics or chemistry) teachers.Common motivational factors were intrinsic value of teaching and perceived teaching abilities. Altruistic factors such as shaping the future of children were significantly stronger motivators for primary pre-service teachers than science teachers. Prior teaching and learning experiences were significantly stronger motivators for science pre-service teachers than primary teachers. The common perception of teaching was that it is a demanding expert career. The science pre-service teachers perceived significantly more that their salary would be comparatively good. As a conclusion, recruitment for science teacher students should emphasize the enjoyment one gets from teaching, the importance of one's own perception of their teaching abilities and the good prior teaching and learning experiences one has had as these are the strongest motivators for current pre-service science teachers.

Basic Needs Satisfaction During a Teaching Practicum: An Intraindividual Perspective
Keywords: Competencies, Motivation, Pre-service Teachers, Self-determination
Presenting Author: Mathias Dehne, Friedrich Schiller University Jena, Germany; **Co-Author:**Miriam Jähne, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Susi Klaß, Friedrich Schiller University Jena, Germany; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany

Learning in a teaching practicum is highly intraindividual. However, to date, this dynamic process has been investigated mainly through trait-like, interindividual (between-person) statistics. In contrast, a state-like, intraindividual (within-person) perspective, for instance, regarding motivation, has rarely been applied. This study aimed to disentangle the basic needs of 115 preservice teachers into their trait-like, interindividual and state-like, intraindividual proportions using biweekly measurement occasions. This analytical approach allowed us to relate preservice teachers' situational basic needs satisfaction to specific learning occasions in the practicum. Applying random intercept cross-lagged panel models, we found generally few carry-over effects from measurement occasion to measurement occasion. Furthermore, negative cross-lagged interrelations between competence and autonomy, as well as competence and relatedness, were found at the beginning of the teaching practicum. The presentation will discuss the implications of this intraindividual analytical perspective for the field of teaching and teacher education.

Predicting student's basic needs through motivational appeals: Outcomes on grit and well-being
Keywords: Secondary Education, Self-determination, Teaching/Instructional Strategies, Well-being
Presenting Author: Elisa Santana Monagas, University of Las Palmas de Gran Canaria, Spain; **Co-Author:**Juan L. Núñez, University of Las Palmas de Gran Canaria - Faculty of Educational Sciences, Spain; **Co-Author:**Jaime León, Universidad de Las Palmas de Gran Canaria, Spain

Following a prospective design, the present study aimed to analyse the predictive value teachers' motivational appeals (i.e., the messages that appeal to a

specific motivation) have on students' basic psychological need profiles. We also examine how these profiles predict students' outcomes on grit and well-being. The sample of the study was comprised of a total of 655 secondary students. To estimate students' profiles a person-centered approach was followed revealing four different profiles: thwarted, fulfilled, low fulfilment and neutral profiles. Teachers' that relied on autonomous motivational appeals were more likely to have students that belonged to the more adaptive profiles, whereas teachers who relied on amotivational appeals had students who were more likely to belong to the non-adaptive profiles. Finally, students whose basic need profiles where more adaptive reported higher levels of both grith and well-being. Thus, the present findings emphasize a new resource teachers can rely on to promote students' needs, well-being, and grit experiences.

Session N 23

25 August 2023 14:45 - 16:15
AUTH_T102
Single Paper
Assessment and Evaluation, Cognitive Science, Teaching and Teacher Education

Reading and Writing in a Foreign Language

Keywords: Cognitive Skills and Processes, Feedback, Foreign and Second Language Acquisition, Higher Education, Learning Approaches, Meta-analysis, Migrant / Refugee and Minority students, Motivation, Quantitative Methods, Reading, Self-efficacy, Writing/Literacy
Interest group: SIG 12 - Writing, SIG 17 - Methods in Learning Research, SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Christian Waldmann, Linnaeus University, Sweden

The relationship between reading, spelling, writing fluency, and text quality
Keywords: Cognitive Skills and Processes, Foreign and Second Language Acquisition, Reading, Writing/Literacy
Presenting Author: Eva Lindgren, Umeå University, Sweden; **Co-Author:**Christian Waldmann, Linnaeus University, Sweden; **Co-Author:**Maria Levlin, Umeå University, Sweden

This study explores (1) how reading and spelling relate to writing fluency, and (2) how reading, spelling and writing fluency relate to text quality. One hundred and thirty Swedish upper secondary school students performed 2 reading tasks (word recognition, reading comprehension) and a spelling dictation task, and wrote one text per language (L1 Swedish/FL English) and genre (narrative/argumentative), in total 4 texts, using keystroke logging. Measures of product (number of characters in final texts, total number of typed characters) and process (number of characters per minute, length of bursts between pauses and revisions) fluency were extracted from the keystroke logs, and the final texts were scored for text quality based on seven dimensions: content, organisation, cohesion, vocabulary, language use, spelling, and punctuation. The data was analysed statistically using ANOVA and regression models. Results showed that reading comprehension and spelling related to both product and process fluency, and that word recognition, reading comprehension, spelling and writing fluence were related to text quality. However, language and genre influence the relationships and created differences between L1 and FL writing as well as between narrative and argumentative texts. The results raise questions about the relationship between reading and writing and how reading seems to be applied differently during writing depending on what language and genre is used.

How can feedback improve L1, L2, and FL learners' writing? A systematic review
Keywords: Feedback, Foreign and Second Language Acquisition, Meta-analysis, Writing/Literacy
Presenting Author: Sina Scherer, Westfälische Wilhelms-Universität Münster, Germany; **Co-Author:**Steve Graham, Arizona State University, United States; **Co-Author:**Vera Busse, Westfälische Wilhelms-Universität Münster, Germany

Writing is a key competence crucial for academic and professional success, but many adolescent students struggle with writing and need better support (see Graham & Perin, 2007), particularly foreign language (FL) and second language (L2) learners (e.g. Authors, in press; Hyland, 2003; Silva, 1993). To improve students' writing, feedback can play an important role (e.g. Biber et al., 2011). Yet, it is unclear to date which kind of feedback works best for different language learners. Thus, our project's aim is to conduct a meta-analysis investigating whether feedback is differentially effective for different language learners, namely L1 (first language), L2, and FL learners. In this paper, we present results from our systematic literature search. We identified 948 studies of which 126 studies could be included after coding (L1 n = 29 studies; L2n = 15; FL n = 82). Results suggest that different learners have different feedback needs, particularly regarding direct and indirect corrective feedback. Most studies investigate teacher corrective feedback in the FL context and show conflicting findings, while corrective peer feedback shows positive results for FL learners. Studies on non-corrective peer feedback in the L2 context and studies on computer-based corrective teacher and computer-based corrective peer feedback in the L2 context are scarce. We outline further steps in data analysis and discuss implications for practice and future research.

EFL/ESL Teachers' and Students' Perceptions and Practices of Written Feedback: A Systematic Review
Keywords: Feedback, Foreign and Second Language Acquisition, Higher Education, Writing/Literacy
Presenting Author: Abderrahim Mamad, University of Szeged, Doctoral School of Education, Hungary; **Co-Author:**Tibor Vígh, University of Szeged, Hungary

Unlike previous studies that focused extensively on the controversial issues of the effectiveness of written corrective feedback, the impact of teacher feedback on students' perceptions in writing, the student's response to written feedback (WF), and its role in improving student learning, this systematic review aims not only to identify based on which aspects EFL, ESL, and academic writing teachers' and students' perceptions and practices of WF are examined but also to determine the relationship between these teachers' and/or students' perceptions and their practices. The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) protocol was used. Electronic searches were performed across Scopus and EBSCOhost, which produced a total of 2398 articles. Two researchers retrieved, screened, and assessed these articles (published after 1996) for eligibility. The results were synthesized using a descriptive analysis of 32 articles that met the inclusion criteria. Most studies focused on students' perceptions of WF more than those of teachers. Whereas few studies concentrated on teachers' and students' reported practices of WF, little research explored the relationship between teachers' perceptions and their reported practices. The comparison also between teachers and students regarding their perceptions of WF was limited, but regarding their practices, no study was derived from the thematic analysis of the systematic review. Therefore, this systematic review fills a gap in feedback research, especially concerning teachers' and students' practices as well as regarding a series of comparisons either between teachers and students or between their perceptions and practices of WF.

Investigating the Effects of Linguistic Distance on German and English Reading and Mathematics
Keywords: Foreign and Second Language Acquisition, Migrant / Refugee and Minority students, Quantitative Methods, Writing/Literacy
Presenting Author: Daria Ferencik-Lehmkuhl, University of Cologne, Germany; **Co-Author:**Nils Jaekel, University of Oulu, Finland; **Co-Author:**Michael Schurig, Technical University Dortmund, Germany; **Co-Author:**Sandra Schwinning, University of Wuppertal, Germany

Multilingual classrooms are becoming more common around the globe following increased migration and mobility. Multilingual learners often have to overcome potential language barriers across the curriculum as the majority language remains the point of reference for learners across subjects. Analytically, multilingualism is often mapped in terms of categories (L1/L2), but a measure of linguistic distance can provide additional information for teaching practice. Little research has considered the impact of linguistic distances from students' L1s to the language of instruction and foreign languages, particularly in immigrant language contexts, in contrast to categorical L1 operationalizations.This study investigates how linguistic distances affect native speakers' and multilingual learners' (N=3,307) attainment of German reading (L1/L2), English reading (L2/L3), and Mathematics in grade 5. We used mixed-effects modeling to examine the role of linguistic distance while rigorously controlling for individual learner characteristics focused on language and students' socioeconomic status. The characteristics controlled for include sex, multilingual status, birth abroad, cultural capital, having one's own room and own computer, as well as household income.Results suggest that cognate linguistic distance is a significant factor in predicting German and English reading scores as well as Mathematics achievement. This could deepen the simplistic understanding of linguistic effects through binary categories. Pedagogical implications and considerations to bridge linguistics distance are discussed.

Non-native pupil motivation in spoken English: learning English with an embodied phonology method
Keywords: Foreign and Second Language Acquisition, Learning Approaches, Motivation, Self-efficacy
Presenting Author:NATHALIE HUET, University of Toulouse 2, France; **Co-Author:**Marie-Héléna Hana Younan, University of Toulouse, France; **Co-Author:**Julie Rouaud, University of Paris-Sorbonne Nouvelle, PRISMES-SeSyliA, France; **Co-Author:**Victoria O'Callaghan, University of Toulouse 2, CLLE-UMR 5263 CNRS, France; **Co-Author:**Anne Przewozny, University of Toulouse 2, CLLE UMR 5263 CNRS, France

In order to improve French secondary school pupils' English pronunciation, a method in learning English phonology that builds on both segmental and suprasegmental production and perception, was developed in line with an embodied cognition framework. In reference to Barsalou (2008), knowledge is embodied because it stems from bodily states resulting from the activity of sensory-motor and emotional neural systems. When applied to articulatory phonetics, the embodied approach aims to make learners aware that segmental production implies a vibratory act and an articulatory process, i.e., a bodily gesture associated with a speech act. The main aim of this study is to assess the efficiency of an embodied method (congruent gesture associated to the pronunciation of the word) on phonetic performance and to test the effect of the method on personal self-efficacy and anxiety on phonetic performance related to six groups of words. A third goal is to verify the evolution of self-efficacy and anxiety after practicing spoken English with such an embodied method. Participants were 13-year-old French pupils. Half of them benefited from the embodied method and the others were in the control group (without gesture) during three weeks. Results show that pupils in the embodied group outperformed those in the control group only on two sets of words. Moreover, self-efficacy and anxiety in English pronunciation do not differ according to the method and they remain stable. Results are discussed in terms of the congruence of the gesture associated to specific phonemes and the length of the learning phase.

The Contributions of Executive Functioning to Handwritten and Keyboarded Compositions in Year 2
Keywords: Cognitive Development, Cognitive Skills and Processes, Self-regulated Learning and Behaviour, Writing/Literacy
Presenting Author: Deborah Pino-Pasternak, University of Canberra, Australia; **Co-Author:**Debora Valcan, Murdoch University, Australia; **Co-Author:**Anabela Malpique, Edith Cowan University, Australia; **Co-Author:**Timothy Teo, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Mustafa Asil, University of Otago, New Zealand

Writing is a highly complex skill, recruiting a range of cognitive processes that involve working memory, attention shifting and inhibition, also known as executive functioning (EF). Despite emerging research examining associations between EF and handwritten composition, the mediating role of transcription skills such as automaticity and spelling on the relation between EF and text composition remains underexplored. Even less is understood about the nature of these potential mediation mechanisms in keyboarding, a writing modality that is becoming pervasive in the early years of schooling. The present study examined whether transcription skills mediate the relation between children's EF and text composition across two modes (handwriting and keyboarding) on a sample of 544 Year 2 Australian children. Assessments of EF, transcription skills and text composition were measured concurrently. Indirect pathways were tested via structural equation modelling. Findings indicated that across text composition modes, transcription skills (i.e., automaticity and spelling) mediated the relationship between children's EF and writing composition (i.e., compositional fluency and compositional quality). The findings of this study extend current understanding of associations between cognitive processes and text composition in the junior years of schooling and innovate by examining whether hypothesised associations between EF and writing can be extrapolated to keyboard-based writing.

Identifying Negative Language Transfer in the English Writing of Chinese and Farsi Native Speakers
Keywords: Artificial Intelligence, Communication Skills, Comprehension of Text and Graphics, Writing/Literacy
Presenting Author: Maria Cutumisu, University of Alberta, Canada; **Co-Author:**Mohammad Karimiabdolmaleki, University of Alberta, Canada; **Co-Author:**Leticia Farias Wanderley, University of Alberta, Canada; **Co-Author:**Carrie Demmans Epp, University of Alberta, Canada

Effective communication in English can facilitate educational and employment opportunities for learners of English as an additional language (EAL) who tend to employ rules from their native language while communicating in English. This results in negative language transfer (NLT) when the rules from the native language do not match those of English. One way to assist EAL learners is to identify NLT errors in their English writing. However, manually identifying NLT is a difficult task that requires time and expertise. A model that automatically identifies NLT in learner writing could help learners in the absence of other supports. In this study, four classification algorithms were implemented to automatically identify NLT errors in EAL learner writing. Two of the language modeling approaches employed, n-gram and RNN, are grounded in the linguistic nature of NLT, whereas the other two are general-purpose classifiers: random forest and logistic regression. The findings revealed that the developed models could identify NLT in the English writing of Chinese and Farsi native speakers. Random forest obtained superior results with average weighted F1-scores of 78.1% on the Chinese First Certificate in English (FCE) dataset and 94.8% on the Farsi Lang-8 dataset. This work shows that the implemented models can be used to identify NLT automatically for two languages that use different writing systems (logographic and alphabetic).

Modelling writing competence
Keywords: Competencies, Quantitative Methods, Secondary Education, Writing/Literacy
Presenting Author: Rebecca Kreutz, Universität zu Köln/ University of Cologne, Germany; **Presenting Author:**Julie Philippek, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Ann-Kathrin Hennes, University of Cologne, Germany; **Co-Author:**Barbara Schmidt, University of Cologne, Germany; **Co-Author:**Alfred Schabmann, University of Cologne, Germany

Deficits in writing competence can lead to problems in school and social participation, which is why it is important to support children as early as possible (Hennes et al., 2018). To ensure adequate support, a profound understanding of the subskills of writing competence is essential. Empirical writing theories have already helped us better understand the contribution of different subskills to writing competence (Berninger & Amtmann, 2003; Berninger & Winn, 2006). However, empirical work is often limited to low-level transcription skills like spelling and handwriting fluency and cognitive components like executive functions. In addition to these, higher-level subskills that produce coherence in texts, such as word competence, syntactic competence and generating coherence, are also relevant, albeit only weakly defined theoretically (Becker-Mrotzek et al., 2014; Gómez Vera et al., 2016). In the current study, we established a model that brings together low- and high-level subskills. We tested executive functioning, handwriting fluency and spelling as low-level subskills and lexical diversity, word and sentence usage, local cohesion and tense correctness as high-level subskills. In addition, students had to write a narrative text, which was used to determine writing competence. The results showed that cognitive components and low-level subskills had primarily indirect effects on writing competence mediated by high-level subskills. Furthermore, the high-level subskills accounted for most of the explained variance in writing competence. Therefore, writing interventions should focus on high-level subskills in addition to low-level subskills.

Benefits of Image Interpretation Models on Adolescents' Historical Reasoning
Keywords: Inquiry Learning, Instructional Design, Reasoning, Writing/Literacy
Presenting Author: Kevin van Loon, University of Applied Sciences Northwestern Switzerland FHNW School of Education, Switzerland; **Co-Author:**Monika Waldis, University of Applied Sciences Northwestern Switzerland, Switzerland

This study investigated adolescents' (secondary school students, *N* = 145, *M* age 13.9 years) historical reasoning when learning with images with the support of different instructional scaffolds. Past research on students' historical reasoning showed that methodological skills are lacking. Image interpretation models, and visual representations (mind mapping) may support students with historical reasoning. However, benefits of such instructional scaffolds are unclear. The present research investigated whether there are differences between two image interpretation models and mind mapping on students' historical reasoning, as assessed with text writing performance. Participants interpreted 3 photographs over three measurement points (one image per measurement point). At measurement point one, students had no instructional scaffold. At measurement point two, the 3 types of scaffolds were introduced (RCT). These were a mind map scaffold, a linear image interpretation scaffold, and a dynamic image interpretation scaffold. At measurement point 3, they again interpreted an image with the assigned scaffold. Student texts were rated with the qualitative content analysis to assess historical reasoning competencies. Results showed that learning with image interpretation models support students historical reasoning better than mind mapping. Further, both interpretation models, the linear and the dynamic, seem to enhance students' historical reasoning. Especially the dynamic model showed promising effects for contextualization and the description of the relevance of the image message for the present. However, this effect was not stable over time. Further research is needed to investigate whether a certain interpretation model is more adequate when learning with a specific type of image.

The promotion of writing strategies and the evaluation of the implementation process
Keywords: E-learning/ Online Learning, Sustainable Development, Teacher Professional Development, Writing/Literacy
Presenting Author: Seda Yilmaz Wörfel, TU Chemnitz, Germany; **Co-Author:**Simone Jambor-Fahlen, University of Cologne, Mercator Institute for Literacy and Language Education, Germany; **Co-Author:**Nora Fröhlich, Institute for Educational Analysis (IBBW), Germany; **Co-Author:**Benjamin Fauth, Institute for Educational Analysis (IBBW), Germany; **Co-Author:**Alexandra Dehmel, Institute for Educational Analysis (IBBW), Germany; **Co-Author:**Michael Becker-Mrotzek, University of Cologne, Mercator Institute for Literacy and Language Education, Germany

Good writing skills are not only necessary for success in school, but also for participation in society. The project "Die Textprofis" aims to promote the basal reading and writing skills (in four fields: reading fluency, reading strategies, writing fluency and writing strategies) of fifth graders at non-academic track secondary schools in Baden -Württemberg.
In this paper, part of the training concept with focus on the promotion of writing strategies and the evaluation of the implementation process will be presented. The overarching research question is:
Which are the main influencing factors when successfully implementing a science-based writing strategies training in practice? The study has a quasi-experimental design. The data consists of N = 901 students at 48 schools, N = 48 principals, N = 106 teachers, N = 17 expert advisors for instructional development and N = 15 advisors for school development.
In this paper, we operationalize the successful implementation a) via the implementation fidelity in terms of e.g., the frequency and the duration of the training units and b) via the perceived acceptance and cost-benefit ratio of the training. As influencing factors we will examine e.g., the teachers' motivation to promote students' writing skills, the perceived usefulness of the teacher training, the perceived transferability of the training's contents and the usefulness of the support by the expert advisors. Overall, the study contributes to implementation and transfer research, especially with regard to the implementation of evidence-based writing strategy training and gives valuable insights into teacher training during the pandemic.

Session N 25

Poster Presentation
Assessment and Evaluation, Higher Education, Learning and Social Interaction

(Self-)Assessment Methods

Keywords: Assessment Methods, At-risk Students, Classroom Assessment, Cognitive Skills and Processes, Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Creativity/Divergent Thinking, Higher Education, Instructional Design, Learning Analytics, Metacognition, Problem Solving, Qualitative Methods, Reasoning
Interest group: SIG 04 - Higher Education, SIG 16 - Metacognition and Self-Regulated Learning, SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Ioannis Dimakos, University of Patras, Greece

Standardization of Metacognition in Creative Problem-Solving (MCPS) Scale
Keywords: Assessment Methods, Creativity/Divergent Thinking, Metacognition, Problem Solving
Presenting Author: Kamila Urban, Institute for Research in Social Communication, Slovak Academy of Sciences, Slovakia; **Co-Author:**Marek Urban, Institute of Psychology of Czech Academy of Sciences, Czech Republic

Metacognition plays an important role in various activities; yet, it is traditionally studied in well-defined tasks such as memory, comprehension, or reasoning. However, metacognition significantly affects the problem solving of ill-defined tasks. An efficient creative problem-solver can transfer previous knowledge to novel and unusual situations. For successful creative problem-solving, a student needs to plan, monitor and regulate the process and evaluate the originality and usefulness of the outcome. The goal of the present study was to standardize the scale for metacognition in problem-solving (MCPS). A representative sample of 350 Czech university students of social sciences and humanities filled the Metacognitive Self-Regulation Scale from MSLQ and the MCPS scale, performed a product improvement task and self-evaluated the level of creativity of their own solutions. The MCPS scale yielded an excellent internal consistency calculated by CFA and IRT modeling. Moreover, MCPS demonstrated adequate convergent and divergent construct validity predicting both creativity and the accuracy of metacognitive monitoring. Therefore, MCPS is an adequate self-reported scale for assessing metacognition in creative problem-solving in the school context.

Teaching Analysis Poll (TAP) in SQUARE: Insights into a Joint Practice and Research Project
Keywords: Assessment Methods, Higher Education, Instructional Design, Qualitative Methods
Presenting Author: Stefan T. Siegel, University of St.Gallen, Switzerland

Since 2016, the Quality Development Services (QD) and the Centre for Learning and Teaching in Higher Education at the University of St.Gallen (IWP) have been offering Teaching Analysis Polls (TAPs) to instructors on a voluntary basis. TAPs are a participatory, formative feedback method with which university instructors can obtain qualitative feedback on their courses during the semester. SQUARE was ceremonially opened in 2022. Designed by the Japanese architect Sou Fujimoto, the building is intended to be an experimental field for teaching and learning, which enables interaction between students, university faculty, business and industry professionals, and local residents. At the request of SQUARE, specialized TAPs were developed and conducted in the spring semester 2022 to gain insights into teaching and learning within SQUARE. This poster will present insights from a joint practice and research project.

Talking Transactivity: Various Perspectives and a Possible Direction for Automated Analysis
Keywords: Assessment Methods, Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Reasoning
Presenting Author: David Otten, University of Twente, Netherlands; **Co-Author:**Pantelis Papadopoulos, University of Twente, Netherlands; **Co-Author:**Maaike Endedijk, University of Twente, Netherlands

Transactivity, or building upon a previous contribution of a learning partner, is important for the co-construction of knowledge during collaborative learning. This presentation presents various definitions and facets of transactivity. Our future goal is to provide tools for automated analysis and feedback on transactivity

within collaborative learning. We aim to answer the following question: *What are different perspectives on transactivity and what perspective can contribute to the development of automated tools for feedback on transactivity*? Some definitions of transactivity, such as solely (dis-)agreeing with a learning partner's contribution, or a simple paraphrase, do not necessarily assess the co-construction of knowledge. In the context of collaborative learning, a tool for automated analysis should ideally also take this factor into account. Based on existing definitions synthesized with recent research, we argue that a linguistic perspective on transactivity is needed to achieve our future goal. The poster provides an overview of coded examples using different perspectives on transactivity. It conclusively presents a model which can be applied when a more linguistic-level approach to transactivity is desirable.

Using students' interaction with self-assessments during the semester for predicting course success
Keywords: Assessment Methods, At-risk Students, Higher Education, Learning Analytics
Presenting Author: Clara Schumacher, Humboldt Universität zu Berlin, Germany; **Co-Author:**Dirk Ifenthaler, University of Mannheim, Germany; **Co-Author:**Jakub Kuzilek, Humboldt Universität zu Berlin, Germany

Using self-assessments to test understanding and progress of learning is considered beneficiary for learning outcomes. However, in higher education offering self-assessments and feedback is predominantly restricted due to resource constraints. Using digital learning environments facilitates the provision of self-assessments and feedback. Furthermore, this allows tracking learners' interaction with the self-assessments. This field study investigates students' interaction with self-assessments over the entire course period and if this could be used for predicting students' success in the course. Findings indicate that students do not allocate the self-assessments over the semester but use them directly before the exam dates. If students do not use the self-assessments, their probability of failing the course is about 32.7%. Hence, students need to be made aware of the benefits of self-assessments and fostered using them. Future research should investigate other disciplines and relate findings from trace data with variables not trackable in the digital learning environment.

Analysis of Creativity in Collaborative Writing Texts Using the T-CREANT Assessment Tool
Keywords: Classroom Assessment, Cognitive Skills and Processes, Creativity/Divergent Thinking, Qualitative Methods
Presenting Author: Noemí Font-Piqué, University of Lleida, Spain; **Co-Author:**Manoli Pifarré Turmo, University of Lleida, Spain

This papers reports the validation and use of a tool to assess the four dimensions of creativity in collaborative writing: flexibility, fluency, elaboration and originality. The tool is called T_CREANT (Tool for evaluating creativity in narrative texts) and it is used to evaluate narrative texts written by high school students who have participated in a writing project-based learning. The research methodology is a case study. 27 secondary school students participated in the study, organized in groups of 4-5 students. The T_CREANT tool allows the collection of quantitative data, such as: number of paragraphs, ideas, different ideas, elaborated paragraphs, original paragraphs, metaphors,; and qualitative data (type of elaborated narrative element, original linguistic, elaborated per paragraph and type of original element per paragraph). Three statistical data analysis have been used: descriptive statistics methods; visualization of the data in graphs and figures and correlation between the dimensions of flexibility-fluency and elaboration-originality. Results show that T_CREANT can assess the four dimensions of creativity within the framework of collaborative writing activity. Each of the categories obtains a final score that allows the teacher to analyse the degree of creativity in the narrative texts written by the students in a collaborative way. Furthermore, T_CREANT captures metaphorical language, metaphorical originality and the presence of humor as characteristics of creative language. Educational implications of using T_CREANT to improve teaching-learning processes in narrative writing will be discussed.

Session N 26

25 August 2023 14:45 - 16:15

Digital team collaboration in kindergartens: An investigation using the Will-Skill-Tool Model
Keywords: Competencies, Digital Literacy and Learning, Early Childhood Education, Teacher Professional Development
Presenting Author: Sebastian Then, University of Bamberg, Germany; **Co-Author:**Matthias Borgstede, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

This presentation deals with digital team collaboration in preschools. The aim is to find out to what extent preschool teachers use digital media in team collaboration and which factors influence their use based on the Will-Skill-Tool Model. In the context of this study, 886 preschool teachers from Germany participated in the survey. On average, preschool teachers use digital media in team collaboration less than once a month, but with a high variance. The results show that training, access to computers, technical support, beliefs and self-efficacy expectations are significant predictors for the use of digital media in team collaboration. In particular, technical support seems to be more significant than equipment alone.

Exploring the intentions and digital competence of pre-service primary school teachers in Ireland
Keywords: Competencies, Digital Literacy and Learning, Educational Technologies, Pre-service Teachers
Presenting Author: Denis Moynihan, Dublin City University, Ireland

This study will examine the self-reported digital competence and self-reported intentions of primary school level pre-service teachers (PSTs) to use digital technologies in their professional practice as part of teaching, learning and assessment. Through the use of a mixed-methods research approach, this study will firstly collect quantitative survey data from PSTs in order to explore and examine any relationships between their self-reported intentions and self-reported digital competence. Next, qualitative interview data will be collected from a subset of eight PSTs. These data will be thematically analysed in order to present understandings of the development of the intentions and digital competence of these PSTs through the unpacking of their rich lived experiences.

Teachers' digital competence - a broad set of comprehensive attitudes, skills, and knowledge
Keywords: Competencies, Digital Literacy and Learning, In-service Teachers, Primary Education
Presenting Author: Susanna Pöntinen, University of Eastern Finland, Finland; **Co-Author:**Sini Kontkanen, University of Eastern Finland, Finland; **Co-Author:**Sinikka Räty-Záborszky, University of Eastern Finland, Finland; **Co-Author:**Mira Kummunmäki, University of Eastern Finland, Finland

Teachers play a key role in fostering students' ability to act openly and goal-oriented ways in digital learning environments. Previous studies tell us that teachers' competence to develop teaching practices is more critical than e.g., the need to master isolated technical skills (Pöntinen & Räty-Záborszky, 2022). This can be also seen in digital competence frameworks for teachers which underline best digital practices (Redecker, 2017) and digital subject didactics (Kelentrić et al., 2017). Overall, it is important to bear in mind that promoting students' positive attitude towards learning in versatile digital learning situations can be a challenging task for teachers. Therefore, studies which aim to investigate how the teachers themselves experience digital classroom practices become important. In the poster, we present results of action research conducted in two Finnish primary school classrooms. The key knowledge, skills and attitudes needed for primary school teachers to support students' digital competence were investigated. The MAP model (Metsäpelto et al., 2021) was used to identify teachers' essential individual and teaching competences when they aim to foster students' digital competence (see Ilomäki et al., 2016). Our results show that teachers' digital competence closely related to social skills, higher-order thinking skills and professional well-being. Openness to respond to changing teaching

situations, positive future orientation and putting new ideas into practice were attitudes among others influencing teachers working. We conclude that digitally competent teachers orchestrate broad practices and strategies for responding to the needs of complexity of educational processes and versatile students' needs in digital era.

Effects of an ICT course on pre-service teachers' self-efficacy: A quasi-experimental study
Keywords: Digital Literacy and Learning, Pre-service Teachers, Quantitative Methods, Self-efficacy
Presenting Author: Sonja Hahn, Darmstadt University of Applied Sciences, Germany; **Co-Author:**Samuel Merk, PH Karlsruhe, Germany; **Co-Author:**Olga Kunina-Habenicht, Technical University of Dortmund, Germany

Along with the growing importance of educational technology, university courses fostering accompanying competencies and beliefs in pre-service teachers are emerging. However, few results from studies containing control groups are available. In our study, we focus on the effect of such a course on different self-efficacy scales in a quasi-experimental design. We administered self-report questionnaires capturing ICT-related self-efficacy in pre-service teachers with differing granularity (general statements vs. specific tasks) and with different focus (non-instructional vs. instructional ICT use). Participants from an introductory course on digital education (*N*=250) answered these scales along with demographic information at the beginning and at the end of the course. Additionally, participants from other introductory courses on research methods and inclusion took part as a quasi-experimental control group (*N*=360). In order to account for systematic differences between the two groups, we used the nearest neighbor matching procedure on multiply imputed data resulting in *N*=75 participants in each group. Preliminary results comparing the two groups on post-test scales revealed significant group differences on both scales capturing instructional ICT use, whereas differences on the remaining scales were not significant. Updated results will be presented at the conference. Results show that attending the general introductory course on digital education fosters self-efficacy beliefs on instructional ICT use. Findings on the non-instructional scales tend to favor participants attending this course, but do not reach significance. This underlines the relevance of using self-efficacy scales that match the content and learning goals of the course under investigation.

The effectiveness of long-term in-service training on teachers' professional development
Keywords: Digital Literacy and Learning, In-service Teachers, Lifelong Learning, Teacher Professional Development
Presenting Author: Sini Kontkanen, University of Eastern Finland, Finland; **Co-Author:**Susanna Pöntinen, University of Eastern Finland, Finland; **Co-Author:**Satu Piispa-Hakala, University of Eastern Finland, Finland

Society has become more digitized and digital technology has become increasingly central in curriculum; however, digital competence is still a complex phenomenon (Erstad et al., 2021). The need for digitally competent teachers has obviously increased (Instefjord & Munthe, 2017), but studies reveal that teachers are not qualified, and their training is insufficient (Fernández-Batanero et al., 2020). Since digital competence is considered as a key factor to improve teachers' professional development, our poster presentation focuses on the effectiveness of professional digital competence training for in-service teaches.
In the poster, we present aspects which in-service teachers assessed meaningful after taking part in long-term in-service teacher training program. The training aimed to support teachers to develop their digital competence, especially from pedagogical autonomy perspective and to explore digitalized learning and teaching research-based from the pedagogical perspective. Research data consisted of teachers interviews which were carried out in the end of the professional training program. Interviews were analysed by theory-driven content analysis identifying features that are related to the effectiveness of training programs presented by Arthur et al., (2003).
Our results show that in-service training program greatly impacted in-service teachers' professional development. Teachers estimated that they learned a lot during the training program, the training had a positive effect on their job description and career, and their skills conducting digital teaching practices improved significantly. As a conclusion, we suggest that long-term in-service teacher digital competence training program can effectively improve in-service teachers' professional development.

What do we do when we simulate? - a design-based research study
Keywords: Competencies, Critical Thinking, Digital Literacy and Learning, Inquiry Learning
Presenting Author: Sonja Bleymehl, Pädagogische Hochschule Ludwigsburg, Germany; **Co-Author:**Christine Bescherer, Pädagogische Hochschule Ludwigsburg, Germany

Since computer simulations are part of our everyday life, responsible citizens need to be able to reflect simulation results critically. To be capable of asking questions concerning assumptions made, used data, pursued purpose, etc., an epistemological understanding of simulation is needed. In German schools, simulations are often used as tools, but teachers rarely discuss simulations themselves.This study addresses teaching about simulations, their importance for science and chances as well as risks involved. A sequence of five math lessons for a 7^{th} grade in lower secondary schools on the topics model, modelling and simulation is under development. Beside the development of materials for teachers, the objective of this study is to investigate which competencies and skills are further developed by learning about simulations. Therefore, we follow a design-based research approach. A first pilot study was conducted.

The effects of standardized and individualized feedback on self-efficacy and anxiety in writing
Keywords: Feedback, Motivation, Self-efficacy, Writing/Literacy
Presenting Author: Katrin Peltzer, Westfälische Wilhelms-Universität Münster (Münster University), Germany; **Presenting Author:**Alina Lira Lorca, Department of Educational Sciences, Oldenburg University, Germany; **Co-Author:**Ulrike-Marie Krause, University of Oldenburg, Germany; **Co-Author:**Vera Busse, Westfälische Wilhelms-Universität Münster, Germany

Writing is a complex undertaking requiring high levels of motivation and self-efficacy for students to maintain engagement in the process, and can pose particular challenges for foreign language (FL) learners. Formative feedback has the potential to support student writing and motivation, however, research examining the motivational effects of different formative feedback methods is scarce. We address this research gap and present data from our experimental intervention study that was conducted in English classes in Germany in Year 9, involving $N = 255$ students of English as a Foreign Language (EFL) . Feedback was implemented within a learning unit that focused on argumentative writing, and participants were randomly assigned to three experimental groups receiving different kinds of formative teacher feedback (individualized, standardized, or combined). We investigate changes in students' self-efficacy and anxiety through pre-, post- and follow-up assessments and compare the experimental conditions to two control groups (learning unit without feedback, no intervention). Data collection has already been completed, while data analysis is still ongoing.

A valid and reliable assessment tool of competencies in higher education
Keywords: Assessment Methods, Competencies, Feedback, Higher Education

Presenting Author: Kris Janssens, Hasselt University, Belgium; **Co-Author:**Annelies Vanheel, Hasselt University, Belgium; **Co-Author:**Bert Brône, Hasselt University, Belgium

Valid and reliable assessment of competencies in complex assignments such asbachelor's and master's theses and internships is a major challenge for every programme. We aimed to design a new tool in which we define clear assessment criteria and levels based on learning goals, guarantee the inter-rater reliability, offer transparency for students and evaluators, provide qualitative feedback for students (intermediate and afterwards), and maintain it time efficiently, user friendly and feasible for large groups. An assessment tool was developed based on rubrics with a unique underlying scoring system for the different parts of the assessment (process, report, presentation) of the bachelor's and master's theses and different internships of the bachelor and master in biomedical sciences. The underlying scoring system varies throughout the different years, as more advanced competence levels are expected in higher years. To summarize the assessment process, the students and evaluators receive the rubrics at the start of the internship or thesis to achieve transparency. Formative assessment is provided intermediate using the assessment tool and working points are identified and discussed. At the end of the internship, the assessment tool is completed for summative evaluation and the students receive the rubrics, feedback and score. Throughout the last 5 years, analyzing the results in addition to focus groups has led to optimization of the assessment tool and finally to a valid and reliable assessment in which students are provided with qualitative feedback and can monitor their progress.

The influence of item design on test performance
Keywords: Assessment Methods, Classroom Assessment, Multimedia Learning, Quantitative Methods
Presenting Author: Tamara Schleepen, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Desirée Joosten-ten Brinke, Open University of the Netherlands, Netherlands

In a national school system, a central exam is offered to all students. The results of this exam, combined with teachers' perception of students' academic performances and future abilities, will determine students' entry level in secondary education. The central exam is provided by six different item constructors that schools may choose from. In this exam, items are presented with pictures or illustrations as context information. These exams require students to be able to interpret the information from the multimedia offered (text combined with pictures). The question is whether a student's test performance depends on the design of the items. In this round table, we would like to elaborate on the possible effects of item design causing differences in performance. We would like to show participants different appearances of items and discuss if and how the design played a role in student performance.

Automated Feedback and Learning Design for Collaborative Problem Solving in Simulation Scenarios
Keywords: Cooperative/Collaborative Learning, Feedback, Higher Education, Simulation-based Learning
Presenting Author: Daniel Sanchez, University of Oslo, Norway; **Co-Author:**Rachelle Esterhazy, University of Oslo, Norway; **Co-Author:**Crina Damsa, University of Oslo, Norway

Despite the proliferation of automatic tools that aim to support collaborative learning, little is understood about how feedback generated by these tools is integrated in simulation-based learning design. This gap is critical as it pinpoints how different ways of combining learning design elements and automated feedback create opportunities for learners to collaborate and engage with knowledge in productive ways. This study uses a design-based research and participatory design approach in a high-fidelity simulation-based learning design in nursing education. The study seeks to identify how teachers initially conceive automated feedback as part of their learning design and how they gradually adjust both feedback and learning design in light of empirical evidence. It does so by taking a departure point in models based on research literature and by analysing multiple data sources: observations of simulations, records from co-design meetings, usability testing, user experience (UX) review, and teacher interviews. Findings from these analyses will feed into future developments of automated feedback in collaborative settings.

A Demonstration and Tutorial of Open Creativity Scoring: Freeware for Educational Researchers

Keywords: Artificial Intelligence, Assessment Methods, Creativity/Divergent Thinking, Quantitative Methods
Interest group:

Please bring your own device if you are attending this ICT demonstration.
Open Creativity Scoring (OCS) is a web-based freeware that is designed to automatically quantify the creativity of responses to verbal divergent thinking tasks via artificial intelligence models from both adult and child participants (see link: https://openscoring.du.edu/). Hosted on a University of Denver server, the freeware can be accessed from any computer connected to the internet and is intended to support the massive 'scaling up' of creativity research within the educational setting. In this demonstration, the creators of the freeware will present a step-by-step demonstration of how to use it, along with a hands-on tutorial that will be designed to get researchers set up to process their own data. Functions related to the measurement of Originality, Fluency, and Elaboration for either adult or child participants will be demonstrated.

Invited Symposium
Lifelong Learning, Teaching and Teacher Education

Intensive longitudinal methods – The way forward in researching professional learning

Keywords: Emotion and Affect, Informal Learning, Lifelong Learning, Motivation, Pre-service Teachers, Qualitative Methods, Quantitative Methods, Teacher Professional Development, Vocational Education and Apprenticeship Training
Interest group: SIG 14 - Learning and Professional Development
Chairperson: Michael Goller, University of Kassel, Germany
Organiser: Michael Goller, University of Kassel, Germany
Organiser: Maaike Endedijk, University of Twente, Netherlands

Organiser: Andreas Rausch, University of Mannheim, Germany
Discussant: Littlejohn Allison, University College London, United Kingdom

A large share of research on professional learning and development is based on cross-sectional research designs, using quantitative or qualitative methods aimed at understanding individual differences in employees' learning and development. Although such research is important on its own, it does not allow to investigate potential within-person variation–that is, "how experiences within one individual can differ depending on time or context" (Myin-Germeys & Kuppens, 2022, p. 17). To capture and understand potential within-person effects, (fine-grained) longitudinal data needs to be collected (e.g., using experience sampling) and analysed using appropriate methods. Without such research approaches, important dynamics that lie on the foundation of learning and development processes in work contexts might easily be overlooked, leading to a biassed or even false understanding of the world (Fisher et al., 2018) and wrong assumptions for the development of interventions. This symposium aims on explaining the need for intensive longitudinal methods as well as to illustrate the challenges of intervention and replication studies. On a more conceptual level, this will be done by the first presentation. The following three presentations will then illustrate distinct methodological approaches based on different empirical studies. The second presentation focuses on how to analyse longitudinal interval data on employees' basic psychological needs satisfaction, arousal, and emotions during daily work tasks using Bayesian multilevel modelling. The third presentation focuses on a microgenetic longitudinal approach using qualitative methods to investigate teachers in their professional contexts. The fourth presentation discusses the use of diary studies to investigate learning from errors.

Time for change: The promises of intensive longitudinal methods for the field of workplace learning
Presenting Author: Maaike Endedijk, University of Twente, Netherlands

An unprecedented speed of technological developments and societal transitions requires professionals to engage continuously in the process of up and reskilling. As the vast majority of professional learning occurs at the workplace, understanding how learning evolves at the workplace and how this can be supported is crucial. Decades of research on workplace learning has provided insights into essential building blocks for individual and contextual factors that drive the workplace learning process. However, factors explaining differences between persons are not necessarily the same ones explaining differences within persons. Intensive longitudinal methods and within-person analyses are required to find crucial moments of workplace learning and the right interplay of contextual factors for workplace learning to evolve. This contribution discusses promising examples to arrive at a better understanding of factors supporting the process of workplace learning, such as experience sampling studies or microgenetic studies. In addition, this paper will discuss the promises and perils of micro-interventions to adaptively support workplace learning. This theoretical paper will argue that it is time for a change. Time to change our methods to commensurate with the fluctuations in the process that we study and to find out which time-varying factors influence the process of workplace learning to build evidence-based support tools. Only then can our research field can truly support workers to remain employable and contribute to the major societal transitions.

Autonomy, emotions, arousal and development of competence in daily work situations
Presenting Author: Petri Nokelainen, Tampere University, Finland; **Co-Author:**Ilmari Puhakka, Tampere University, Finland; **Co-Author:**Eija Lehtonen, Tampere University, Finland

The current study used longitudinal interval-contingent design (Bolger & Laurenceau, 2013) to examine the relationship between the development of competence in different daily work situations and the prevailing emotional states (Pekrun & Perry, 2014), the experience of autonomy (Ryan & Deci, 2017) and the ambulatory measured levels of arousal (Boucsein, 2012). The data (N = 65) were collected in 2019 from the white-collar employees of two large Finnish engineering companies. Participants wore Moodmetric smart rings (arousal level from electrodermal activity, EDA, by one minute interval) for 3 to 9 days and self-reported three times per day work task related emotional states, experienced autonomy and development of competence via LearningTracker smartphone app (Nokelainen & Hartikainen, 2020). Results of two-level mixed-effects regression analysis indicated that both within and between-person level autonomy was the strongest (positive) predictor for competence. Also positive emotions had some predicting value related to higher levels of experienced competence. Within-person level arousal was weakly positively related to competence. Further investigation of within-person multilevel mediation showed that autonomy was positively associated with valence and arousal, but they did not have a mediating role in the model of competence development.

Two microgenetic studies on teacher learning: Investigating learning in process
Presenting Author: Alba Vallés, University of Lleida, Spain; **Co-Author:**Marc Clarà, University of Lleida, Spain

Unlike other longitudinal methods, microgenetic approaches permit us to observe learning phenomena while they happen, in process; therefore, these methods are especially adequate to investigate questions related to how learning phenomena happen. In this paper, we present two microgenetic studies about how teacher professional learning takes place, with the aim of providing the reader with a clear vision of how a microgenetic study looks like, why it is useful, and how it can be conducted in the field of professional learning. In the examination of the two studies, we focus on the observational setting, the analytical tools, and the kind of results obtained, in order to provide readers with diverse resources and models that can inspire further microgenetic research in the field.

Replicating and extending a diary study on emotions, coping and learning in error situations at work
Presenting Author: Andreas Rausch, University of Mannheim, Germany

Learning from errors is a complex and dynamic process that includes contextual characteristics, individual coping approaches, and emotional experience. Semi-standardised diaries allow to collect this fluctuating data near real-time and adapt to natural settings. However, this makes every diary study unique and hard to replicate. The present study is an extended replication study of Rausch et al. (2017; Journal of Workplace Learning, Vol. 29, No. 5, 374). Fifty-one young employees of a Rural District Office participated in the voluntary study and recorded n = 352 error situations. Some findings from the original study were replicated but some were not. Surprisingly, the emotion-focused coping approach of self-blaming showed one of the highest correlations with self-perceived learning from the error situation (r = .50) while it showed almost no correlation in the original study. Furthermore, an additional assessment of one's emotional experience after coping showed that emotions during error processes are very dynamic and therefore the time of measurement matters. Finally, the additional coping approaches were selected very frequently suggesting that these coping approaches also played a role in the first study but were not recorded. In general, reproducibility, robustness, and replicability are important criteria for the credibility of an empirical study. Since research on workplace learning is based on still evolving theoretical frameworks and conducted with field studies in various contexts, exact replications are impossible. This is particularly the case when using intensive longitudinal methods. Nevertheless, replication studies provide important information on the validity and generalizability of original findings.

Session O 2

25 August 2023 17:00 - 18:30
UOM_CH
Invited Symposium
Learning and Special Education

Fundamental academic learning in students with various educational needs - longitudinal evidence

Keywords: Anxiety and Stress, At-risk Students, Cognitive Development, Learning and Developmental Difficulties, Learning and Developmental Disabilities, Mathematics/Numeracy, Quantitative Methods, Special Education
Interest group: SIG 15 - Special Educational Needs
Chairperson: Pirjo Aunio, University of Helsinki, Finland
Organiser: Pirjo Aunio, University of Helsinki, Finland
Discussant: Kerry Lee, The Education University of Hong Kong, Hong Kong

This symposium analyzes the cognitive mechanisms of learning difficulties in typical and atypical populations using longitudinal samples. So far, most specific learning difficulties research has concentrated on rather small sets of predictive variables and groups of children studied cross-sectionally. Data in our symposia were obtained using longitudinal designs with four different age groups and countries (Belgium, Netherlands, Finland, United Kingdom) (Table). The data

presented includes 976 participants in total. The following analysis methods were used: variance, correlation and Structural Equation Modeling (confirmatory factor, latent growth curve, mediation). In general, these findings suggest that a wide range of cognitive as well as emotional factors have an effect on development of learning difficulties. Importantly, the use of longitudinal data, using the same participants, show that the factors that impact on positive outcome or learning difficulties changes over development. As such, the important value of this symposium is that longitudinal samples contribute in understanding the predictive value of cognitive and emotional variables in children and adults learning and learning difficulties. It highlights the importance of following children who have at risk for learning difficulties, taking account various cognitive, linguistic and emotional factors, as the impact of them varies also over time to learning of fundamental academic skills. This knowledge is important for identifying students in need for extra and/or special educational support and in providing them support.

The Cognitive Profile of Preschoolers at Risk for Dyslexia and ADHD
Presenting Author: Silke Kellens, Katholieke Universiteit Leuven, Belgium; **Co-Author:**Dieter Baeyens, KU Leuven, Belgium; **Co-Author:**Pol Ghesquière, KU Leuven, Belgium

Dyslexia and ADHD frequently co-occur, as approximately 15-40% of children with one diagnosis also have symptoms of the other. However, in prospective research, preschoolers at risk for dyslexia and ADHD are often neglected. Yet, insight into the cognitive profile of these at-risk children might enhance early identification and remediation. Therefore, overall, our study aimed to investigate the cognitive development of preschoolers at risk for dyslexia and/or ADHD and typically developing preschoolers, by following them up longitudinally from preschool (age 5) to third grade (age 8) (N = 178 in third grade). In this presentation, we specifically compared preschool risk status to cognitive deficits and investigated to what extent these preschool deficits were related to later formal diagnoses in third grade. Prospectively, we examined the likelihood of working memory (WM), processing speed (PS), or inhibition deficits in specific risk groups through an individual deviance analysis. The results showed that when a WM, PS, or inhibition deficit was present in preschool, most children were simultaneously at risk for dyslexia, with or without ADHD. Additionally, we retrospectively assessed the relation between these preschool deficits and the probability of a formal diagnosis of ADHD and/or dyslexia by the time they were in third grade. These specific preschool deficits were indeed associated with later difficulties, as preschool WM and PS deficits were related to the probability of a future diagnosis of ADHD and/or dyslexia. This study's results highlight the importance of cognition in identifying children with special educational needs and developing interventions for these children.

Linguistic Precursors of Advanced Math Growth in Children with and without DLD
Presenting Author: Eliane Segers, Radboud University, Netherlands; **Co-Author:**Constance Vissers, Radboud University, Netherlands; **Co-Author:**Tijs Kleemans, Radboud University, Netherlands

The first aim of the present study was to examine the differences between children with and without Developmental Language Disorder (DLD) in advanced mathematics. Secondly, we investigated the extent to which the basic and advanced linguistic skills of children with and without DLD directly and indirectly (through arithmetic) predict their growth in advanced mathematics from fourth to sixth grade. Participants were 59 children with DLD and 136 typically developing peers from 9 to 11 years of age. Classroom as well as individual measures were administered. First, the preliminary results in fourth grade showed children with DLD to score below their peers on both basic arithmetic skills and advanced mathematics. With respect to the second research question, indirect effects of phonological awareness and naming speed, via basic arithmetic skills, on geometry and fractions were found to be equally strong for both groups. Furthermore, similar strengths for both groups were found for nonverbal intelligence and academic vocabulary, in directly predicting the scores in advanced mathematics. Overall, these results highlight the general need for opportunities to learn the basic and advanced linguistic skills associated with mathematics over the extent in which linguistic skills are impaired.

Developmental trajectories of math anxiety and performance in lower secondary education
Presenting Author: Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Anna Widlund, Åbo Akademi University, Finland; **Co-Author:**Pekka Räsänen, Univerisity of Turku, Finland

Math anxiety (MA) is thought to increase during schooling and reach peak levels during adolescence. However, there are surprisingly few studies that have investigated developmental patterns of MA in general, and during adolescence in particular. Thus, this study sought to address these research gaps by investigating the development of MA and performance from grade 7 to grade 9 across 4 time points in a sample of Finnish lower secondary students (N = 583). MA was measured with a five-item scale inspired by the Math Anxiety Rating Scale and math performance was measured with a standardized math test. Longitudinal confirmatory factor analyses supported measurement invariance of the MA scale across time. Latent growth mixture modeling identified two distinct groups that differed in their MA initial level and development. The typical group (N=460) had low initial level of MA in grade 7, which showed a stable developmental trend across lower secondary education. The MA group (N = 123) had higher initial level of MA in grade 7 and exhibited a steep increase during grade 7 which levelled out in the end of lower secondary education. Both groups developed similarly in math performance although the MA group started with lower scores in grade 7.

Mathematical Abilities in Williams syndrome: Longitudinal findings from the WisDom Database
Presenting Author: Jo Van Herwegen, UCL Institute of Education, United Kingdom; **Co-Author:**Stella Xu, UCL- Institute of Education, United Kingdom; **Co-Author:**Harry Purser, The Nottingham Trent University, United Kingdom; **Co-Author:**Michael Thomas, Birkbeck College, University of London, United Kingdom

Williams syndrome (WS) is a rare genetic syndrome that results in an uneven cognitive profile and many individuals with WS are delayed in their mathematical abilities. The current study is the first study to examine the long-term mathematical abilities of 20 individuals with WS using data from the WiSDom database that brings data together from several labs in the UK combined with newly obtained data. The results showed that, over a time period of more than 10 years, mathematical abilities (as assessed by Quantitative Reasoning task from British Ability Scales) improved in younger as well as older participants with WS but this improvement was larger for those who had a longer time difference between the two assessment points in both groups. There was no effect for age group or interaction between age group and mathematical ability improvements. There were a wider range of statistical significant correlational analyses at T2 compared to T1, suggesting spread of compensatory strategies or that as a resolution to narrow barriers of success a wide range of abilities become relevant to mathematical abilities over time. These and other explanations will be discussed.

Session O 3

25 August 2023 17:00 - 18:30
AUTH_CH
Invited Symposium
Learning and Social Interaction

Social sustainability efforts and learning experiences in diverse and multicultural practices

Keywords: Communication Skills, Communities of Learners and/or Practice, Cultural Diversity in School, Digital Literacy and Learning, Educational Policy, Foreign and Second Language Acquisition, Game-based Learning, Immersive Technologies for Learning, Informal Learning, Migrant / Refugee and Minority students, Mindsets, Social Aspects of Learning and Teaching, Social Interaction, Social Media, Sustainable Development
Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Gudrun Ziegler, Luxembourg
Chairperson: Andreas Gegenfurtner, University of Augsburg, Germany
Organiser: Maria Bäcke, University of Jönköping, School of Education and Communication, Sweden
Discussant: Sikunder Ali, Norwegian University of Science and Technology (NTNU), Norway

In this symposium, we explore cross-cultural interactions including identities, discourses and practices in education environments and how participatory decision-making processes influence language ideologies and language practices that emerge from, construct, or contest cultural beliefs and norms. These have an impact on social sustainability in multicultural and complex educational practices, which affect feelings of hope for students as well as educators. For

education to become a force for hope in society, we explore societal polarization and issues of center-peripheries bound up with the challenges of consuming, interpreting, and participating in everyday digital communities of practice from the perspectives of sociocultural learning and social sustainability. Sustainability and digitalization are highlighted in educational curricula all over the world (United Nations, 2021; European Commission, 2020), and digitalization initiatives are framed as reimagining, revitalizing, and resetting education to increase inclusivity and accessibility (Facer & Selwyn, 2021), thus emphasising aspects of both education and social sustainability. While focusing on environmental and economic dimensions of sustainability, social sustainability rarely receives significant attention. Our focus on decoding how diverse and complex multicultural practices explores the interplay between learning, digital practices, and social sustainability. The core objective is to understand and address the richness and potential of the complexities, challenges, and this symposium address it from a range of different communicative and learning perspectives and through a variety of methodological and theoretical approaches. Few areas bring together these as strongly as education with respect to how learning, digital practices, and social sustainability may be more thoroughly integrated with the aim to further hope.

Individualising Swedish for Immigrants: Tensions and innovations in teachers' professional practice
Presenting Author: Dimitrios Papadopoulos, University of Gothenburg, Sweden

Individualising processes in adult education contexts have emerged over several decades as all-embracing solutions to identified societal challenges (Fenwick, 2003). As a consequence, demands are placed on educational organisations and teachers to enact individualised pedagogical practices addressing the needs of increasingly diverse student groups. Previous research has shown that individualisation has a plethora of expressions and implications for adult education systems worldwide, as it is raised by a variety of societal needs causing several transformations of adult education. In Sweden, demands to offer tailor-made programmes and solutions for diverse adult student groups become increasingly evident in policy landscape (Fejes et al., 2018). One such example is Municipal Adult Education in Swedish for Immigrants (SFI), a program often seen as a labour-market instrument that offers basic knowledge of the Swedish language to adult immigrant students. Key policy documents, such as Curriculum for Adult Education (Skolverket, 2017) and program syllabus (Skolverket, 2022), define students' needs and conditions as the point of departure for SFI. Through deregulation and marketisation processes, Swedish adult education organisations are expected to be transformed by creating flexible conditions and by expanding the connections of SFI with other societal actors, such as labour market and integration policy makers. At the same time, large-scale features of global phenomena, such as COVID19 pandemic, create a landscape of uncertainty due to their acute character. In this context, SFI teachers are expected to enact innovative pedagogies in supposedly flexible educational frameworks which, nevertheless, provide limited margins of manoeuvre.

Transmedia Educommunication Method for Social Sustainability
Presenting Author: Maria Bäcke, University of Jönköping, School of Education and Communication, Sweden; **Co-Author:**Renira Gambarato, Jönköping University, Sweden; **Co-Author:**Lorena Tárcia, Centro Universitário de Belo Horizonte, Brazil; **Co-Author:**Geane Alzamora, Universidade Federal de Minas Gerais, Brazil; **Co-Author:**Leo Cunha, Puc-MG, Brazil

In the post-pandemic world, we see the exacerbation of digital connections but also inequalities between countries with higher or lower degrees of access to fast Internet services. Digitization processes enable and intensify global exchanges and yet expand disconnections as they globalize debates and solutions without considering the different levels of accessibility, digital literacy, and Internet infrastructure in less privileged communities. Such discrepancies are reflected in learning levels and, consequently, in the development of social sustainability. The original transmedia educommunication method discussed here consists of a week-long gamified intervention in schools with students between 11 and 14 years old. Through this experience, we aim to develop media and text literacy skills in students and teachers. Our objective is to give them the tools to distinguish between textual genres and their purposes.

Invisible and unrecognised global citizenship and diversity among students at upper secondary level
Presenting Author: Maria Bäcke, University of Jönköping, School of Education and Communication, Sweden; **Co-Author:**Sylvi Vigmo, University of Gothenburg, Sweden

A survey on reading at Swedish upper secondary level (conducted by us in Spring 2022) generated 712 responses in a student body of 1,500 students. As many as 41 languages were distributed among them and we were surprised to learn that the teacher team was largely unaware of the linguistic variety among students. Our aim then became to explore how students framed language skills, when and in what contexts these were used, and for what purposes. We conducted six follow-up focus group interviews with 27 students and it became evident that diverse linguistic backgrounds were not only invisible in the school setting, they were also downplayed by the students themselves, who sometimes seemed to regard their language skills as inferior and drew on these informally only, often as a part of their everyday digital media use.

Reading for pleasure and reading for school – Student agency vs normative curricula
Presenting Author: Sylvi Vigmo, University of Gothenburg, Sweden; **Co-Author:**Maria Bäcke, University of Jönköping, School of Education and Communication, Sweden

Emanating from a collaboration with practicing teachers at a Swedish upper secondary school, and their experiences of challenges concerning their students' reading, a survey was given to a student body of 1,500 students, resulting in 712 responses. With the aim of investigating students' perspectives and reading in school, and out-of the curricula context, the survey also invited students to formulate thoughts on reading habits, experiences and personal views in several open-ended questions. The results indicate there is a gap between the reading norms in curricula, and the reading that occurs beyond "schooling", not only regarding other media genres than fiction but also regarding how mandatory reading negatively impacts motivation and reading with pleasure. The survey results are discussed from perspectives on critical literacy and social sustainability.

Session O 4

25 August 2023 17:00 - 18:30
AUTH_DC3
Symposium
Teaching and Teacher Education

Understanding teaching quality in the Nordic context using a shared observation system

Keywords: Qualitative Methods, Quantitative Methods, Teaching/Instructional Strategies, Video-based Learning
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Kirsti Klette, University of Oslo, Norway
Organiser: Mark WHite, University of Oslo, Norway
Discussant: Pamela Grossman, University of Pennsylvania, United States

Significant advancements have been made in conceptualizing, operationalizing, and measuring teaching quality in the last two decades. The development of observation systems has paved the way for a more targeted and systematic measurement of features of teaching quality across contexts. The goal of this symposium is to present the results of an effort to study instruction, drawing on video data from lower secondary mathematics and language arts classrooms in all Nordic countries. The papers within show how systematic coding can serve to generate broad pictures of instructional practice and can serve as a starting point to guide richer qualitative explorations of videos. The symposium demonstrates how the common framework and conceptual language provided by the observation manual can serve as the starting point for supporting deeper collaborations in the study of teaching quality. The four papers provide a first step for our comparative classroom ambition in the newly funded Nordic Center of Excellence "Quality in Nordic Teaching" (QUINT). The first paper provides an overview of key findings based on using a common observational measure across Nordic lower-secondary classrooms. The second paper investigates the role of purpose and feedback within Icelandic classrooms across math and language arts. The third and fourth paper dig into, respectively, features of high quality classroom discourses in language arts and characteristics of cognitively activating mathematics classrooms. Together these four papers summarize dilemmas and developments in our search for trying to understand features of high quality classroom teaching and learning relevant for Nordic classrooms and beyond.

Observation manuals as lenses into classroom teaching – towards a common language of instruction?
Presenting Author: Kirsti Klette, University of Oslo, Norway; **Co-Author:**Astrid Roe, University of Oslo, Faculty of Education, Norway; **Co-Author:**Marte Blikstad-Balas, University of Oslo, Norway; **Co-Author:**Mark WHite, University of Oslo, Norway; **Co-Author:**Michael Tengberg, Karlstad University, Sweden

Classroom-based observational research is important for focusing attention directly on instructional practices. The use of observation systems, which combine a well-defined conceptualization of teaching quality with an instrument to measure that conceptualization, creates the potential to drive systematic and cumulative research on instructional practice. This paper presents the results of such an effort, which systematically applied the Protocol for Language Arts Teaching Observation (PLATO) across the Nordic lower-secondary math and language arts classrooms. This application of PLATO provides a broad picture of instructional practices across countries and subjects, supporting and providing coherence to further, qualitative explorations of instructional practices. We discuss the results of applying the PLATO instrument across settings and the affordances that this provides to more targeted efforts to examine instructional practices within these settings. Our findings suggest, for example, rather similar patterns of instruction across countries and subjects and with systematically high scores on some elements (Time Management and Behavioral Management) and mediocre to low scores on other elements (Classroom Discourse; Representation of Content and Strategy Instruction, Modelling, and Feedback). We find that the use of PLATO facilitated both collaborations across researchers and accumulation of understandings of instructional practice.

Stated Purpose and Feedback practices in Icelandic classrooms: Results from a video study
Presenting Author: Berglind Gisladottir, University of Iceland School of Education, Iceland; **Co-Author:**Birna María Svanbjörnsdóttir, University of Akureyri, Iceland; **Co-Author:**Sólveig Zophoníasdóttir, University of Akureyri, Iceland

The aim of the study was to provide insight into teaching quality in Icelandic lower secondary classrooms, specifically the use of feedback and stated purpose in mathematics and language arts lessons. The study used classroom video-data that were recorded in grade eight in 10 Icelandic schools. The data were analysed according to the PLATO protocol, a standardized observation instrument for teaching quality. Findings showed that in majority of observed lessons, purpose and feedback were at the lower end of the PLATO observation protocol, indicating limited evidence for quality feedback to students and explicit purposes. Furthermore, there was limited evidence for a clear connection between the elements of purpose and feedback in the observed teaching practices.

Features of language arts classrooms with high-level classroom discourse across Nordic contexts
Presenting Author: Camilla Magnusson, University of Oslo, Norway; **Co-Author:**Kirsti Klette, University of Oslo, Norway; **Co-Author:**Jennifer Luoto, University of Oslo, Norway; **Co-Author:**Marte Blikstad-Balas, University of Oslo, Norway

Through video observations, this study explores characteristics of classroom discourse across 109 videotaped language arts lessons from three Nordic contexts: Norway, Denmark, and Sweden. Although numerous studies have examined classroom discourse patterns, few studies have focused on whether and how high-level classroom discourse patterns differ across national contexts. We address these issues by qualitatively exploring lessons with high scores on the classroom discourse element, as measured by the Protocol of Language Arts Teaching Observation manual, by looking in particular at students' opportunities to talk, and how these opportunities are used through teachers' uptake of student utterances. The findings show that high level classroom discourse share many of the same key characteristics regardless of national context, such as 1) most discussions concentrate around literature discussions/discussions on narrative texts, 2) teachers use a mix of question types, and 3) teacher uptake consist of a mix of asking for elaborations, clarifications, and justifications as well as revoicing the student utterances. This study thus provides insights into classroom discourse in Nordic language arts classrooms by shedding light on key characteristics of high-level discourse across three different Nordic contexts.

Characteristics of cognitively activating Nordic mathematics classrooms
Presenting Author:Jóhann Örn Sigurjónsson, University of Akureyri, Iceland; **Co-Author:**Alexander Selling, ILS, University of Oslo, Norway

Cognitive activation is a dimension of teaching quality that describes the degree to which teachers address the educational goal of student understanding. Presenting a clear and explicit purpose to support student understanding of lesson goals can support the goal of student understanding. Developing deeper understandings of practices that support high-cognitive activation has both practical and theoretical implications. This paper aims to enrich empirical understandings of teacher-student interactions in lessons considered cognitively activating. Eight mathematics lessons with outstanding cognitive activation scores were purposefully sampled and analyzed using content analysis and thematic analysis. The selected lessons greatly varied in terms of both instructional formats and the mathematical content being taught. The lessons showed teachers who emphasized student understanding through mathematical connection-making, frequent shifts between types of interactions, formative feedback and use of explicit student roles to facilitate engagement. Three out of eight lessons had purpose scored at a high level. The paper presentation will further describe how, when, and to what extent the purpose of the lessons was communicated and manifested in teacher-student interactions. The paper contributes to the knowledge of different dimensions of teaching quality, including those addressing student understanding, i.e., cognitive activation, and communication of learning goals.

Learning and Instructional Technology

(Intelligent) Tutoring Systems and Their Affordances as a Research Tool From Multiple Perspectives

Keywords: Achievement, Artificial Intelligence, Computer-assisted Learning, Educational Technologies, Feedback, Foreign and Second Language Acquisition, Learning Analytics, Mathematics/Numeracy, Motivation, Primary Education, Problem Solving, Teaching/Instructional Strategies
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Cora Parrisius, University of Education Karlsruhe, Germany
Chairperson: Hannah Deininger, University of Tübingen, Germany
Discussant: Vincent Aleven, Carnegie Mellon University, United States

Within the last years, the application of intelligent tutoring systems (ITS) in educational practice became more and more common, not least stimulated by the COVID-19 pandemic. ITS are developed to provide learners with individual learning and practicing opportunities, thereby addressing the learner's individual needs. They are thought to be used in individual learning phases without the need for a human instructor, thus working towards decreasing educational injustice. However, besides their apparent advantages for educational practice (e.g., through individual feedback or automated exercise or content selection), ITS also show a high potential to serve as a research tool itself. Given the fact that ITS are at the same time content and learning opportunity provider, a learning companion, and data collector, ITS introduce new opportunities to the landscape of research methods. The main objective of this symposium is to highlight different affordances of ITS as a research tool by adopting perspectives from the fields of learning analytics (stressing the added value of access to behavioral trace data and explainable AI methods to predict learning outcome), intervention research (emphasizing the value of ITS to implement different intervention conditions with reduced thread of spillover contamination), personalization (highlighting the affordances of ITS to enable personalization while also showing its positive effects on student interests), and technology-enhanced teaching (illustrating the possibility provided by ITS to triangulate information about learner performance, classroom events, and teachers' teaching). The findings will be discussed in light of their relevance for research on learning and instructional technology.

Analyzing Behavioral Trace Data with Machine Learning and Explainable AI to Predict Learning Success
Presenting Author: Hannah Deininger, University of Tübingen, Germany; **Co-Author:**Cora Parrisius, University of Education Karlsruhe, Germany; **Co-Author:**Leona Colling, University of Tübingen, Germany; **Co-Author:**Ines Pieronczyk, University of Tübingen, Germany; **Co-Author:**Detmar Meurers, University of Tübingen, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany; **Co-Author:**Benjamin Nagengast, Eberhard Karls Universität Tübingen,

Germany; **Co-Author:**Gjergji Kasneci, University of Tübingen, Germany

In research on education, determining variables that contribute to learning success is an important goal. Typically, investigated variables include demographics, achievement measures, and survey data. With the rise of intelligent tutoring systems in educational practice, there is potential to easily collect data on students' practicing behavior. Understanding what behavior is relevant to students' learning, could help teachers to support students better. To analyze which practice behavior is related to learning success, machine learning methods are a suitable approach. Yet, it has been argued that machine learning models are not interpretable by humans, thereby restricting their utility for studying human learning. However, explainable AI frameworks can be used to obtain explanations of the model's decision path.Based on data from a cluster-randomized controlled field trial conducted in schools (N = 472 students), we trained several machine learning models based on demographics, achievement measures, and behavioral data from an intelligent tutoring system to predict students learning success. XGBoost showed the best predictive accuracy and was combined with an explainable AI component to illuminate which variables impacted learning success most. Overall, pretest scores had the highest impact on learning success with higher pretest values related to higher learning success. However, behavior-related variables had an impact on the model output, too, which indicates that particular interaction behaviors lead to better learning, independently of the student's basic abilities. Using intelligent tutoring systems as a tool to observe practicing behavior could help to further understand the impact of such behavior on learning success.

Effective Features of Feedback in an Intelligent Tutoring System: A Randomized Controlled Trial
Presenting Author: Cora Parrisius, University of Education Karlsruhe, Germany; **Co-Author:**Katharina Wendebourg, University of Tübingen, Germany; **Co-Author:**Sven Rieger, University of Tübingen, Germany; **Co-Author:**Ines Loll, University of Trier, Germany; **Co-Author:**Diana Pili-Moss, Leuphana University Lüneburg, Germany; **Co-Author:**Leona Colling, University of Tübingen, Germany; **Co-Author:**Carolyn Blume, TU Dortmund University, Germany; **Co-Author:**Ines Pieronczyk, University of Tübingen, Germany; **Co-Author:**Heiko Holz, Novatec Consulting GmbH, Germany; **Co-Author:**Stephen Bodnar, University of Tübingen, Germany; **Co-Author:**Torben Schmidt, Leuphana University Lüneburg, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany; **Co-Author:**Detmar Meurers, University of Tübingen, Germany; **Co-Author:**Benjamin Nagengast, Eberhard Karls Universität Tübingen, Germany

Automatic feedback has increasingly been considered in foreign language learning as it can be highly beneficial when provided by an intelligent tutoring system (ITS). However, it remains an open question what features of automatic feedback (e.g., metalinguistic, criterion-referenced, or motivational) are effective in supporting language learning. In this study, we made use of the ITS FeedBook and the affordance of ITS to easily implement different intervention conditions at the individual level with alleviated thread of spillover effects. The FeedBook is an ITS for English learning developed for seventh-graders in German secondary schools. A first study on the FeedBook found larger learning gains for students who received automatic, scaffolded, and individualized feedback as compared with students who only received correctness-of-response feedback. In the current follow-up trial, we tested for the effectiveness of the scaffolded feedback with a larger sample of $N = 616$ students. Furthermore, we tested for positive effects on students' English proficiency if criterion-referenced feedback (i.e., a dashboard informing students about their performance level in relation to a set learning goal) and motivational elements (i.e., a pedagogical agent presenting praise sentences) were added to the FeedBook. Even though we could not replicate the positive effects of the scaffolded feedback by the Meurers et al. study in this 1-year investigation, students reached partly higher test results when receiving criterion-referenced and additionally motivational feedback. We will discuss the use of the FeedBook as helpful research tool to facilitate complex research designs in field research.

The Effect of Career-Personalized Mathematics Instruction on Students' Learning and Interests
Presenting Author: Matthew Bernacki, University of North Carolina at Chapel Hill, United States; **Co-Author:**Candace Walkington, Southern Methodist University, United States; **Co-Author:**Vanessa Vongkulluksn, University of Nevada, Las Vegas, United States; **Co-Author:**Meghan J. Greene, University of North Carolina at Chapel Hill, United States; **Co-Author:**Taylor Darwin, Texas Tech University, United States; **Co-Author:**Brooke Istas, Southern Methodist University, United States; **Co-Author:**Elizabeth Leyva, Texas A&M University - San Antonio, United States

Personalizing instruction to students' interests has been shown to increase students' interest, performance, and learning in academic domains, although effects have varied significantly between studies documented in the literature. Most prior studies of context personalization in mathematics education have presented students with personalized math problems to solve, and these math problems have been personalized to students' everyday or popular culture interests (e.g., sports, locations students are familiar with). In the present study, we used a 2 × 2 randomized-control experimental design to test the effects of two design approaches to personalization: personalization by having students pose their own math problems (rather than just solve problems), and personalization to students' career interests (rather than their popular culture or everyday interests). We designed a series of activities in ASSISTments that presented middle school, high school, and community college students in Algebra courses with personalized (or typical business-as-usual) activities over 3 to 4 units. We found that personalized problem-posing increased students' algebra learning, but decreased their STEM career interest or their mathematics interest. We discuss how these design choices and those of and additional variables impact the implementation of personalized education.

Adaptive Learning Technologies and Dashboards as an Instrumentation Tool to Study Teachers
Presenting Author: Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands

Background. In the literature, it has been proposed that educational technologies can be used to better understand how learners learn using instrumentation tools. Adaptive learning technologies (ALT) are increasingly used in Dutch primary education. In these technologies, students practice math, spelling, and grammar at a level adjusted to their needs, while teachers are provided with concurrent information about students' progress via teacher dashboards. Indeed, ALTs can be used to understand students' learning better, but at the same time, they can help us understand teachers' feedback and teaching practices better. *Aim.* In this contribution, we discuss how teacher feedback and teaching practices can be examined with ALTs and dashboards based on findings from 4 selected studies. This helps us to understand how ALTs are not just a great instrumentation tool to study how learners learn, but also how teachers teach.*Results.* We outlined how ALTs can be used to examine teacher practices during teaching and how the methodology developed helps us advance our understanding of teachers' feedback practices. We illustrate how this approach contributed to advanced insights into teachers' practices in multiple studies. *Conclusion.* Adaptive learning technologies and dashboards can indeed be used as an instrumentation tool to better understand teaching practices.

Symposium

Teacher-Student Relationships in Education—What we know and what we don't (yet) know

Keywords: Achievement, Developmental Processes, Large-scale Assessment, Meta-analysis, School Effectiveness, Social Aspects of Learning and Teaching, Social Interaction, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Valentin Emslander, Luxembourg
Discussant: Hinke Endedijk, Leiden University, Netherlands

Positive teacher-student relationships (TSR) are key to developing a good school climate in which both teachers and students can thrive. While existing research has brought to light the educational benefits of positive TSR, for instance, by showing that students in classrooms and schools with positive TSR tend to achieve better grades, the evidence base is scattered and lacks some key elements. Specifically, empirical studies on the benefits of positive TSR largely focused on academic achievement and less so on other, educationally relevant outcomes, such as socio-emotional skills, motivation, sense of belonging, or behavior. Moreover, TSR has often been conceptualized differently across studies, and its development in educational contexts has hardly been understood. This symposium aims to clarify some of these issues by presenting studies that (a) review the conceptualizations and definitions of TSR within the frameworks of school climate; (b) synthesize the evidence base on the relation between TSR and a broad range of educationally relevant outcomes; (c) identify longitudinal

trajectories of TSR and their relation to student engagement; and (d) examine the potential of TSR to facilitate a positive error culture and student participation in classrooms. Ultimately, we provide an updated, scientific overview of the existing body of knowledge about the conceptualization and educational potential of TSR and its current gaps. This overview shall not only inform scholars in the field but shall also encourage teachers to strive for positive TSR.

CANCELLED: A Systematic Review of Studies Examining School Climate and Student Outcomes
Presenting Author: Nani Teig, University of Oslo, Norway; **Co-Author:**Trude Nilsen, University of Oslo, Norway

School climate is a key factor in explaining student outcomes. Although several studies have reviewed existing research on the link between school climate and student outcomes, these studies only emphasized one or a few aspects of school climate and have rarely included data from international-large scale assessments (ILSAs). The present study aims to (1) describe how ILSAs conceptualize school climate and assess its multiple aspects: academic, community, safety, and institutional environment; and (2) review how studies using ILSA data identify the relations between different aspects of school climate and student outcomes in mathematics, science, and reading. In general, ILSA frameworks cover all aspects of school climate. While the academic, community, and institutional environment aspects are explicitly assessed at the student, class, or school levels, the safety aspect was less emphasized. Although ILSAs assess multiple aspects of school climate, studies included in this review mainly focused on investigating the academic aspect, particularly in examining teaching and learning. Few studies examined the community aspect, including the quality of teacher-student relationships. Concerning the relations between school climate aspects and student outcomes, this review reveals a high alignment between findings from the studies using ILSAs and other studies, including meta-analyses, reviews, and longitudinal studies. The implications of these findings are discussed in relation to improving the assessment of school climate in ILSAs and providing methodological recommendations and directions for future research on school climate using ILSA data.

Reviewing Meta-Analyses on the Link Between Teacher-Student Relationships and Student Outcomes
Presenting Author: Valentin Emslander, Universtiy of Luxembourg, Luxembourg; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany; **Co-Author:**Antoine Fischbach, Luxembourg Centre for Educational Testing, Luxembourg; **Co-Author:**Ronny Scherer, University of Oslo, Norway

Background and Aims: Teacher-student relationships play a vital role in establishing a positive school climate and promoting positive student outcomes. Several meta-analyses suggested significant associations between teacher-student relationships and, for example, school engagement, good peer relationships, executive functioning, well-being, and little disruptive behavior. However, these meta-analyses differ substantially in their methods, moderators, and quality, thus complicating the interpretation of their findings. In this preregistered systematic review of meta-analyses, we aim to answer the following research questions: (RQ1) To what extent are student outcomes associated with teacher-student relationships? (RQ2) Which moderators influence these relationships, and how? (RQ3) What is the methodological quality of the included meta-analyses?Methods and Findings: In our review of 24 meta-analyses including more than one million participants, the strongest associations were found between negative teacher-student relationships and students' behavioral problems. Positive teacher-student relationships showed the strongest association with school involvement, prosocial, externalizing, and internalizing behaviors, and learning motivation combined with student involvement (RQ1). Age, gender, and informant (student-, peer-, or teacher-assessment) were the most frequently examined moderators (RQ2). Additionally, we found quality differences between the meta-analyses (RQ3).Significance: Considering our findings, we argue that teachers should be made aware of the potential impact of positive teacher-student relationships and how they could contribute to creating a positive school climate. To accompany the existing meta-analyses, we need experimental tests to causally confirm the impact positive teacher-student relationships can have as an effective strategy for improving student outcomes and school climate at large.

Student-Teacher Relationship Trajectories and Secondary Students' School Engagement
Presenting Author: Debora Roorda, University of Amsterdam, Netherlands; **Co-Author:**Rianne Bosman, University of Amsterdam, Netherlands

Previous research has shown that the affective quality of student-teacher relationships is associated with secondary school students' school engagement. However, most of these studies have used a cross-sectional design. In the present study, we therefore measured student-teacher relationship quality at the beginning, middle, and end of the school year. We used a person-centered approach to examine whether student-teacher relationships change during the course of one school year and whether these changes are the same for all students or not. Furthermore, we investigated whether the found relationship trajectories were associated with students' end of year school engagement. Secondary school students (N = 1252; 51.4% girls) reported about their relationship quality (closeness, conflict) with their Dutch and mathematics teachers at three occasions and about their behavioral and emotional engagement at the end of the school year. For closeness with both the Dutch and mathematics teacher, four relationship trajectories were found: high-stable, medium-stable, low stable, and very low-stable (for the Dutch teacher) or very low-decreasing (for the mathematics teacher). Three trajectories were found for conflict with the Dutch teacher (very low-stable, low-increasing, high-increasing) and the mathematics teacher (low-increasing, high-increasing, very high-stable). More optimal relationship trajectories (e.g., high-stable closeness, very low-stable or low-increasing conflict) were associated with higher end-of-year behavioral and emotional engagement. To conclude, secondary school students seem to differ in their relational experiences with teachers during the course of an academic school year and these different experiences have consequences for their engagement with schoolwork.

Teacher Support and Student Participation: Generalizability across Students and Subjects
Presenting Author: Simon Munk, Technical University of Munich, Germany; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany

Teacher support plays an important role in students' learning. Previous studies suggest that error culture as one facet of teacher support relates to student participation in classroom discourse. However, the question remains whether error culture is equally important for students with different learner characteristics and in different school subjects. In this contribution, we want to shed light on the generalizability of the relationship between error culture and student participation: We will examine whether the link (a) depends on students' self-concept and migration background and (b) differs across subjects. We analyze these topics with video and questionnaire data from N = 387 8^{th}-grade students in German Language Arts and Mathematics classes. Hierarchical linear models show that the role of error culture and self-concept for participation differs across school subjects. Furthermore, self-concept and migration background seem to play no significant role in the relationship between error culture and student participation. Overall results encourage teachers to strive for a positive error culture to foster student participation.

Symposium
Cognitive Science

Children's spatial skills: Relations to cognitive development and educational implications

Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Early Childhood Education, Mathematics/Numeracy, Problem Solving, Reasoning
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Anke Maria Weber, University of Luxembourg, Luxembourg
Organiser: Anke Maria Weber, University of Luxembourg, Luxembourg
Discussant: Samuel Greiff, University of Luxembourg, Luxembourg

Spatial skills are core cognitive abilities that support representation and mental transformation of object features, such as shapes, sizes, and orientation. These skills include spatial visualization and mental rotation (mentally represent an object and imagine its rotational movement), form perception (differentiate between different shapes and symbols), and visual-spatial working memory relevant for navigation skills (Newcombe et al., 2013). Spatial skills are an essential building

block for future academic performance in the STEM fields (Uttal & Cohen, 2012). However, research on cognitive correlates, e.g., working memory, verbal abilities, problem-solving strategies, and fluid intelligence, remains sparse in young children. Moreover, our understanding of why and how children's spatial skills are associated with performance in the STEM fields is quite limited and the present symposium will make a considerable contribution.
Paper 1 examines the development of visuospatial abilities and their relation to working memory and verbal abilities in 2- to 4-year-olds. Paper 2 investigates the impact of spatial play, gender, and fluid intelligence on 5- to 6-year-olds' mental rotation. Paper 3 reports on the relation between 6- to 8-year-olds' mental rotation and their arithmetic skills, focusing on children's gender and their strategy use. Paper 4 focuses on 6- to 8-year-olds' spatial problem-solving in relation to their verbal abilities, fluid intelligence, and content knowledge.
These perspectives expand our understanding of young children's spatial skills and what cognitive correlates may influence them. Moreover, the present findings will extend and qualify previous research with respect to how research on spatial cognition may translate into educational settings.

The use of search strategy improves with age and visuospatial working memory in 2- to 4-year-olds
Presenting Author: Katarzyna Bobrowicz, University of Luxembourg, FLSHASE, Luxembourg; **Co-Author:**Anke Maria Weber, University of Luxembourg, Luxembourg; **Co-Author:**Samuel Greiff, University of Luxembourg, Luxembourg

Using spatial cues, such as shape, orientation and pattern, aids visuospatial working memory, as it allows strategies that reduce the load on working memory. One of such strategies, namely taking advantage of patterned spatial distributions, remains understudied. This strategy supports, for instance, searching for a missing item, and requires keeping track of already-searched locations and excluding them from further search, and so requires visuospatial working memory. The use of such strategies should, in principle, develop in early childhood, but, as most studies focus on chunking, the development of other strategies reducing the load on working memory is understudied in younger children. Therefore, in this study, we tested whether children between 2 and 4.5 years (N = 88) could take advantage of spatial cues in their search, and whether this ability correlated with their verbal ability and visuospatial working memory. The results showed that the ability to use a patterned spatial distribution (searching a row of locations from one side to the other instead of a random search) improved with age and visuospatial memory but did not correlate with verbal ability. These results suggest that visuospatial abilities may rapidly develop between 2 and 4 years, and given their impact on later mathematic achievement, demand increased attention in cognitive developmental research and early childhood education.

Young children's mental rotation and the relation with fluid intelligence, block play, and gender
Presenting Author: Anke Maria Weber, University of Luxembourg, Luxembourg; **Co-Author:**Katarzyna Bobrowicz, University of Luxembourg, FLSHASE, Luxembourg; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany; **Co-Author:**Samuel Greiff, University of Luxembourg, Luxembourg

Spatial skills such as mental rotation are an integral part of children's cognitive development and are referred to as gatekeepers to STEM. Mental rotation emerges in children as young as 4 years of age and is malleable. However, it remains unclear when these gender differences emerge and whether intelligence is related to mental rotation in the preschool years. Additionally, finding ways to foster mental rotation might help to alleviate possible early gender differences. This study aims at contributing to this research area by investigating playful approaches to foster mental rotation in girls and boys in an experimental design with three measurement points, employing a sample of 5- to 6-year-old preschool children. In addition to this, we are interested in exploring the relation of gender and fluid intelligence with mental rotation. Thus, a playful intervention with different amounts of guidance provided by an adult (verbal + material scaffolds, material scaffolds, and free play) was employed. Results showed that mental rotation increased more in boys than in girls and that playful interventions fostered children's mental rotation. However, girls in the group with the highest guidance showed the least gains compared to all other groups, while boys profited most from this group. Girls who played freely or with little guidance showed similar increases in mental rotation as the boys. Fluid intelligence was related to mental rotation in preschool children. Play can foster mental rotation, but different amounts of guidance seem to be crucial for girls and boys.

Mental rotation and mathematics: A closer look at relations in primary school children
Presenting Author: Wenke Möhring, University of Basel, Switzerland; **Co-Author:**Léonie Moll, University of Basel, Switzerland; **Co-Author:**Marta Szewczyk, The John Paul II Catholic University of Lublin, Poland; **Co-Author:**Madga Szubielska, The John Paul II Catholic University of Lublin, Poland

Spatial and mathematical thinking are closely related. Intervention studies revealed tentative evidence for causal relations, however, potential intervening processes and differential effects remain poorly understood. In the present study, we investigated links between spatial thinking (mental rotation) and arithmetic skills in primary school children. Previous research suggested that the usage of mental strategies in mathematical computations such as decomposing a mathematical problem into a simpler problem may mediate the space-math relation (Casey et al., 2017). Thus, we assessed children's strategy use while solving arithmetic problems in addition to their mental rotation skills. Data from 6- to 8-year-olds (N = 170) revealed associations between mental rotation and arithmetic skills (r = .174, p < .05), after accounting for age, sex, fluid and verbal reasoning. A moderation analysis revealed that girls showed no relation between mental rotation and mathematics (r = .033, p = .78, n = 76), whereas the same relation was significant for boys (r = .410, p < .001, n = 94, see Fig. 1). Mediation analyses for boys revealed a significant indirect effect of mental rotation on mathematics via decomposition (95% CI [0.031; 0.441]), but no other indirect effects (see Fig. 2). The same mediation analysis for girls revealed non-significant results. These findings suggest that boys with higher spatial skills may be more inclined to use decomposition strategies which in turn is positively related to how accurately they solve mathematical problems.

Domain-general and domain-specific competencies in children's spatial problem-solving
Presenting Author: Jonas Schäfer, University Kaiserslautern-Landau (RPTU), Germany; **Co-Author:**Timo Reuter, Rheinland-Pfälzische Technische Universität Kaiserslautern - Landau, Germany; **Co-Author:**Julia Karbach, University of Koblenz-Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany

Problem-solving (*PS*) skills are considered crucial for children's subsequent professional and personal success and therefore are targeted in many early childhood intervention programs. However, more research is needed to understand young children's PS skills. So far, little is known about the contribution of task-specific knowledge, domain-general skills, and spatial cognition to PS abilities in 6- to 8-year-old children. In the present study, 215 children (age range: 6-8 years, M = 7.18 years, SD = 0.78) completed tests on their knowledge of building blocks' stabilities and the turning-direction and -speed of gears. Afterwards, they solved related spatial problems by stabilizing block constructions and building carousels with gears. Additionally, we measured vocabulary and figural reasoning as indicators of cognitive abilities. Data were collected on tablets by trained supervisors in one-on-one test situations. Data analyses revealed that the PS performance was significantly correlated across the different types of problems (ρ=.283 to .461). Moreover, vocabulary and figural reasoning significantly correlated with PS performance (ρ=.336 to .429). However, task-specific knowledge was significantly related to PS only in the tasks of the gear domain (ρ=.197 to .224). The results suggest that spatial PS in six- to eight-year-old children requires domain-general competencies rather than task-specific knowledge. We conclude spatial cognition to account for the domain-general competencies, which we control for by targeting explicit measures for individual spatial abilities, like mental rotation and visuospatial working memory, in a current follow-up study.

Advancing Self-Regulated Learning Research with AI: Implications from Multimodal Trace Studies

Keywords: Artificial Intelligence, Computer-assisted Learning, Educational Technologies, Emotion and Affect, Eye Tracking, Game-based Learning, Learning Strategies, Lifelong Learning, Metacognition, Self-regulated Learning and Behaviour
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Roger Azevedo, University of Central Florida, United States
Organiser: Maria Bannert, Germany
Discussant: Jeff Greene, United States

Self-regulated learning (SRL) is critical for learning, reasoning, problem solving, and understanding for all humans across ages, tasks, domains, and educational

contexts. Emerging interdisciplinary research on SRL has focused on using multimodal trace data to detect, measure, trace, model, and foster cognitive, affective metacognitive, motivational, and social SRL processes to understand the dynamics of these processes and their implications for learning, especially with learning technologies. The next stage of this research is to transition from descriptive analyses of the SRL processes to their use in intelligent learning technologies to provide adaptive scaffolding. Our symposium brings together four learning international research groups with extensive research experience and track record in the use and collection of SRL multimodal trace data. More specifically, the first paper focuses on emotion synchrony through regulatory triggers in collaborative learning across collaborative tasks. In the second paper, the authors measuring and understanding SRL with digital trace data with adolescents. As for the third paper, the authors investigated how real-time personalized scaffolds influence SRL processes during a complex technology task. Lastly, the authors of the fourth paper focus on analyzing log files and eye movements to examine SRL sequences during game-based learning. The authors will discuss the opportunities and challenges when considering how their methods and findings are applied to the design of AI-based technology learning environments aimed at fostering SRL across tasks and domains. Our session include Dr. Greene a leading SRL scholar who will discuss the theoretical, methodological, analytics, and AI-base educational implications of our research.

Emotional Synchrony through Regulatory Triggers in Collaborative Learning
Presenting Author: Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Yante Li, University of Oulu, Finland; **Co-Author:**Yang Liu, Univerity of Oulu, Finland; **Co-Author:**Eija Vuorenmaa, University of Oulu, Finland, Finland; **Co-Author:**Ahsen Çini, University of Oulu, Finland; **Co-Author:**Guoying Zhao, University of Oulu, Finland

Despite the importance of socially shared regulation of learning (SSRL) in collaborative learning success, there remains a paucity of evidence on how it could be detected and supported effectively. In this paper, we present an experimental study with a systematic analysis approach that utilises facial expression recognition technology to examine emotional triggers for collaborative learning regulation. The study involved high school students (N=27) working in groups of three with a collaborative learning task. During the learning process, the collaborative groups were intervened with a controlled cognitive trigger followed by three emotional triggers. AI facial expression recognition was utilised for analysing students' continuous valence and changes in emotions throughout the collaborative learning task. Cross-recurrence quantification analysis (cRQA) approach has been employed to examine emotional synchrony through regulatory triggers. Our findings present evidence for the regulatory trigger concept and offer novel insights into how the regulatory triggers facilitate emotional synchronisation among learners in collaborative learning. Furthermore, the study also demonstrates the use of AI technology for examining collaborative learning regulation. The study further discusses not only the potential role of the trigger concept in generating a better understanding of the regulatory processes but also its contribution to establishing foundations for designing support for regulation in collaborative learning.

Measuring and understanding self-regulated learning with digital trace data
Presenting Author: Joni Lämsä, University of Oulu, Finland; **Co-Author:**Susanne de Mooij, Radboud University, Netherlands; **Co-Author:**Olli Aksela, University of Oulu, Finland; **Co-Author:**Inti Bistolfi, Radboud University Nijmegen, Netherlands; **Co-Author:**Inge Molenaar, Radboud University, Netherlands; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

Self-regulated learning (SRL) theory defines learning as a goal-oriented process in which students make conscious choices while working toward learning goals (Winne, 2015). Measuring complex SRL processes has been a major challenge. Fortunately, recent advancements in artificial intelligence (AI) have brought novel opportunities to enable real-time measurement of SRL processes. This presentation is embedded in a larger study focused on measuring SRL action patterns of 13—15-year-old students from five different countries when they work individually with an AI-content-related essay task in a digital learning environment (N = 200, data will be collected in November 2022—January 2023). The SRL processes are captured by trace data (navigational log, mouse, and keyboard data). We implement an existing action library using an AI-rule based system to automatically detect SRL processes from the trace data (Fan et al., 2021). We also examine how the detected SRL processes are associated with metacognitive and domain knowledge. Preliminary findings of an exploratory study (n = 21) indicate that students mostly engage in the cognitive processes (reading and writing) while the students' low utilization of the digital tools in the environment might limit the detection of the metacognitive processes (orientation, planning, monitoring, evaluation). The aggregated duration and frequency counts of the cognitive and metacognitive processes were not associated with the metacognitive and domain knowledge. In the presentation, we shed light on how AI and other data modalities could further enhance measuring, understanding, and ultimately supporting various facets of SRL.

Investigating How Real-Time Personalized Scaffolds Influence Self-Regulated Learning Processes
Presenting Author: Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Joep van der Graaf, Radboud University, Netherlands; **Co-Author:**Yizhou Fan, Peking University, China; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Inge Molenaar, Radboud University, Netherlands; **Co-Author:**Johanna Moore, University of Edinburgh, United Kingdom; **Co-Author:**Dragan Gasevic, Monash University, Australia

Scaffolding learners in self-regulated learning (SRL) has been found to improve learning outcomes. However, the effects of scaffolds can differ based on how learners use them as well as specific scaffold effects on learning processes, warranting a need for deeper and finer-grained analyses into how scaffolds influence learning. Personalized scaffolds have been proposed to be more beneficial for learning due to their adaptivity to learning progress and individualized content to learning needs. Past research has focused on SRL support which were either identical for all students or self-created by students. The current pre-post experimental study investigated personalized scaffolds based on students' real-time learning processes. Students in experimental group 1 (n = 35) received personalized scaffolds while students in experimental group 2 (n = 30) received generalized scaffolds. The control group (n = 29) learned without scaffolds. All students completed a 45-min learning task in an online learning environment with learning tools embedded. This contribution takes a closer look into how specific scaffolds influence learning processes and performance. Preliminary analyses indicated no performance differences but differences in frequencies of learning processes between groups. Process models showed temporal structures of learning processes to be similar between groups, potentially explaining no performance differences. In the presentation, further analyses will be presented discussing the finer effects of scaffolds on learning processes and their implications with respect to the development and improvement of advanced learning technologies will be discussed.

Using Multimodal Data to Examine Self-regulated Learning Sequences during Game-based Learning
Presenting Author: Daryn Dever, University of Central Florida, United States; **Co-Author:**Nathan Sonnenfeld, Univeriry of Central Florida, United States; **Co-Author:**Megan Wiedbusch, University of Central Florida, United States; **Co-Author:**Roger Azevedo, University of Central Florida, United States

While open-world learning environments, such as game-based learning environments (GBLEs), increase engagement and interest, learners must deploy self-regulated learning (SRL) strategies consistently to increase learning gains. However, most learners are unable to deploy these strategies efficiently and accurately. As such, it is important to understand how learners currently deploy SRL strategies while learning with a GBLE. This study uses both eye-tracking and log-file data to identify instances in which undergraduate students (N=56) sequentially used searching, monitoring, assembling, rehearsing, and translating (SMART) operations to engage in SRL while learning with Crystal Island, a GBLE focused on increasing microbiology knowledge. Results found that participants most frequently engaged in Searching and Assembling/Rehearsing operations followed by Monitoring and Translating operations. Transition matrices were identified for each participant to understand the probability, or likelihood, each participant sequentially transitioned between SMART operations. These probabilities were entered into multiple linear regressions to predict learning gains where results showed that the greater the likelihood participants transitioned from Monitoring to Assembling/Rehearsing, the greater their learning gains. Results theoretically indicate an importance in understanding the sequential deployment of SMART operations. Methodologically, multimodal data is essential to fully capture all SRL processes accurately. Further, educational implications support the need for GBLE elements to encourage participants' transitions between some SMART operations (i.e., Assembling/Rehearsing to Monitoring) while discouraging others (e.g., Assembling/Rehearsing to Translating).

Examining the relation between algebra and different aspects of fraction knowledge
Keywords: Achievement, Cognitive Development, Cognitive Skills and Processes, Mathematics/Numeracy
Presenting Author: Jo Van Hoof, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Previously, strong relations were found between learners' fraction understanding and their algebra performance (e.g. Booth et al., 2014). However, these studies only included measures of learners' fraction size understanding, which forms a first and basic step in learners' rational number development (e.g., Van Hoof et al., 2017). Conceptual knowledge about the set of rational numbers, including the dense structure of fractions might be (even more) strongly related to algebra performance, as both require an advanced understanding of (abstract features of) number. In the present study, data from 240 Finnish secondary school students indicate that learners' algebra performance is more strongly related to their conceptual knowledge of the set of rational numbers, than to the understanding of the size of fractions. These results might contradict previous research claiming that the relation between fraction understanding and algebra performance can especially be explained by the fact that relational reasoning is needed both in rational size and algebra understanding (e.g. DeWolf et al., 2016).

Cognitive activation within a dynamic learning environment and developing a basic fraction concept
Keywords: Computer-assisted Learning, Instructional Design, Mathematics/Numeracy, Problem Solving
Presenting Author: Rowena Merkel, University of Education Freiburg, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Timo Leuders, University of Education Freiburg, Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany

Research has shown the beneficial effect of generating multiple solutions during a problem-solving phase before subsequent instruction (*problem solving prior to instruction*, PS-I). This can be supported by visual representations that afford the use of multiple solution strategies. To support the acquisition of a conceptual understanding of fraction, a digital learning environment with dynamic fraction bars was developed in two versions (dynamic vs static visual representation). In the digital learning environment, the students acquire a first conceptual understanding of the fraction concept by comparing fractions. We investigate whether more solution strategies are generated in the dynamic learning environment than in the static environment and if this difference leads to more conceptual knowledge. In an experiment with n=92 students of grade 6, we found a descriptive trend that students in the dynamic version performed better on the posttest than the static condition; however, the difference was not significant. Furthermore, in the dynamic learning environment, the cognitive activity during the learning-phase correlated with the level achieved in the post-test. This finding indicates the relevance of the cognitive activities in a dynamic learning environment for successful learning.

Adaptive teaching with fractions: a mixed method study
Keywords: Mixed-method Research, Pre-service Teachers, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Sara Becker, Freiburg University of Education, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Anika Dreher, Freiburg University of Education, Germany

Teachers' diagnostic competence includes the ability to notice misconceptions in student solutions and to respond adaptively to these solutions. Although adaptive teaching has often been investigated, there is a lack of content-specific research that asks whether teachers adapt their responses to student and goal focus. A mixed-methods approach was used to examine the aspects that guided pre-service teachers' responses to incorrect student solutions. The sample consisted of 50 pre-service secondary mathematics teachers. Participants' justifications for the responses were measured using vignettes presenting incorrect student solutions to fraction problems and three possible teacher responses. Participants were asked to choose the most adaptive response and to provide verbal a justification for their choice. The results show that participants' choices were guided more frequently by aspects of goal focus than by aspects of student focus. The results also indicate that participants' choices were not very adaptive because almost none of the justifications were related to aspects of student focus as well as to aspects of goal focus.

The Power of Framing: Support Teachers to Shift to Dialogic Discourse via Mixed-Reality Simulation
Keywords: Dialogic Pedagogy, Simulation-based Learning, Teacher Professional Development, Video-based Learning
Presenting Author: Rupert Wegerif, University of Cambridge, United Kingdom; **Co-Author:**Lydia Cao, Harvard University, United States; **Co-Author:**Sara Hennessy, University of Cambridge, United Kingdom

The teacher's response, the third turn in classroom discourse, plays a vital role in creating opportunities for student sense-making and determines the quality of classroom discourse. Nonetheless, research repeatedly shows that many classroom discourses are monologic, dominated by teacher talk. Teachers' responses to students are partly driven by their framing, their sense of "what is going on in interaction", or their "sense of what activity is being engaged in". This study used a design-based research method in which researchers and teachers (of students aged 6-16) in Pakistan co-designed a professional development programme on leading productive science discussions. Notably, in this study, we incorporated mixed-reality simulations, in which teachers had the opportunity to practise dialogic teaching. One of the design features was the 'dialogic framings' embedded in mixed-reality simulation scenarios (i.e., elicitation, consolidation, and explanation discussions). We found that teachers adhered to the dialogic framings in the simulation scenarios, which led them to drastically shift their discourse patterns. We also observed that teachers transferred their learning in the simulation to their own classroom and voluntarily adopted dialogic framings during class discussions after the PD. This study showed that a macro-level shift in framing could result in a micro-level shift in teachers' discourse patterns. This finding has significant practical implications for future professional development initiatives and pre-service teacher education. Teacher educators can help teachers to recognise their own default framings and expose them to alternative dialogic framings to shift towards more dialogic discourse patterns.

Video-based Evaluations of Cognitive Activation: An Explorative Study in Science Teacher Education
Keywords: Classroom Assessment, Pre-service Teachers, Science Education, Video-based Learning
Presenting Author: Benjamin Heinitz, Leibniz University Hannover, Germany; **Co-Author:**Andreas Nehring, Gottfried Wilhelm Leibniz Universität Hannover, Germany

Cognitive activation is a central dimension of instructional quality and strong predictor for student learning gains. At the same time, video vignettes appear as a useful tool to foster teacher candidates' ability to evaluate cognitive activation in sciences classes. The purpose of this exploratory observation study was twofold: First, to investigate how cognitive activation is perceived and evaluated by teacher candidates in video vignettes. Second, to analyze if teacher education seminars based on video vignettes contribute to changes in their perception and evaluation. 21 teacher candidates from four science specific seminars were examined to evaluate the cognitive activation in two video vignettes in a written pre-post survey. Between the two data collection points, the teacher candidates visited a seminar lesson with their advisors. The seminar was focused on four predefined criteria of cognitive activation. One video vignette also served as a learning opportunity during the seminar, while the other was used as a transfer test vignette. The participants showed an increase in the overall use of criteria for cognitive activation after their seminar. However, this increase was limited to only two of the four predefined criteria and a substantial number of criteria non-related to cognitive activation was observed. We discuss these findings with regards to possible limits and requirements of using cognitive activation as a concept for science teacher candidates evaluating instructional quality.

The role of cooperative activities for differentiated instruction
Keywords: Inclusive Education, Instructional Design, Teacher Professional Development, Video-based Learning
Presenting Author: Robbert Smit, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Alexanda Taras, University of Teacher Education St.Gallen, Switzerland

Differentiated instruction is increasingly encouraged in inclusive learning settings, but there are still some difficulties with respect to the full implementation of joint learning activities in such settings. We used video clubs as a promising tool to enhance Austrian and Swiss teachers' competencies in noticing core features of their own inclusive teaching. Eight general and special-needs teachers met three times locally and once in a cross-national setting. Our qualitative research focused on patterns of frequencies and differences in the perception of inclusive education by teachers across two different school levels. A model of differentiated instruction incorporated into joint learning activities is presented, and we illustrate the model and results with an exemplary description of a joint learning lesson.

Session O 11

25 August 2023 17:00 - 18:30

Assessment and Evaluation, Teaching and Teacher Education

Argumentation and Reasoning

Keywords: Argumentation, Assessment Methods, Competencies, Higher Education, Metacognition, Quantitative Methods, Reasoning, Science and STEM, Secondary Education, Teacher Effectiveness, Teacher Professional Development, Teaching/Instructional Strategies, Writing/Literacy
Interest group: SIG 11 - Teaching and Teacher Education, SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Monika Nerland, University of Oslo, Norway

Students' use of connectives in argumentative writing – Which aspects of family background matter?
Keywords: Competencies, Quantitative Methods, Secondary Education, Writing/Literacy
Presenting Author: Elisabeth Mundt, University of Kassel, Germany; **Co-Author:**Madeleine Domenech, University of Kassel, Germany

As a central element of academic language competence, knowledge of connectives has proven relevant for learning. However, it is still unclear which roles distinct aspects of family background play regarding the formation of students' language competences. This study strives to further clarify this aspect. We use data of $N = 1005$ grade 5 students and their parents, who took part in the FUnDuS project in Germany. The questionnaires on the family background assessed the parents' education, the HISEI, home possessions related to family wealth, number of books at home, parents' aspirations concerning their children's education, migration background, and family language use. In addition, students completed a nonverbal cognitive abilities test and wrote persuasive letters. These texts were rated with regard to the number and diversity of argumentative connectives used as well as their length. Controlling for students' general cognitive abilities, partial correlations showed no relations between the use of connectives and parental education, HISEI, or home possessions, but with the number of books and parental aspirations. Furthermore, migration background was associated with less connectives, but family language was not linked to students' use of connectives. Interestingly, text length was related with all the indicators of students' socio-economic background, but neither with migration background nor family language use. Thus, our findings add to the evidence negating the impact of family language use on students' language competences but point towards the significance of socio-economic aspects, in particular, "soft" factors like parents' educational aspirations for their children.

Measuring students' argumentation skills: validation of a test instrument
Keywords: Argumentation, Assessment Methods, Higher Education, Quantitative Methods
Presenting Author: Yvonne Berkle, University of Koblenz - Landau, Germany; **Co-Author:**Andreas Janson, University of Kassel, Germany; **Co-Author:**Thiemo Wambsganß, Ecole Polytechnique Fédérale de Lausanne (EPFL), Switzerland; **Co-Author:**Denise Löfflad, University of Kassel, Germany; **Co-Author:**Jan Marco Leimeister, University of Kassel, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany

The importance of argumentation skills for academic disciplines is well evident. Two core aspects of argumentation skills are a) the recognition of argumentation fallacies and b) the recognition of the structure of arguments. These two argumentation skills might be related to domain-specific knowledge. In our study, we aim to evaluate an instrument to assess the recognition of argumentation fallacies and the structure of arguments in the context of different domains. Thus, we implemented a self-developed instrument to measure both argumentation skills in different student groups (business economic students and pre-service teachers) in different domains: a) the study-domain of their own courses, b) the study-domain of the respective other courses and c) a neutral domain (sustainability). We assumed these three domains to represent different dimensions within the ability to recognize argumentation fallacies and within the ability to recognize argument structures. This assumption could not be confirmed, what leads to the assumption that our instrument captures cross-domain argumentation skills. However, our research implies a difference in the recognition of formal compared to informal argumentation fallacies. Furthermore, the results indicate that the instrument measures argumentative skills in both groups of students equally well.

Noticing Confirmation Bias and Emphasizing Scientific Reasoning During Modeling
Keywords: Metacognition, Science and STEM, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Amanda Cottone, University of Pennsylvania, United States; **Co-Author:**Susan Yoon, University of Pennsylvania, United States; **Co-Author:**Clark Chinn, Rutgers University, United States; **Co-Author:**Noora Noushad, University of Pennsylvania, United States; **Co-Author:**Huma Hussain-Abidi, Rutgers University Graduate School of Education, United States; **Co-Author:**Thomas Richman, University of Pennsylvania, United States

Confirmation bias is one reason for the spread of misinformation among the public and this necessitates that science teachers shift focus towards promoting students' use of reliable scientific reasoning strategies (in addition to content knowledge) during instruction. To better understand how best to support teachers in this shift, we engaged 14 high school biology teachers in a professional development (PD) activity that prompted them to evaluate the strategies students used while engaging in scientific modeling and reflect on ways to promote their students' scientific reasoning. Our findings demonstrate that teachers varied widely in their identification of some of the hallmarks of confirmation bias in students' reasoning and that time constraints and the ability to make students' thinking visible often interfere with their ability to redress such biases. This study can contribute to our understanding of effective ways to support teachers in improving their identification of confirmation bias and then creating learning opportunities needed to redress it during class.

The Multiplicity, Adaptability, and Orientation of Teachers' Noticing of Proof-related Reasoning
Keywords: Reasoning, Teacher Effectiveness, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Mei Yang, University of Cambridge, China

Research on teacher noticing can help us unpack the perceptual and cognitive processes underlining teachers' in-the-moment decisions, but this construct is seldom studied in the area of teaching proving. Taking a small unit of analysis (i.e., looking at the moments teachers noticed each student argument), this study aimed to investigate in what ways teachers notice students' reasoning in the context of a proving activity, and what evident patterns existed in their ways of noticing. Twelve Chinese pre-service and in-service secondary mathematics teachers participated in a semi-structured, vignette-based interview where they were presented with realistic classroom scenarios. Based on the interview results, teachers' different ways of paying attention to, interpreting, and deciding how to respond to students' proof-related reasoning were characterized. Three evident patterns of teacher noticing were identified to capture ways of teacher noticing. It was found that individual teachers' ways of noticing were multiple and adaptive at any moment, and they worked internally consistently to drive individual teachers' noticing of the whole proving activity. These findings made a theoretical contribution to our understanding of both the dynamic and situational nature of teacher noticing and the potential relationships between teacher noticing at different grain sizes. To better understand and enhance teacher noticing and subsequently teaching practice, future research and training on teacher noticing can take into account the multiplicity, adaptability, and orientation of teacher noticing.

Didactical Design Dice - a meta-knowledge framework for (re)designing technology-mediated education
Keywords: Digital Literacy and Learning, Instructional Design, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Sylvana Sofkova Hashemi, University of Gothenburg, Sweden; **Co-Author:**Maria Spante, School of Business, Economics and IT Division of Informatics, Sweden

The aim of this study is to investigate and critically discuss the orchestration of opportunities for equal participation in learning in technology-mediated situations when using a meta- knowledge framework. The study is situated in a newly built school providing flexible access to variations of rooms, furniture and digital resources. We focus on teacher teams' design conducted in workshops applying the Design Dice model. The analysis is based on data from workshop-driven activities, lesson observations, and focus group interviews with five teacher teams of totally 26 teachers. The findings demonstrate that the teacher teams' design requires flexibility in the planning process and approaching student-driven choices in a meta-structure for students to participate and learn. Teaching required extensive collective planning to uphold the shared design throughout the spaces, activities, and resources. The Design Dice model helped to create a tool for obtaining common ground in the teacher teams' negotiations when designing for learning. However, there is reason to believe that in some situations the model becomes too static rather than the creative support as this study showed. Future studies are therefore needed to investigate the restricting part of the Design Dice model.

Digital multimodal teaching and assessment: developing teachers' knowledge and competence
Keywords: Digital Literacy and Learning, Primary Education, Qualitative Methods, Teacher Professional Development
Presenting Author: Sylvana Sofkova Hashemi, University of Gothenburg, Sweden; **Co-Author:**Petra Magnusson, Kristianstad University, Sweden

This paper presents initial findings from an ongoing research project, Teachers' meta knowledge and assessment practices in digital, multimodal learning environments (2022-2024). The project is grounded in multimodal social semiotics (Kress, 2010), didactic design theoretical perspective (Selander, 2022; Sofkova Hashemi & Spante, 2016; Åkerfeldt, 2014) and Design Based Research (DBR) (Anderson & Shattuck, 2012). The project explores and develops teachers' digital multimodal teaching and assessment in compulsory schools. This paper concentrates on the first iteration of three, which aims to increase teachers' knowledge and competence regarding how meaning-making, with different modes and digital learning resources, can be used and articulated in lesson activities and acknowledged in students' work. Nineteen teacher teams from two schools participated in a workshop and designed their lesson through a tool set up by the researchers. The tool addressed six areas 1) Knowledge content, 2) Skills, 3) Timeframe, 4) Space, 5) Resources, and 6) Reflection regarding knowledge and skills. The empirical material consists of these lesson plans, workshops, focus group interviews with teachers and observations. The empirical material was analysed from a design-oriented multimodal social-semiotic perspective focused on framing, functional load, and meaning potential (Kress, 2010; Selander, 2022). The findings showed three emerging themes: discrepancy in focus between content and form, lack of explicit recognition of students' digital competence and weak framing in the planned teaching with digital learning resources.

Remote digital assessment – variations in teachers' experiences
Keywords: Educational Technologies, Engineering Education, Higher Education, Teacher Professional Development
Presenting Author: Ida Naimi-Akbar, KTH Royal Institute of Technology, Sweden

In this phenomenographic research, engineering teachers' different ways of experiencing the transition of assessment to remote digital settings during the COVID-19- pandemic are investigated. Transition to remote assessments was experienced in three different ways: as an external concern, as an adjustment and as changed conditions for students learning. Different ways of experiencing assessment will likely have different consequences for how the assessment practice is enacted and what and how students learn. The findings indicate that if digitalisation contributes to better support for students' learning, as often argued, teachers' conceptions and ideas about assessments in remote settings need to be developed and problematised.

The discrepancy in the technology integration: teachers seek short-term, students long-term goals
Keywords: Attitudes and Beliefs, Educational Technologies, Qualitative Methods, Secondary Education
Presenting Author: Doris Kristina Raave, University of Tartu, Estonia; **Co-Author:**Eric Roldan Roa, Center for Scalable Data Analytics and Artificial Intelligence, Germany; **Co-Author:**Margus Pedaste, University of Tartu, Estonia; **Co-Author:**Katrin Saks, University of Tartu, Estonia

The integration of digital technology into the teaching-learning processes is a characteristic of contemporary education, made even more prominent due to the COVID-19 pandemic. The prevalent use of digital technology implies it beneficiary for teaching and learning. However, research on how digital technology benefits learning and the reasons behind the integration of digital technology is scarce. Further, one underlying question is whether these reasons are congruent by both stakeholders of the teaching-learning processes, teachers and students, to implement and reflect on meaningful digital technology integration that effectively supports achieving desired learning goals.
This study aims to get a preliminary understanding of teachers' and students' reasoning for digital technology integration in the learning process. To do this, we conducted semi-structured interviews with K–12 teachers and their students to understand why they integrate digital technology into the teaching-learning process. We found that teachers were mainly guided by short-term learning strategies such as practicality and engagement, whilst students sought a long-term goal of improvement in learning by deeper understanding. This finding indicates a discrepancy between teachers' and students' reasons for digital technology integration, possibly contributing to students' distancing from the teacher-led learning process and, thus, also to its limited effect on students' learning outcomes. To tackle this discrepancy, support more student-centred teaching-learning processes and achieve desired learning outcomes, we suggest giving students more voice and choice in how digital technology is integrated to promote their self-determination, agency and ownership in the learning process.

Teachers' profiles of content knowledge, motivational and emotional orientations in statistics
Keywords: Competencies, Mathematics/Numeracy, Quantitative Methods, Teacher Professional Development
Presenting Author: Sarah Huber, Technical University of Munich, Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Kristina Reiss, Technische Universität München (TUM), Germany

Teachers' professional competence includes both their affective and cognitive aspects. Investigating these aspects is important as they are related to student achievement. In the field of statistics, however, research on teachers' professional competence is sparse. Since previous studies yielded contradictory results regarding the relationship between teachers' cognitive and affective aspects, it stands to reason that there are groups of teachers with atypical competence profiles, such as teachers with low content knowledge but high motivational and emotional orientations. Identifying such competence profiles could contribute to more targeted teacher education programs. Therefore, we surveyed $N = 87$ in-service mathematics teachers about their self-efficacy, anxiety, and joy regarding teaching statistics and tested their statistical content knowledge. Using this data, we conducted a cluster analysis, which revealed three different competence profiles: Cluster (1) included teachers who tended to overestimate their statistical knowledge. They should be better aware of their knowledge gaps. Cluster (2) included teachers with comparatively high content knowledge and rather positive orientations. They could need support with advanced statistical concepts or instructional strategies. Cluster (3) included teachers who showed moderate orientations and low content knowledge. Improving their knowledge by teacher development programs might improve also their orientations. The clusters found provide a possible explanation for the contradictory results regarding the relationship between cognitive and affective aspects in statistics, thus adding value to research on teachers' professional competence. The findings are in particular relevant for the further development of teacher education: Courses should be designed to adaptively support teachers with different competence profiles.

Efficacy of induction elements on the development of beginning teachers' qualities
Keywords: Emotion and Affect, Motivation, Teacher Effectiveness, Teacher Professional Development
Presenting Author: Xiangyuan Feng, University of Groningen, Netherlands; **Co-Author:**Michelle Helms-Lorenz, University of Groningen, Netherlands; **Co-Author:**Ridwan Maulana, GION - University of Groningen, Netherlands

The present study examined how the quantity and quality of induction elements and element configurations explain the development of beginning teachers' quality over the first two career years. Teacher quality is studied as an integral framework that covers both motivational-affective (i.e., endowed professional value, affection for teaching and the subject, self-efficacy for instruction, classroom management, and student engagement) and teaching behavioural aspects (i.e., Learning Climate, Classroom management, Instructional Clarity, Activating Teaching, Differentiated Instruction, and Teaching Learning Strategies). This study accounts for the potential impact of teacher-level characteristics and group heterogeneity. 280 Dutch beginning teachers were surveyed at three waves. The study reveals that the quantity of induction elements (rather than the quality of elements, program length, or program quality) has superior explanatory power for the changes in beginning teachers' quality, especially when group heterogeneity of beginning teachers is taken into account. The direction and strength of induction elements vary across teacher subgroups and different aspects of teacher quality. The findings unravel the complexity of induction evaluation that is often simplified in previous research, signifying the need to elaborate on the properties of induction, contexts, and teachers.

Teachers' awareness of the generalising potential of school assignments
Keywords: Inclusive Education, Primary Education, Science Education, Teacher Professional Development
Presenting Author: Birgit Vogt, University of Koblenz, Germany; **Co-Author:**Markus Linnemann, University of Koblenz, Germany

One of the functions of academic language is generalising (Feilke, 2012). In the context of educational language functions, generalising is a prerequisite for cognition and communication of cognition. It is thus a central variable for educational research, nonetheless generalising has received little attention so far, despite its role as a key skill. Generalisation processes, such as analysing and evaluating in Bloom's taxonomy of learning (Anderson & Krathwohl, 2001), are at the core of cognitively activating teaching. A closely related operation to generalising is categorising. Cognitive categories are products of the interaction of structures in the world and information-processing systems (Müsseler & Rieger, 2017) and thus a central aspect of human information processing. The question arises whether teachers recognise inherent potential for generalising in tasks despite the underrepresentation of generalising in educational research and how it is taken into account in the course of inclusive lesson planning. First results make clear that an existing potential for the promotion of generalising as a target competence is seen only to a small extent. Only about 14% of the teachers surveyed recognised the generalisation potential of suitable tasks. Particularly in inclusive teaching, further weaknesses become apparent: 18% of the teachers stated that tasks that lend themselves to generalisation are withheld from learners with special needs. Overall, it became clear that there is a need to create a greater awareness of using tasks for generalisation.In the presentation, the construct, study and results will be presented and discussed against this background.

A positive impact of a PBL-based online course: A multidimensional model of identity construction
Keywords: E-learning/ Online Learning, Learning Approaches, Pre-service Teachers, Science Education
Presenting Author: Yulia Muchnik-Rozanov, Technion - Israel Institute of Technology, Achva Academic College, Israel; **Co-Author:**Dina Tsybulsky, Technion - Israel Institute of Technology, Israel

This study demonstrates that the online project-based learning course, designed as a pedagogy of practice, tends to be positively linked to developing preservice teachers' professional identity. The linguistic and content analyses revealed that the construction of professional identity was manifested through six motifs: Self-confidence, self-agency, sense of belonging, self-awareness, autonomy, and envisioning a future teaching self. Each of the motifs was portrayed with its characteristic set of time-oriented types of discourse (i.e., using past, present, and future tenses while describing feelings and thoughts regarding one's teaching self.) Based on the findings, we introduce a multidimensional model that explains identity construction as the intersection between the dimensions of identity and the temporal dimensions of reflective discourse.

Reading from Paper, Computers, and Tablets in First Grade: The Role of Comprehension Monitoring
Keywords: Comprehension of Text and Graphics, Digital Literacy and Learning, Primary Education, Reading
Presenting Author: Elena Florit, University of Verona, Italy; **Co-Author:**Pietro De Carli, University of Milano-Bicocca, Italy; **Co-Author:**Kate Cain, Lancaster University, United Kingdom; **Co-Author:**Lucia Mason, University of Padova, Italy

Recent meta-analyses indicate the inferiority of reading from a screen (i.e., mainly computer screen), compared to paper-based reading of informational texts, among undergraduates and high school students. Meta-analyses also suggest that the screen inferiority for text comprehension may be linked to individual differences in metacognition. This study focuses on beginner readers to investigate whether the inferiority of screen-based reading for informational texts emerges in beginner readers and includes screen-reading from both computers and hand-held devices, and the influence of comprehension monitoring skills. Participants were 58 first graders (35 F; M_{age} = 6.8 years). Text comprehension at the level of the main idea, literal and inferential information was assessed using six texts; one narrative and one informational text (i.e., descriptive text) on each of paper, laptop, and tablet. Comprehension monitoring was assessed through an inconsistency detection task in which children were required to identify inconsistent sentences in texts. A standardized measure of reading comprehension was included as a control. Main results from mixed models showed the superiority of main idea and literal comprehension for descriptive texts presented on tablets and the superiority of inferential comprehension for narrative texts. Comprehension monitoring uniquely accounted for main idea and literal comprehension independently of medium and text genre and had a greater effect on descriptive than narrative text comprehension at the inferential level. Overall, these findings inform educational practices by showing that the screen inferiority effect is not detected in beginner readers' text comprehension. The latter is supported by metacognition, independently of the medium.

Reciprocal relations between morphological awareness and literacy among Greek Cypriot children
Keywords: Achievement, Primary Education, Reading, Writing/Literacy
Presenting Author: Evdokia Pittas, University of Nicosia, Cyprus; **Co-Author:**Terezinha Nunes, University of Oxford, United Kingdom

There is considerable support for the contribution of morphological awareness to reading and spelling in different orthographies, but few studies have examined the reverse connection: whether experience in reading and spelling helps children to develop morphological awareness. The aim of this longitudinal study was to examine whether morphological awareness and literacy reciprocally influence each other. Participants (N=404) were children, 6 to 9 years at the start of the project, who learn literacy in Cyprus using Standard Modern Greek (SMG). Because there are no standardised measures of morphological awareness in SMG, measures were developed during a pilot study and their internal consistency was assessed. A stringent analysis was carried out controlling for the effects of the outcome measure at Time 1 (auto-regressor). The cross-lagged partial correlation between morphological awareness at T1 and reading and spelling at Time 2, controlling for the auto-regressor, was significant. The same was true when the outcome measure was morphological awareness: Time 1 reading and spelling correlated significantly with morphological awareness at Time 2 even after controlling for morphological awareness at Time 1. Thus, the better the children's morphological awareness, the better they learn to read and spell; also, the more experience children have with reading and spelling, the more their morphological awareness develops. By establishing the plausibility of a causal and reciprocal link between morphological awareness and literacy, this study makes theoretical and empirical contributions to understanding the reciprocal relation between morphological awareness and literacy. This relation should be tested in further research using intervention methods.

The role of task models and goal management in 6th graders' online reading strategies.
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Reading, Secondary Education
Presenting Author: Jean-Francois Rouet, University of Poitiers, France; **Co-Author:**Yann Dyoniziak, CeRCA UMR7295 Université de poitiers, France; **Co-Author:**Mônica Macedo-Rouet, CY Cergy Paris Université, France; **Co-Author:**Émilie Dujardin, Université de Poitiers, France; **Co-Author:**Anna Potocki, Université Grenoble Alpes, France

Reading to learn requires secondary school students to correctly interpret their assigned reading task demands (i.e., an accurate task model) as they engage with the materials. We examined the contribution of sixth graders' task models and strategy knowledge on their literal and inferential comprehension of texts varying in length and complexity. Participants were assigned 9 computerized reading comprehension tasks, a strategy knowledge questionnaire, a word reading test and a reading self-concept inventory. Structural equation models were to be used in order to assess the specific contribution of students' task model accuracy to comprehension performance, controlling for word reading and reading self-concept.

Compensation in children with (a risk of) reading difficulties: A scoping review
Keywords: At-risk Students, Primary Education, Reading, Resilience
Presenting Author: Sanne Appels, University Utrecht, Netherlands; **Co-Author:**Sietske van Viersen, Utrecht University, Netherlands; **Co-Author:**Lisette Hornstra, Utrecht University, Netherlands; **Co-Author:**Sara van Erp, Utrecht University, Netherlands; **Co-Author:**Elise de Bree, Utrecht University, Netherlands

This scoping review aims to systematically review empirical evidence for specific protective, skill-enhancing and promotive factors involved in compensation of literacy difficulties in children (aged 6-16) with (a risk of) reading difficulties (RD). While there has been ample attention for identifying risk factors in the field of RD and dyslexia, much less research has focused on resilient trajectories in atypical literacy acquisition. In this scoping review, we examine which evidence for compensatory factors has been found in studies taking either a variable-centered approach or a person-centered approach. The five phases of the methodological framework of Arksey and O'Malley (2005), extended by Levac et al. (2010), were followed: a) specifying the research question; b) identifying relevant studies; c) selecting studies; d) charting the data; and e) collating, summarizing, and reporting the results. Twenty-nine studies were included in which children with (a risk of) reading difficulties were studied on relevant reading and spelling measures (e.g. word-reading accuracy or fluency, text-reading fluency, reading comprehension, and/or word-level spelling), and in which there was a focus on protective, skill-enhancing and/or promotive factors. This scoping review highlights the lack of empirical evidence on compensatory factors behind resilience in literacy acquisition.

Satisfied and High Performing? A Meta-Analysis on the Correlates of Teachers' Job Satisfaction
Keywords: Meta-analysis, Motivation, Teacher Effectiveness, Well-being
Presenting Author: Gyde Wartenberg, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Karen Aldrup, IPN – Leibniz Institute for Science and Mathematics Education, Kiel, Germany; **Co-Author:**Simon Grund, University of Hamburg, Germany; **Co-Author:**Uta Klusmann, IPN – Leibniz Institute for Science and Mathematics Education, Kiel, Germany

This meta-analysis examines the relationship between teachers' job satisfaction and teachers' professional performance. Job satisfaction represents a key indicator of occupational well-being and describes the cognitive evaluation of ones' job likely resulting in a positive affect. As such, job satisfaction is negatively associated with turnover intentions and absenteeism. Established theoretical models propose that job satisfaction enhances professional performance through both a cognitive-driven and affective-driven pathway (Weiss, 2002). Accordingly, teachers evaluating their job as positive likely invest more resources in lesson

planning and teacher-student interactions (Siegrist, 2002). Additionally, due to the positive affect that is associated with job satisfaction, satisfied teachers can fall back on an extended thought-action repertoire (Fredrickson, 2001), enabling teachers to react more flexible to students educational, emotional and social needs. A comprehensive literature search in PsychINFO, Web of Science, and Open Grey yielded a total of 856 records, of which 91 were included in the present study. Meta-analyses using random-effects models demonstrated small to moderate positive associations between teachers' job satisfaction and teacher-student interactions, student motivation, and achievement, while turnover intentions and absenteeism were negatively related to job satisfaction. Meta-regressions showed that the positive associations between teachers' job satisfaction, the quality of teacher-student interactions, and student motivation were stronger when teachers reported on the outcomes. Based on the meta-analytic summary of different consequences of teachers' job satisfaction, we aim to identify areas where empirical findings are lacking, set an agenda for future research, and discuss implications for the importance of facilitating teachers' professional well-being.

Teachers' Occupational Well-Being in Relation to Teacher–Student Interactions
Keywords: Burnout, Engagement, Secondary Education, Social Aspects of Learning and Teaching
Presenting Author: Sze Wah Chan, Universtiy of Jyväskylä, Finland; **Co-Author:**Sanni Pöysä, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland

Teachers' occupational well-being is critical for their teaching quality as well as for students' learning. Review shows that knowledge about the relations of observed classroom interactions with positive occupational well-being particularly in the secondary education context is scarce. The present study aims to fill in such literature gaps by investigating the roles of both positive and negative aspects of occupational well-being and its relation towards all domains of observed classroom interactions quality, in the lower secondary school level. Subject teachers (N = 48) rated their occupational well-being in terms of engagement, stress, job demands, and emotional exhaustion. Teacher–student interactions in classrooms were video-recorded and coded with the Classroom Assessment Scoring System–Secondary (CLASS–S) measure (Pianta et al., 2012). The results of multivariate regression analyses showed that teachers who reported higher work-related stress were observed with a lower quality of emotional support, classroom organization, and instructional support when controlling for background factors. The results suggest that the observed quality of teacher–student interactions is related to teachers' work-related stress in lower secondary schools. The results also provide insights that teachers' occupational stress and possibly also emotional engagement could relate differently to the three domains of teacher–student interactions.

Investigating the interplay of teachers' emotions, subjective well-being, and daily work situations
Keywords: Burnout, Emotion and Affect, In-service Teachers, Well-being
Presenting Author: Tanja Bross, Augsburg University, Germany; **Co-Author:**Ulrike Nett, Augsburg University, Germany

In their daily work life, teachers are experiencing various emotions. These emotions fluctuate during the day and are closely linked to aspects such as subjective well-being. A possible factor that influences the variation of emotions are context variables. Previous research mainly investigated these context variables by capturing challenging situations experienced by teachers and their impact on general outcomes like subjective well-being. However, these studies neglected the role of distinct emotions. The aim of the present study was to investigate emotions experienced in these situations, linkages with subjective well-being and possible moderating effects of challenging situations. In total, 168 teachers participated in a diary study during sixteen consecutive days. The findings of our study hint to the relevance of the emotions experienced in challenging situations. Our results highlight the role of emotions and their interplay with challenging situations as well as subjective well-being. On an educational level, teachers should be supported to deal with challenging situations and the emotions arising in these situations.

Student engagement and self-regulation in adolescence: A within-person reciprocal relation
Keywords: Engagement, Metacognition, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Kristján Ketill Stefánsson, University of Iceland, Iceland; **Co-Author:**Steinunn Gestsdóttir, University of Iceland, Iceland; **Co-Author:**Freyja Birgisdottir, University of Iceland, Iceland

Drawing on recent scholarly work on the positive synergy between engagement and motivation (see Skinner & Raine, 2022), a reciprocal relation between student engagement and intentional self-regulation (ISR) in adolescence would be expected. However, previous research has been limited to between-person models to test the reciprocal relation between student engagement and ISR. We thus reanalyzed data previously used by Stefansson et al. (2018). The sample consisted of 561 adolescent students in Iceland (46% girls; Mage at Wave 1 = 14.3 years; SD = 0.3) and four waves of data collected during Grades 9 and 10. Using the random-intercept cross-lagged panel model (RI-CLPM; see Mulder & Hamaker, 2021), the results demonstrated a moderate (β = .17 - .41) within-person reciprocal relation between school engagement and ISR after controlling for several covariates (e.g., academic achievement). The cross-lagged effects observed using the RI-CLPM showed a similar pattern to the cross-lagged effects previously observed using the traditional CLPM (see Stefansson et al., 2018). However, the cross-lagged effect sizes were nearly twice as strong using the RI-CLPM. The results highlight the importance of considering both student engagement and intentional self-regulation when designing optimal learning environments for adolescents.

"Don't Chat in Class!": Self-regulated School Engagement Profiles and Academic Achievement
Keywords: Achievement, Emotion and Affect, Engagement, Self-regulated Learning and Behaviour
Presenting Author: Ioannis Katsantonis, University of Cambridge, United Kingdom

Students' self-regulation goes hand-in-hand with school engagement in predicting academic achievement and competence. Yet, the question remains whether different profiles of behavioural and affective self-regulated school engagement exist that differentially influence students' academic achievement. Hence, the present study aimed to address this evidence gap. The data came from 13,847 British primary school students (age *M*=7.24, *SD*=.25), who participated in the *Millennium Cohort Study*. Latent profile analysis revealed four profiles of students' behavioural and affective self-regulatory skills and engagement. 63.7% of the students were classified as *highly self-regulated engaged*, whereas 29.97% were *slightly dysregulated and disengaged*. 1.86% of the students were classified as *dysregulated but engaged*, whilst 4.43% were *disengaged and dysregulated*. Having denominated the profiles, the BCH method was deployed to explore differences across profiles in standardised maths and reading achievement. In short, the findings illustrated that the majority of primary school students, who had acquired good self-regulatory skills and were highly engaged, had the highest scores in maths and reading. Students with incompatible levels of self-regulation and school engagement had the lowest scores in maths and reading across all profiles. The analyses underscored that students need to develop not only high levels of emotional and behavioural self-regulation but also high levels of behavioural and emotional school engagement in order to be academically flourishing. Finally, the results indicate that early emotional and behavioural self-regulatory skills training is necessary in pre-primary education since good self-regulatory skills were connected to higher behavioural and affective engagement, and achievement.

The Effect of Generalised and Personalised Scaffolds on Self-Regulated Learning

Keywords: Computer-assisted Learning, Educational Technologies, Higher Education, Self-regulated Learning and Behaviour
Presenting Author: Joep van der Graaf, Radboud University Nijmegen, Netherlands; **Co-Author:**Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Yizhou Fan, Peking University, China; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Johanna Moore, University of Edinburgh, United Kingdom; **Co-Author:**Dragan Gasavic, Monash University, Australia; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands

Self-Regulated Learning (SRL), also called “Learning to learn”, is important to master for lifelong learning. SRL is executing cognitive and metacognitive processes in order to attain learning goals. Students struggle with SRL, but scaffolds can help. However, scaffolds often are not based on a learner’s actual learning process. Therefore, the present study investigated the effect of generalised and personalised scaffolds on learners’ SRL processes, their learning outcomes, and the association between those. University students were assigned to one of three conditions (control, generalised, or personalised) and performed a writing task. We measured their domain-specific knowledge, SRL processes, and essay scores. Results showed similar learning gains in all conditions and higher essay scores in the personalised compared to the control condition. Furthermore, frequencies of four SRL processes were higher in the scaffold conditions. Condition did not moderate the relation between SRL processes and essay scores, with the exception of high cognition. The control condition showed a negative and the generalised condition a positive relation. To conclude, the personalised scaffolds were effective, as the essays were of better quality. Furthermore, results suggest that our personalised scaffolds were indeed personal, as the relation between SRL and learning outcome did not change.

Approaches to learning and self-regulation strategies among Chilean higher education students
Keywords: Higher Education, Learning Approaches, Learning Strategies, Self-regulated Learning and Behaviour
Presenting Author: Carlos González, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Juan Pedro Ross, Universidad de Chile, Chile

This study aims to deepen our understanding of the relationship between SAL, SR, and learning strategies. A sample of 9045 students from 10 HEIs, representing the diverse nature of Chilean higher education, participated. The correlations among approaches to learning scales are in line with previous research. Also, as expected, the deep approach and organized study scales present positive associations with self-regulation and learning strategies and negative ones with the unreflective approach. Latent profile analysis yielded three students’ profiles. The first one represents a group of unreflective students with low self-regulation who applied poor learning strategies (n = 1806; 20% of the sample). The second is a group of deeply strategic students with high self-regulation who applied good learning strategies (n = 2666, 29%). The third group, near-average students, is a group presenting an overall average deployment of approaches to learning, self-regulation, and learning strategies (n = 4573, 51%). Chi-squared tests show that only the unreflective and deep-strategic groups present differences among characterization variables. The average group has no significant differences among any of them. Results are relevant for HEIs in Chile, where evidence is key to understanding and supporting students' learning processes in the context of universal access to higher education.

Relation of conceptual understanding and epistemic beliefs in biology: A person oriented approach
Keywords: Conceptual Change, Misconceptions, Science Education, Secondary Education
Presenting Author: Vesta Aleknavičiūtė, Vytautas Magnus University, Lithuania; **Co-Author:**Ilona Södervik, University of Helsinki, Finland; **Co-Author:**Erno Lehtinen, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Photosynthesis and respiration in plants are fundamental, interconnected biological topics. Without a proper understanding of these concepts, it is impossible to realize the crucial role of plants to the planet and all life forms. Although studies have been conducted to understand students‘ conceptions, there is a lack of research regarding different types of learners‘ knowledge levels concerning heterogeneity of learners and their discipline-specific epistemic beliefs. In order to examine such individual differences, more than 1000 Lithuanian students from 7 to 11 grades answered 13 two-tier type questions dedicated to photosynthesis and respiration in plants topics. In addition, students answered 17 Likert-type questions about biology-specific epistemic beliefs. In the analysis students‘ conceptual test answers were classified as either expressing scientifically correct concepts, synthetic models, or misconceptions. Latent profile analysis shows that besides high and low performing students there are students in transition, which is characterized by low misconceptions, high synthetic models and average level of scientific concepts. Furthermore, students‘profile membership and epistemic beliefs were strongly related. Scientific profiles were associated with higher epistemic beliefs scores, non-scientific profiles had lower epistemic beliefs scores. Synthetic profile had only a little lower epistemic beliefs scores than scientific profile, but higher than non-scientific profile. Understanding of different learners could help science education researchers and teachers to understand deeper the transition phases in learning towards scientific understanding and further develop interventions that can more effectively support learning of these demanding but highly important topics.

A Comprehensive Validation Study of an Instrument for Measuring Epistemic Beliefs
Keywords: Assessment Methods, Attitudes and Beliefs, Higher Education, Knowledge Construction
Presenting Author: Belinda Berweger, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Florentine Diersch, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Baerbel Kracke, University of Jena, Germany; **Co-Author:**Julia Dietrich, Friedrich-Schiller-University Jena, Germany

The acquisition of pedagogical and psychological knowledge requires learners to evaluate and weigh different knowledge claims (e.g., contradicting scientific findings). Epistemic beliefs, defined as beliefs about knowledge and knowing, are crucial in such learning processes.Merk et al. (2017) developed a domain-specific instrument (FREE) to assess the individual level of development of students’ epistemic beliefs (absolutism, relativism, and postrelativism) when engaged in thinking about real-world educational problems. The FREE aims to quantify a person’s level of epistemic development using a D-index. However, it has not yet been examined whether the items included in the D-index actually measure the factors absolutism, relativism, and postrelativism. The aim of the present study was to validate the instrument FREE in a sample of preservice teachers (N = 468) and students of educational science (N = 149). We conducted factor analyses (EFA and CFA) and tested for reliability, and convergent, discriminant and criterion validity. The model fits did not support internal factorial validity of the instrument, which is in line with previous findings on self-report instruments in this field. However, tests for convergent and discriminant validity with other instruments measuring epistemic beliefs were in line with our expectations. Furthermore, we found significant relationships between the FREE scales and learnings strategies such as elaboration and self-regulated learning, which supports previous notions that these two constructs are interrelated.

R- and P-epistemic beliefs – On the inter- and intraindividual structure of epistemic beliefs
Keywords: Assessment Methods, Attitudes and Beliefs, Personality, Quantitative Methods
Presenting Author: Eric Klopp, Saarland University, Germany; **Co-Author:**Robin Stark, Saarland University, Germany

In the dimensional approach to epistemic beliefs, their structure is usually determined from cross-sectional data (R-data). It represents the structure of interindividual differences (R-epistemic beliefs). This structure is typically also meant to represent the structure of an individual’s epistemic beliefs. However, this is not necessarily the case. Thus, there is the question if the intraindividual structure of epistemic beliefs emanating from longitudinal data (P-data and P-

epistemic beliefs) corresponds to the structure of R-epistemic beliefs. Additionally, there is the question of whether previously occurring P-epistemic beliefs may affect current P-epistemic beliefs and whether the domain affects current P-epistemic beliefs. In this study, we investigate the structure of P-epistemic beliefs using P-factor analysis, i.e., the factor analysis of longitudinal data. We also analyze if previously occurring epistemic beliefs affect current epistemic beliefs using autoregressive vector regression models and if domains affect P-epistemic beliefs. Two individuals who provided data for 80 consecutive days. It turns out that the structure of P-epistemic beliefs did not correspond to the structure of R-epistemic beliefs. For almost all P-epistemic belief factors, the previous day's epistemic belief affected the current epistemic beliefs in the sense of an autoregressive effect, and for some P-epistemic beliefs, there were also cross-belief effects. Additionally, the domain also had effects on current P-epistemic beliefs. We discuss the implications of these findings regarding potential issues for the measurement of P-epistemic beliefs.

The Study of Conceptual Change and the Diffusion of Knowledge across Disciplinary boundaries
Keywords: Cognitive Skills and Processes, Conceptual Change, Science Education, Synergies between Learning / Teaching and Research
Presenting Author: Gregg Solomon, National Science Foundation, United States

I discuss research on conceptual change in the greater context of the diffusion of knowledge across disciplinary borders in Educational research and Cognitive Science. Two studies of knowledge integration are presented, one looking at the report How People Learn and the other at awards funded by the US National Science Foundation (NSF). The results show that all but one of the grants funded in the last ten years were to researchers in domain science departments studying undergraduates.I conclude by discussing how some of the challenges posed by this multidisciplinarity and the translation of research to practice underscore a need to re-examine how value is placed on research and researchers.

University and school-based support for teachers in career entry
Keywords: Mentoring and Coaching, Qualitative Methods, Social Aspects of Learning and Teaching, Teacher Professional Development
Presenting Author: Anja Winkler, University of Teacher Education Bern, Switzerland; **Presenting Author:**Daniela Freisler, Pädagogische Hochschule, Institut Forschung & Entwicklung, Bern, Switzerland

In the process of becoming and staying a teacher, career entry is considered a key phase in the professional biography of teachers. During their education at the university, students complete internships in schools and enter the profession directly after graduation. When entering the profession, challenges are perceived in the areas of teaching, extracurricular duties such as administrative and organizational tasks or meetings, and school reforms. Therefore, it's important that support services at universities and schools accompany teachers in handling suchchallenges in order to create learning opportunities for the professional development of one's own competencies. This presentation focuses on the question of which university and school support services are used for which purpose in order to support the professional development of teachers entering the profession. To answer the question, 24 teachers were retrospectively surveyed with semi-structured, guided interviews at the beginning of their second year in the profession. The results show that the first professional year was perceived by the teachers as interesting overall, but also as demanding and associated with new challenges. The more detailed analysis shows that the teachers entering the profession in various situations seek, above all, the exchange with other teachers about their experiences and difficulties that arise.

Novice teachers' sense of professional identity explored through portrait methodology
Keywords: Mentoring and Coaching, Qualitative Methods, Self-concept, Teacher Professional Development
Presenting Author: Ella AIT-ZAOUIT, Fontys University of Applied Sciences, Netherlands

In this talk I will discuss the findings of a completed doctoral research carried out on the development of four novice English teachers' sense of professional identity and how the use of portrait methodology has illuminated this. Portrait methodology is a qualitative and narrative research approach that sets out to explore the realities of participants' perspectives on their lived experiences through in-depth interviews and aims to capture the essence of these perspectives and experiences in a written portrait, which is consequently used as a reflection tool during the research process. The findings on teacher identity development within a southern Dutch context show that all four novice teachers have undergone three significant shifts in their sense of teacher identity. The research findings have furthermore presented an explicit connection between the use of portrait methodology and the construction of a narrative identity and the conceptualisation of the five Rs (implications to be taken into consideration when conducting portrait methodology). This study has shown that portrait methodology is a very effective approach to help stimulate teacher identity construction. It is recommended to build in more structured and organised *teacher identity* reflection activities as part of a professional development programme in schools and in teacher education colleges. Portrait methodology could serve as an effective reflection tool for this.

A systematic review of research on field practicum and professional identity development
Keywords: Inquiry Learning, Mentoring and Coaching, Pre-service Teachers, Self-concept
Presenting Author: Elaine Munthe, University of Stavanger, Norway

Eight teacher education programs have national frameworks that regulate their structure, content and learning outcomes in Norway. They are 1 to 5 years in duration and require 60-130 days of supervised field practice. Learning outcomes are also provided nationally for field practice. The importance of field practice is consistently highlighted in research and evaluations, but we ask: What evidence do we have about how field practice contributes to student teachers' professional identity development in Norway? To answer this question, we have re-analyzed a systematic review of research published about field practice in Norwegian ITE programmes. The review included 93 peer reviewed publications (1998 – 2019) from three international databases plus searches in Norwegian language journals.

What themes do preservice teachers focus on in peer coaching dialogues? Results of a pilot study.
Keywords: Communication Skills, Mentoring and Coaching, Peer Interaction, Pre-service Teachers
Presenting Author: Bettina Gautel, Gottfried Wilhelm Leibniz Universität Hannover, Germany; **Co-Author:**Katharina Mueller, Leibniz University Hannover, Germany

Peer coaching is increasingly recognized as an opportunity for preservice teachers (PSTs) to learn about planning and teaching (Lu, 2010), without the guidance of an expert. Previous findings report positive effects of peer coaching regarding competence development as well as motivation and self-efficacy of PST (summarized by Lu, 2010). In contrast, some studies criticize that PSTs do neither have the necessary skills to appropriately analyze lessons or lesson plans nor to give effective feedback based on this analysis (Oven, 2004). Therefore, the aim of this intervention is to provide effective communication and feedback strategies as well as assistance in setting focus areas when analyzing and discussion lesson plans. In the study, which will be presented at the conference, we focus on two areas: 1) we analyzed the themes focused on in simulated peer coaching dialogues by preservice teachers prior to the intervention and 2) evaluated their reflective analysis before and after the intervention to explore the extent to which changes regarding the awareness of general as well as genre-specific communication strategies took place. 13 audiotaped peer coaching dialogues were transcribed and analyzed using qualitative content analysis; initial

results indicate three key themes. Additionally, the reflective analysis of their peer coaching dialogues before and after the intervention were evaluated. The results indicate changes regarding the awareness of general communication and feedback strategies.

PISA Reading Achievement, Literacy Motivation and School Burnout Predicting Educational Outcomes
Keywords: Burnout, Educational Attainment, Motivation, Reading
Presenting Author: Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Asko Tolvanen, University of Jyväskylä, Finland; **Co-Author:**Minna Torppa, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Kaisa Aunola, University of Jyväskylä, Finland

In the present four-year longitudinal study, we examined how PISA reading achievement, literacy motivation and school burnout symptoms at the end of comprehensive school predict choice of educational track (academic or vocational) and educational attainment from upper secondary education. The sample consisted of 1351 Finnish students, whose PISA reading achievement, self-concept of ability in literacy, task value on literacy and school burnout symptoms of cynicism and exhaustion were assessed at the end of comprehensive school, in Grade 9 at age 15-16, their educational track during the first year of the upper secondary, and information of their qualifications from upper secondary education were achieved from school registers four years later. The results indicated that the better students performed in the PISA reading test and at the higher level their self-concept of ability in literacy was at the end of comprehensive school, the more likely they were entering academic track after comprehensive school. Symptoms of school burnout appeared different among those who ended up in academic and vocational track: the more symptoms of exhaustion students reported, the more likely they ended up in academic track, but the more symptoms of cynicism they reported, the more likely they ended up in vocational track. The results further indicated that the symptoms of exhaustion significantly increased the risk of non-completion of general upper secondary school in normative time.

How Does Studying Latin in Secondary Education Predict Study Achievement in Higher Education?
Keywords: Achievement, Foreign and Second Language Acquisition, Higher Education, Secondary Education
Presenting Author: Cathy Hauspie, Ghent University, Belgium; **Co-Author:**Stijn Schelfhout, Ghent University, Belgium; **Co-Author:**Nicolas Dirix, Ghent University, Belgium; **Co-Author:**Lot Fonteyne, Ghent University, Belgium; **Co-Author:**Mark Janse, Ghent University, Belgium; **Co-Author:**Arnaud Szmalec, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Alexandra Vereeck, Universiteit Gent, Belgium; **Co-Author:**Wouter Duyck, Ghent University, Belgium

Studying Latin in secondary education has a rich tradition and is still practiced to a considerable extent in Europe. The instruction of Latin is often justified on the assumption that it leads to cognitive benefits beyond the linguistic domain. The present study set out to explore the relation between studying Latin in secondary education and later academic achievement, in 12 first year programs of open access Flemish higher education (N = 1,898). First, we demonstrated that Latin students exhibit increased levels of study achievement in higher education, and particularly in non-STEM study programs. Second, we explored in which prediction models of academic achievement the instruction of Latin was included as a predictor and thus provided incremental predictive value over 22 other cognitive, affective, and demographic factors. Latin instruction in secondary education was included as a factor in the prediction models of academic achievement in 42% of the (mainly non-STEM) programs.

English Media Use Predicts Skill and Motivation Development in English as a Foreign Language
Keywords: Achievement, Foreign and Second Language Acquisition, Informal Learning, Motivation
Presenting Author: Jennifer Meyer, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Johanna Fleckenstein, University of Hildesheim, Germany; **Co-Author:**Maleika Krüger, University of Potsdam, Germany; **Co-Author:**Stefan Keller, Zürich University of Teacher Education, Switzerland; **Co-Author:**Nicolas Hübner, University of Tübingen, Germany

Skills in English as a foreign language are necessary for active participation in an increasingly globalized and diversified world. Consequently, fostering English-language learning constitutes a major goal of most education systems. In many countries, however, student learning is stagnating. Thus, informal learning activities have recently received increased interest as potential gateways to enhance students' formal learning progress. Informal foreign-language activities such as reading books or watching films provide important language input and learning opportunities, which might be associated with increases in achievement and motivation. In this study, we investigated how English media use during leisure time might benefit students' skills in English reading and listening as well as their English motivation (self-concept and interest). Capitalizing on rich data from a longitudinal study with a large sample of upper secondary school students in Germany (N = 1,994), we investigated different modalities (e.g., reading- and listening-focused activities) outside the laboratory. We found evidence that frequent English media use benefits both skill and motivation development. In addition, we found that reading activities had incremental power when predicting English-language skills beyond listening activities for both reading and listening comprehension skills, as well as for self-concept. The pattern differed for interest, with our results indicating positive incremental associations for the frequency of listening activities beyond reading activities. The relevance of English media use as an informal, inexpensive, and scalable leisure-time intervention is discussed.

Does the use of ICT at school predict lower PISA scores or vice versa?
Keywords: Achievement, Digital Literacy and Learning, Quantitative Methods, Special Education
Presenting Author: Nestori Kilpi, Tampere University, Finland; **Co-Author:**Ninja Hienonen, Tampere University, Finland; **Co-Author:**Mari-Pauliina Vainikainen, Tampere University, Finland

Studies have showed that the use of information and communication technologies (ICT) in leisure time, and also at school, is related to lower level of school performance. Furthermore, data from PISA studies have shown that higher levels of ICT use is related to lower scores in reading literacy, and theses findings have been interpreted as an indication of the harmful effects of digitalisation in education. The present study tests the hypothesis that ICT is used as means of support by targeting more ICT use to students performing lower at school.
The present study utilized PISA data collected in Finland between 2000 and 2018 using the Mplus software with school-level clustering and multiple group regression analyses taking into account student weight coefficients. The results showed that ICT use was negatively related to reading literacy scores, and the effects were statistically significant in all cycles. However, the ICT use explaining only one to three percent of the variation in reading literacy scores. Analyzed by proficiency levels, we examined whether these different levels of student performance explained negative effects of ICT use on reading literacy scores. On average, students at the lowest levels used ICT in school more than those at higher levels. Based on the results, we argue that previous interpretations of the negative effects of ICT use on learning outcomes have been overstated and that the results primarily reflect the use of ICT as a tool for differentiation and support lower performing students.

Measuring communication competence of medical students: Validation of a situational judgment test
Keywords: Assessment Methods, Communication Skills, Health-care Education, Higher Education
Presenting Author: Sabine Reiser, University of Erfurt, Germany; **Co-Author:**Laura Schacht, University of Erfurt, Germany; **Co-Author:**Eva Thomm, University of Erfurt, Germany; **Co-Author:**Kristina Schick, Technical University of Munich, Germany; **Co-Author:**Pascal Berberat, TUM Medical Education Center, Germany; **Co-Author:**Martin Gartmeier, Technical University of Munich (TUM), Germany; **Co-Author:**Johannes Bauer, University of Erfurt, Germany

Patient-encounters, for example during an initial conversation, are a daily task for physicians. An effective communication between physician and patient provides a basis for successful treatment and the provision of optimal care. Therefore, it is important to foster medical communication competence (MCC) in medical studies and assess its development. To measure MCC we designed the *Video-Based Assessment of Medical Communication Competence*(VA-MeCo), a construct-driven Situational Judgment Test. The VA-MeCo assesses MCC along three dimensions: *advancing the content* of the conversation, *providing structure*, and *building a relationship* in the conversation. Extending evidence from preliminary studies, the present contribution presents an in-depth evaluation of the test's reliability and validity based on a sample of $N = 395$ medical students. First, factor analyses showed that the test adequately reflects the theoretically assumed three-dimensional structure of MCC. Second, consistent with earlier results, we found high reliability for the tests' total and subscale scores (McDonald's $\omega > .81$). Third, concerning construct validity, correlations with convergent and discriminant measures were largely consistent with theoretical expectations. Altogether, these findings indicate that the VA-MeCo is a promising instrument to measure MCC in medical education.

"Am I being observed?": Medical students' perceptions about remote proctoring
Keywords: Assessment Methods, Attitudes and Beliefs, Educational Technologies, Health-care Education
Presenting Author: Vasiliki Andreou, KU LEUVEN, Belgium; **Co-Author:**Sanne Peters, University of Melbourne, Australia; **Co-Author:**Jan Eggermont, KU LEUVEN, Belgium; **Co-Author:**Birgitte Schoenmakers, KU LEUVEN, Belgium

The COVID-19 pandemic obliged medical educators to embrace technology and to search for innovative and viable solutions for administering safe but academically integral high-stakes medical exams. By looking for solutions outside the realm of medical education, remote proctoring has gained medical educators' interest to facilitate high-stakes exam administration, while reducing the chances of cheating. To evaluate whether remote proctoring could offer a viable solution, we aimed to explore medical students' perceptions about remote proctoring during an online high-stakes medical exam. Specifically, we utilised remote proctoring to remotely administer a high-stakes proficiency-testing exam for admission to the Flemish Postgraduate General Practitioner's Training. We used a survey comprising 6 closed-ended and 2 open-ended questions to explore medical students' perceptions. We used an exploratory factor analysis and thematic analysis respectively to analyse the data. In total, 472 students took the proficiency-testing exam remotely using the remote proctoring software. Out of 472, 304 filled in the questionnaire, 213 women and 91 men. Our findings indicate that students' perceptions are ambiguous regarding remote proctoring. Increased text anxiety but also feelings of reassurance are indicative of students' mixed feelings about remote proctoring.

Context factors affecting experienced agency to engage in interprofessional feedback dialogues
Keywords: Assessment Methods, Feedback, Health-care Education, Lifelong Learning
Presenting Author: Marije Lesterhuis, UMC Utrecht, Netherlands; **Co-Author:**Marijke Eurelings, Spaarne Gasthuis, Netherlands; **Co-Author:**Marieke van der Schaaf, University Medical Center Utrecht / Utrecht University, Netherlands; **Co-Author:**Reinier Hoff, University Medical Center Utrecht, Netherlands

Interprofessional feedback at the workplace can be driver of residents´ development and improvement of communication and collaboration in healthcare teams. However, interprofessional feedback dialogues are still scarce. We questioned which contextual factors affect residents and healthcare professionals´ feelings of agency to engage in this dialogue. Agency is defined as the interaction between the individual´s capacity and context factors. Therefore, semi-structured interviews (residents *n=9,* healthcare professionals *n*=9) were performed and thematically analyzed on the factors mentioned. Results are presented according to different social systems of interactions: from microsystems representing residents and healthcare professionals' interactions, till exo- and macro systems that create policies and norms respectively that affect feelings of agency. We conclude that in the complex context of a hospital, existing out of several systems, many factors affect feelings of agency. For example, on the level of the residents and healthcare professionals, experienced capacity and attitude are at play. Curriculum designers affect the feelings of agency by the feedback instruments provided for residents. But feedback culture and experienced hierarchy play a role as well. For future research on the effectiveness of feedback interventions these results imply that context needs to be considered. For practice this means that when aiming to increase interprofessional feedback, multiple stakeholders within a hospital should be aware on how they can play a role.

The impact of paediatric public health degree programs: hope for South Africa.
Keywords: Competencies, Health-care Education, Higher Education, Qualitative Methods
Presenting Author: Danica Sims, University of the Western Cape, South Africa; **Co-Author:**Anthony Westwood, University of Cape Town, South Africa; **Co-Author:**Jawaya Shea, University of Cape Town, South Africa

Background: Maternal, neonatal, child and adolescent Public Health (MNCAPH) is a discipline in the health sciences that deals with the many areas that determine the health and wellbeing of these vulnerable groups.*Methods*: Graduates of MNCAPH programs, from a number of African countries, were invited to participate in online semi-structured interviews (n = 13). Thematic analysis of verbatim transcripts was undertaken.*Results*: Three dominant themes were developed: educational content; educational practice; and, the impact of educational programmes; along with a number of sub-themes and descriptors. For educational content, the public health perspective, including contextualised community-based child rights and advocacy, was emphasised. The courses on leadership and management were especially helpful for district-level health professionals. In terms of educational practice, encompassing the flexible blended teaching, learning and assessment approaches, graduates found the diversity of their peers to be rich resources to draw upon, the interdisciplinary teaching staff valuable, the remote learning environment supportive, but the workload intensive and institutional administrative support lacking. The reflective and experiential pedagogical methodology was highlighted as effective. Graduates' experiences of their postgraduate MNCAPH training was overwhelmingly positive. The impact of the programmes were evidenced by improved senses of agency, leadership and management competency by graduates. Furthermore, their metacognitive reflection, communication skills, public health systems thinking and use of data for systemic decision-making were enhanced. Some graduates reported career promotion as a result of their qualification.*Conclusions*: Overall, the MNCAPH curricula were found to be contextually responsive, addressing African health system needs.

Students' experiences of remote online exams at a distance learning university
Keywords: Assessment Methods, E-learning/ Online Learning, Higher Education, Pandemic
Presenting Author: Simon Cross, The Open University, United Kingdom; **Co-Author:**Maria Aristeidou, Institute of Educational Technology/The Open University, United Kingdom; **Co-Author:**Klaus-Dieter Rossade, The Open University, United Kingdom; **Co-Author:**Carlton Wood, The Open University, United Kingdom

As a result of the Covid-19 pandemic, universities had to re-structure their assessment design, policies and processes. The assessment conversation around the design of the online exams and the technology used aimed at ensuring that student expectations were met while securing assessment standards. This study aimed to explore student views at a major distance-learning university in the UK about participating in online remote exams. The institution replaced the common pre-covid practice of taking face-to-face exams at local centres appointed by the university with remote open book-style exams. Findings from 107 student responses to an online survey on online exams pointed to positive and negative areas of experience with online exams. This study provides an agenda for universities with temporary and permanent distance learning programmes to develop or improve ways that students or particular groups of students are assessed by providing positive areas of perception.

Reducing cheating behavior in online exams by considering students' needs, conceptions, and reasons
Keywords: Assessment Methods, E-learning/ Online Learning, Higher Education, Mixed-method Research
Presenting Author: Marco Rüth, University of Cologne, Germany; **Co-Author:**Maria Jansen, University of Cologne, Germany; **Co-Author:**Kai Kaspar, University of Cologne, Germany

University students have been taking online exams with increasing frequency since the start of the Covid-19 pandemic. However, cheating is widespread in online exams and can hamper the informative value of exam results as well as student learning and well-being. To reduce cheating behavior in online exams, university students' needs, conceptions, and reasons should be considered and understood in more detail. Consequently, we examined the role of students' needs, conceptions, and reasons in students' cheating behavior by means of an experimental, correlational, and qualitative approach. Based on an online survey of 339 university students, we identified important student needs, conceptions, and reasons. University students' cheating intention was lower when they expected exam content that is relevant to their profession, practically relevant exam tasks, and detailed feedback. In addition, university students' past cheating behavior was lower when they agreed that online exams improve teaching, and students refrained from cheating because of fear of consequences and moral standards and values. Overall, our findings can be useful in the design of online exams and support efforts to reduce cheating.

Using a conversational agent to support goal setting amongst higher education students
Keywords: E-learning/ Online Learning, Higher Education, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Gabrielle Martins Van Jaarsveld, Erasmus University Rotterdam, Netherlands; **Co-Author:**Jacqueline Wong, Utrecht University, Netherlands; **Co-Author:**Martine Baars, Erasmus University Rotterdam, Netherlands; **Co-Author:**Marcus Specht, TU Delft, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands

Goal setting is the first and driving stage of the self-regulated learning (SRL) cycle. Studies have shown that supporting goal setting is an effective means of improving academic performance and SRL skills among higher education students. However, doing so can be a complex and resource-intensive process. In this study, a goal-setting conversational agent was designed and deployed to support higher education students in setting and reflecting on short-term academic goals. Following a 2x2 factor design, we tested the effect of goal setting prompts (guided vs. unguided) and Feedback (with vs. without) when delivered via a goal setting conversational agent. We explored the effect of these goal setting characteristics (i.e., guidance and feedback) on students' 1) goal quality, 2) goal attainment, and 3) changes in goals over time. Findings showed that both guidance and feedback had a significant effect on goal quality. They also revealed that goal guidance provided initially high-quality goals, but feedback was needed to maintain this quality over time. This study provides insights into how a goal setting conversational agent can be used to support the academic goal setting process for higher education students. Furthermore, this study informs future iterations of the design of this goal setting conversational agent, which will be trained to offer students personalized support and feedback to enhance their SRL process.

Back to face-to-face teaching and learning: I (don't) want to!
Keywords: E-learning/ Online Learning, Higher Education, Pre-service Teachers, Self-efficacy
Presenting Author: Elisabeth Seethaler, Pädagogische Hochschule Salzburg, Austria; **Presenting Author:**Julia Klug, PH Salzburg, Austria

When courses began to be held online in March 2020 due to COVID-19, we did not know yet that the following four semesters would be almost completely online. This brought unknown challenges for teachers and students. In 2021, we investigated teacher students' preferences for online vs. f2f learning, their self-efficacy, motivation, emotions and self-assessed achievement in an online-learning (OL) setting after two semesters of pandemic-caused OL. In the present study, we want to compare the findings of the previous study with a sample of teacher students with four semesters of OL to see if their assessments differ. We used data of 135 teacher students from an Austrian educational university (53 with four and 82 with two semesters of OL experience). All participants worked on the Teachers' Sense of Efficacy Scale and self-constructed closed and open-ended items to assess their preferences, reasons, effort, achievement, motivation and emotions. Combining quantitative and qualitative analyses, we found that most of the students still prefer f2f teaching, even after four semesters of OL. However, the advantages they see in OL are more differentiated when teachers and students are more experienced in OL. Teacher self-efficacy still rises in the fourth semester of OL. Students evaluate effort as lower than and achievement as similar as in f2f teaching. Levels of affect and motivation do not differ between the four- and two-semester OL groups. These results can give us hints for planning future courses, like relying on approved OL methods, whilst getting back to f2f teaching and learning.

Learning Aids' Effect on Mathematics in Grade 8 of Vocational Education in Flanders (Belgium)
Keywords: Large-scale Assessment, Mathematics/Numeracy, Secondary Education, Vocational Education and Apprenticeship Training
Presenting Author: Margo Vandenbroeck, KU LEUVEN (BE 0419.052.173), Belgium; **Co-Author:**Jonas Dockx, KU LEUVEN, Belgium; **Co-Author:**Rianne Janssen, KU LEUVEN, Belgium

Based on the sociocultural theory of learning and distributed cognition, using learning aids should benefit students' performance, as learning aids can compensate for a lack of knowledge or skills and reduce strain on short term memory. The present study investigated the use of a diverse set of learning aids in Grade 8 of vocational education in Flanders (northern part of Belgium) and whether access to learning aids affects students' mathematics performance. Data from the 2019 National Assessment on Mathematics were used. A field experiment was conducted, with a condition where students were allowed to use

learning aids and a condition where students were not allowed to use learning aids. A multilevel model was used to test for differences. The results revealed that access to learning aids does not significantly increase students' performance, and, thus, access to learning aids does not generate an unfair advantage.

Not Adding It Up: Grade 1 mathematics outcomes in two South African provinces
Keywords: Achievement, Large-scale Assessment, Mathematics/Numeracy, Primary Education
Presenting Author: Irene Pampallis, University of the Witwatersrand, South Africa; **Co-Author:**Nic Spaull, Stellenbosch University, South Africa; **Co-Author:**Cally Ardington, University of Cape Town, South Africa; **Co-Author:**Ingrid Sapire, University of the Witwatersrand, South Africa; **Co-Author:**Permie Isaac, Funda Wande, South Africa

Although improving school mathematics has long been a policy priority in South Africa, learning outcomes remain low. Given the cumulative nature of mathematics, it is likely that learning deficits have their origins in the early grades. However, no reliable large-scale studies have yet assessed the mathematics knowledge of South African students younger than Grade 3. This paper begins to fill in this gap by reporting findings from two large studies of Grade 1 students. A total of 3,264 students from 57 schools in the Eastern Cape province and 120 schools in Limpopo province completed Early Grade Mathematics Assessments, testing various components of early numeracy. The test questions were classified using Fritz et al.'s (2020) 5-level model of numerical conceptual development. The results showed poor conceptual understanding overall. Very few learners (30% from the Eastern Cape sample and 27% from the Limpopo sample) had reached Level 3 (an understanding that numbers can be decomposed into smaller units), which is the basis for over 70% of the Grade 1 curriculum. This means that the bulk of the curriculum is not accessible to most children. It was also found that most participants had low computational fluency with addition and subtraction. Taken together, these results suggest that the faultlines in South African mathematics education are firmly in place before the end of Grade 1. The practical implications are clear: resources should be channelled towards developing early grade mathematics, and curricular reform should be considered to develop learners' number concept from a more basic level.

Time on task in 9th grade low-stakes and high-stakes Math assessment
Keywords: Achievement, Assessment Methods, Educational Policy, Large-scale Assessment
Presenting Author: Janica Vinni-Laakso, University of Helsinki, Finland; **Co-Author:**Risto Hotulainen, University of Helsinki, Finland; **Co-Author:**Sirkku Kupiainen, University of Helsinki, Finland

The present study incorporates two strands of educational research and theory: The relative impact of cognitive competence and motivational attitudes in explaining achievement, and the mediating role of time on task (TOT) on students' attainment in high-stakes vs. low-stakes assessment. The data is drawn from a national sample of 8495 Finnish ninth graders in an assessment of curricular and non-curricular competences and motivation. The results based on Structural Equation Model show that motivational attitudes relates to Math test scores in low-stakes and high-stakes conditions, and more strongly in low-stakes condition. TOT was shown to mediate the association between motivational attitudes and Math test scores in both conditions, while also showing direct relations. TOT was shown to mediate the effects between motivational attitudes and Math test scores more strongly in low-stakes than in high-stakes assessment. Girls, on average, spend more time on Math tasks in both test conditions compared to boys. However, gender was not significantly related to test scores directly. Finally, academic achievement was associated with motivational attitudes, TOT, and Math test scores in both low-stakes and high-stakes conditions. The results have implications for schools/ teachers and for interpreting the results of both national and international low-stake assessments.

What explains the performance gap in mathematics between native and immigrant students in Finland?
Keywords: Large-scale Assessment, Learning Analytics, Mathematics/Numeracy, Migrant / Refugee and Minority students
Presenting Author: Faruk Nazeri, Tampere University, Finland; **Co-Author:**Mari-Pauliina Vainikainen, Tampere University, Finland

Students' immigrant background is associated with weaker educational achievement. The PISA studies have revealed that the difference between immigrant and native students is among the largest in Finland. It has been suggested that immigrant students' lacking skills in the language of teaching is reflected on their performance in other areas. The aim of this study was to explain the differences between native and immigrant students in mathematics assessment tasks. We used the data from a nationally representative DigiVOO study (N=8557) assessing students' performance in Finnish and Mathematics. We used multiple-group structural equation modelling to compare native students, first and second generation immigrants, and multicultural students. The results showed expected differences between the groups in the Finnish and Mathematics tests. Students' performance in the Finnish test was a relatively strong predictor of performance in all groups. The use of digital technology in schools predicted math scores negatively, but the effect was statistically significant only for native students who reported lower levels of technology use compared to the different immigrant groups. The strongest predictor of performance was time on task extracted from the log files. This indicates that the deficits in the language of teaching is only a partial explanation of lower performance of immigrant students in other domains and the effort put in assessment tasks also play a significant role. We conclude that lower performance of immigrant students is a much more complicated phenomenon than what assessment research has often focused on and discuss possible ways of closing performance gaps.

A Comparison Between Rereading and Reading of Multiple Texts
Keywords: Learning Strategies, Metacognition, Reading, Self-regulated Learning and Behaviour
Presenting Author: Peter Seban, Institute of Psychology, Czech Academy of Sciences, Slovakia; **Co-Author:**Kamila Urban, Institute for Research in Social Communication, Slovak Academy of Sciences, Slovakia; **Co-Author:**Radovan Šikl, Institute of Psychology, Czech Academy of Sciences, Czech Republic

Rereading is a widely used learning technique but its effectiveness is questionable. We have therefore investigated whether the multiple text reading technique, which is rather similar to rereading, might provide more benefits to learners. We used an experimental design where we compared test performance and accuracy of metacognitive judgements of a multiple text reading group, rereading group, and single reading group in a one-day vs. one-week delayed test. 186 psychology students participated in the experiment. Results of the knowledge test indicate that in the one-day delayed test, multiple text reading and rereading yield similar results: both deliver slightly better results than single reading. In the one-week delayed test, though, multiple text reading yields better results than rereading, and both these techniques outperform single reading. Moreover, multiple text reading results in fairly robust knowledge retention with only a slight decrease in scores between the one-day delayed and one-week delayed test. Regarding metacognitive monitoring, judgements of learning in the multiple text reading group remained relatively stable after each reading and participants were underconfident about their knowledge. In the rereading group, judgements of learning increased after each reading and participants were overconfident about their knowledge, especially on the one-day delayed test.

The Role of Headings for Self-Regulated Learning From Texts
Keywords: Instructional Design, Metacognition, Reading, Self-regulated Learning and Behaviour
Presenting Author: Anja Prinz-Weiß, University of Education Karlsruhe, Germany; **Co-Author:**Aline König, University of Education Freiburg, Germany

When learning from texts, it is important not only that learners remember and comprehend the contents but also that they monitor and accurately judge their memory and comprehension so as to efficiently regulate their learning. In the present experiment with 51 university students, we investigated to what extent

headings within texts promote these processes. The results revealed that headings supported learners in comprehending the texts as well as in accurately judging their comprehension. The effects of headings on memory and judgment accuracy concerning memory were less pronounced. This study indicates the usefulness of implementing headings in texts to support learners in self-regulated learning from texts.

Do E-book interventions help promote near-transfer in first-grade students?
Keywords: Early Childhood Education, Educational Technologies, Metacognition, Self-regulated Learning and Behaviour
Presenting Author:GILA DUSHNITZKY, Talpiot College of Education, Israel; **Co-Author:**Adina Shamir, Faculty of Education, Bar-Ilan University, Israel

Children at-risk for SLD are often characterized by developmental delays in language and literacy acquisition and show difficulties in metacognitive skills that might affect transfer of previous learning to new contexts. Thus, researchers are looking for interventions that could support such literacy abilities and transfer. The current study investigated the effects of metacognitive interventions (general/specific/combined) with an electronic book (e-book) for promoting transfer of literacy (vocabulary, word reading, story comprehension) among 150 first-grade students at risk for SLD, from one e-book to a different e-book with a similar structure. The findings show that specific and combined metacognitive interventions may support transfer of vocabulary & story comprehension. However, the metacognitive interventions do not support transfer of Word Reading from the e-book. The results will be discussed.

Improving Monitoring Accuracy and Text Comprehension: Effects of Delayed and Immediate Diagramming
Keywords: Comprehension of Text and Graphics, Instructional Design, Secondary Education, Self-regulated Learning and Behaviour
Presenting Author: Sophia Braumann, University Utrecht, Netherlands; **Co-Author:**Margot van Wermeskerken, Utrecht University, Netherlands; **Co-Author:**Héctor J. Pijeira-Díaz, Maastricht University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Learners need to make strategic study decisions, such as planning, seeking help, and restudying, based on their judgments about their own text comprehension (i.e., monitoring). Unfortunately, students' monitoring of their own text comprehension is often inaccurate, which can lead to suboptimal restudy decisions. Completing causal diagrams after text reading (i.e., diagramming) has been shown to improve students' monitoring of text comprehension to some extent. Furthermore, studying completed causal diagrams was shown to improve text comprehension. In two experiments, we investigated whether students' monitoring accuracy and text comprehension could be further improved by providing feedback in the form of a correctly completed diagram (i.e., standard) with and without instructions for scoring one's own diagrams. Additionally, we tested whether the effect of self-scoring instructions (SSI) on monitoring accuracy transfers to later trials without SSI, and whether delayed (Experiment 1) or immediate (Experiment 2) diagramming after reading improves monitoring accuracy and text comprehension. In Experiment 1, 125 secondary school students were assigned to one of two conditions: diagramming+standard or diagramming+standard+SSI. We found that students with SSI did not outperform students without SSI on monitoring accuracy or text comprehension on the delayed diagramming task. We conclude that providing explicit self-scoring instructions during diagramming does not have an added value for improving students' monitoring accuracy compared to diagramming and receiving a correct diagram-standard in a delayed diagramming intervention. Data collection for Experiment 2 on the effects of immediate diagramming is still ongoing and results will be presented during EARLI.

GaiaXus Citizen Science: New Avenues for Metacognition, STEM Career Motivation, and Achievement
Keywords: Achievement, Metacognition, Motivation, Science and STEM
Presenting Author: Suzanne Hiller, Blue Swallow Farm Foundation, Center for Research and Instruction in the Natural World, United States

Citizen science, an activity where hobbyists collect data for professional research studies, provides authentic learning experiences, which support student STEM self-motivational beliefs, achievement, and career motivation. An area less studies is how integrating metacognitive monitoring within citizen science program further enhances these dynamics. The current presentation outlines a series of studies using the GaiaXus probe, an innovative tool which precisely measures water quality, while simultaneously providing citizen scientists with metacognitive prompts to analyze and interpret data. Research studies occurred in the Southeast United States with high school citizen science programs, which incorporated the GaiaXus probe, contributory and student-directed forms of citizen science, and interactions with scientists and engineers. Findings from this body of work highlight the implications of this type of tool for expanding student achievement, self-motivational beliefs, environmental attitudes, and behaviors. Suggestions for practical classroom applications and future research will be provided.

Concreteness in Quantum Chemistry
Keywords: Higher Education, Instructional Design, Science and STEM, Science Education
Presenting Author: Charlotte Müller, ETH Zurich, Switzerland; **Co-Author:**Markus Reiher, ETH Zurich, Switzerland; **Co-Author:**Manu Kapur, ETH Zurich, Switzerland

Concreteness fading is an instructional approach that suggests to start with concrete representations and progress sequentially to more idealized representations. It has been previously argued that since external representation highly differ between domains, concreteness fading might not be generalizable. Here, we argue from the perspective of the definition of concreteness rather than the external representations. We analyze standing domain-specific definitions of concreteness in chemistry and offer a starting point for a discussion to solve this verbal dispute. Specifically, we argue that concreteness might not be sufficiently described when defined unidimensional. Rather, aspects of concreteness that are targeted should be clearly specified.

Is mathematics and science integration worth the cost?
Keywords: Instructional Design, Mathematics/Numeracy, Meta-analysis, Science and STEM
Presenting Author: Patrice Potvin, Université du Québec à Montréal, Canada; **Co-Author:**Emmanuel Ahr, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Stéphane Cyr, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Martin Riopel, Université du Québec à Montréal (UQAM), Canada

Hurley's 2001 systematic review on mathematics and science integration revealed a somewhat positive effect of fully integrated and mathematics-infused science lessons on science performances. As many national and international institutions made calls for a better integration of mathematics and science for the 21st century, we investigated the current state of the question by means of a qualitative and quantitative systematic review of the literature from the last twenty-five years. We found as few as five studies that addressed this issue by means of a pre-test/post-test and experimental group/control group design. A detailed examination of these five studies revealed that mathematics-infused science lessons does improve mathematics and mathematics-infused science performances more than science lessons that did not purposedly include mathematics. Mathematics-infused and non-integrated lessons impacted pure science performances equally. Moreover, one study revealed that a fully integrated lesson did not improve performances on an integrated science assessment more than a non-integrated lesson. Our findings support somewhat of a truism according to which mathematics-infused science lessons improve science performances on mathematics-infused science assessments only.

Effect of a Workshop Intervention on Faculty Instructional Practices: A Randomized Control Trial
Keywords: Higher Education, Quantitative Methods, Science and STEM, Teacher Professional Development
Presenting Author:jenefer husman, University of Oregon, United States; **Co-Author:**Maura Borrego, The University of Texas at Austin, United States; **Co-Author:**Cynthia Finelli, University of Michigan, United States; **Co-Author:**Michael Prince, Bucknell University, United States; **Co-Author:**Lea Marlor, University of Michigan, United States

In this study, we utilized a randomized control trial to evaluate the effect of a faculty development workshop on Science, Technology, Engineering, and Mathematics undergraduate faculty's plans to use Active Learning and Strategies to Reduce Students' Resistance to Active Learning. Additionally, we examined the impact of the workshop on changing the relation between faculty's perception of student attitudes on changes in their instructional practices. We found, over the course of the term, participants increased their plans to use Active Learning and Strategies to Reduce Students' Resistance to Active Learning regardless of their participation in the faculty development workshop. The workshop did increase faculty's plan to use Explanation Strategies to Reduce Resistance. Additionally, we found that the workshop did have an impact on the relation between faculty's perception of Student Attitudes as a Barrier to change in instructional practices and their change in plans to use Active Learning and Explanation strategies. These findings suggest that even a relatively short faculty workshop can have a modest effect on changes to instructional practices and highlight the importance of using rigorous research methodology when testing the effectiveness of any intervention.

"you're supposed to be good at science": Making Experiences of Asian-American Women in STEM Visible
Keywords: Cultural Diversity in School, Higher Education, Science and STEM, Well-being
Presenting Author: Dionne Cross Francis, University of North Carolina at Chapel Hill, United States; **Co-Author:**Jasmyne Yeldell, University of North Carolina Chapel Hill, United States; **Co-Author:**Pavneet Kaur Bharaj, University of North Carolina, United States; **Co-Author:**Anina Mahmud, University of North Carolina, United States; **Co-Author:**Kerrie Wilkins-Yel, University of Massachusetts Boston, United States

One of the poignant issues influencing Asian-American Women of Color's racialized and gendered experiences in STEM is the ostensibly positive stereotype surrounding their academic ability, described as the Model of Minority Myth (MMM). We explored how this phenomenon impacted Asian-American women's experiences within academic spaces. Based on the data from participants' race/gender-based experience, we found that all participants either downplayed these experiences or internalized the existing positive stereotypes without recognizing its psychological toll on their mental wellbeing. The study calls to go beyond simply raising institutional and faculty and student awareness about creating healing spaces with meaningful interaction across racial groups.

Gender differences in adolescents' task value development based on dimensional comparison
Keywords: Achievement, Gender Issues, Motivation, Science and STEM
Presenting Author: Kezia Olive, University of Helsinki, Finland; **Co-Author:**Janica Vinni-Laakso, University of Helsinki, Finland; **Co-Author:**Junlin Yu, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

This study addresses gender differences in values through examining relationships between past achievement to subsequent task values. Taking the Situated Expectancy-Value Theory framework (Eccles, 2011; Eccles et al., 1983), we aim to investigate the processes through which girls and boys develop their task values based on previous achievement through dimensional comparison (Möller & Marsh, 2013). Participants were from a longitudinal sample of students from 38 middle schools in Helsinki (N = 1471, mean age at grade 7 = 12.8 years old). We use their task values and achievement data from grade 7 to 9 in Mathematics, Physics, and Finnish language subjects. We will model their end-of-year grades in the specific subjects and their subsequent task values in each domain using multi-group analysis. We hypothesize that girls and boys differ in the strength of their cross-domain comparison. Specifically, we expect gender differences in the strength of cross-domain comparison between subjects in mathematical domains (i.e., mathematics and Physics) and verbal domain (Finnish language). Preliminary analysis shows that girls' subsequent task values seem to be more influenced by their verbal domain achievement, while boys by their mathematical achievement. Further investigation will test whether the direction and strength of the relationship between achievement and subjective task value is moderated by gender. These results will inform educators and researchers alike on potential points for interventions to support students' domain-specific values development.

Exploring the dynamic features of team reflexivity in student project teams
Keywords: Communities of Learners and/or Practice, Higher Education, Lifelong Learning, Metacognition
Presenting Author: Lieke Lochten, University of Antwerp, Belgium; **Co-Author:**Piet Van den Bossche, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium

Teams are widely used in workplaces and workforces. The past decades, many scholars have studied how teams function and what determines their success. Teams have to cope with setbacks, adapt and grow to remain successful. These crucial actions relate to the concept of team reflexivity. Although many studies conclude that reflexivity is helpful for team performance, the process of the phenomenon has received far less attention. There is no profound understanding about how reflexivity develops and manifest in teams. This study aims to describe the dynamic features of team reflexivity. More specifically, it will explore whether and how different reflexive behaviors develop and evolve over the course of a team's lifespan. In a longitudinal study with 12 student project teams, we discovered several patterns in the developmental path of team reflexivity. We conclude that team reflexivity does not develop in a linear way, but has fluctuations over time. Furthermore, we noticed differences in the reflexive trajectory between teams and between underlying behaviors and components of team reflexivity.

Student Engagement and the Learning Environment in the First Year in HE – A Systematic Review
Keywords: Achievement, Developmental Processes, Engagement, Higher Education
Presenting Author: Taiga Brahm, University of Tübingen, Germany; **Co-Author:**Mikaël De Clercq, Université catholique de Louvain (UCL); Académie de Recherche et de l'Enseignement Supérieur (ARES), Belgium; **Co-Author:**Franziska Zellweger, Zurich University of Teacher Education, Switzerland

The question of students' successful transition to Higher Education (HE) has been largely investigated for many years now. Research showed that student's engagement is one of the most proximal predictor of student success and that students' diversity need to be considered in order to better understand this challenging period. Yet it is still unclear today how the learning environment empirically plays a role for the transition of diverse students during their first-year of studying. Grounded in the educational interface model, this systematic literature review investigated recent studies on students' experience during the first-year in HE. More precisely, this research focuses on the question: How does the learning environment support student engagement during the transition to HE? Guided by the PRISMA 2020 statement, the search string allowed to identify 349 studies. Those studies were screened and refined to 22 articles directly relevant to our research question. Content analysis of the full papers will be conducted which will be finished for the EARLI conference.The result of this

systematic review aimed at reducing the shortage of consideration of the learning environment on first-year experience. It also focused on the identification of the features of the learning environment that provide a better consideration for students' diversity. From a practical point of view, a clarification of the role of the learning environment can support lecturers in designing more engaging classes and study programs.

Professional identity development and academic success during the transition to higher education
Keywords: Achievement, Educational Attainment, Higher Education, Quantitative Methods
Presenting Author: Pieter van Lamoen, Erasmus University Rotterdam, the Netherlands, Netherlands; **Co-Author:**Marieke Meeuwisse, Erasmus University Rotterdam, Netherlands; **Co-Author:**Annemarie Hiemstra, Erasmus University Rotterdam, Netherlands; **Co-Author:**Arends Lidia, Erasmus University Rotterdam, Netherlands; **Co-Author:**Sabne Severiens, Erasmus University Rotterdam, Netherlands

Besides being a challenging educational transition, the transition to higher education (HE) can be understood as a major career transition that constitutes the start of students' professional identity development in particular fields, for instance, Law, Engineering, or Medicine. The purpose of this paper was to investigate the development of ethnic majority and minority Law students' professional identity over the course of their first year in HE and the extent to which this identity is influenced by perceived social factors in the learning environment (sense of belonging to the study programme and teachers as role models). Further, it was tested whether a strong professional identity supports students during the transition to HE in terms of achievement and retention in the course programme. To do so, we used recently obtained questionnaire data administered at two time points (Nt1 = 204; Nt2 = 141) linked to student background information and objective achievement data obtained from the university's educational research database. First analyses, using linear regression modelling, showed that sense of belonging and perceiving senior teachers as role models were positively related to professional identity development in the first year, both for ethnic majority and minority students. Perceiving junior teachers as role models did not contribute to professional identity development. Analyses further indicated that students with a stronger professional identity had a higher intention to continue their studies in the law field. Further analyses will be performed with the data from the university' educational research database, using structural equation modelling.

Doctoral graduates in the eye of employers outside academia
Keywords: Attitudes and Beliefs, Doctoral Education, Quantitative Methods, Researcher Education
Presenting Author: Lien Wille, Ghent University, Belgium; **Co-Author:**Anneleen Mortier, Ghent University, Belgium; **Co-Author:**Katia Levecque, Ghent University, Belgium

Doctoral graduates play a crucial role in economic growth (Cyranoski, Gilbert, Ledford, Nayar, & Yahia, 2011) as well as innovation creation and diffusion (Garcia-Quevedo, Mas-Verdú, & Polo-Otero, 2012). Doctoral graduates may fulfill this role from a job in academia, but also from a non-academic job (Mortier, Levecque, & Debacker, 2020). The transition to the non-academic labor market and the difficulties associated with it have been researched from the doctoral graduates' perspective. The other side of mobility from academia, the employer-side, is however often overlooked (Wille, Legrand, Mortier, & Levecque, 2020). Nevertheless, employers' perceptions of doctoral graduates may present barriers hindering doctoral graduates' transition to the non-academic labor market. The limited number of studies that focused on how non-academic employers think about doctoral graduates indicate that they hold positive and negative stereotypes concerning doctoral graduates' knowledge, skills, abilities, and personal characteristics (CFE research, 2014; Stassen, Levecque & Anseel, 2016). However, these studies are outdated and/or based on limited responses, leaving little room to distinguish between different types of employers. The research aim is hence to gain insights into the perceptions of employers outside academia regarding the skills of doctoral graduates and whether these perceptions differ depending on employer characteristics. Findings will be presented at the conference. The results will (1) help universities to change their doctoral training into outstanding programs that consider non-academic employers perceptions and (2) inform doctoral candidates and graduates on what skills they need to develop to a further extent when aiming for a job outside academia.

Students' Intentions to Enrol in Higher Education: The Multilevel Effects of Grade Retention
Keywords: At-risk Students, Educational Policy, Engagement, Higher Education
Presenting Author: Natalie de Nóbrega dos Santos, ISPA-Instituto Universitário, Portugal; **Co-Author:**Vera Monteiro, ISPA- Istituto Universitário, Portugal; **Co-Author:**Carolina Carvalho, UIDEF, Instituto de Educação da Universidade de Lisboa, Portugal

Higher education has become an increasingly valued instrument for social cohesion and democracy and a central element of economic stability and development. The present study aimed to explore the impact of grade retention and schools' retention composition on students' intention to enrol in higher education. Additionally, we studied the mediation effects of students' school identification and behavioural engagement on the relationship between grade retention and students' intention to enrol in higher education at the individual level. We used a probabilistic, multi-stage sample of 1089 students from the 6^{th} to 10^{th}grade level, spread over 45 public schools in Portugal. The multilevel probit regression model with random intercept and fixed slopes showed that retained students were less likely to enrol in higher education. Furthermore, students in schools where there was a higher proportion of retained students had a lower probability of intent to enrol in higher education. This association was mediated at the individual level by students' school identification. Students retained presented lower levels of school identification, resulting in a lower probability of intention to enrol in higher education. Students' behavioural engagement was related neither to grade retention nor to students' intentions. Our findings suggest that attending higher education could be supported by finding alternatives to grade retention and creating a supportive classroom environment that fosters students' school identification.

Career-related perceptions of the Atidim program graduates
Keywords: Higher Education, Interest, Science and STEM, Self-efficacy
Presenting Author: Or Shav-Artza, Technion, Israel; **Co-Author:**Shahaf Rocker Yoel, Technion, Israel; **Co-Author:**Yehudit Judy Dori, Technion and Samuel Neaman Institute, Israel

In response to the severe shortage of science and technology personnel in Israel, the Atidim (Futures) program was established in 1999 with the aim of increasing the number of populations from under-represented groups who choose a scientific or technological career as a three-year national service. The goal of the current research is to investigate the perceptions of the Atidim graduates about choosing a career in science, technology, engineering, mathematics, or medicine (STEMM). The theoretical framework of this study is based on the social-cognitive theory (SCT), the social-cognitive career theory (SCCT), and the theory of justice of Rawls. Examining 215 Atidim graduates, we identified five new factors that combine the three theories and the relations between the factors that influence the choice and persistence in scientific and technological career at an early age among under-represented groups in academia. Results showed that self-efficacy with respect to family-work balance is in line with SCT and SCCT, and social justice is served by narrowing the gap between central and peripheral populations, both culturally and economically.

Academic Writing Interventions in Higher Education: A Systematic Review
Keywords: Higher Education, Synergies between Learning / Teaching and Research, Teaching/Instructional Strategies, Writing/Literacy
Presenting Author: Julianne van Meerten, University of Maryland, United States

In this systematic review, academic writing interventions in higher education are analyzed for academic writing genre, types of intervention and instructional features, and overall effectiveness regarding undergraduate students' academic writing. Interventions included in the review are empirical studies conducted in a classroom environment that employed an academic writing outcome measure. Preliminary findings regarding academic writing genres, types of intervention, and patterns regarding instructional features are discussed. Conclusions of the review will serve both researchers and practitioners regarding what has been done in the field of academic writing in higher education, as well as practical recommendations for supporting undergraduates' academic writing in instructional practice.

How Data Literate Is My School Team? Designing An Instrument To Measure Data Literacy
Keywords: Communities of Learners and/or Practice, Teacher Efficacy, Teacher Professional Development, Tool Development
Presenting Author: Ariadne Warmoes, Vrije Universiteit Brussel (VUB), Belgium; **Co-Author:**Iris Decabooter, Hasselt University, Belgium; **Co-Author:**Els Consuegra, Vrije Universiteit Brussel, Belgium; **Co-Author:**Katrien Struyven, Hasselt University / Vrije Universiteit Brussel, Belgium; **Co-Author:**Roos Van Gasse, University of Antwerp, Belgium

Research shows that educators' decisions are best based on expertise and data, often referred to as the process of *data use*. Educators' data literacy is an important enabler for effective data use (e.g. Schildkamp & Kuiper, 2010). However, these competences appear to be poorly developed in schools. Collaborative inquiry is considered essential, because it can make up for an educators' lack of data literacy (Schildkamp & Kuiper, 2010). As data use is proven to be a collective process, the question arises if the different competences of data literacy should be present in a school team, rather than individuals being proficient in all of the competences. Current data literacy instruments measure individuals cognitive data skills and not the team's capability of applying systematic data use (Ansyari et al., 2020). In this roundtable we present a conceptual instrument to measure school teams' data literacy. The instrument is based on analyzing school teams' data discussions around hypothetical data scenarios. This contributes to the need of a measurement instrument for data literacy that captures its complex and collective construct. ReferencesAnsyari, M. F., Groot, W. & De Witte, K. (2020). Instructional Quality in Economics Education
Keywords: Classroom Assessment, In-service Teachers, Teacher Effectiveness, Teaching/Instructional Strategies
Presenting Author: Stefanie Findeisen, University of Konstanz, Germany; **Co-Author:**Patricia Köpfer, University of Hohenheim, Germany; **Co-Author:**Liane Platz, University of Konstanz, Germany

Classroom instruction is often described as the core business of teachers. Therefore, instructional quality has become a strong focus of empirical research. General, subject-independent characteristics of teaching quality (three generic dimensions cognitive activation, constructive support, and classroom management have become established) are now considered to be quite well studied. Quite recently, it is being discussed whether these quality aspects are applicable across subjects and how the framework of instructional quality needs to be adapted for different domains. However, there are still hardly any findings on subject-specific characteristics of teaching quality. The present study addresses this research gap and investigates instructional quality in economics education. We implement a video study in economic classrooms of ten teachers with their 280 students. We follow each class over the course of eight lessons. Both teachers and students are surveyed prior to the first lesson and after the eighth lesson. In the analyses we specifically combine the basic dimensions of general instructional quality with subject-specific aspects (e.g., use of action-oriented methods; fostering students' ability to assess economic situations from different (contradictory) perspectives). We also pay specific attention to classroom activities that are typically regarded as subject-specific (e.g., explaining content, handling student errors). In addition, we are interested in the stability of different quality aspects over the course of several lessons and in differences and commonalities in the perception of different perspectives (students, teachers, and observers). Finally, we relate instructional quality to students' learning both in a post-test and in the next exam.

Practice-based educational research: making practice-research activities part of teacher's work
Keywords: Communities of Learners and/or Practice, Qualitative Methods, Synergies between Learning / Teaching and Research, Teacher Professional Development
Presenting Author: Anna Åkerfeldt, Stockholm University, Sweden; **Co-Author:**Sylvana Sofkova Hashemi, University of Gothenburg, Sweden

An international trend in educational policy aims to stimulate links between educational research and practice (Wyse et al, 2018) with the purpose to develop, and understand how things work in a classroom rather than strive for a fixed solution. Research projects from this perspective have varied theoretical and methodological approaches and different study designs such as action research, design-based research, intervention, and learning study. One challenge in practice-based educational research is to achieve collaboration between practitioners and researchers that works and is part of the teachers' regular tasks and everyday work: what is meant and expected by collaboration, how is it planned for, what roles are possible, and desirable, for teachers to take and, how do teachers develop and perceive the possibilities of agency and ownership in research and work? This round table invites scholars to take part in a discursive explorative discussion on these issues starting with an example from an ongoing Swedish research project Teachers' meta knowledge and assessment practices in digital, multimodal learning environments, that applies a Design-Based Research research approach (Ball, 2004; McKenney & Reeves, 2019). ReferencesBall, P. (2004). On the Theoretical Breadth of Design-Based Research in Education. ICT Demonstration

Translating evidence into practice: A clearinghouse approach for (pre-service) teacher education

Keywords: E-learning/ Online Learning, Pre-service Teachers, Teacher Professional Development, Teaching Approaches
Interest group: SIG 11 - Teaching and Teacher Education

Please bring your own device if you are attending this ICT demonstration.The purpose of the *"Clearing House Unterricht (Engl.: Teaching)"* project *(CHU)* is to provide a link between research and practice in teacher education. With the *CHU*, we want to support evidence-based decision-making and practice for teacher educators, (pre-service) teachers and interested educators by informing them about recent and relevant educational research evidence in a targeted way. The central product of the *CHU* is a public service platform that offers access to recent educational research evidence in various formats (e.g., short summaries, podcast, and glossary). The development and design of these formats follow quality standards, which we developed according to literature and user feedback. The material can be used as learning tools in a course or as part of a self-study for teacher students, or anyone else who wants to expand their knowledge on effective teaching.With the newly founded *CHU-Academy* we developed a digital learning environment, which aims at further facilitating teacher educators in working with the *CHU* formats and educational research evidence. The *CHU-Academy* introduces the basics and background of empirical educational research: from experimental research to the proper interpretation and classification of effect sizes. Further courses focus on effective teaching strategies, such as inquiry learning, flipped classroom, etc. Both understanding and implementing research evidence paves the way for evidence-based teacher education and, in turn, for the implementation of evidence-based teaching. During the ICT-Demonstration we will give insights into the materials (specifically, the *CHU*-short summaries) and the *CHU-Academy* learning platform with its course offerings.

Enhancing GTAs' questioning techniques in a mandatory training course
Keywords: Pre-service Teachers, Teacher Effectiveness, Teacher Efficacy, Teaching/Instructional Strategies
Presenting Author: Peter Fat Man Lau, The University of Hong Kong, China

This action research aimed to explore whether a new implementation in a mandatory training course could enhance graduate teaching assistants' (GTAs) questioning techniques. Based on the three modeling stages of Chen's (2016) theoretical framework, implementation was designed. It included an interactive quiz using a game-based online tool (*teacher questioning stage*), a debriefing to reinforce the concept of effective questioning techniques (*group discussion stage*) and a guided reflection to identify mistakes in questioning techniques and to revise questions (*student question generation stage*). 37 and 38 students participated in two cycles respectively. Implementation was only introduced in the second cycle. All participants completed a pre-survey on self-confidence about their teaching skills. Their final micro-teachings were observed and assessed by the same instructor using the same rubric. Thematic analysis was used to analyse instructor's feedback and students' reflection.The pre-survey results showed that all participants were not confident in teaching and crafting questions. Independent sample *t*-test to the pre-survey data showed no significant difference between the two groups. Four issues relating to questioning techniques were identified in their initial teaching practice. After training, participants experiencing implementation demonstrated higher achievement in micro-teaching. Positive significant changes were identified in two assessment criteria (Interactivity and Alignment). Quantitative and qualitative findings suggested that effective questioning techniques could be developed through Chen's (2016) three modeling stages: *teacher questioning*, *group discussion* and *student question generation*. Improved questioning techniques may also enhance GTAs' teaching skills by promoting meaningful interactions in class and strengthening the alignment between assessment and learning outcomes.

Students' participation: how it is understood and experienced by second-year teacher students
Keywords: Citizenship Education, Qualitative Methods, Teacher Professional Development, Teaching Approaches
Presenting Author: Irina Ivashenko Amdal, University of Agder, Norway; **Co-Author:**kristin endresen-maharaj, University of Agder, Norway

Teacher education institutions are responsible for qualifying teachers who can work in a democratic society. One of the crucial preconditions for this qualification is to present students with opportunities to participate in their education. In this study, we use the concept of student participation to investigate how second-year teacher students in Norway understand and experience their participation in the construction of seminars. This study was conducted on the background of a semester where teacher educators systematically collected feedback from students and used this information to construct their seminars. The data material consists of 38 reflection notes that students wrote at the end of the semester. Students were asked to reflect on four questions regarding their understanding and experience of participation during the semester. Results of the study shed light on teacher students' understanding of participation as an opportunity for influencing the seminar content as well as students' realization of their responsibility for learning. Moreover, teacher students experience participation as an opportunity to demonstrate their capability to contribute with subject-relevant content in the constructing and shaping seminars. The results also shed light on crucial preconditions for participation, namely, teacher educators' initiative and teacher students' willingness to participate.

Faculty participation in discipline-based education research in the neoliberal university
Keywords: Higher Education, Qualitative Methods, Science Education, Teaching Approaches
Presenting Author: Trisha Douin-Manning, University of Louisville, United States; **Co-Author:**Raymond Chastain, University of Louisville, United States; **Co-Author:**Jeffrey Hieb, University of Louisville, United States; **Co-Author:**Marci DeCaro, University of Louisville, United States; **Co-Author:**Linda Fuselier, University of Louisville, United States

Neoliberal ideology impacts components of the academy that have shaped teaching and learning in science and the trajectory of higher education in general. Concordant with this ideology is the increasing dependence on faculty in temporary or non-tenure-track faculty positions (NTT). We used institutional ethnography to interrogate institutional texts at a USA university for the infiltration of neoliberalism and to uncover impacts of this ideology upon choices to participate in discipline-based education research (DBER). Discourse analysis of institutional texts revealed guidance by neoliberal ideology at multiple levels. The interaction of academic position, department culture, and teacher-researcher identity emerged as central to understanding how NTT and TT professionals navigate the neoliberal university and still invest in DBER.

Teachers' implicit and explicit knowledge of learning in daily classroom pedagogy
Keywords: Assessment Methods, Knowledge Construction, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Erik Meij, Windesheim University of Applied Sciences, Netherlands; **Co-Author:**Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Anneke Smits, Windesheim University, Netherlands

It is evident that teachers should know something about how learning happens. However, we know from the literature that daily pedagogical reasoning is more often based on experience, beliefs and intuition rather than on theory. Nevertheless there might be implicit ideas and convictions that do comply with scientific principles of learning and that are used subconsciously. We investigated whether it is possible to examine if these implicit ideas comply with learning

principles.We designed a test that consists of four components differing from more implicit to more explicit assessment of how much teachers knew of or relied on principles of learning. The test was made online by more than 300 pre- and in-service teachers and researchers in secondary education. All four components were based upon ten basic principles of learning taken from APA's consensus group's list, five covering a more cognitive and five a more affective content.Participants' answers were correlated for explicit and implicit measures, within cognitive and affective principles and also for each principle. Correlations were found between reaction times and positive recognition of words, self scored extend of conviction and the use of principles in describing situations.

Invited Symposium

Process Measures in the era of Artificial Intelligence

Keywords: Artificial Intelligence, Comprehension of Text and Graphics, Computer-assisted Learning, Cooperative/Collaborative Learning, Health-care Education, Immersive Technologies for Learning, Learning Analytics, Reading, Self-regulated Learning and Behaviour
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Kshitij Sharma, Norwegian University of Science and Technology (NTNU), Norway
Organiser: Leen Catrysse, Belgium
Discussant: Kshitij Sharma, Norwegian University of Science and Technology (NTNU), Norway

Artificial intelligence (AI) brings novel opportunities to analyze multi-channel process data to gain new insights into learning processes and how to support these learning processes. The use of AI in educational research presents both opportunities and challenges. On the one hand, AI can enable researchers to process large amounts of data and perform complex analyses, leading to new insights and a deeper understanding of educational phenomena. For example, AI can be used to analyze student process and performance data to identify factors that impact learning processes and outcomes. AI can also be used to personalize learning experiences, making education more effective and efficient. On the other hand, the use of AI in educational research also presents a number of challenges. One of the main challenges is the need for high-quality and representative data sets, as AI algorithms can only be as good as the data they are trained on. Additionally, the interpretation of AI-generated results can be difficult, and it is important to ensure that AI-generated insights are valid and reliable. The ethical implications of using AI in education also need to be carefully considered, particularly with regards to data privacy and the potential for algorithmic bias. This symposium intends to gain a better understanding of how to apply AI to measure learning processes, how to integrate AI in intelligent and adaptive learning technologies and how to align findings from AI with current learning theories taking both opportunities and challenges into account.

Unfolding Socially Shared Regulation of Learning Processes with Multimodal Data and AI
Presenting Author: Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Carolyn Rose, Carnegie Mellon University, United States

Artificial Intelligence (AI) has the potential to greatly enhance research on socially shared regulation of learning (SSRL), which focuses on the collaborative and interactive processes that underlie the regulation of cognition, emotion, and behavior in collaborative learning. In this paper, we demonstrate, through empirical evidence, our progress in advancing SSRL research with AI. We specifically highlight the use of AI for automated coding and analysis of behavioural and physiological data, social interactions, and computational models to predict SSRL. The advantages of using AI in SSRL include the ability to quantify and analyse data at a large scale, improved precision and accuracy, and the creation of virtual social interactions for experimental manipulation. However, the use of AI in SSRL research also poses some challenges, such as ensuring the validity and reliability of AI-generated data, and the ethical implications of using AI to study human behaviour. To overcome these challenges, interdisciplinary collaboration between researchers in learning sciences, AI, and related fields is essential. This would allow the integration of theoretical and methodological advances from multiple fields and ensure that the AI-generated data and models are valid, reliable, and interpretable. Overall, this paper provides an overview of the possible benefits and challenges of using AI in socially shared regulation research and serves as a call for further development and application of AI in this field, which could benefit the ability to understand and facilitate effective learning processes for SSRL.

Using AI and Multimodal SRL Trace Data to Augment Clinical Reasoning with Holoportation Technology
Presenting Author: Roger Azevedo, University of Central Florida, United States; **Co-Author:**Megan Wiedbusch, University of Central Florida, United States; **Co-Author:**Daryn Dever, University of Central Florida, United States; **Co-Author:**Bari Hoffman, University of Central Florida, United States

Across health professions, clinical reasoning has been taught and assessed using various technologies ranging from simulations to high-fidelity mannequins. Our paper focuses on using AI and multimodal self-regulated learning trace data to augment clinical reasoning with innovative holoportation technologies. In this session, we will (1) provide the theoretical bases for collecting clinicians' multimodal self-regulated learning (SRL) data during diagnostic tasks using a specific holoportation technology; (2) illustrate, using trace data, the challenges associated with detecting, inferring and modeling clinicians' multimodal data, and, (3) discuss challenges associated with using current AI techniques to detect, analyze, and infer the underlying SRL processes (e.g., clinical reasoning strategies) that can subsequently be fed back using both static and dynamic representations of their multimodal data with the assistance of embedded artificial agents (e.g., intelligent virtual humans) onto the interface of the teleportation technology to model, scaffold, and augment clinical reasoning.

Reading Comprehension of Causal Relations With Diagrams: Toward Automated Feedback of Sequence Order
Presenting Author:Héctor J. Pijeira-Díaz, Maastricht University, Netherlands; **Co-Author:**Shashank Subramanya, Maastricht University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

Students struggle to understand causal relation chains (i.e., what implies what) in expository texts and have inaccurate judgments of their own comprehension (i.e., metacomprehension). An intervention requiring them to complete empty pre-structured diagrams helps to improve their metacomprehension to a certain extent but not their reading comprehension. Previous studies on this diagramming intervention show that students place about half of their correct diagram answers in the wrong order in the causal relation chain. We hypothesize that automated feedback of sequence order of causal relations can scaffold their self-regulated learning processes for better metacomprehension and reading comprehension. To enable testing this hypothesis in an upcoming study, in this study we test how accurate and reliable such feedback would be by leveraging advances in natural language processing (NLP) on the mathematical representation of texts. We compare two NLP approaches based on semantic similarity to estimate the correct sequence order in causal relation chains and evaluate them using data from previous diagramming experiments where the sequence order was rated by two human coders with an interrater reliability of Cohen's kappa = 0.84. An accuracy of up to 89% was obtained for the automated sequence order estimation, and a kappa of 0.84 for human-computer, which matches the human-human reliability. Other standard NLP performance metrics are reported. These results enable testing in a following study whether providing automated feedback on the sequence order of causal relation diagrams enhances students' metacomprehension and reading comprehension.

Using Learning Analytics and Artificial Intelligence (AI) to Scaffold Self-Regulated Learning
Presenting Author: Joep van der Graaf, Radboud University Nijmegen, Netherlands; **Co-Author:**Mladen Raković, Monash University, Australia; **Co-Author:**Yizhou Fan, Peking University, China; **Co-Author:**Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Johanna Moore, The University of Edinburgh, United Kingdom; **Co-Author:**Dragan Gasevic, Monash University, Australia; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands

Students' ability to regulate their own learning within technology-enhanced learning environments (TELs) is increasingly important. Prior research has shown that self-regulated learning (SRL) leads to better learning performance but students often experience difficulties to adequately self-regulate their learning. Instructional scaffolds are a successful method to help learners and consequently improve learning outcomes. However, scaffolds are often standardized and do not adapt to individual SRL processes. Learning analytics and artificial intelligence offer novel ways to better measure and understand SRL during learning. This improved insight in SRL and usage of scaffolds can consequently be used to improve the design of personalised scaffolds. In this study, we designed

generalised scaffolds which were the same for all students and personalised scaffolds which were based on individual SRL process as detected by the FLORA algorithm. Although we have found no difference in learning outcomes between conditions, we found differences in SRL processes. Specifically, students with personalised scaffold showed more high cognition and monitoring compared to the control condition and compliance with the scaffolds was related to improved learning outcomes. Hence, results showed that scaffolds affect SRL processes and when learners comply also improve learning outcomes. We discuss these results in light of future use of Artificial Intelligence to further personalise scaffolds for SRL and improve the efficacy of scaffolds.

Session P 2

Invited Symposium
Cognitive Science, Learning and Social Interaction

Recent advances of eye-tracking methods applied in educational research

Keywords: Artificial Intelligence, Classroom Management, Cognitive Skills and Processes, Comprehension of Text and Graphics, Eye Tracking, Mathematics/Numeracy, Pre-service Teachers, Teacher Professional Development, Well-being
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Markku Hannula, University of Helsinki, Finland
Discussant: Marjaana Puurtinen, University of Turku, Finland

Recent advances in eye-tracking research include the development of mobile (wearable) eye-tracking devices (eye-tracking glasses) that can be used in natural contexts as well as Artificial Intelligence (AI) to facilitate data analysis and to gain novel insights from eye movement data. Mobile eye tracking allows researchers to study behavior of active participants in ecologically valid contexts, with natural social interactions and multimodal sources of information. AI, on the other hand, will not only facilitate the pervasive adoption of eye tracking in education practice but also facilitates the data analysis in interaction with human researchers and allows to extract novel insights for the extremely rich eye-movement data that typically has hundreds of data points per minute of data. Two of the symposium presentations will use eye-tracking for investigating teacher's visual attention as part of their decision-making process. One of these studies uses mobile eye trackers, the other uses static eye-tracker and the discussion will focus on the new affordances of mobile device. The other two presentations will focus on how AI algorithms can assist in identifying student understanding and their strategies working on mathematical tasks.

Histogram recognition - An algorithmic model of eye movement
Presenting Author: Markku Hannula, University of Helsinki, Finland; **Co-Author:**Enrique Garcia Moreno-Esteva, University of Helsinki, Finland; **Co-Author:**Lonneke Boels, Utrecht University, Netherlands

Histograms are omnipresent in research and media. For example, Google Scholar returns over 3.2 million hits for 'histogram' (January 9, 2023). However, students persistently confuse histograms with value bar charts leading to misinterpreting mean and variation in histograms. This could be solved by providing students *immediate* personalized feedback but such feedback requires that students' recognition success or failure can be instantly determined by a model. For this aim, we developed an interpretable mathematical model (IMM) to explain eye movements during histogram recognition tasks based on a qualitative study in which we collected eye movements of fifty upper secondary students during 25 recognition tasks with statistical graphs, including value bar charts and histograms. The purpose of the IMM is to determine whether students succeeded in recognizing histograms or whether they interpreted the histogram as if it was a value bar chart. The IMM is much faster than our machine learning algorithm (MLA) in classifying the data into students' successful and unsuccessful recognition of histograms. In addition, the IMM does not need any training. Moreover, the IMM allows the determination of possible success or failure in real time as the recognition task is in process. Given our aim, the algorithm compares favorably with a MLA baseline. This makes it possible to use the IMM with a computer screen fitted with an eye tracking device to provide feedback to students in real time.

Visual expertise in teachers' classroom management – a mobile eye tracking study
Presenting Author: Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Sharisse van Driel, Open University, Netherlands; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Frank Crasborn, Fontys University of Applied Sciences, Netherlands

Teachers must manage complex classroom situations in their daily practice. This is key to students' learning. However, preservice and beginning teachers struggle with classroom management. One key prerequisite for successful classroom management is that teachers notice visual cues indicative for potential classroom management issues and that they interpret these cues correctly. This skill is often referred to as visual expertise. In the current study, we compared 22 preservice, 17 beginning, and 19 experienced teachers' visual expertise. These teachers taught their own classes while wearing mobile eye tracking glasses. Our initial analyses showed that, first, teachers did not differ in their total count of visual intakes. That means that we found no relation between the efficiency of visual processes and teaching experience. Second, beginning teachers had marginally longer average durations of visual intakes compared to preservice teachers. This indicates a tendency of preservice teachers to experience more mental effort compared to beginning teachers. Third, experienced teachers had marginally more dispersed visual intakes compared to preservice teachers. This finding indicates that experienced teachers have larger visual spans than preservice teachers. Our findings shed rare insights into the visual expertise of a larger population of teachers during authentic teaching of their own classrooms. In further steps, we will dive more into different parts of the lesson (e.g., beginning, switching of work forms) and different elements of the classroom (e.g., pupils, teaching material) to gain more detailed insights into teachers' visual expertise in their educational practice.

What can eye movements reveal about the cognitive processes underlying teachers' diagnoses?
Presenting Author: Sara Becker, Freiburg University of Education, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Anika Dreher, University of Freiburg, Germany; **Co-Author:**Birgit Spinath, Heidelberg University, Germany; **Co-Author:**Tobias Dörfler, Heidelberg University, Germany

Mathematics teachers' diagnostic competence includes the ability to identify and interpret features of mathematical tasks that make them potentially difficult for students to solve. In real classroom situations, teachers' cognitive capacities may be limited due to external factors such as stress, making diagnostic processes more challenging. So far, little is known about the influence of stress on teachers' cognitive processes of perceiving and interpreting mathematical task features. In an experimental study, we investigate the influence of stress on the cognitive processes underlying teachers' diagnoses of mathematical word problems with fractions. The sample consisted of 64 pre-service secondary mathematics teachers. Participants' perceptions were measured using eye tracking, and interpretation (i.e., their reasoning about task features) were measured using verbal protocols. The results suggest that under stress, participants' perceptual processes were impaired. Furthermore, the results indicate that under stress, attention can still be directed to potentially relevant task features, but that further interpretation processes of the features were impaired. The results highlight the importance of the triangulation of eye tracking and verbal data

Using eye tracking and AI to identify student strategies: Illustrated by studies in math education
Presenting Author: Maike Schindler, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Erik Schaffernicht, Örebro university, Sweden, Sweden; **Co-Author:**Anna Lisa Simon, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Parviz Asghari, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Achim J. Lilienthal, TU Munich, Germany

In mathematics education and beyond, it is crucial for researchers and teachers to investigate not only students' performance and outcomes but also the cognitive processes and strategies that lead to those results. Our paper presents an innovative approach to facilitate the analysis of student strategies: using Artificial Intelligence (AI) to support researchers. This is particularly useful for the laborious analysis of large datasets. We present two studies in mathematics education where we used eye tracking in combination with AI to identify student strategies. Specifically, we used AI-enhanced analysis of gaze heatmaps by applying clustering (unsupervised machine learning) to partition the data such that the heatmaps in each cluster are similar in appearance to each other, yet dissimilar to the heatmaps in other clusters. This approach provides an independent perspective on the data. For analysis of student strategies, the AI

suggestions are then interpreted by human experts who use their content knowledge to assign student strategies to the suggested clusters. In our paper, we illustrate the power of combining eye tracking and AI by two studies: One study investigated student strategies in small number enumeration, the other one student strategies in number line estimation. In both studies, we were able to find meaningful strategies based on the suggestions by the AI. Further, we were able to find significant group differences in the identified strategy use by, for example, students with and without mathematical difficulties.

Multimodal analytical approaches in researching collaborative problem solving

Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Educational Technologies, Higher Education, Learning Analytics, Problem Solving, Secondary Education, Self-regulated Learning and Behaviour, Simulation-based Learning
Interest group: SIG 04 - Higher Education, SIG 27 - Online Measures of Learning Processes
Chairperson: Crina Damsa, University of Oslo, Norway
Organiser: Hanni Muukkonen, University of Oulu, Finland
Discussant: Nikol Rummel, Ruhr University Bochum, Germany

Collaborative problems solving is a key process to addressing complex problems in education and work. CPS has been shown to facilitate increased learner engagement and learning of both knowledge and skills through the exchange of verbal and non-verbal cues and higher-quality communication processes, which enables shared understanding and completion of difficult tasks as a group/team. Understanding CPS still poses a challenge for research and supporting learners in the process is dependent of understanding both the micro-level aspects of collaboration and the (inter)disciplinary contents teams work with. As new technologies and methods emerge in the field of capturing and analysing digital and co-located collaboration, new opportunities arise to both study CPS and to facilitate students to learn and solve problems collaboratively. This symposium presents research work that feature multimodal collaborative analytics, and aims at generating knowledge and analyses that build on hybrid analytical accounts to better understand CPS. It highlight existing approaches to analysing collaborative processes and products based on analytics of verbal interactions, but also of individual actions, physical positioning and movement, manipulation of tools. While holding potential to disclose aspects of collaboration in CPS that are not accessible through regular observation, integration of different data streams and with qualitative accounts of collaboration still represent a methodological challenge. The contributions in this symposium each present and discuss solutions that can bring an additional input to how we can understand collaboration by using a multimodal lens.

Multimodal collaboration analytics in collaborative problem solving – a scoping review
Presenting Author: Rachelle Esterhazy, University of Oslo, Norway; **Co-Author:**Rogers Kaliisa, University of Oslo, Faculty of Education, Norway; **Co-Author:**Daniel Sanchez, University of Oslo, Norway; **Co-Author:**Malcolm Langford, Fcaulty of Law, UiO, Norway; **Co-Author:**Crina Damsa, University of Oslo, Norway

This study presents a scoping review on multimodal collaboration analytics (MMCA). Guiding and assessing students as they work in collocated collaboration is a challenging and time-consuming task for teachers. This is related to the complex simultaneous interplay of multiple modalities during collaborative learning situations, which are challenging to capture and process in a reliable manner. In recent years, advancing technology has made it possible to develop approaches to analyze and support students' collaborative learning by means of multimodal collaboration analytics. Using a scoping review of 65 studies, we provide an overview of MMCA literature by analyzing thematic, conceptual, and methodological approaches as well as empirical and practical contributions. Our findings show that several studies (N=10) refer to well-established frameworks on collaborative problem solving (CPS). In addition, 15 studies establish links to learning theory by using concepts from specific theoretical traditions. Most prominent are socio-constructivist and socio-cognitivist traditions. The remaining studies build primarily on empirical or practical literature. Further results provide overviews of modalities and variables used in the empirical studies and how these variables are combined to address collaboration research problems. Based on the results, we identify common challenges and potential solutions presented in the literature.

Monitoring complex collaboration processes in HE contexts: conceptual challenges in data integration
Presenting Author: Hanni Muukkonen, University of Oulu, Finland

Higher education (HE) is expanding its digital ecologies, which is accompanied with an extraordinary growth of data available on collaboration processes. Research on collaborative problem solving takes multiple methodological approaches, focusing, for instance, on interaction, regulation, knowledge creation or competences. In this study, four data types from a course extending six weeks are compared through triangulation, to consider affordances and limitations the data types pose for understanding the processes and outcomes of collaboration.Five iterations of an organizational simulation course are investigated, involving students (N=120) in educational psychology, engineering, economics, humanities, and education. The dataset combines a) qualitative data, i.e., individual diary data and video data on team interaction, b) questionnaire data on knowledge work competence development and personal background, and c) teacher evaluations.The study contributes to building methodological approaches and indicators for monitoring complex collaboration processes in HE contexts. The dataset makes visible, for instance, how an individual diary account of collaboration may highlight personal contributions and agency, even when it does not come equally apparent in a video recording of the collaboration situation. Thus, it may generate contradictory interpretations of personal and shared agency in a situation. Further, present continuous education goals lead to a more varied student background in HE. The question raises how personalized learning paths tailored to varying starting level competences could be available. The dataset triangulates longitudinal and situated evaluations on competence development. The role of mediating digital tools and resources in collaborative problem solving processes is also discussed.

Multimodal learning analytics of collaborative problem solving in embodied teamwork
Presenting Author: Dragan Gasevic, Monash University, Australia; **Co-Author:**Linxuan Zhao, Monash University, Australia; **Co-Author:**Vanessa Echeverria, Monash University, Australia; **Co-Author:**Lixiang Yan, Monash University, Australia; **Co-Author:**Roberto Martinez Maldonado, Monash University, Australia

EEmbodied team learning is a form of group learning that occurs in co-located settings where students need to interact with others while actively using resources in the physical learning space to solve a problem and thus achieve a common goal. In such situations, different processes associated with collaborative problem solving can occur in different locations of the physical space with varied team member configurations. This can make it hard for teachers to assess the effectiveness of teamwork and for students to reflect on their own experiences. In this paper, we present the findings of a research program that aims to harness the potential of multimodal learning analytics to analyse collaborative problem solving of simulation-based learning of embodied learning teams in healthcare education. Specifically, the paper will provide a synthesis of the findings of multimodal learning analytics that(a) made use of indoor positioning data of students in embodied simulation-based learning to (i) uncover relationships between collaborative processes and performance assessment and (ii) differentiate collaborative problem-solving process between low-performing and high-performing teams;(b) combined indoor positioning and audio data to model embodied team communication with ordered network analysis and identify key differences in the communication dynamics of high and low performing teams; and(c) combined team dialogue content with indoor positioning and temporal data to identify key differences between high and low performing teams i) across the whole learning session, ii) at different phases of learning sessions, and iii) at particular spaces of interest in the learning space.

The conditions for collaborative groups' regulation: what multimodal data can showcase?
Presenting Author: Jonna Malmberg, University of Oulu, Finland; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Kateryna Zabolotna, University of Oulu, Finland, Finland; **Co-Author:**Tatiana Shubina, University of Oulu, Finland

Coupled with the recent novel process methods, developing a theoretical understanding on socially shared regulation (SSRL) has contributed to possibilities to extend the research focus from the processes of collaborative groups' SSRL to conditions for these processes to emerge. Different data modalities and -

channels can together reveal actualised regulation processes and their temporal interconnections, as well as their contextualised premises at a level of detail and diversity that has not been possible before. This presentation aims to show our recent research that drives to bridge collaborative groups' regulatory activities with the socio-emotional context the collaboration takes place. Despite the evidence that a positive socio-emotional atmosphere is favourable for collaborative learning, there is a lack of research exploring how it relates to metacognitive monitoring that initiates groups' regulation. We address this gap through different data channels implementation for capturing psychophysiological processes alongside the features of interaction (behaviour and speech) on a data sample from 21 collaborative 9th-graders who were to build and program a robotic arm, Alvin. The student's collaborative problem solving was videotaped and included the video recordings of each group and individual audio recordings of each student. Additionally, physiological data (EDA) was recorded. Through this data example, we will demonstrate the role of regulation in groups' problem solving and highlight the role of multimodal methods in studying the role of socioemotional and metacognitive conditions for initiating collaborative groups' regulation.

Motivational, Social and Affective Processes

Perceptions of Student Achievement: Insights on Teacher Expectations and Peer Academic Reputations

Keywords: Achievement, Attitudes and Beliefs, Emotion and Affect, Engagement, Motivation, Peer Interaction, Personality, Secondary Education, Self-determination, Social Aspects of Learning and Teaching, Teacher Professional Development, Teaching/Instructional Strategies
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Astrid Poorthuis, Utrecht University, Netherlands
Organiser: Astrid Poorthuis, Utrecht University, Netherlands
Discussant: Tim Mainhard, Leiden University, Netherlands

Academic expectations of significant others influence students' self-beliefs, engagement, and performance at school. Most research has focused on expectations of teachers. It is increasingly recognized that classmates can also be considered "significant others" who have academic expectations of each other (called peer academic reputations). This symposium brings together scholars from the research fields of teacher expectations and of peer academic reputations with the aim to learn from each other's approaches. The aim of this symposium is to address questions on the formation of expectations, the mechanisms through which expectations influence students, and the impact of expectations on others than the student. The first paper addressed the question how expectations are formed. It showed which student characteristics in primary school predicted peer academic reputations in secondary school and whether there was bias in this process. The second paper focused on a possible mechanism through which teacher expectations influence student outcomes. It investigated how teacher expectations may lead to differences in teacher-provided need support and subsequently, students' need satisfaction. The third and fourth paper addressed the question how expectations may influence others than the student. Specifically, the third paper studied whether students with a high peer academic reputation influence their classmates' engagement over time. The fourth paper studied the relation between teacher expectations and teacher emotions in class. After the four paper presentations, the discussant (an expert on classroom social interactions) will reflect on the role of teacher expectations and peer academic reputation in students' educational experiences and directions for future research.

The Formation of Peer Academic Reputations after the Transition to Secondary School
Presenting Author: Astrid Poorthuis, Utrecht University, Netherlands; **Co-Author:**María Belén Casalá, Utrecht University, Netherlands

Students' academic reputations among their peers influence their academic adjustment. How these peer academic reputations are formed in a new peer group is still unknown. This cross-transitional study investigated which student characteristics in primary school shape peer academic reputations in secondary school. Furthermore, this study investigated possible bias in the formation of reputations, by assessing whether peers form their classmates' academic reputations based on the right characteristics (i.e., those that actually predict academic performance) or not. A sample of 322 students (53% female, M_{age} = 12.2) reported on their school engagement, academic self-concept, Big Five personality traits, narcissism, and gender at the end of primary school. Peer academic reputations were assessed within three weeks after the transition to secondary school. Academic performance was measured using grades of the first report card students received. Students' observable characteristics indicative of high performance were those more strongly related to their peer academic reputations than less observable characteristics. Further, results mainly suggested that peers are accurate observers, as they base peer academic reputations on almost all the right characteristics, those that predict actual performance. This study also provides initial evidence that peer academic reputations at the start of secondary school are biased to some extent: academic self-concept and being a girl predicted academic performance, but were not taken into account by peers accordingly. Overall, our findings suggest that peers rapidly perceive their classmates' characteristics to form their academic reputations, which predict their academic performance a few months later.

Differential Need-Support: The Role of Teacher Expectations and Academic Achievement
Presenting Author: Astrid Poorthuis, Utrecht University, Netherlands; **Co-Author:**Iris Boer, Utrecht University, Netherlands; **Co-Author:**Anouke Bakx, Fontys University, Radboud University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands

According to Self-Determination Theory, teachers can support their students' motivation and engagement in learning through need-supportive teaching (provision of autonomy support, structure, and involvement). Within classes, however, there appears to be great diversity in the extent to which students' needs are supported by teachers, and subsequently in the extent to which students feel that their needs for autonomy, competence, and relatedness are satisfied. This study aimed to provide more insights into how teacher expectations of their students may be underlying differences in teacher-provided need support and subsequently, students' need satisfaction. A sample of 72 teachers and 585 students participated. Multilevel mediation analyses confirmed that there are large differences within classes in need support. Overall, our findings suggest that teacher expectations play an important role in explaining these differences, especially for autonomy support and structure. That is, teachers differentiated their need support based on their expectations of their students. Even after taking into account actual differences in students' academic achievement, teacher expectations were a medium to strong predictor of need support. Moreover, teacher expectations were directly related to students' competence satisfaction. The findings suggest that teachers tend to adopt a so-called controlling teaching style (low autonomy, high structure) toward students with lower academic achievement levels and/or those of whom teachers have lower expectations. This is concerning as such a teaching style can further undermine motivation, engagement, and achievement of students who are already academically at risk.

Peer Influence on (Dis)Engagement: The Role of Academic Reputation, Friendship and Social Status
Presenting Author: Karine Verschueren, KU Leuven, Belgium; **Co-Author:**Nina Steenberghs, KU Leuven, Belgium; **Co-Author:**Jeroen Lavrijsen, KU Leuven, Belgium; **Co-Author:**Noona Kiuru, University of Jyväskylä, Finland

Whereas the role of friends and popular peers for engagement has been examined previously, this study extends this research by investigating also the extent to which classmates high in academic reputation (i.e., perceived as intelligent) influence adolescents' own behavioral and emotional engagement and disengagement, using longitudinal social network analysis. A total of 3,409 Flemish 8th grade students in 158 classes in 27 schools participated in the study (M_{age} = 13.48; 49.91% boys). Students nominated classmates whom they considered as friends, as popular, and as intelligent, and reported on their own behavioral and emotional (dis)engagement in the fall and the spring of the school year. Longitudinal social network analysis revealed that, controlling for selection effects and structural network features, students high in academic reputation and popular students influenced emotional engagement and disengagement. Friends influenced both emotional and behavioral engagement and disengagement. These findings do not only demonstrate the importance of a multidimensional approach to engagement, but also encourage researchers to take a broad view of the social context of early adolescents, taking into account not only peers' social, but also their academic status.

Relations Between Teacher Emotions and Expectations
Presenting Author: Christine M Davies, University of Auckland, New Zealand; **Co-Author:**Mengnan Li, Univeristy of Auckland, China

This study aimed to examine the relations between teacher emotions and teacher expectations, both of which, in separate studies, have been shown to be significant in influencing teaching practices and students' outcomes. The participants were 135 Chinese homeroom teachers from 14 high schools. Structural equation modelling showed that 1) high teacher expectations positively predicted pleasant emotions of joy, pride, and love, and 2) negatively predicted negative emotions of anger, fatigue, hopelessness, and anxiety. The results suggested that teachers appeared to improve their emotional experiences when their expectations for their students were high. The study contributes to the scarce base of knowledge on the interplay of these two factors in the teaching profession. Additionally, the findings from this study have practical implications by indicating that teacher emotions might be improved through an intervention related to their beliefs.

Symposium

Evidence-based development of school & teaching: fostering informed decision-making through data use

Keywords: Achievement, Assessment Methods, At-risk Students, Classroom Assessment, Feedback, Mixed-method Research, Quantitative Methods, School Effectiveness, Teacher Effectiveness, Teacher Efficacy
Interest group:
Chairperson: Luisa Grützmacher, University of Vienna, Austria
Organiser: Luisa Grützmacher, University of Vienna, Austria
Organiser: Alexander Naumann, Friedrich-Schiller-University Jena, Germany
Discussant: Charalambos Charalambous, University of Cyprus, Cyprus

In a constantly evolving world, schools need to adapt to a changing external environment. Schools can adapt through intentional improvement processes that are carried out by members of the individual schools at the school or classroom level. Fundamentally, these development processes at the school or classroom level should be evidence-based, as researchers regularly point out that that data use will foster informed decision making about how to allocate resources, thereby also improving teaching and learning in a cost-effective manner.
The overall goal of this symposium is to gain a deeper insight into the manifold use of data in the context of improving schools, teaching and learning. In order to gain a full picture, different approaches will be addressed in the presentations. Presentations range from more theoretical approaches to more methodological approaches to the use of data in real life school settings. In addition, the multi-level structure within the educational system will be considered to illustrate the diversity of data use. Accordingly, the presentations address the use of data at school, classroom and student levels. The presentations are then discussed by an expert in the field of educational effectiveness research. In summary, we are confident that our symposium will contribute to a better understanding of data use at different levels of the education system.

A Bayesian multivariate multilevel modelling approach for analyzing classroom heterogeneity
Presenting Author: Alexander Naumann, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Dimitra Kolovou, St. Gallen University of Teacher Education (PHSG), Switzerland; **Co-Author:**Jan Hochweber, St. Gallen University of Teacher Education, Switzerland; **Co-Author:**Anna-Katharina Praetorius, University of Zurich, Switzerland

Educational effectiveness research regularly addresses questions related to classroom heterogeneity, for example, teachers' judgement accuracy. Teachers' judgement accuracy refers to the ability of teachers to make accurate judgements of their students' achievement and is considered a necessary condition for meaningful teaching activities, especially in terms of optimal tailoring teaching practice to students' strengths and needs (e.g., Pielmeier, Huber, & Seidel, 2018). However, commonly applied measures of teachers' judgement accuracy have significant limitations as they (a) are prone to sampling and measurement error and (b) do not adequately deal with imbalanced and hierarchical data structures. Thus, the aim of our study is providing a Bayesian multivariate multilevel model tailored to overcome these modelling issues and allowing for the investigation of teachers' judgement accuracy in multiple content domains simultaneously. For illustration purposes, we applied our model to empirical data from 54 teachers and their students in three math content domains. The model worked well in the application. Our approach allows for model-based estimation of teachers' judgement accuracy, including appropriate handling of hierarchical and imbalanced data structures, and the specification of latent variables to deal with measurement error comparable to "doubly latent" analyses of contextual effects (Lüdtke, Marsh, Robitzsch, & Trautwein, 2011).

Orientation of development perspectives in the school improvement process
Presenting Author: Luisa Grützmacher, University of Vienna, Austria; **Co-Author:**Julia Holzer, University of Vienna, Austria; **Co-Author:**Marko Lüftenegger, University of Vienna, Austria; **Co-Author:**Barbara Schober, University of Vienna, Austria; **Co-Author:**Manfred Prenzel, University of Vienna, Austria

Schools in socially deprived areas face particularly challenging circumstances and therefore tend to have greater development needs. Difficulties, success and experienced challenges can be a drive force for learning. The overall goal of this study is to gain a deeper understanding about the situation of schools in socially deprived areas and the decisions regarding the orientation of those schools in the school improvement process. Thus, strengths, difficulties, challenges and developmental perspectives of schools in socially deprived areas are examined. Matches of developmental perspectives with reported strengths, difficulties, or challenges indicate whether schools are trying to build existing strengths, reduce difficulties, or overcome challenges. No matches of developmental perspectives indicate that schools are oriented toward unidentified factors. The study comprises data from 100 Austrian schools in socially deprived areas. A mixed-methods approach was applied. Qualitative data of school principals were analyzed using qualitative content analysis and showed a diversity of challenges, difficulties, strengths and development perspectives. While some aspects were mentioned only rarely, there was a high level of agreement on other aspects. The qualitative data were processed for further quantitative analysis. Results of the latent profile analysis performed in Mplus indicate that there are different underlying profiles in the orientation of development perspectives toward strengths, difficulties, challenges and/or unidentified factors.

On the Importance and Necessity of Multiple Informant Studies for Evidence-based School Development
Presenting Author: Christoph Helm, Johannes Kepler University Linz, Austria; **Co-Author:**Stephan Gerhard Huber, PH Zug, Switzerland

Evidence-based school development processes heavily rely on valid data. However, the validity of survey data strongly depends on how is asked (e.g., school leaders or teachers). Therefore, we present two studies that question, whether and to what extant multiple informants, i.e., school principals, teachers, students, and parents agree when rating school quality (study 1) and quality of distance learning (study 2). In study 1, using hierarchical data of 2380 German teachers nested within 116 principals we perform cross-level group measurement invariance models to estimate the latent mean differences and the latent correlations (at school-level) between principal and teacher ratings. Results of study 1 show that principals rate the quality of their schools exceedingly stronger than their teachers. Although findings in study 2 yield a quite similar pattern across the three respondent groups, some associations (i.e., parental support and student outcomes) largely differ between the groups. In total, our results indicate that multiple informant studies are needed to obtain valid data for decision making during school development processes. We discuss your findings against the limitation of the design of your studies and draw implications and consequences for evidence-based school development processes.

Computer-based formative assessment and its potential for classroom and school development
Presenting Author: Julia Käfer, Institute for Educational Analysis (IBBW), Germany; **Co-Author:**Evelin Ruth-Herbein, Institute for Educational Analysis (IBBW), Germany, Germany; **Co-Author:**Eva-Maria Böker, Institute for Educational Analysis (IBBW), Germany, Germany; **Co-Author:**Benjamin Fauth, Institute for Educational Analysis (IBBW), Germany, Germany

Empirical studies have shown that formative assessment is a promising way to improve teaching and learning (e.g., Black & Wiliam, 2009). The central idea of formative assessment is to make use of assessment information about students' understanding in order to adapt instructions according to students' needs as well as to provide students with individual feedback (e.g., Corno, 2008). In order to do so, teachers need to assess the development of students' understanding continuously (Schütze, Souvignier & Hasselhorn, 2018). Computer-based solutions may help teachers to implement the concept of formative assessment in an economic way.In the symposium, we present the project "Computer-based Formative Assessment in Elementary School" (Co-FormAt) that started in summer 2021. The aim of the Co-FormAt project is to develop an online tool for formative assessment that can be easily implemented in everyday classroom practices, fits the pedagogical as well as subject-specific didactical principles of the targeted subject, and is evaluated regarding its effectiveness for teaching and learning. Development and evaluation of the Co-FormAt-online tool follow a step-by-step approach in cooperation with researchers as well as practitioners. For the symposium, results of two pilot studies will provide information a) on the quality of the diagnostic instruments and b) on the online tool's implementation in everyday classroom practices. We are convinced that by supporting teachers to understand the potential of formative assessment and by providing a tool that helps teachers to implement this concept in their teaching routines, we can foster teaching and learning processes at different levels.

Symposium
Learning and Social Interaction

Transactivity and shared regulation in collaborative problem solving: Concepts, scaffolds, analyses

Keywords: Argumentation, Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Game-based Learning, Knowledge Construction, Learning Analytics, Peer Interaction, Problem Solving, Problem-based Learning, Social Interaction
Interest group: SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Freydis Vogel, Universität Hamburg, Germany
Organiser: Freydis Vogel, Universität Hamburg, Germany
Organiser: Armin Weinberger, Saarland University, Germany
Organiser: Miguel Angel Rejon Zamudio, Saarland University, Germany
Organiser: Jun Oshima, Shizuoka University, Japan
Organiser: Cindy Hmelo-Silver, Indiana University, United States
Organiser: Chen Feng, Indiana University, United States
Discussant: Ingo Kollar, University of Augsburg, Germany

Collaborative problem solving is commonly used to engage learners in joint discourse and knowledge co-construction. The related collaborative learning processes have the possibility for both misunderstandings and mutual support towards deeper understanding. Important qualities for such learning processes to be successful are transactively reasoning together and co-regulating each other to advance towards solutions. To clarify the role of these qualities of collaborative learning processes, this symposium will bring together perspectives on conceptualizing, facilitating and analyzing mechanisms of collaborative learning, namely shared regulation and transactivity. The papers will particularly focus on the learning discourse in different collaborative problem-solving settings. Jun Oshima et al. will introduce how temporal network analysis can be used to analyse learning regulation and transactivity as emerging mechanisms in collaborative learning discourse on solving a Jasper Woodbury problem. The paper by Chen Feng et al. reveals facilitation strategies used in collaborative discourse in game-based complex problem-solving environments focusing on supporting socially shared regulation. Miguel Rejon et al. will present findings from a study on how transactive sentence openers can facilitate social modes of co-construction during collaborative problem-solving discourse and eventually affect learning. Finally, Vogel and Weinberger present refinements of the conceptualization of transactivity as a relevant mechanism for collaborative discourse targeting problem solving and learning. The significance and relation of the collected papers for our understanding of the relevant processes and mechanisms in collaborative problem solving will be discussed.

Regulating transactive learning discourse: A new analytics framework using temporal network analysis
Presenting Author: Jun Oshima, Shizuoka University, Japan; **Co-Author:**Ritsuko Oshima, Shizuoka University, Japan; **Co-Author:**Shotaro Yamashita, Shizuoka University, Japan; **Co-Author:**Jun Lu, Shizuoka University, Japan

In small groups, learners have to regulate their epistemic engagements in improving their ideas through transactive discourse. In this study, we introduce a new analytics framework to examine learners' engagement in their transactive discourse using temporal network analysis. First, transcriptions of their collaborative discourse are transformed into a bipartite graph of discourse exchanges and vocabulary for representing their ideas. Then a vocabulary network is created based on the co-occurrence of words in each exchange. Finally, temporal change in the vocabulary network is visualized, and metrics are calculated to identify how each learner contribute to their collaborative discourse by displacing her discourse from the dataset. In this study, we demonstrate how the application software of the temporal network analysis, Knowledge-Building Discourse Explorer (KBDeX), works for analyzing the transactivity in collaborative discourse. We use discourse data where groups of three university students collaboratively solved a Jasper Woodbury problem. Several patterns of the transactive discourse were identified and discussed from the perspective of the idea improvement. We did not find many groups where all three students engaged in transactivity all the time. Instead, they intentionally or unintentionally rotated their leadership in the transactivity in various ways. Through in-depth discourse analysis, we discuss how they rotated their leadership in the transactivity.

Exploring Facilitation Strategies for Socially Shared Regulation in Game-based Problem-Solving
Presenting Author: Chen Feng, Indiana University, United States; **Co-Author:**Haesol Bae, Indiana University Bloomington, United States; **Co-Author:**Tianshu (Haley) Wang, Indiana University Bloomington, United States; **Co-Author:**Daeun Hong, Indiana University Bloomington, United States; **Co-Author:**Krista D. Glazewski, Indiana University Bloomington, United States; **Co-Author:**Cindy Hmelo-Silver, Indiana University Bloomington, United States; **Co-Author:**Thomas Brush, Indiana University Bloomington, United States; **Co-Author:**Seung Lee, North Carolina State University, United States; **Co-Author:**Bradford W. Mott, North Carolina State University, United States; **Co-Author:**James C. Lester, North Carolina State University, United States

Problem-based learning is an ideal context for understanding how learners engage in socially-shared regulation within complex problem-solving environments. Successful problem-based learning (PBL) often requires students to collectively regulate their learning processes as a group, or engage in socially shared regulation of learning (SSRL). This paper focuses on how facilitators supported SSRL in the context of middle-school game-based PBL. During the gameplay three to four students in a group explored a fictional island to solve the problem and negotiate their ideas in text-based, in-game chat. The facilitators closely monitored the group chat and provided contingent support. This study analyzed chat messages during gameplay by conversation analysis to reveal the facilitation strategies that supported SSRL. They used direct modeling strategies, which included establishing regulatory processes, promoting group awareness and dealing with contingency. They also used indirect strategies, such as prompting questions and acknowledgment of regulation. We further investigated the facilitation patterns associated with fading the support and transferring responsibility to students for regulating their own learning. The findings will inform researchers and practitioners about designs for prompts and development of technological tools such as adaptive scaffolding to support SSRL in PBL or other forms of game-based complex problem-solving environment.

Effects of Transactive Sentence Starters on Knowledge Co-Construction Processes and Outcomes
Presenting Author: Freydis Vogel, Universität Hamburg, Germany; **Co-Author:**Miguel Angel Rejon Zamudio, Saarland University, Germany; **Co-Author:**Armin Weinberger, Saarland University, Germany

Engaging in specific social modes of co-construction, such as consensus building, is important for successful collaborative learning. As a basic quality of collaborative learning, transactivity has been defined as operating on the reasoning of a learning partner. This implies that during the learning process learners

need to alternately contribute novel ideas and refer to each other based on shared contributions. The present 2×2-study (N = 154) explores the effects of scaffolding reference and novelty by means of respective sentence starters during a synchronous text-based collaborative task about attribution theory. While all learners improved their descriptive domain-knowledge, learners provided with novelty scaffolds outperformed learners without novelty scaffolds regarding the acquisition of domain knowledge. The analysis of the collaboration process does not suggest that novelty scaffolds positively affect engaging in various social modes of co-construction and thus, cannot explain the positive effects on individual learning outcomes. In contrast, scaffolding for reference reduces externalization and quick consensus building but increases integration-oriented and conflict-oriented consensus-building. This would be a pattern in the learning processes that is assumed to be positively related to learning outcomes, yet the study did not show reference scaffolds affecting descriptive domain knowledge learning. While the study shows that it is worthwhile to integrate both novelty and reference as factors of transactivity, future research needs to identify the learning processes mediating the effects of novelty scaffolds and the learning outcomes that align with the effects of reference scaffolds on the social modes in the collaborative learning process.

Transactivity in collaborative learning processes: The complementary roles of novelty and reference
Presenting Author: Freydis Vogel, Universität Hamburg, Germany; **Co-Author:**Armin Weinberger, Saarland University, Germany

Transactivity is considered an important quality of effective collaborative learning, defined as “reasoning operating on the reasoning of the other” (Berkowitz & Gibbs, 1983, p. 402). Previous approaches focus on learners building upon each other’s contributions to conceptualize transactivity. Here, activities such as paraphrasing or criticizing learners’ interactions are specified as being transactive and beneficial for learning. However, effects of such transactive moves on individual learning are commonly related to their specific features facilitating cognitive elaboration which in turn is not a defining feature for transactivity. Building upon other contributions may not be sufficient to fully define transactivity as it disregards the idea that for knowledge building new aspects need to be integrated into the collaborative exchange. With this paper, we explore how the conceptualization of transactivity can be refined as a mechanism of collaborative learning processes distinct from their individual cognitive qualities. We introduce the complementary roles of novelty and reference to describe transactive learning processes. Furthermore, we suggest the ideal ratio of novelty and reference in contributions to vary throughout the collaborative learning process. For instance, ideal transactivity in the beginning of a learning dialogue may contain novelty to a higher degree while during the critical reflection of arguments a higher ratio of reference may be needed. The refined conceptualization of transactivity has implications for research and practice (e.g., how scaffolding needs to be adjusted to dynamics of ratio for novelty and reference at different times). Further hypotheses included in the refined conceptualization of transactivity will be discussed.

Symposium

Towards a better understanding of EF and its closely related constructs in school-age children

Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Mathematics/Numeracy, Self-regulated Learning and Behaviour
Interest group:
Chairperson: Claudia Roebers, University of Bern, Switzerland
Organiser: Claudia Roebers, University of Bern, Switzerland
Organiser: Ebru Ger, University of Bern, Switzerland
Discussant: Evelyn Kroesbergen, Radboud University, Netherlands

Executive functions (EF) are closely related to numerous distinct cognitive skills such as working memory (WM), intelligence, and academic skills (Blair, 2006; Blair & Razza, 2007; Spiegel et al., 2021). Understanding these links' nature and underlying mechanisms is fundamental to understanding their development and developing targeted interventions and curricula in educational settings. In this symposium, we focus on these links in an age window spanning kindergarten to adolescence and will present contemporary and cutting-edge research on the processes driving the link between EF, WM, and academic skills. Our results suggest that inhibition and WM differentially relate to distinct math skills. Although the traditional measure of accuracy and no measure of shifting was found related to fluid intelligence and verbal WM, the opposite pattern was found for math skills. Namely, post-error slowing as a possible indicator of monitoring within EF tasks was more strongly related than the traditional measures of inhibition and shifting. In the planned symposium, we will discuss the possibility that fine-grained measures of cognitive control and shifting may be important for academic skills; “pure” inhibition may instead be more critical for fluid intelligence. Furthermore, our results will open new avenues for research as they underline the importance of employing a multitude of measures in EF and taking into account potential moderating factors such as intelligence and academic skills.

Post-error slowing across inhibition and switching tasks: An explorative study
Presenting Author: Kerry Lee, The Education University of Hong Kong, Hong Kong; **Co-Author:**Xiaozi Gao, The Education University of Hong Kong, Hong Kong

Post-error slowing (PES) refers to the phenomenon that people slow down in their responses after committing an error. It was widely observed in cognitive tasks with demands on inhibition control with a conflict component, such as the Stroop, Simon, and Flanker tasks (Dubravac et al., 2022; Ger & Roebers, 2023). However, few studies have examined whether the phenomenon is observed in executive control tasks that have lower inhibitory demands (e.g., switching tasks). Furthermore, although PES has been used as an indicator of cognitive control (Roebers, 2017), it is not clear whether PES explains academic performance better than traditional indicators of cognitive control. This study tested whether PES could be observed in both inhibition and switching tasks and examined whether PES was more strongly associated with behavioural inhibition and early numeracy performance than traditional inhibitory measures. Children (N = 339, M_{age} = 57.37) from Hong Kong was administered the Simon (a measure of inhibition), Picture-Symbol (switching), Head-Toes-Knees-Shoulders (behavioural inhibition), and a battery of numeracy tasks. PES was related positively to task accuracy in both the Simon and Picture-Symbol tasks. Children with either high or low accuracy engaged in PES in the Simon task. Only children with high-accuracy exhibited PES in the Picture-Symbol task. PES was more strongly related to behavioural inhibition and numeracy performance than traditional measures of inhibitory or switch costs. These findings suggest that PES is related to children’s abilities to perform switch tasks accurately and may be a more sensitive measure of cognitive control than cost-based subtraction measures.

Do Science and Non-science Students Similarly Use Executive Function Skills in Maths and Physics?
Presenting Author: Konstantinos G Tsigaridis, University of Cambridge, Greece; **Co-Author:**Rui Wang, University of Cambridge, United Kingdom; **Co-Author:**Jiayin Zheng, University of Cambridge, UK, United Kingdom; **Co-Author:**Michelle Ellefson, University of Cambridge, United Kingdom

Executive function skills seem to play a role in a variety of school learning settings. Recent findings suggest that executive function skills could impact science learning. However, it is unclear how this impact applies to different science domains. One science domain where a better understanding of how executive function skills impact learning is physics. We focused on physics because teachers and policymakers often express concerns about secondary school students’ physics attainment, especially in the areas of problem solving and understanding physics concepts. Mathematical skills seem to underpin physics learning. Additionally, there are links between mathematical and executive function skills. As such, we included measures of mathematical skills to better understand whether they mediate any links between executive function skills and physics problem solving or understanding physics concepts. We recruited 15- to 17-year-old students from Greece (N = 403, M_{age} = 15.78 years, SD_{age} = 0.74 years) to complete a variety of tasks covering core aspects of these skills. For science students, executive function skills predicted mathematical skills, which in turn predicted physics problem solving and concepts. Executive function skills did not directly predict either of the physics skills but did so indirectly through mathematical skills. In contrast, for non-science students, executive function skills did not have direct or indirect links to any of the mathematical or physics skills, but there were links between mathematical skills and both of the physics skills. These findings help enhance our understanding of the core cognitive skills that might underpin physics learning.

The role of Executive Function in math and literacy domains in young children
Presenting Author: Laura Traverso, Department of Education Sciences, University of Genoa, Italy; **Co-Author:**Paola Viterbori, Department of Education

Sciences, University of Genoa, Italy; **Co-Author:**Elena Gandolfi, University of Turin, Italy; **Co-Author:**Irene Tonizzi, Department of Education Sciences, University of Genoa, Italy; **Co-Author:**Maria Carmen Usai, Department of Education Sciences, University of Genoa, Italy

In the last decades several studies showed that there is a strong relationship between performance in EF tasks and academic achievement. Despite this, the mechanisms by which EF skills support literacy and math development are not fully understood. To advance in this research field, significant attention should be paid to better understanding which EF component is associated with which aspect of learning at a particular age. Given that both EF and literacy and math domains are complex constructs (and even debate constructs) that change over time, “fine-grained” examinations may be useful. In this talk, two studies that investigate the role of EF in both literacy and math domains (pre academic skills) will be presented and the role of specific EF in accounting for specific aspects of learning will be discussed. Advancing in this research field is essential to successfully inform and influence classroom practice.

The relationship between executive functions, working memory, and intelligence in children
Presenting Author: Ebru Ger, University of Bern, Switzerland; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

Executive functions (EF), working memory (WM), and intelligence are closely associated but distinct constructs (Blair, 2006). What underlies the associations between these constructs, especially in childhood, is less well understood. In this pre-registered study, along with traditional average accuracy and RT-based measures of EF, we investigated post-error slowing (PES) in EF, as a manifestation of cognitive control, in relation to WM and intelligence. Thereby we aimed to elucidate whether cognitive control may be one underlying component to explain the associations between these constructs. We tested kindergarten children (Mage=6.4 years, SDage=0.3) in an EF, verbal WM, visuospatial WM, and a fluid (non-verbal) intelligence task. We found significant and positive associations between accuracy in the incongruent block of the EF task (mainly assessing inhibition component) with fluid intelligence (r=.19, p=.024) and verbal WM (r=.18, p=.028), but not visuospatial WM (r=.07, p=.375). No significant associations emerged between congruency effect, shift cost, or PES in EF and intelligence or WM. Verbal WM and visuospatial WM were positively correlated (r=.20, p=.015), while intelligence was positively correlated only with verbal WM (r=.16, p=.049). Exploratory analyses revealed a significant negative correlation between mean RT in the incongruent block of the EF task and visuospatial WM, even after controlling for accuracy (r=-.28, p

Necessary Skills to deal with uncertainties: Insights from teachers and students

Keywords: Attitudes and Beliefs, Higher Education, In-service Teachers, Knowledge Construction, Learning Approaches, Mathematics/Numeracy, Pre-service Teachers, Primary Education, Quantitative Methods, Reasoning, Science Education, Secondary Education, Teaching/Instructional Strategies
Interest group:
Chairperson: Meg Farrell, Technische Universität München, Germany
Organiser: Despoina Georgiou, Utrecht University, Netherlands
Discussant: Olga Ioannidou, University College Dublin, Ireland

Education is faced with a rapidly changing and uncertain world, requiring teachers and students to move beyond formulaic knowledge and skills. To bring certainty to the uncertainty in education, teachers and students are expected to be equipped with the necessary skills and knowledge to make evidence-informed decisions. This symposium maps the literacy and reasoning skills to deal with challenges and uncertainties in education focusing on insights from both students and teachers. The first contribution introduces a framework to support pre-service teachers’ efforts to learn how to evaluate and deal with evidence in uncertain times, such as the COVID-19 pandemic. The second contribution explores primary school teachers’ attitudes toward research, their information literacy skills, and the frequency of evidence used during the times of the pandemic. Contribution three implements’ a scenario-based teaching approach to promote secondary school students’ agency and scientific literacy skills when dealing with global challenges, such as climate change. Finally, contribution four focuses on the development of primary school students’ conditional reasoning skills in everyday and mathematical contexts toward a better understanding of uncertainty. Overall, this symposium highlights the role of formal and informal education in equipping students and teachers with the necessary skills to deal with uncertainties in everyday life. The overarching aim of these contributions is to provide recommendations for the inclusion of such skills in national curricula, as well as teacher education programs. The session will close with a discussion by Gabriela Martinez Sainz whose work focuses on how to foster 21st-century skills in education.

Learning about the Nature of Knowledge – Lessons in Teacher Education
Presenting Author: Olga Ioannidou, University College Dublin, Ireland; **Co-Author:**Alison Cullinane, University of Edinburgh, United Kingdom

The way in which knowledge is produced in science entails a high degree of uncertainty and tentativeness, however, explicit reference of these aspects is rarely communicated in the classroom, science textbooks and curricula. School textbooks often present factual concepts with limited understanding of how science content knowledge has come to exist. This study investigates the impact of a teaching unit introducing the concept of the Nature of Knowledge (NOK) with preservice secondary teachers. It aimed to investigate their understanding of information about Covid from the media and subsequently investigate the value they saw for incorporating NOK in school science. The study took place as part of a teacher training programme in England. Results revealed that preservice teachers’ (n=37) understanding of theories, laws and models were improved. In-depth qualitative analysis reveals patterns in participants definitions, as well as the shift in their conceptualisations after the teaching session. This study highlights the impact of a short session on preservice teachers’ conceptual understanding and perceptions regarding NOK once highlighted to them.

Dealing with Uncertainties in Teaching: Primary School Teachers’ Skills, Attitudes, and Evidence Use
Presenting Author: Despoina Georgiou, Utrecht University, Netherlands; **Co-Author:**Maria Rodriguez Alcolea, Utrecht University, Netherlands

Primary school teachers often deal with complex situations which lead to uncertainty about how to act when teaching. The use of research evidence to inform teaching practice may support teachers’ efforts to deal with uncertainties when preparing to teach. There have been several initiatives all around Europe aimed at supporting teachers to easily access and critically reflect upon research evidence. However, little is known about teachers’ engagement in evidence-informed teaching practices. This study explores the relationships between primary school teachers’ information literacy skills, attitudes toward research, and their self-reported frequency of use of scientific evidence in teaching practice. We employed a quantitative design and collected data from $N = 120$ primary school teachers. Results indicate a significant positive relationship between attitudes and information literacy skills and a significant negative relationship between information literacy skills and teachers’ self-reported use of evidence. Most primary school teachers possess relatively positive attitudes (65%) toward research; however, they almost never (87%) use scientific evidence to inform their teaching practice. Accordingly, they show low to medium information literacy skills (95%). These findings suggest that positive attitudes towards evidence-informed practice do not necessarily lead to using evidence in teaching practice. Low information literacy skills and in particular low skills when assessing the quality of research evidence may be a factor limiting teachers’ use of research evidence. Professional development courses targeting teachers’ information literacy skills to establish an information culture within schools may support the use of evidence in teaching practice.

Student Agency and Future Literacy Skills: A Case Study of Scenario-Based Teaching
Presenting Author: Olga Ioannidou, University College Dublin, Ireland; **Co-Author:**Liam Guilfoyle, University of Oxford, United Kingdom; **Co-Author:**Sibel Erduran, University of Oxford, United Kingdom

The 21st century has been characterised by fast-paced global societal, scientific, and technological challenges. As such, future citizens should be adequately equipped with necessary skills to navigate the high degree of uncertainty that they entail. Utilising the affordances of learning in informal spaces, this study explores the use of a scenario-based teaching approach to facilitate students’ agency and global competencies towards climate change. For this purpose, a

teaching session focusing on possible positive, as well as troubled climate change scenarios, was designed and delivered in a Museum of Natural History in England. Twenty-four (n=24) secondary school students (Year 12) took part in the study. Students responded to a paper-pencil questionnaire before and after the teaching session and paired-sample t-tests were performed to examine potential gains in their feeling of agency, futures literacy and epistemic emotions. Results indicated a statistically significant positive effect on students' climate agency [$t(22) = 2.1$, p

Conditional Reasoning: Supporting Elementary Students' Skills in Mathematical and Everyday Contexts
Presenting Author: Anastasia Datsogianni, University of Cyprus, Cyprus; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

Conditional reasoning (i.e. reasoning about "if...then" statements) is founded on the understanding of uncertainty. Not only in everyday life but also in mathematics, students need to derive logical inferences from given premises by generating mental alternative models. Elementary students' conditional reasoning skills within mathematics have been rarely investigated (Datsogianni, Sodian, Markovits, & Ufer, 2020). Even though this reasoning type is well-researched in developmental psychology (e.g Barroulliet & Lecas, 2002), the evidence about instructional methods that might support students to cope with conditionals more efficiently, is still poor. Hence, this study aimed to explore the effects of two short-term trainings based on alternatives generation training on students' conditional reasoning scores within mathematics and everyday context. The study was carried out in a 60 minute small group school activity consisted of the pre-testing, intervention, and post-testing. GLMM analysis was conducted about students 'conditional reasoning scores in each context (mathematical/ everyday) by time (pre and post), specific condition (experimental/ control) and logical form (MP, MT, AC, DA). Data from 285 elementary students from Cyprus (5th grade $N = 144$, and 6th grade $N = 141$) showed mixed results, revealing an increase of AC and decrease of DA reasoning score after the training in the mathematical context and the exact opposite results for the everyday one. Even if none of the trainings seemed to totally function as scaffold of students' conditional reasoning skills in each context and logical form, this study adds some necessary evidence in this research area.

Session P 9

25 August 2023 18:45 - 20:15
UOM_A03
Symposium
Cognitive Science, Lifelong Learning

Self-regulation in young learners

Keywords: Cognitive Development, Cognitive Skills and Processes, Early Childhood Education, Learning Strategies, Lifelong Learning, Metacognition, Self-efficacy, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Charlotte Dignath, TU Dortmund University, Germany
Chairperson: Bernadette van Berk, Technical University of Dortmund, Germany
Discussant: Nancy Perry, University of British Columbia, Canada

Self-regulation (SR) has been shown to be a key competence for children to be successful learners throughout their academic career (Dent & Koenka, 2016). Recent research indicated that even young children can learn to self-regulate their thoughts and actions, but open questions remain with regard to factors associated with developing SR and the role that SR has for academic performance across time (Perry, 2019). More research is required across the kindergarten and primary school years to investigate the developmental trajectory of SR processes to understand how best to foster SR even before children enter school and during their first years of schooling. This symposium seeks to fill this gap by providing research evidence on (1) how the environment of early childhood classrooms invite young children to engage in SR, (2) the role of early SR at kindergarten age for later learning outcomes at school, (3) factors to explain variation in SR in young primary school children, and (4) how motivational and metacognitive aspects of SR can predict academic performance in older primary school students. The results will provide new insights into SR development at key transitions from early childhood education to primary school, which can be used to derive implications for interventions.

How do self-efficacy and procedural metacognition predict performance?
Presenting Author: Mariette van Loon, University of Zurich, Switzerland; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

Metacognitive monitoring accuracy and self-efficacy are presumed to affect learning performance. It is yet unknown to what extent children's metacognitive monitoring judgments and self-efficacy judgments about their ability to successfully complete a specific task are related. The first aim of the present study was to investigate how monitoring judgments and self-efficacy judgments are related. The second aim was to investigate to what extent self-efficacy and monitoring accuracy affect regulation and performance. These questions were addressed for a group of 10-year-olds and a group of 12-year-olds, who worked on a self-regulated concept learning task. For both age groups, self-efficacy judgments were moderately and significantly correlated with monitoring judgments. For fourth graders, regulation (effective restudy) had an effect on performance, however, there were no direct effects of monitoring accuracy and self-efficacy. For sixth graders, however, there were significant effects of self-efficacy and monitoring accuracy on task performance. These findings may indicate that monitoring accuracy and self-efficacy start to affect children's learning between the age of 10 and 12 years old. Moreover, results imply that, when supporting children in middle childhood with learning, teachers may mainly focus on effective regulation of learning. When supporting children in late childhood, in addition to supporting them with regulation, supporting with metacognitive monitoring accuracy and self-efficacy may have beneficial effects on their learning outcomes.

What makes primary school students use SRL strategies? Expectancy and value to explain SRL
Presenting Author: Bernadette van Berk, Technical University of Dortmund, Germany; **Co-Author:**Charlotte Dignath, TU Dortmund University, Germany

Self-regulation of learning (SRL) is considered a strong predictor for future academic success (Dent & Koenka, 2016; Robson et al., 2020) and an important basis for lifelong learning (Weinstein et al., 2011). Studies have shown that already young children from 2-3 years onwards use self-regulation strategies (Perry, 2019). But there is a lot of variation: while some students adapt to challenges in learning processes strategically, others give up and fall behind. To date we have little understanding on what explains this variation between students in self-regulated learning. We apply an skill-and-will-based expectancy-value approach to SRL to investigate how young students' strategy knowledge, and their self-efficacy and utility beliefs regarding SRL explain students' use of SRL strategies in primary school homework situations.Fifty students and their parents have participated in an online study (data collection still ongoing), using a multi-method approach to assess students' use of SRL strategies. Preliminary analyses suggest that expectancy and value beliefs are significant predictors for students' self-reported use of SRL strategies, while strategy knowledge explained parents' ratings of their children's SRL strategy use. The findings will be replicated using the interview and thinking-aloud data of students' SRL strategy use gathered in the data collection, and the analyses will be updated once the data collection has ended. Results will be available by the time of the conference.

Longitudinal predictors of academic outcomes in the first year of school
Presenting Author: Elena Vasseleu, University of Wollongong, Australia; **Co-Author:**Steven Howard, University of Wollongong, Australia

An extensive research base supports foundational abilities – including academic concept knowledge (e.g., basic literacy and numeracy ability) and self-regulation – as important, longitudinal predictors of academic outcomes across formal schooling. Whereas theoretical reasoning around the role of earlier academic knowledge infers a more direct link (i.e., knowledge as cumulative), self-regulation is seen as more of an indirect supporter of knowledge acquisition (i.e., supporting effective and sustained engagement with learning). Few studies to date, however, have sought to examine how these two abilities (when measured in the preschool years) may interact to longitudinally predict academic achievement. The current study sought to examine main and possible

interaction effects between prior-to-school self-regulation and academic knowledge on Kindergarten academic outcomes (i.e., numeracy and vocabulary ability), 18 months later. Longitudinal findings from 199 children (mean age at preschool = 4.49 years), supported preschool self-regulation and academic concept knowledge as significant independent predictors of academic knowledge at the end of the first year of school. Results also suggested a significant interaction between self-regulation and academic knowledge, such that higher levels of self-regulation showed greater strength of association with academic outcomes when children had initially lower academic knowledge. Current findings provide empirical support for the important independent and protective role of early self-regulation for later learning outcomes and reinforce self-regulation as an important and viable target for early intervention.

Examining environmental affordances for Self-Regulation in Australian Early Childhood settings
Presenting Author: Deborah Pino-Pasternak, University of Canberra, Australia

It is well established that young children's capacity to self-regulate develops significantly during the early years and predicts subsequent academic and social outcomes. Despite widespread evidence of the benefits of self-regulation (SR) interventions as add-ons to curriculum, there is a dearth of research examining how teachers in Early Childhood (EC) environments promote SR in daily routines, beyond measures of classroom quality. This qualitative study used Affordance Theory, examining how the physical and the social environment of EC classrooms invite young children to engage in SR. Five preschool and four kindergarten classrooms in one Australian Early Childhood School were observed over three hours at different times of the day. Data was gathered using naturalistic observations and running records of physical and social affordances for SR. Physical affordances were operationalized as access to spaces, belongings, food/drinks, and materials; and nature of tasks or activities. Social affordances were defined as social practices such as routines, affective interactions, and dialogic practices (including instruction). Affordances for SR were examined alongside a continuum that ranged from adult-determined (minimal affordances for child regulation) to student-determined (maximum affordances for child regulation). Findings showed more and more varied affordances for children's self-regulation in preschool classrooms when compared to kindergarten. Across groups most environmental and social affordances involved adults supporting SR during adult-determined activities rather than actively promoting children's goal setting and decision-making. Lack of opportunities for children's agency in their learning environments was consistent across settings but considerably diminished in kindergarten classrooms.

PhD Students' Acceptance of Teaching Culture and by the Teaching Community: a Phenomenographic Study
Keywords: Doctoral Education, Higher Education, Qualitative Methods, Social Aspects of Learning and Teaching
Presenting Author: Triinu Soomere, University of Tartu, Estonia; **Co-Author:**Mari Karm, University of Tartu, Estonia; **Co-Author:**Torgny Roxå, Lund University, Sweden

One of the aims of PhD students' socialisation is for them to accept the norms of teaching culture, and to be fully engaged with and accepted by the university community. However, when PhD students enter universities, they do not necessarily accept all cultural norms, neither do they all experience acceptance by the teaching community. This phenomenographic study explored the experiences of twenty-five PhD students' around their acceptance of norms of teaching culture, and of their acceptance by the university teaching community. The study identified three qualitatively different ways in which PhD students experienced acceptance of teaching culture and acceptance into the teaching community: as equal partners, as knocking against boundaries and as being on the margins.

Industrial PhD students' research communication practices in academia and the industry
Keywords: Communication Skills, Doctoral Education, Metacognition, Science and STEM
Presenting Author: Maria Cervin-Ellqvist, Chalmers University of Technology, Sweden

Collaborations between academia and industry are becoming increasingly common, especially in STEM. In an industrial or hybrid academic/industrial setting, research must be communicated both to researchers and other audiences, a presumably complex communication reality that has received comparatively little attention in research. One example is industrial PhD students, who are funded by industry and thus have both academia and industry as main stakeholders for their research communication. This project examines research communication practices of researchers who transition between academia and industry, aiming to pinpoint how universities can support such transitions. This specific study explores industrial PhD students' experiences of communicating research for different audiences, and how they learn to do so. The findings show that industrial PhD students indeed do communicate to both researchers and industry, and that there are several challenges in doing so, including writing scientific articles, and adapting to varying levels of knowledge. Moreover, the strategies students use to face these challenges corroborate conclusions from previous research that genre awareness and self-regulation are important in transitions across different contexts, and in learning to communicate research to different audiences. However, few students had participated in formal training that they had found useful in communicating to industry, and many wanted more support. The insights from this study can be used to better meet industrial PhD students' needs in this regard, for example in the design of communication courses in HE, and specifically in STEM.

The Influence of Role Models on Women in Academia - an Interview Study
Keywords: Doctoral Education, Economics of Education, Mentoring and Coaching, Qualitative Methods
Presenting Author: Jule Hangen, Goethe University Frankfurt, Germany; **Co-Author:**Patricia Köpfer, University of Hohenheim, Germany

Women in tenured professorships are still a minority, the so-called "leaky pipeline" (diminishing share of women for higher positions) is particularly evident. However, women's and men's decision-making processes seem to be different: women still disproportionately leave academic careers after graduation or after a successful doctorate. We focus on the impact of role models and examine decision-determining factors at each career stage in academia to gain a deeper understanding of the aforementioned decision-making process. For this reason, an interview study was conducted (N=30). Results show that women partly lack female role models. Not all men as well as women see the need for role models. Women in particular are looking for role models who are also pioneers in reconciling family and career.

Graduate school leadership: How Danish humanities research education leaders constitute their roles
Keywords: Curriculum Development, Doctoral Education, Educational Policy, Higher Education
Presenting Author: Lynn McAlpine, University of Oxford / McGill University, Canada; **Co-Author:**Søren Bengtsen, Aarhus University, Denmark; **Co-Author:**Andrew Gibson, Trinity College Dublin, Ireland

Increasing government policy oversight of research education has led universities to establish central units, such as graduate schools, with their Heads responsible for leading research education. Yet, few studies on such leadership exist. Further, rarely are such studies case-based so examining the interaction between structural, disciplinary and individual influences. Thus our decision to conduct a case study of five Heads of Graduate Humanities Schools in five Danish universities: individuals responsible for interpreting and enacting external policies as well as creating and monitoring internal policies related to PhD education. We asked: How do these Heads constitute their roles? We used a narrative case-based framework examining the interplay between the individual's biography and the institution's history to understand how their own goals and responsibilities interacted with perceived structural factors such as Ministerial

regulations and institutional rules and strategies. While all were Heads, there were organizational differences in their job roles related to the profile and strategy of the specific university, as well as their own past experiences and values. They placed great reliance on their PhD experiences when articulating their perspectives: past PhD experience was the 'knowledge base' they drew on, rather than policy or best practice examples. As well, their general stance to policy was that of support. What was striking overall was their perspectives on change were largely individually-focused: as leaders, they saw their role as enabling individual student learning, rather than their role as engaging multiple players (e.g., supervisors, program leaders) to enable collective structural change.

Research use in the teaching profession: A systematic review
Keywords: In-service Teachers, School Effectiveness, Synergies between Learning / Teaching and Research, Teacher Professional Development
Presenting Author:Sølvi Mausethagen, Oslo and Akershus University College of Applied Sciences, Norway; **Presenting Author:**Hege Hermansen, Oslo Metropolitan University, Norway; **Co-Author:**Hanna Holmeide, Oslo Metropolitan University, Norway; **Co-Author:**Marte Lorentzen, Oslo Metropolitan University, Norway; **Co-Author:**Vera Niederberger, Pädagogische Hochschule Schwyz, Switzerland; **Co-Author:**Guri Skedsmo, Pädagogische Hochschule Schwyz, Switzerland

This paper presents a systematic review of 'research use' in education. As a policy construct, 'research use' has gained significant attention over the past decade. An often-stated assumption is that research use is important for strengthening educational quality in schools and improving educational outcomes. However, the concept of research use, and particularly its translation to practice, is often left undefined. This is problematic because it obscures the processes and dynamics that are at play as practitioners relate to research in their work and integrate research-based knowledge with other knowledge sources. In this systematic review, we examine published research that analytically foregrounds the *use* in research use, with two main objectives: First, we contribute to existing research by conceptually clarifying different dimensions of the term 'research use', the ways in which this concept has been applied in existing research, and the ways in which the concept has evolved over time. Second, the review documents how research use has been empirically investigated, and the assumptions about research use that guide researchers' approaches to this phenomenon. The review contributes to developing our conceptual understanding of 'research use', and of the ways in which practitioners are positioned with regard to the phenomenon of research use. The findings suggest that there is a need to challenge the linear reference frames frequently used by politicians and researchers when addressing research use, and to develop methodological and analytical approaches that can account for the integration of research and other knowledge sources for educational practitioners.

Combining a utility value and a mindset intervention to foster teachers' research motivation
Keywords: Attitudes and Beliefs, Mindsets, Motivation, Pre-service Teachers
Presenting Author: Helene Zeeb, University of Erfurt, Germany; **Co-Author:**Thamar Voss, University of Freiburg, Germany

Teachers often see little value in engaging with research methods and lack confidence in their own research skills. A utility value intervention could support them in developing more positive value beliefs; a growth mindset intervention could support their growth mindset and, in turn, their expectancy beliefs. Combining these two interventions could have an even stronger effect on beliefs and motivation. In this randomized field study, student teachers (N = 177) worked either on a utility value intervention (UVI), a growth mindset intervention (GMI), or a combined intervention (UV-GMI). All interventions were online and similar in structure and length. There were two follow-up sessions after eight and sixteen weeks. Results indicated that the UV-GMI was as effective as the single interventions with respect to fostering beliefs. However, there were no additional effects on motivation and performance at a statistics test. The UV-GMI supported especially student teachers with low competence beliefs. We conclude that the combined intervention could be a powerful tool for teacher educators who aim to foster future teachers' positive beliefs about engaging with research methods.

Teachers' beliefs, attitudes and engagement towards educational research - A longitudinal study
Keywords: Attitudes and Beliefs, Pre-service Teachers, Self-efficacy, Teacher Professional Development
Presenting Author: Karlien De Jaeger, KULeuven / EDU-Cel (main work address Kortrijk), Belgium; **Co-Author:**Mieke De Cock, KU Leuven - Department of Physics and Astronomy, Belgium; **Co-Author:**Wim Van Dooren, KU Leuven, Belgium

Engaging teachers with existing educational research and engaging them in conducting educational research is a professionalisation strategy that is important for themselves, their schools and the educational community. However, teachers often are negative about it.Teachers' beliefs regarding and attitudes towards educational research have a major influence on their (planned) behaviour. The current study wants to gain further insight in these beliefs and attitudes, as well as in the engagement of teachers with and in educational research. In particular, we investigate the evolution during the teaching career, starting in teacher education. This paper reports on the first steps of this longitudinal study: a survey study comparing the beliefs, attitudes and planned engagement of student-teachers before and after a course on educational research during their Master of Teaching programme. Results show that students think they will more likely engage with existing educational research than in conducting it, unless, as a teacher, they can collaborate with researchers. Their beliefs, including self-efficacy beliefs, and attitudes are strong predictors for the planned engagement.

Science Teachers' Beliefs about Teaching and Learning Science Content and Scientific Inquiry
Keywords: Attitudes and Beliefs, In-service Teachers, Pre-service Teachers, Science Education
Presenting Author: Verena Petermann, Justus Liebig University Giessen, Germany; **Co-Author:**Andreas Vorholzer, Technical University of Munich, Germany; **Co-Author:**Claudia von Aufschnaiter, Insitute of Physics Education, Germany

Fostering students' competencies regarding science content and scientific inquiry are both important goals of science education. However, it seems that in actual classroom practice, science content knowledge is typically addressed explicitly, but scientific inquiry knowledge is not. It can be assumed that this difference in teaching practice is at least in part related to teachers' beliefs about teaching and learning science content and scientific inquiry. This study investigated and contrasted teachers' beliefs regarding these two goals. Data was collected from N = 170 science teachers with an online questionnaire. After modelling the data and assessing the quality of measurement via Rasch analyses, t-tests were used to compare teachers' beliefs about teaching and learning science content and scientific inquiry. The results reveal that teachers' beliefs can vary considerably between both goals. For instance, teachers believe that explicitly addressing conceptual information is more important for teaching and learning science content than for teaching and learning scientific inquiry. Furthermore, teachers believe that they are more able to teach science content than to teach scientific inquiry. The presentation will provide an overview of the observed differences in teachers' beliefs. Implications for research and teacher education will be discussed.

Don't we need two control groups in large Randomized Controlled Trials?
Keywords: Quantitative Methods, Researcher Education, Teacher Efficacy, Teacher Professional Development
Presenting Author: Sarah Pariser, Université Paris 8, France; **Co-Author:**André Tricot, University Paul Valéry, Montpellier, France, France; **Co-Author:**Caroline Viriot-Goeldel, Universite Paris Est Creteil, France

Evidence-based practices have been irrigating research in education for decades, raising great hopes of improved efficiency of educational systems. However,

translating teaching practices proven effective in RCTs conducted by researchers into ordinary classrooms don't often achieve significant results with large effect sizes (James-Burdumy et al., 2009).
A literature review on this issue shows that new study designs have emerged, involving teachers in the design and/or the implementation phases, process evaluations complementing the quantitative measurement of the intervention (Connolly et al., 2018). Researchers collect information on how teachers appropriate the experimental teaching practices. Their experiment can be adjusted directly to real working conditions and target the teachers' zone of proximal development more accurately (Bryck, 2015). Translating those experiments then has greater chances to be efficiently implemented in ordinary practices.
This paper specifically focuses on how to select participants in this type of study design, where the experiment is facilitated by regular teachers. Participants are often volunteer teachers, randomly assigned to an experimental or a control group (Banerjee & Duflo, 2009). A paired control group can also be recruited among non volunteer teachers, in order to reflect the ordinary practices. This paper explores the pros and cons of these two solutions to constitute a control group and suggests a promising third: comparing the experimental group to two control groups: (a) a group of volunteer teachers, randomly assigned (b) a non volunteers group, paired to the experimental group. We describe a study using this method with 43 classrooms and 982 middle school students.

Learning from errors in vocational education and training
Keywords: Informal Learning, Lifelong Learning, Quantitative Methods, Vocational Education and Apprenticeship Training
Presenting Author: Veronika Anselmann, University of Education Schwäbisch Gmünd, Germany

While errors in schools are often seen as important source for learning, errors at nurses´ workplace can have severe consequences for patients´ health. In Germany nurses´ vocational education and training (VET) consists of a mainly school based theoretical part and a practical component where trainees work in hospitals. Learning from errors at work is based on the concept of experiential learning and includes developing strategies for error prevention and reflection about the causes. An error-friendly learning climate at schools can be described as teachers´ and learners´ perception of errors as an important part of learning. While studies found out what factors facilitate learning from errors at work (Rausch et al., 2022), less is known how an error-friendly climate in schools can influence nursing trainees´ learning from errors. Therefore, this study wants to find out if an error-friendly climate at schools can influence nursing trainees´ learning from errors at work. 374 nursing trainees (N=374) participated in a cross-sectional questionnaire study with an online questionnaire. Results of our structural equation modelling indicate that beside contextual and individual components, error climate can influence trainees´ learning from errors at work. Nursing trainees´ learning from errors can be fostered in their theoretical and practical part of their training.

In-service student teacher competency development: the impact of an adapted guidance approach
Keywords: In-service Teachers, Informal Learning, Mentoring and Coaching, Mixed-method Research
Presenting Author: Katrien Cuyvers, University of Antwerp, Belgium; **Presenting Author:**Tom Smits, University of Antwerp, Belgium; **Co-Author:**Hannes Van der Linden, University of Antwerp, Belgium; **Co-Author:**Sabrina Govaerts, AP University of Applied Sciences and Arts Antwerp, Belgium; **Co-Author:**Barbra Schits, AP University of Applied Sciences and Arts Antwerp, Belgium

Workplace learning has long been a substantial part of teacher education. In Flanders, in-service student teachers are employed as teachers in a school while simultaneously being enrolled in a teacher education programme. For in-service student teachers to effectively learn from teaching practice and teaching activities, self-regulation of workplace learning (SRwpL) is assumed to be of major importance. SRwpL is evoked by work and refers to the ability to engage in different strategies that shape the learning process dynamically unfolding over time. Research shows that the education and guidance of (self-regulated) workplace learning of in-service student teachers is very challenging leading to different needs of the actors involved with the need of an adapted guidance approach coming to the fore. This study aimed to strengthen teacher education by developing such an adapted guidance approach, and investigate the impact of different elements from this approach performed by mentor coaches and supervisors on the development of SRwpL and basic competencies of in-service student-teachers. A single-case adapted alternating treatments design with time-series repeated quantitative and qualitative measures of SRwpL and the basic competencies of in-service student teachers were used. Data are being collected between September 2022 and March 2023. Consequently, no findings can be reported on yet. Nevertheless, since this projects ends on August 31st, 2023 and the report should be finalised by that time, we aim to report on all the findings at the EARLI-conference.

A Diary Study on Formal and Informal Learning Opportunities for Teachers in Vocational Schools
Keywords: Informal Learning, Lifelong Learning, Quantitative Methods, Teacher Professional Development
Presenting Author: Manuel Böhm, Universität Mannheim, Germany; **Co-Author:**Andreas Rausch, University of Mannheim, Germany

There is little research on teachers' learning in vocational schools. It is argued that the traditional approach of formal and non-formal teacher training does not fit the current state of research. Therefore, the focus lies on informal vocational teacher learning. Moreover, the importance of informal learning is stressed (Imants & van Veen, 2010, p. 569; Kwakman, 2003, p. 150). In a diary study with a developed teacher task framework, vocational teachers reported their daily professional tasks as well as their according level of perceived learning, stress, and coping. Of interest are (RQ1) the time teachers invest into formal and non-formal learning activities and (RQ2) the daily work tasks teacher perceive as conducive. It was found that teachers invest 0.98 hrs into formal and 0.36 hrs into non-formal learning. Furthermore, the perceived distress and perceived learning during daily teacher tasks and their changes across the different categories is examined. The most stressful teacher tasks are in line with the literature on teacher stress. The found teacher learning activities confirm findings from other studies. Based on the learning hypothesis (Karasek, 1979) and the transactional model of stress (Lazarus & Folkman, 1984), stress and coping are assumed as predictors of the perceived learning. It is therefore (RQ3) checked whether stress and coping predict informal learning in teachers' daily work tasks. Stress and coping as well as their interaction term were found to be significant predictors of the perceived learning, (R^2 = .07, $F(3, 10468) = 263{,}36$, $p < .001$).

Exploring the integration of theory and practice in work-based learning
Keywords: Higher Education, Informal Learning, Lifelong Learning, Mixed-method Research
Presenting Author: Zsuzsa Kovács, Eötvös Loránd University, Budapest, Hungary; **Co-Author:**Emese Schiller, Eötvös Loránd University, Hungary; **Co-Author:**Nóra Hegyi-Halmos, Eötvös Loránd University, Budapest, Hungary

Work-based learning enables a powerful connection between the labour market and higher education institutions. The integration of work-based learning into higher education programs has gained importance. This paper thus aims to present initial results of a pilot research project that outlines Hungarian university students' experiences and learning outcomes of work-based learning in the mandatory practicum within a master's degree program. This exploratory study, containing both questionnaire and interview sub-studies, was conducted with the overarching aim to explore (1) how theory-based training and work-based learning are integrated and (2) by what means the mandatory practicum may contribute to the practical application of the knowledge acquired in formal university education. Results show a diversity in terms of students' prior work experience which may also imply diverse learning paths.Keywords: professional identity, work-based learning, theoretical and practical training in higher education

A Systematic Review of Empirical Studies Examining the Teaching Profession in the COVID-19 Pandemic
Keywords: Competencies, E-learning/ Online Learning, Pandemic, Teaching/Instructional Strategies
Presenting Author: Sherry Shilon, the Open University of Israel, Israel; **Co-Author:**Ayelet Becher, the Open University of Israel, Israel; **Co-Author:**Tali Aderet-German, Ben Gurion University of Negev, Israel

The COVID-19 pandemic has brought increased uncertainties viewed as either a liability or an asset to the teaching profession. In this systematic review, we explored the external and internal factors that shaped the teaching profession during COVID-19 pandemic. Qualitative, quantitative, and mixed methods empirical studies published in 2020-2022 were obtained from various databases, namely, ISI Web of Science core collection, Education Resources Information Centre (EBSCO), SCOPUS, and PsycINFO (EBSCO) as well as from leading journals in the field of teaching and education research. Upon executing careful selection criteria, 112 articles were selected for review. Findings indicate six emerging themes and analysis adopts Glazer's inside-out view of professionalism, relying on Abbott's framework of jurisdictional strength. This review will be helpful for educational policy makers and educators to gauge the opportunities and challenges which increase and decrease the profession's strength and may serve as a hope in shaping the future of the teaching profession from within.

Teacher educators' experiences and well-being during COVID-19 online teaching
Keywords: E-learning/ Online Learning, Higher Education, Teacher Efficacy, Well-being
Presenting Author: Marjaana Veermans, University of Turku, Finland; **Co-Author:**Piia Naykki, University of Jyväskylä, Finland; **Co-Author:**Anne-Maria Korhonen, Hamk University of Applied Sciences, Finland; **Co-Author:**Eetu Lehtiö, University of Turku, Finland; **Co-Author:**Lauri Salo, University of Turku, Finland

This study explored how teacher educators experienced online teaching practices during COVID-19 pandemic, and how the experiences reflected to their well-being. Three Finnish teacher education universities with 17 teacher educators participated in the study. The data were collected first by the self-assessment tool that aimed to increase teachers' awareness of their teaching practices that may also reflect their well-being. Second, the focus group interviews related to online teaching and well-being were conducted online. The theory- and data-driven content analysis were implemented. The findings indicate challenges, but also positive approaches for online teaching. Teacher educators highlighted a challenge to follow students' emotional reactions and their individual needs for guidance and scaffolding. The fact that students switched off cameras during the online teaching resulted in a lack of communication. Furthermore, the need to prepare and design online teaching sessions and learning activities with details and a structured way was highlighted. This requirement also had a parallel role to positively impact teacher educators' competence development. Teachers experienced their new role as an online teacher inspiring and supportive for their professional development. Teachers viewed that their well-being was increasing due to online teaching brining certain flexibility to everyday life, and easiness of transitions. This study provides knowledge for developing teacher education and teacher educators' possibilities to design and implement successful online teaching and learning activities. The implications of this study highlight a need for analyzing and revising online teaching practices in order to have students actively participating in online sessions.

Effects of the COVID-19 pandemic on social-emotional skills of students from a teachers' perspective
Keywords: Emotion and Affect, Pandemic, Social Aspects of Learning and Teaching, Social Development
Presenting Author: Birgitta Kopp, Ludwig-Maximilians-University, Germany; **Co-Author:**Annika Lueg, Ludwig-Maximilians-Universität (LMU), Germany

In this study, we investigated social-emotional skills of students due to the Corona pandemic from a teachers' perspective using qualitative interviews. First, teachers evaluated social-emotional skills of their students regarding individual and social aspects due to Corona. And second, further effects of Corona on student's social-emotional development were gathered. Nine teachers from diverse primary and secondary schools in Germany were interviewed using an interview guideline for answering these questions. All interviews were transcribed and analysed using MAXQDA. A coding scheme was developed deductively using theoretical assumptions regarding social-emotional learning, and inductively using the data set. Two coders double rated 30 per cent of the transcripts. Inter-rater reliability was high with r=.93. Results show that all teachers value social-emotional skills as very important for establishing a good learning atmosphere in class. During the pandemic, teaching with digital devices had been realized which reduced social-emotional issues in classrooms. Thus, from a teachers' perspective, students' social-emotional skills declined regarding the individual level of self-controlling emotions, and the social level of building relationships and showing empathy. Furthermore, regarding students' social-emotional development, depressions and aggressions increased, especially regarding kids with parents having a lower socio-economic status and giving lower social-emotional support during the pandemic. This interview study shows the importance of stressing social-emotional learning using explicit training methods to improve students' skills as they decreased during the pandemic.

Student perceptions of teaching quality during the COVID-19 pandemic in Indonesia
Keywords: Attitudes and Beliefs, Large-scale Assessment, School Effectiveness, Teacher Effectiveness
Presenting Author: Maria Teodora Ping, Mulawarman University, Indonesia; **Co-Author:**Anindito Aditomo, Educational Standards, Curriculum and Assessment Agency, MOECRT and University of Surabaya, Indonesia; **Co-Author:**Irsyad Zamjani, Centre for education standard and policy, MOECRT, Indonesia; **Co-Author:**Asrijanty Asrijanty, Center for Education Assessment, MOECRT, Indonesia; **Co-Author:**Tri Lestari, Widya Mandala Catholic University, Indonesia; **Co-Author:**Anita Lie, Widya Mandala Catholic University, Indonesia; **Co-Author:**Ridwan Maulana, GION - University of Groningen, Netherlands

The present study aims to investigate student perceptions of teaching quality from Indonesian perspectives, by taking into account similarities and differences across education levels, geographic locations, and school type. Teaching quality was measured using a three-dimensional questionnaire initially developed in the German context including Classroom Management, Student Support, and Cognitive Activation. A total of 6,758,399 students from 256,366 schools across Indonesia were surveyed during the 2021/2022 school year. Descriptive analysis and ANOVA were performed. Results reveal a significant difference ($p < 0.0005$) in student perceptions across education levels, geographic locations as well as school types- albeit with a meager effect size. Furthermore, the differences in student perceptions towards all of teachers' teaching quality dimensions between effective (top 20%) and less effective (bottom 20%) schools were found to be significant. This study paves the way for improving the quality and equity of learning environments in Indonesia.

Culture, pedagogy, and cognition: Think-aloud analysis of cultural differences in teacher cognition
Keywords: Cognitive Skills and Processes, Eye Tracking, Mixed-method Research, Teacher Effectiveness
Presenting Author: Nora McIntyre, University of Southampton, United Kingdom; **Co-Author:**Phyllis Lau, University of Southampton, United Kingdom; **Co-Author:**Davy Tsz Kit Ng, The University of Hong Kong, Hong Kong

Think-aloud is a methodology with unique potential to generate exceptional insight into teacher expertise. By obtaining think-aloud verbalisations, expertise researchers are able to trace each moment of what can be regarded as 'optimal' task performance as cognitive dimensions are identified that support expert task performance in classroom teaching. The present study adapts an existing framework for teacher cognition to think-aloud elicited by gaze-cued own-perspective videos. In doing so, the present study asks to what extent does a framework for teacher cognition that has been applied to Western European teachers also applies to East Asian teachers in Hong Kong. Additionally, how does the teacher cognition of Hong Kong experts differ from that of Hong Kong novices, and what are the cultural differences in expert teacher cognition when comparing teachers in the UK with those in Hong Kong? Thus, this study address the preoccupation with Western European trends and populations in the field of Educational Psychology. This study also advances methodology for educational research by applying pioneering and rigorous mixed methods to investigate processes which are core to learning and instruction.

Prior knowledge predicts students' learning and later systems thinking skills of wicked problems
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Eye Tracking, Sustainable Development
Presenting Author: Tomi Kiviluoma, University of Helsinki, Finland; **Presenting Author:**Ilona Södervik, University of Helsinki, Finland; **Co-Author:**Riitta Savolainen, University of Helsinki, Finland; **Co-Author:**Helena Åström, University of Helsinki, Finland

This study combined longitudinal and individual process-level analyses to investigate the development of expertise among university biology students (N = 33) during their bachelor studies. Open-ended tasks measuring students' conceptual understanding regarding photosynthesis and evolution was repeated three times during the bachelor studies. Additionally, a case task including scientific research material and questions concerning a multifaceted and complex phenomenon, that is the effects and challenges of the climate change for the forest ecosystems, was used. The processing of the case task material was investigated using eye-tracking. The results showed that students with deeper conceptual understanding in the beginning of the university studies succeeded better also in the third study year both in the conceptual understanding tasks and in the case task that required systemic thinking and applying of conceptual knowledge. Additionally, longer reading times regarding the sentences presenting conflicting information was related to weaker success in considering the expected challenges and effects of warming climate for forests. The result might indicate about certain students' difficulties in processing material that includes conflicting knowledge and hence, their weaker systems thinking skills. Further, the results of this study indicate that conceptual understanding and systems thinking skills are related in aiming to understand complex, wicked problems such as climate change. The results also highlight the importance of early support, since the level and quality of prior knowledge seems to predict later success both regarding basic conceptual knowledge and related systems thinking skills.

Hybrid explanatory animations: Anti-cued context improves compositional design
Keywords: Comprehension of Text and Graphics, Educational Technologies, Eye Tracking, Instructional Design
Presenting Author: Jean-Michel Boucheix, University of Dijon, LEAD-CNRS, France; **Co-Author:**Richard Lowe, Curtin University, Australia

A recent composition approach for designing complex educational animation lead to an improvement of learner's mental model quality, compared to the conventional animation design based on the presentation of comprehensive realistic behaviour of the content to be learnt. However, this improvement remained suboptimal. In a previous experiment the effectiveness of a hybrid design that selectively combined features of the composition and of the comprehensive approaches by using anti-cueing was tested. Three groups of participants were presented either the original composed version of an upright piano mechanism or an anti-cued version or a comprehensive version (control group). Results showed the hybrid version was the best learning condition, but despite control of information exposure across conditions, participants who self-launched each animation cycle spent longer studying animation in the Hybrid and Compositional animations than the Conventional animation. Therefore, in the second present study, a strictly equal study time (system-paced) was used with the three previous conditions as well as with a fourth condition that presented event units' pairs along the causal chain in a progressive cumulative manner ('snowball accretion'). Learners eye movements were also recorded during animation study time in order to address perceptual and cognitive processing. Results of study 2 demonstrate that the Hybrid version produced the best learning, even better than the Compositional version. The Cumulative version did not differ from the Comprehensive control condition. The two studies showed very similar results.

School stressors in adolescents with Specific Learning Disorders: frequency and vulnerability
Keywords: Anxiety and Stress, Emotion and Affect, Higher Education, Learning and Developmental Disabilities
Presenting Author: Valentina Tobia, Vita-Salute San Raffaele University, Italy; **Co-Author:**Michela Moretti, Vita-Salute San Raffaele University, Italy; **Co-Author:**Martina Lattanzi, Vita-Salute San Raffaele University, Italy; **Co-Author:**Anna Lucia Ogliari, Vita-Salute San Raffaele University, Italy

Are students with Specific Learning Disorders (SLD) more exposed than their peers to stressful episodes in the school context? If this is the case, stressors of which nature? How much do they feel vulnerable to these stressors? These research questions were investigated through the administration of an adaptation of the School stressors questionnaire (Agrawal et al, 2010) to an Italian sample of 235 high school students (75,7% females; mean age = 16,21± 1,64 years) half of whom were students with SLDs. The questionnaire investigated (1) vulnerability to and (2) frequency of academic and disciplinary stressors, as well as stressors related to relationships with their peers and teachers. Also, children's learning self-reported skills were measured. Results showed that students with SLDs experienced more often academic stressors, compared to controls, whereas they refer more vulnerability to stressors in the area of teacher relationships. A pattern of positive associations between learning difficulties and vulnerability/frequency of some of the questionnaire's subscales was found. Implications of these results for school well-being and learning of students with SLD are discussed.

Anxiety in students with intellectual disabilities: The influence of social acceptance and rejection
Keywords: At-risk Students, Emotion and Affect, Social Interaction, Special Education
Presenting Author: Verena Hofmann, University of Fribourg, Switzerland

Students with intellectual disabilities often exhibit increased anxiety levels, which can be associated with additional limitations and severe emotional distress. This study investigated the role of social acceptance, social rejection, and general functioning in predicting anxiety. Using data on 1,125 students in 179 special

needs classrooms that was collected at the beginning and end of one school year, multilevel models were used to predict whether future anxiety was associated with prior social acceptance or rejection by classmates, and with general functioning. We found that greater social acceptance was related to a decrease in anxiety over the school year, however, no effect was found for social rejection. Further, there was no moderating effect of students' general functioning. Positive peer relationships in the classroom appear to contribute to less anxiety, while negative relationships do not seem to further worsen anxiety.

Resilience and its association to loneliness in adolescents with and without learning difficulties
Keywords: Emotion and Affect, Learning and Developmental Difficulties, Resilience, Secondary Education
Presenting Author: Filippos Papazis, National and Kapodistrian University of Athens, Greece; **Co-Author:**Anastasia Vlachou, Department of Educational Studies, National and Kapodistrian University of Athens, Greece; **Co-Author:**Panayiota Stavroussi, Department of Special Education, University of Thessaly, Greece

Resilience can be defined as a process for positively adapting to different types of hardships and difficulties. Learning difficulties (LD) constitute a risk factor for resilience, as students with LD experience loneliness and social dissatisfaction due to their marginalization by peers. The aim of this study was to investigate resilience in adolescents with and without LD, as well as its relationship with their sense of loneliness and social dissatisfaction. The study also aimed to examine whether resilience, loneliness and social dissatisfaction are influenced by demographic characteristics. The "Resilience Scale" and the "Loneliness and Social Dissatisfaction Scale" were used for collecting data. The sample consisted of 862 students of typical development and 288 students with LD originated from Attica, Greece. The results indicated that students with LD were less resilient and were experiencing more loneliness and social dissatisfaction in comparison to their typically developing peers. Gender was found to influence some factors of resilience in both groups of students, while no statistically significant difference between boys and girls was observed regarding the feeling(s) of loneliness and social dissatisfaction. School performance was found to influence some factors of resilience in both groups of students. No statistically significant difference was observed in relation to feeling(s) of loneliness and social dissatisfaction in students with LD, while statistically significant difference was observed regarding feelings of loneliness in students without LD. The results of the study are discussed in relation to the development of counseling support systems necessary for the enhancement of resilience among adolescents.

Reading research meets multimedia: text-picture combinations are validated automatically
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Multimedia Learning, Reading
Presenting Author: Anne Schueler, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Pauline Frick, Leibniz-Institut für Wissensmedien (IWM), Germany

During reading, automatic validation processes verify whether the integration of a currently read sentence with information read before is meaningful. It is still an open question whether validation processes also occur when processing text and pictures (i.e., multimedia materials). To answer this question, we conducted two experiments, where we used the epistemic Stroop paradigm (Richter et al., 2009). The underlying rationale of this paradigm is that automatic validation processes can induce positive or negative response tendencies in the reader. These response tendencies make it difficult to respond to another unrelated task, if this task requires the opposite response. In our experiments, participants were presented with sentence-picture (Experiment 1) or text-picture (Experiment 2) combinations. The sentence/text either matched (valid version) or mismatched (invalid version) the accompanying picture. After each combination, participants had to perform an unrelated task, that is, they had to react to the probe words right or wrong. This resulted in a 2x2 within subjects design with the factors validity (valid vs. invalid) and probe word (right vs. wrong).
Results showed that after matching items the reaction time to the probe word "wrong" was significantly slower than to the probe word "right" (Experiment 1 & 2). Further, after mismatching items the error rates for the probe word "right" were higher than for the probe word "wrong" (Experiment 1). These findings are in line with the assumed validation mechanism and corroborate the assumption that validation processes also occur when processing text-picture combinations.

Aesthetics of illustrations in emotional design: effects on user experience and multimedia learning.
Keywords: Comprehension of Text and Graphics, Educational Technologies, Emotion and Affect, Multimedia Learning
Presenting Author: Julien Venni, University of Geneva, Switzerland; **Co-Author:**Mireille Bétrancourt, University of Geneva, Switzerland

Research on emotional design has studied several principles to make visual illustrations more appealing, with mixed results regarding learning outcomes. As no previous study has systematically assessed the effect of each of these principles considered separately on aesthetic judgement, an online experimental study was conducted to evaluate the perceived beauty of illustrations varying according to 3 variables: colours (harmonious, non-harmonious, greyscale), anthropomorphism (with, without) and dimensionality (2D, 3D). Participants (N = 100) evaluated on a 7-point likert scale 12 versions of 5 items resulting in 60 trials. Results showed a significant effect of each variable on the perceived aesthetics of the illustrations, as well as an interaction between dimensionality and anthropomorphism. More specifically, we observed that harmonious colours, without anthropomorphism, in 3D representation are the most aesthetically appealing dimension of emotional design. Moreover, the findings challenge the benefits of integrating anthropomorphism in multimedia illustrations. Further research is being conducted combining in an instructional web site the most aesthetically appealing combination of each feature versus the least ones in order to investigate the effects of aesthetics on user experience, learning processes (eye tracking, navigation) and outcomes.

Interactive Dynamic Visualizations – Evidence from an Experimental Study
Keywords: Comprehension of Text and Graphics, Instructional Design, Multimedia Learning, Vocational Education and Apprenticeship Training
Presenting Author: Stefanie Findeisen, University of Konstanz, Germany; **Presenting Author:**Josef Guggemos, University of Education Schwäbisch Gmünd, Germany

Visualizations facilitate the learning of new content. They make it possible to link verbal information with visual representations. However, when it comes to illustrating dynamic processes, conventional (static) visualizations reach their limits. Dynamic visualizations could address this problem, especially if learners can control the presentation themselves (interactive, dynamic visualizations). A recent literature review has revealed several important open questions concerning interactive, dynamic visualizations. These mainly concern the investigation of learning processes and the conditions under which interactive, dynamic visualizations become effective for learning. To answer these questions, we have developed an online-based learning platform in the field of economic education. The visualizations are dynamic graphs of economic models where students can actively manipulate the parameters of supply and demand curves. In an experimental design with n = 200 learners conducted in a laboratory, we compare interactive dynamic graphs to static graphs. Using pre- and posttests, we can capture the development of student cognitive and non-cognitive outcomes. Embedded-experience sampling and extensive process data allows us to open the black box of the learning processes. Analyses show that the way students interact with interactive, dynamic visualizations varies substantially. Our research has implications for theory and practice. In terms of theory, we can shed light on the conditions under which interactive, dynamic visualizations yield positive results. In terms of practice, teachers can use the platform we have developed in their teaching of complex phenomena in economics for commercial trainees in vocational education.

Fostering student teachers' expert-like video analyses to develop professional vision
Keywords: Classroom Management, Competencies, Example-based Learning, Pre-service Teachers
Presenting Author: Jasmin Lilian Bauersfeld, TU Dortmund, Germany; **Co-Author:**Bernadette Gold, TU Dortmund University, Germany

Expert teachers interpret classroom events adequately, focus on students' on-task behavior and learning, and take multiple perspectives when analyzing classroom events. Student teachers have difficulties to analyze classroom events and do not implement expert features (EF) in their analyses. Instructional principles, such as worked examples, could support student teachers in deriving EF from an expert worked example of a classroom analysis (WECA) and transfer them to their own video analysis to presumably develop professional vision. Instructional explanations, prompts for self-explanation, and fading EF in the WECA could lead to more effective processing of the WECA. In the study, 410 student teachers either received no WECA, received a complete WECA or a faded WECA of a classroom event, which they had to study prior to analyzing videos. Results show that student teachers could improve their use of EF in their analyses of classroom situations. The experimental groups, which received a WECA, were able to generate more expert-like analyses of classroom events than a control group. They used more EF in their interpretations and stayed on the same low level in focusing on on-task behavior and learning. The control group addressed significantly less students' on-task behavior and learning and used less EF in their interpretations. However, there were no differences between the experimental groups. The results reveal that student teachers could be instructionally supported by a WECA in their analyses of classroom events. Further findings on the influence of EF as a mediator for developing professional vision and limitations will be addressed.

Using videos in training fourth grade children's inferencing skills
Keywords: Comprehension of Text and Graphics, Primary Education, Reading, Video-based Learning
Presenting Author: Brechtje van Zeijts, Erasmus University Rotterdam, Netherlands; **Co-Author:**Dianne Venneker, Leiden University, Netherlands; **Co-Author:**Lesya Ganushchak, Erasmus University Rotterdam, Netherlands; **Co-Author:**Björn de Koning, Erasmus University Rotterdam, Netherlands; **Co-Author:**Huib Tabbers, Erasmus University Rotterdam, Netherlands

Inference-making is considered a central element of reading comprehension (McNamara & Magliano, 2009). The ability to draw inferences is not only important for understanding written text, but also for understanding other forms of language, such as audio narratives and videos (Kendeou et al., 2020). The present study aimed to explore whether children's inference skills can be effectively trained using videos. Thirty-five fourth grade children were randomly assigned to either a video-based training, a text-based training, or a no-training control group. Children in the two training groups followed four lessons about making knowledge-based inferences, either with texts or with videos. Before and after the training, all children completed an inference test in video format ánd in text format, and they made a general reading comprehension test. The results showed that our text-based training was effective in improving children's inference skills with texts, replicating previous inference studies (e.g., Bos et al., 2016). However, the text-based training did not result in improved inference skills with videos, indicating that there was no transfer across media. Unfortunately, for children in the video-based group we found no improvements in inference skills, neither with videos nor with texts. Regarding children's reading comprehension skills, we found that all children improved from pretest to posttest, including the control group. This suggests a natural development over time unrelated to our training programs. We are currently conducting a follow-up training study with a larger sample size and more lessons focused on individual practice.

Using a 360° hypervideo for peer analysis of healthcare professional practice. An explorative study
Keywords: Comprehension of Text and Graphics, Computer-assisted Learning, Multimedia Learning, Video-based Learning
Presenting Author: Francesca Amenduni, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland; **Co-Author:**Vito Candido, SFUVET, Switzerland; **Co-Author:**Rita Cosoli, SFUVET, Switzerland; **Co-Author:**Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland

In this exploratory study, we observed how vocational education healthcare learners (N = 24; F = 22; Average age = 18; SD =.97) used an interactive 360° video (360HV) to analyse the professional practice of a peer engaged in the performance of blood sampling. The 360HV allows to change the user's perspective from a 360° video (360V) which includes all the procedure of blood sampling to a standard video, focused on the vein's details. Students were divided into 6 groups aiming at analysing the professional practice of a peer in the 360HV. The group discussion was audio-recorded together with the screencast of the 360HV the students watched during the analysis. Preliminary results show a substantial variability within the six groups in their behaviour toward the 360HV which seems to correspond to the adoption of different strategies of analysis. Results also show that while watching a 360HV, the groups discussed more about socio-emotional aspects and environmental elements compared to when they watched a standard video. Conversely, while watching the standard video, generally groups discussed more about the medical-technical procedure and errors compared to when they watch the 360HV. Results of qualitative content analysis will be triangulated with results of the topic modelling and content network analysis in order to present a deeper understanding of the inquiry processes.

Effects of expert feedback type on students' professional vision and self-efficacy
Keywords: Competencies, Feedback, Pre-service Teachers, Video-based Learning
Presenting Author: Christopher Neil Prilop, Aarhus University, Denmark

Teachers require classroom management skills to provide effective learning environments for their students. Numerous studies have shown teachers' self-efficacy is positively related to effective teaching. Furthermore, it is assumed that teachers need professional vision of classroom management (PVCM) to maintain effective learning environments. Various studies have shown that video analysis supported by expert feedback can increase PVCM and self-efficacy. However, little is known about which type of feedback best promotes student teacher self-efficacy and PVCM. Therefore, the present study examines the following questions in a pre-post-intervention-design:(1) To what extent do student teachers improve their PVCM with tutorial expert feedback (intervention group: IG) or evaluative expert feedback (control group: CG)?(2) To what extent does tutorial expert feedback (IG) or evaluative expert feedback (CG) increase the self-efficacy of student teachers?56 student teachers took part in two identical courses in which they analyzed classroom videos. In response to the written analyses, the IG students (n=26) received written, tutorial expert feedback, while CG students (n=30) received written, evaluative expert feedback.Analyses showed that the students in both groups improved significantly in terms of PVCM. A significant interaction effect showed that CG students improved their PVCM more compared to IG students. Analyses of student self-efficacy showed no significant time or interaction effect. The study was able to show that evaluative expert feedback promoted the PVCM of student teachers better than tutorial expert feedback. The results suggest that feedback that provides too much information could make students passive and hinder their development.

On the Joint Effects of Social, Dimensional, and Temporal Comparisons: A Longitudinal Experiment
Keywords: Achievement, Cognitive Skills and Processes, Competencies, Self-concept
Presenting Author: Fabian Wolff, Universität of Koblenz, Germany

This research examined the joint effects of social comparisons (comparisons of one's achievements with those of others), dimensional comparisons (comparisons of one's achievements in different domains), and temporal comparisons (comparisons of one's achievements across time) on students' ability assessments. For the first time a longitudinal experiment (N = 411) was conducted to examine these comparison effects on students' own self-concepts, inferred self-concepts of another student, and assessments of another student's actual abilities in the figural and verbal domains. Regression analyses revealed significant social and dimensional comparison effects on the different kinds of ability ratings in both domains. These effects resulted from higher domain-specific ability assessments following downward rather than upward comparisons (i.e., comparisons with lower rather than higher achievements of others or in the other domain, respectively). However, most temporal comparison effects were nonsignificant. The social comparison effects were stronger than the dimensional comparison effects. Moreover, the social comparison effects were stronger, and one dimensional comparison effect was weaker, when students assessed the other student's actual abilities, rather than inferring this student's self-concepts.

Expectancy-Value Constructs and Basic Needs as Predictors for Performance in Data-Based Modeling
Keywords: Achievement, Motivation, Secondary Education, Self-determination
Presenting Author: Matthias Mohr, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

In a student laboratory on data-based modelling, situation-specific expectancies, task values, and cost beliefs as well as factors of situational experience (fulfillment of basic needs) from secondary school students (N=369) are examined to explain inter-individual differences in motivated behavior (state motivation and effort) and in data-based modeling achievement, controlling prior knowledge. The paper describes a framework which takes up constructs from situated expectancy-value theory and self-determination theory to explain these inter-individual differences. The results show that expectancies, task values, and costs are important antecedents of the experience of the learning situation (fulfillment of basic needs), and that basic needs fulfillment acts as a mediator to explain differences in motivated behavior and performance.

How Do Mindset Beliefs Relate to Other Forms of Motivation?
Keywords: Achievement, Meta-analysis, Mindsets, Motivation
Presenting Author:BENGU CILALI, Bilkent University, Turkiye; **Co-Author:**Aikaterini Michou, University of Ioannina, Greece, Greece; **Co-Author:**Martin Daumiller, University of Augsburg, Germany; **Co-Author:**Chris S. Hulleman, University of Virginia, United States; **Co-Author:**Kenn Barron, James Madison University, United States; **Co-Author:**Claudia C. Sutter, University of Virginia, United States

Abstract Certain motivational mechanisms enable individuals to persevere in their academic endeavors. In the present meta-analysis, we aimed to better understand the associations between growth and fixed mindset beliefs as proposed within Mindset Theory (Dweck, 2006) and other forms of motivation. Specifically, we investigated motivation from either a Self-Determination or Expectancy-Value theoretical lens, as both motivational frameworks offer consistent evidence that more internalized forms of motivation help initiate effort and sustain perseverance. We conducted a series of three-level random-effects meta-analyses including 112 effect sizes from 45 empirical studies and 27,895 participants. Our findings revealed small-to-moderate but robust correlations between mindset beliefs and well-internalized forms of motivation. In particular, while growth mindset beliefs were positively linked to well-internalized forms of motivation, their associations with poorly internalized forms of motivation were found to be non-significant. In contrast, we found negative yet much weaker links between fixed mindset beliefs and well-internalized motivation types (except for the identified group). Among all the poorly internalized motivation types, fixed mindset beliefs are only significantly related to controlled motivation. The results of the current synthesis also highlight the lack of research examining the links between different motivation types and mindset beliefs, particularly fixed mindset beliefs.

Motivation-effort-achievement cycle in learning: a short-range dynamic experiment
Keywords: Achievement, Motivation, Self-concept, Self-efficacy
Presenting Author: TuongVan Vu, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Abe Hofman, Universiteit van Amsterdam, Netherlands; **Co-Author:**Brenda Jansen, University of Amsterdam, Netherlands; **Co-Author:**Lucía Magis-Weinberg, University of Washington, United States; **Co-Author:**Nienke van Atteveldt, Vrije Universiteit Amsterdam, Netherlands

The present research investigates the reciprocal relations between motivation, effort, and achievement in educational contexts. We employ a short-range dynamic experimental design where participants perform a learning task during which their motivation, effort, and achievement are measured at multiple time points. The first aim is to study the mediating pathway between motivation and achievement by measuring actual effort behaviors. Second, we examine the causality of these relations by experimentally manipulating perceived achievement. Finally, we asked if implicit theory about intelligence (whether one thinks intelligence is malleable) moderates the relationship between motivation and achievement. In the first experiment, we introduced different types of performance feedback (relative to own previous achievements vs. that of peers) which were expected to influence perceived achievement and subsequent motivation. The findings indicate no statistically significant differences in motivation between those who hold different implicit theories of intelligence. In the follow-up experiment, perceived achievement is directly manipulated instead. Halfway in the experiment, participants receive rigged feedback that their achievement has dropped to below peer average. In this innovative design, we also measured the amount of time participants actively view learning materials (i.e. quantitative measure of effort) and also gave them a choice between high-effort vs. low-effort learning materials (i.e. qualitative measure of effort). This second experiment is a registered report where planned analyses and expected (narrative) results are available prior to data collection. Data collection is now finished, and we will be able report the results at the conference.

Co-designing for Immersive Learning Experiences in the Classroom

Keywords: Computer-supported Collaborative Learning, Immersive Technologies for Learning, Qualitative Methods, Well-being
Presenting Author: Morgane Domanchin, University of Oslo, Norway; **Co-Author:**Hans Christian Arnseth, University of Oslo, Norway; **Co-Author:**Kenneth Silseth, University of Oslo, Norway; **Co-Author:**Rolf Steier, Oslomet, Norway

This research paper draws on a teacher-led innovation project to create digitally mediated learning experiences targeting the theme of “Health and Wellbeing”. Over a year, high school teachers, students and researchers co-designed three interdisciplinary learning activities involving immersive technologies such as virtual reality (VR) and augmented reality (AR) as well as social media. Each of the three learning activities represents flexible innovative learning ecologies targeting students’ deep learning. By adopting a design-ethnographic approach and social interaction analysis of the development process, the findings provide insight into the designed activities as reflective of broader learning ecologies. In addition, we discuss the potential of immersive technologies to support students’ talk and engagement in small groups. The study documents the development of new teaching and learning practices targeting societal level challenges.

Virtual Reality to support the development of student-teachers’ classroom management skills
Keywords: Classroom Management, Immersive Technologies for Learning, Pre-service Teachers, Video-based Learning
Presenting Author: Wilfried Admiraal, Oslo Metropolitan University, Norway; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Deniz Atal, Ankara University, Turkiye; **Co-Author:**Brigitte Theeuwes, ICLON, Leiden University, Netherlands

Virtual reality (VR) technology can support an immersive experience of the classroom context enabling student-teachers to practice their teaching in a variety of different artificial classrooms scenarios within the safe environment of teacher education. Recent research shows that VR technology is effective in noticing classroom problems and forming effective teaching strategies. The objective of the current study is twofold. First, we explore whether 360° video VR technology is an effective tool in improving student-teachers’ classroom management self-efficacy and reducing their stress level. Second, we explore *how* student-teachers notice classroom processes using VR. Two studies have been carried out with pre-service teachers: one mixed-method study focusing on VR improving classroom management self-efficacy and reducing stress levels, and one qualitative study focusing on how VR affects classroom noticing. Findings show that VR helped to lower student-teachers’ stress levels but did not improve their self-efficacy more than just watching videos on screen. Moreover, the combination of watching the classroom events with VR and reflections in small groups supported the development of student-teachers’ noticing skills, i.e. to identify salient events and problematic behavior, to interpret these and think about ways to respond to these. The current studies contribute to our understanding of student-teachers’ process of noticing and how this can be induced by VR technology. It seems that VR with head-mounted displays is more effective in supporting student-teachers’ noticing process compared to watching videos on a screen, and is even more effective when used in combination with reflections in small groups.

Preservice Teachers’ Self-Regulated Learning in Immersive Virtual Environments: A Multimodal Study
Keywords: Educational Technologies, Immersive Technologies for Learning, Pre-service Teachers, Self-regulated Learning and Behaviour
Presenting Author: Engin Ader, Boğaziçi University, Turkiye; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Tova Michalsky, Bar Ilan University, Israel; **Co-Author:**İpek Paksoy, Boğaziçi University, Faculty of Education, Turkiye; **Co-Author:**Florentine Hickethier, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Mathias Dehne, Friedrich Schiller University Jena, Germany; **Co-Author:**Roger Azevedo, University of Central Florida, United States; **Co-Author:**Zorit Jassin, Bar Ilan University, Israel

This study, conducted by an international group of academics in an EARLI EFG project, is targeting an examination of preservice teachers’ perceptions on their SRL behaviors and VR learning environments while using a VR task. Another aim is to use multimodal data to show how data collected from varying records of performance (such as think aloud, screen recording, birds-eye-view recording) can be linked with preservice teachers’ perceptions manifested by interview data. A triangulation mixed method design was adopted for this study. Participants were 41 preservice teachers from three countries: Germany, Israel and Turkey. Preservice teachers experienced a STEM VR learning task to understand how a virus spreads through everyday activities. While working on the task, participants were instructed to think-aloud and their performance in the VR environment was also captured through separate recordings of the screen and their movements on a bird's eye view camera. Afterwards, participants were interviewed about their perceptions relating to the experience in the VR environment. A coding scheme was developed for analyzing the interview data and three cases from the participants were selected for an investigation of the multimodal data from preservice teachers’ performance during the task. Preliminary findings revealed that evaluation was the most frequently mentioned group of SRL behaviors while planning was mentioned the least, and that the VR environment is an immersive experience which hardly allows participants to mention specific SRL behaviors (e.g. planning) during the task.

Children’s and adults’ spatial representations of a virtual environment.
Keywords: Cognitive Development, Cognitive Skills and Processes, Comprehension of Text and Graphics, Developmental Processes
Presenting Author: Sophie Bénard - Linh Quang, University of Geneva, Switzerland; **Co-Author:**Sandra Berney, University of Geneva, Switzerland; **Co-Author:**Mireille Bétrancourt, University of Geneva, Switzerland; **Co-Author:**Roland Maurer, University of Geneva, Switzerland

The elaboration of mental representations of space is essential for everyday activities, especially when navigating in a new environment. The cognitive processes underlying these representations develop and refine during childhood, but their evolution remains unclear. New technologies such as virtual environments can not only provide insight but also be used to scaffold this development. This study examined spatial representations in 2nd to 4th graders (aged 7-10) and adults (aged 18-60). Spatial representations were assessed through a variety of spatial assessment tasks involving the landmarks recognition, their location, the route taken and distance estimation, after navigating in a virtual city through a guided route. Preliminary analyses of results from primary school students indicate an interaction between gender and school grade on landmark knowledge and relative distance estimation. Girls improved on landmark recognition and location tasks, while boys improved on relative distance estimation tasks. Theoretical and practical implications will be discussed.

Diagnosing and Promoting the Understanding of Chemical Bonding Theory
Keywords: Conceptual Change, Misconceptions, Science Education, Secondary Education
Presenting Author: Adrian Zwyssig, ETH Zurich - Research on Learning and Instruction, Switzerland

Is a salt crystal comprised of molecules? 39% of science undergraduates falsely assume so as they overgeneralize the covalent bonding type. Overgeneralization is a major challenge in science education. Typically, students neglect the differences between the three types of chemical bonds, i.e. covalent, ionic, and metallic bonds. This overgeneralization was confirmed by assessing undergraduates’ knowledge about bonding theory before attending lectures at a Swiss university (N = 1946). This assessment revealed the prevalence of various misconceptions such as the overgeneralization of the model of covalent bonding, as well as uncertainties concerning the differences between chemical bonds and intermolecular forces. Thus, the question arises, how can we promote a better understanding of chemical bonding theory?Comparing and contrasting activities have been proven effective for learners to keep the differences between similar concepts in mind (Alfieri et al., 2013). Therefore, I designed teaching materials (23 lessons) containing multiple comparing and contrasting

activities, introducing the three types of chemical bonds simultaneously. In a pre- and post-test classroom intervention study at Swiss Gymnasiums (N = 326, grade 10) the materials' effectiveness was evaluated. Comparing and contrasting activities fostered students' conceptual understanding more strongly (0.60 < d < 1.05) and were better suited to promote conceptual change than the conventional sequential introduction of the different bonding types. Alfieri, L., Nokes-Malach, T. J., & Schunn, C. D. (2013). Learning Through Case Comparisons: A Meta-Analytic Review. *Educational Psychologist*, *48*(2), 87-113. https://doi.org/10.1080/00461520.2013.775712

The Cronbach's Alphas of Domain-Specific Knowledge Tests Before and After Learning: A Meta-Analysis
Keywords: Conceptual Change, Knowledge Construction, Meta-analysis, Quantitative Methods
Presenting Author: Michael Schneider, University of Trier, Germany; **Co-Author:**Peter Edelsbrunner, ETH Zurich, Switzerland; **Co-Author:**Bianca Simonsmeier, University of Trier, Germany

Cronbach's Alpha is frequently reported in studies on knowledge acquisition and learning. Alpha indicates the internal consistency, i.e., the interrelatedness of the items. Many researchers use fixed cut-off values to evaluate whether a value of Alpha is acceptable. This use of fixed cut-off values is inadequate, in particular, for knowledge tests. Knowledge is a heterogeneous construct. Thus, a low interrelatedness of the items adequately reflects the nature of the assessed construct. Fixed cut-off values are also inadequate because (a) Alpha might be higher after interventions stimulating knowledge integration than before, (b) depends on the number of items in a test, and (c) can differ systematically between subpopulations, e.g., age groups or content domains. To provide more adequate and flexible empirical standards for the Alphas of domain-specific knowledge tests, we conducted a meta-analysis of these indices. We included studies with at least two measurement points. Based on 285 effect sizes from 55 samples, we found that the typical Alpha of domain-specific knowledge tests is α = .847, CI90 [.817; .871]. Alpha was higher after interventions, in tests with more items, tests with open answers, and older age groups. It differed between content domains. The distribution of Alphas showed an underrepresentation of shorter knowledge tests with low Alphas, indicating bias either in the publication record or in test construction. We present guidelines for typical Alphas that researchers can expect for their tests and discuss implications for the theory and assessment of domain-specific knowledge.

Identifying central misconceptions via network analysis
Keywords: Assessment Methods, Knowledge Construction, Misconceptions, Science and STEM
Presenting Author: Christian Thurn, ETH Zurich, Switzerland

A core aspect of successful instruction is to identify and change students' initial misconceptions about a topic. Assessing misconceptions and prior knowledge in physics is often done via concept inventories. These concept inventories are traditionally analyzed by summing up correct answers to infer on students' conceptual knowledge. Yet, for the relational character of conceptual knowledge (e.g., Goldwater & Schalk, 2016), network analysis is more suitable to model the relations of students' answers. When analyzing concept inventories through the lens of network analysis, researchers and educators can gain important insights into students' knowledge structures and identify problematic misconceptions that hinder conceptual change.For this endeavor, I used data about concepts in magnetism. In total, 2210 students from primary and secondary school classes in Switzerland participated in instruction on magnetism in 15 cognitively activating lessons. They completed a concept inventory on magnetism before and after instruction. Following the approach by Brewe et al. (2016), I used network analysis on the distractor answers (the misconceptions) to analyze which misconceptions were central and maybe hindered learning, and which misconceptions persisted after instruction. The results showed that at pretest central misconceptions that related to many other misconceptions were that copper is magnetizable, or related to the shielding of a magnetic field via iron and wood plates. At posttest, central misconceptions were related to the shielding of magnetic fields via aluminum plates and about fair experiments. I will discuss how teachers could use such results to tackle central misconceptions.

Communicating scientific complexity encourages intellectual humility and epistemic trust
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Critical Thinking, Informal Learning
Presenting Author: Dorothe Kienhues, University of Münster, Germany; **Co-Author:**Nina Vaupotič, University of Vienna, Austria; **Co-Author:**Regina Jucks, WWU Münster, Germany

For socio-scientific issues, such as the complex issue of a sustainable future energy strategy, public's support and understanding is needed. While simplifying science can lead to overconfidence, complexity can be daunting and could hinder action. Therefore, in this preregistered study we were interested in the effects of communicating complexity alongside providing suggestions for concrete actions to be taken. We focused on variables explaining how individuals engage with science-related information: intellectual humility (individual's understanding that their knowledge is limited), source's trustworthiness judgments, and willingness to act. 478 participants (mean age = 30.4, SD = 9.3) took part in a 2 x 2 experimental design study, in which they read a text about a future energy strategy. We manipulated the degree of communicated complexity (reduced vs. not reduced) by explaining how scientific modeling is employed to make predictions about the future energy strategy, and we varied whether concrete actions regarding on how to practically support the transition to sustainable energy were suggested (suggested vs. not suggested). We found that communication of complexity (vs. reduction of complexity) led to higher topic-specific intellectual humility and more trust in the source. Furthermore, when a concrete action was communicated, participants reported lower topic-specific intellectual humility. Participants' willingness to act was neither significantly affected by the way complexity was communicated nor by concrete actions being suggested. Our findings exemplify that individuals can grapple with the complexity and uncertainties of science and that intellectual humility is a virtue that may contribute to productively dealing with knowledge limits.

Do students fall for the easiness effect of science popularization? An intervention study
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Critical Thinking, E-learning/ Online Learning
Presenting Author: Marc Stadtler, Ruhr-University Bochum, Institute of Educational Science, Germany; **Co-Author:**Lisa Scharrer, University of Frankfurt, Germany; **Co-Author:**Franca Urbisch, Ruhr-University Bochum, Institute of Educational Sciences, Germany

Previous research shows that the easiness by which adult laypeople can understand textual information on a scientific issue seduces them to overlook limitations in their evaluative capabilities, although they usually lack the deep-level knowledge required for fully informed validity judgments. As a result, laypeople tend to more confidently accept easy than difficult scientific information as true (e.g., Kerwer et al., 2021; Scharrer et al., 2012, 2019). This *easiness effect* is especially problematic given that false accounts and conspiracy theories are particularly often characterized by a simplification of complex issues and problems (e.g., Bischof & Senninger, 2018).The present study sought to investigate (1) whether even school students are susceptible to overestimating their evaluative capabilities when encountering easy-to-comprehend scientific information and (2) whether the easiness effect can be mitigated through an instructional video. 104 secondary school students (Grades 10 to 13) read scientific texts that were either easy or difficult to comprehend due to the use/translation of technical terms. Half of the participants watched a short instructional video before their text reading emphasizing the complexity of scientific knowledge and laypeople's resulting dependence on experts.Results showed that after their reading, participants agreed more strongly and confidently with easy than difficult texts. Hence, even secondary school students are susceptible to the easiness effect. The effect was not mitigated when students saw the

instructional video. This shows the robustness of the easiness effect and suggests that more elaborate intervention programs are required to prevent laypeople from being uncritically persuaded by easy misinformation.

Refuting educational myths: Do reading goals make a difference?
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Conceptual Change, Critical Thinking
Presenting Author: Andreas Lederer, University of Erfurt, Germany; **Co-Author:**Jana Asberger, University of Erfurt, Germany; **Co-Author:**Eva Thomm, University of Erfurt, Germany; **Co-Author:**Johannes Bauer, University of Erfurt, Germany

Refutation texts are a promising approach to refuting misconceptions. They provoke a cognitive conflict by explicitly naming a misconception and correcting it with a scientific explanation. To date, however, there is little evidence on the conditions that influence the efficacy of refutation texts. For example, when presenting preservice teachers a refutation text to combat an educational myth, the instructed reading goal might be of importance because reading goals can affect how readers' processes a text. Therefore, the present study investigated whether the efficacy of a refutation text on an educational myth (the role of hemisphere dominance for learning) depends on reading goals. The preregistered online experiment (N=168 preservice teachers) followed a 2x2x2 mixed design with the between-subject factors text type (refutation vs. traditional) as well as reading goal (explanation vs. entertainment), and the within-subject factor time (before vs. after reading the text). As hypothesized, participants who read a refutation text were more likely to change their belief than participants who read a traditional text. Contrary to our expectations, however, the refutation effect was independent of the reading goal. Our results show that to address misconceptions, refutation texts are more successful than standard texts typically presented in textbooks. However, it is still unclear which conditions foster the efficacy of refutation texts. According to our data, reading goals seem to be less relevant to this.

Critical graph reading: Graphs can mislead adolescents
Keywords: Competencies, Comprehension of Text and Graphics, Critical Thinking, Mathematics/Numeracy
Presenting Author: Kristian Kiili, Tampere University, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland; **Co-Author:**Antero Lindstedt, Tampere University, Finland; **Co-Author:**Tua Nylén, University of Helsinki, Finland; **Co-Author:**Petteri Muukkonen, University of Helsinki, Finland; **Co-Author:**Manuel Ninaus, University of Graz, Austria

One of the main challenges of our times is the spread of misinformation and disinformation on the Internet. Manipulation of graphs is one powerful way that has been used to persuade and mislead people. We investigated how adolescents (N = 404) can read and interpret well-constructed and misleading bar graphs. A misleading graph is based on valid data, but the visual appearance of the graph has been manipulated to distort the message of the graph. The results indicated that most students knew how to read a single data point from a graph. However, students' graph interpretation skills (inferring relationships in the represented data) varied considerably. We performed latent profile analysis (LPA) and identified five profiles, which differed in students' abilities to interpret well-constructed and misleading graphs, and their risk of being misled with visual manipulations. The students of the best performing profile (Critical graph readers; 17%) could consistently interpret well-constructed and misleading graphs correctly. The weakest performing group (17%) had considerable difficulties in graph interpretation, suggesting an overall lack of understanding of how to interpret graphs. Importantly, the students of the largest profile (Misleadable graph readers; 35%) could interpret well-constructed graphs but were misled by visual manipulations leading to faulty interpretations. We assume that these readers neglected the numerical information of the graph and based their interpretation only on the visual aspects of the graph, i.e., the height of the bars. There is a clear need to develop interventions to help students build resistance against common graph manipulation techniques.

Evidence-based Music Teaching: a Systematic Review and a Meta-Analysis
Keywords: Art Education, Meta-analysis, Synergies between Learning / Teaching and Research, Teaching/Instructional Strategies
Presenting Author: Daniela - Georgiana Valache (Voinescu), West University of Timisoara, Romania; **Co-Author:**Marian Ilie, West University of Timisoara, Romania

In this paper, we aim to investigate the impact of music teaching activities (MTAs) on musical-artistic outcomes, intending to contribute to what evidence-based teaching means in the field. We started with a broad search with a result of 93,291 articles from querying online search engines. After carefully applying the inclusion criteria and extracting information using the coding scheme, we included only 20 articles in the effect size calculation. The results indicate an overall medium and heterogeneous effect size of MTAs (d = .722, SE = .126, Z = 5.240, p < .001, k = 26; $Q_{(20)}$ = 114.971, p

Music Training Produces Near but not Far Transfer of Learning in School-age Children
Keywords: Cognitive Skills and Processes, Primary Education, Quantitative Methods, Social Sciences and Humanities
Presenting Author: Leonor Neves, University Institute of Lisbon (ISCTE-IUL), Portugal; **Co-Author:**Marta Martins, University Institute of Lisbon (ISCTE-IUL), Portugal; **Co-Author:**Ana Isabel Correia, University Institute of Lisbon (ISCTE-IUL), Portugal; **Co-Author:**São Luís Castro, University of Porto - Portugal, Portugal; **Co-Author:**César Lima, University Institute of Lisbon (ISCTE-IUL), Portugal

There is a growing interest in potential transfer of learning from music training to non-musical cognitive domains. Because most studies on this topic have focussed on transfer from music to language and domain-general abilities (e.g., IQ), whether music training affects socio-emotional abilities remains poorly explored. Moreover, recent studies suggest that, while transfer across closely related domains (near transfer) might exist, transfer between substantially different domains (far transfer) is rare or non-existent. We conducted a longitudinal training study with 7-year-old second graders (N = 110; 54 girls, M_{age} = 7.01 years, SD = 0.46), and examined near and far transfer effects of music training. The study was implemented in a regular school environment, and included pre-test, training and post-test phases, in three conditions: music (experimental condition), sports (active control condition), and no training (passive control condition). The training programs were conducted over two school years and lasted for approximately 13 months (ca. 111 hours). The measures of near transfer included auditory skills, fine-motor skills, and gross-motor skills, and the measures of far transfer included emotion recognition and voices and faces, and higher-order socio-emotional skills. We examined longitudinal effects of training by using mixed-effects modelling. Compared to the control groups, musically trained children improved significantly more on auditory and motor skills (near-transfer), but not on emotion recognition or higher-order socio-emotional skills (far-transfer). These findings inform debates on the use of music as an intervention tool in educational and clinical settings and have implications for models on music-related behavioral plasticity.

Music and Music Integration in Preschool Programs: A Scoping Review
Keywords: Art Education, Curriculum Development, Early Childhood Education, Learning Approaches
Presenting Author: Ana Rodrigues de Lemos, Faculty of Psychology and Educational Sciences of the University of Porto, Portugal; **Co-Author:**Teresa Leal, University of Porto, Portugal; **Co-Author:**Diana Alves, Centre for Psychology at University of Porto, Portugal; **Co-Author:**Isabel M.P. Abreu-Lima, University of Porto, Portugal

Music plus music integration is a framework based on the arts education movement. It constitutes an approach that puts the music at the center of the curricula,

valuing both the authentic and comprehensive study of music and the contribution of music concepts, skills, and processes for teaching and learning in other domains (Scripp & Gilbert, 2016). The positive relationship between music training and cognitive, social-emotional abilities, and academic achievement strengthens the value of this framework (e.g., Schellenberg, 2004, 2006). Documented initiatives based on this framework include mainly projects and programs directed at elementary and upper levels (Burnaford et al., 2007; Scripp et al., 2014). Therefore, the present scoping review aims to map the extent, variety, and characteristics of preschool programs relying on music skill development along with music as a means to enhance other competencies. The review includes data-based search, as well as gray literature, to ensure a comprehensive coverage of the topic. Preferred Reporting Items for Systematic Reviews and Meta-Analysis – Extension for Scoping Reviews (PRISMA-ScR) were followed. From the database search, 526 references were stored in the *Mendeley* software and screened for title and abstract assessment, based on the pre-defined eligibility criteria. Two independent reviewers conducted the screening process and disagreements were solved through discussion with an additional reviewer. 435 records were excluded and 91 followed to the full-text assessment. After data extraction and screening of the reference lists, gray literature will be searched, and further results will be discussed in this presentation.

Teaching Crows and Nightingales to Sing: Exploring Vocal Abilities in Primary School Music Education
Keywords: Art Education, Cognitive Skills and Processes, Curriculum Development, Primary Education
Presenting Author: Zyxcban Wolfs, Open University of the Netherlands, Netherlands; **Co-Author:**Els Boshuizen, Open University of the Netherlands, Netherlands; **Co-Author:**Saskia Brand-Gruwel, Open University of the Netherlands, Netherlands

As music curriculums in primary school vary widely, so do musical abilities of primary school children. Existing literature reports large differences in vocal abilities in children of the same age. Consequently, music teachers face challenges to teach various difficulty levels in one classroom. More empirical knowledge about how musical abilities are associated with other characteristics of children and their learning environment might improve the structure and content of primary school music curriculums. We explored associations between vocal abilities (singing accuracy, melodic achievement, and rhythmic performance), perception of musical features (pitch, tonality, timing, timbre, and loudness), and cognitive levels (math, grammar, reading accuracy and comprehension) among children aged 6 to 12 ($N = 233$). We investigated whether age, gender, cognitive levels, school type, music perception abilities, and music training) predicted vocal abilities, and whether these vocal abilities differed by age. All vocal abilities were predicted by music perception abilities. Singing accuracy was predicted by gender but not by age. Math level was negatively associated with singing accuracy and melodic achievement, while rhythmic performance was not. Rhythmic performance was the only vocal ability predicted by formal musical training. Gender plays a role in singing accuracy; on average girls outperform boys. Age is positively associated with melodic achievement and rhythmic performance. However, regardless of children's age, differences in singing and rhythmic abilities were large. Music teachers should pay attention to singing accuracy, melodic achievement, and rhythmic performance by expanding children's usable vocal register, enhancing their musical cognition, and improving their psychomotor skills.

Teachers' self-efficacy and attitudes towards gifted and talented education
Keywords: Attitudes and Beliefs, Gifted and Talented Students, In-service Teachers, Self-efficacy
Presenting Author: Lucía Barrenetxea-Mínguez, University of Deusto, Spain

Teachers' self-efficacy and attitudes towards gifted and talented education influence the quality of the instructional intervention directed to the needs of such students. Therefore, studying how teachers perceive their ability towards gifted education and assessing their beliefs will provide useful information when planning teacher training in this area. With such rationale, our study aims to investigate teachers' self-efficacy and attitudes towards gifted and talented education. In total, 546 teachers filled out the "Teacher self-efficacy in the educational response to gifted and talented students" and the "Educational attitudes toward gifted and talented education" questionnaires, which were previously validated. A set of 11 additional variables were studied as possible moderators: sex, age, teaching experience, type of school, location of the school, previous experience working with gifted students, previous training on gifted education, type of training, type of enrolment in the training (i.e., voluntary), closeness to gifted people (e.g., family, friends), and self-perception as a gifted person. Descriptive and analysis of variance (ANOVAs) were performed. Results indicated self-efficacy is low among the teachers and should be improved; additionally, teachers generally reported favourable attitudes towards gifted and talented education. These results have practical implications for the improvement of future teacher development programs in the area of gifted and talented education.

Teachers' Use of Informal Learning Opportunities in Germany
Keywords: In-service Teachers, Informal Learning, Self-efficacy, Teacher Professional Development
Presenting Author: Sebastian Röhl, University of Tubingen, Germany; **Co-Author:**Jana Groß Ophoff, University College of Teacher Education Vorarlberg, Austria; **Co-Author:**Colin Cramer, University of Tübingen, Tübingen School of Education, Germany

The professional work as a school teacher requires continuing professionalization throughout the whole career. In addition to participation in in-service training and professional development courses, this process also includes the use of informal learning opportunities which exist outside of organized events in everyday professional life, and which are mostly initiated by the teachers themselves. This study focuses on the field of continuing professional development of teachers, which has hardly been investigated so far. Based on a quantitative questionnaire survey of a representative sample of $N = 405$ teachers from Germany, we applied structural equation models to analyze the factorial structure and the use of informal learning opportunities, as well as their personal and school-related determinants. The findings indicate predictive effects of teachers' demographic and dispositional characteristics (age, gender, lack of traditional qualification, self-efficacy), but also of job characteristics (extended area of responsibility) on the use of informal learning opportunities. Furthermore, indications pointed to the necessity of differentiating print and online media regarding reception behavior. The role of informal learning opportunities in the context of the teachers' overall professionalization is discussed.

Resilience, Self-Compassion and Self-Efficacy in Reducing Special Education Teachers Technostress
Keywords: Anxiety and Stress, Educational Technologies, Resilience, Teacher Efficacy
Presenting Author: Pierpaolo Limone, University of Foggia, Italy; **Co-Author:**Giusi Antonia Toto, University of Foggia, Italy; **Co-Author:**Benedetta Ragni, University of Foggia, Italy

Special education teachers face significant stress during work delivery and care provision of students with special needs, and this increased with COVID-19 pandemic, having to adapt to new methods of teaching and technologies, such as Information and Communication Technology (ICT) tools. While factors that could influence technostress have been investigated, relatively few studies explored how to reduce teachers' technostress effectively. Identifying these variables could support teachers' professional development and reduce their technostress. The main aim of the current study was to analyze the role of ICTs self-efficacy, resilience, and self-compassion in reducing ICTs technostress in a sample of special needs teachers. 629 Italian special needs teachers (89% female) aged from 22 to 60 ($M = 39.00$; $SD = 8.00$) were enrolled and completed online *The Self-Compassion Scale*, *The Brief Resilience Scale*, and a tool to evaluate different dimensions related to the use of ICTs by teachers (Dong et al., 2020; ICTs Self-efficacy and ICTs Technostress subscales were used). Preliminary Pearson's bivariate correlations among the studied variable were performed with SPSS v.27. Overall, teachers' technostress (R2=0.46, p=.000) resulted

negatively associated with teachers' ICTs self-efficacy, resilience, and self-compassion. These results can usefully inform training programs aimed at reducing technostress through the improvement of not only teachers' level of ICTs literacy but also their level of confidence in using the technology. The research implications of our study also concern the identification of resilience and self-compassion as protective factors that may change teachers' stress processing.

Motivational determinants of early-career teachers' work engagement
Keywords: In-service Teachers, Motivation, Teacher Professional Development, Well-being
Presenting Author: Dora Petrović, Institute for Social Research in Zagreb, Croatia; **Co-Author:**Iris Marušić, Institute for Social Research, Croatia; **Co-Author:**Jelena Matić, Institute for Social Research - Zagreb, Croatia, Croatia

Research on teacher motivation points to the importance of different motivational characteristics in explaining the professional development of teachers and the quality of teaching, as well as desired academic outcomes for their students. The initial motivation for choosing the teaching profession was associated with plans related to professional engagement and career development at the beginning of teachers' professional career. In addition, research on teacher motivation suggests that teacher goal orientations, through coping mechanisms, relate to indicators of teacher well-being such as job engagement and burnout. The aim of this study is to examine the role of the initial teacher motivation and goals for teaching in the work engagement of teachers at the beginning of their professional career. The study was carried out on 118 teachers with up to 5 years of teaching experience. Hierarchical regression analysis with motivation for the teaching profession and goal orientations for teaching as predictor variables was carried out for the overall work engagement of teachers and its four components. The results indicate that teachers with different motivational profiles in their early years of teaching report different levels of emotional, cognitive and social work engagement. This evidence could inform differentiated support for early career teachers' professional development to promote their work engagement as an important aspect of professional well-being.

Experiences fostering self-efficacy in teaching science among in-service elementary school teachers
Keywords: In-service Teachers, Primary Education, Science Education, Self-efficacy
Presenting Author: Estelle Desjarlais, Université du Québec à Montréal, Canada; **Co-Author:**Pierre Chastenay, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Jean-Philippe Ayotte-Beaudet, Université de Sherbrooke, Canada

Elementary school plays a crucial role in science education (Hasni & Potvin, 2015). In contrast, teachers' sense of science teaching self-efficacy (the belief in their ability to succeed at a task (Bandura, 2003)) is particularly low for this subject (Sandholtz & Ringstaff, 2014). This presentation aims to explore the relationship between elementary school teachers and science teaching. More precisely, we aimed to further understand personal and professional experiences fostering a sense of self-efficacy in science teaching among female elementary teachers. We conducted qualitative interpretive research with seven female teachers whose sense of self-efficacy (as measured by a questionnaire) had significantly improved since the beginning of their careers. Results suggest that in-service training plays a vital role in developing self-efficacy in science teaching. The full results of this project will be discussed in this paper. This work aims to contribute to a better understanding of the long-term development of a sense of self-efficacy in elementary school science teaching, which has been studied mainly among pre-service students. In particular, they will allow the identification of effective interventions and resources for professional development.

Enjoyment is Reciprocally Transmitted Between Teachers and Students
Keywords: Educational Technologies, Emotion and Affect, Higher Education, Multimedia Learning
Presenting Author: Muhterem Dindar, Tampere University, Finland; **Co-Author:**Anne Christiane Frenzel, Ludwig-Maximilians-Universität München, Germany; **Co-Author:**Reinhard Pekrun, University of Essex, United Kingdom; **Co-Author:**Corinna Reck, Ludwig-Maximilians-Universität München, Germany; **Co-Author:**Anton Marx, Ludwig-Maximilians-Universität, Germany

The critical importance of positive emotions for classroom functioning is well established, but their social dynamic during instruction is poorly understood. This study provides evidence of facial joy mimicry between teachers and students in real-life instruction. Data include video-recorded interactions of 13 university instructors and 69 of their students, analyzed on a frame-by-frame basis (80,000 frames per video). Participants' joy expressions were captured through a multi-camera setup and submitted to AI-based automated facial emotion coding. Facial mimicry within each teacher–student dyad was determined through cross-recurrence quantification analysis. Results showed that students' facial expressions of joy co-occurred substantially above chance level -2s and +3s seconds relative to the teachers' expressions. Post-session self-reported joy was significantly positively correlated the teacher–student dyad mimicry quantity for teachers. These findings imply that enjoyment transmission between teachers and students is reciprocal process, and that teachers emotionally benefit from their students' joy mimicry.

Student Perception of Empathy and Teacher Professional Development: A Model for Identity Exploration
Keywords: Emotion and Affect, Feedback, Motivation, Teacher Professional Development
Presenting Author: Joseph Eisman, Temple University, United States; **Co-Author:**Jeff Vomund, George Mason University, United States

We suggest a novel approach to teacher empathic development through identity-based professional development, which aims to support identity exploration and improve student outcomes. We argue that the recently developed Student Perceptions of Teacher Empathy Scale (SPTES), which measures students' perceptions of teacher empathy, can support identity exploration. Paralleling other teacher empathy and instruction literature, the SPTES is specifically organized around students' perceived teacher empathy through their instructional, organizational, interpersonal interactions in the classroom. We suggest two avenues for identity-based professional development using SPTES: (a) teachers may review their classroom data and plan strategies to continue practices that students experience as empathetic; (b) teachers might review the items of the SPTES and reflect upon potential interactions and strategies that may increase students' perceptions of empathy. In both cases, this operationalization of teacher empathy can promote teacher empathetic identity through reflection on student experience and perspective

Instructional strategies as a moderator between self-regulated learning and academic achievement
Keywords: Learning Strategies, Motivation, Self-regulated Learning and Behaviour, Teaching Approaches
Presenting Author: Yuichiro Sato, Keio University, Japan; **Co-Author:**Yuno Shimizu, Hyogo University of Teacher Education, Japan; **Co-Author:**Takashi Fukutomi, Minami Kyushu University, Japan

This study examined the effects of teachers' instructional strategies on the relationship between students' self-regulated learning processes and academic achievement. Multi-level structural equation modelling was conducted using a questionnaire administered to elementary school teachers (N = 84) and their students (N = 2665) in Japan's 5th and 6th grades. The results showed that the constructive strategy was positively related to academic achievement, while the transmissive strategy was negatively related to academic achievement. Additionally, the transmissive strategy had a positive moderating effect on the relationship between elaboration and academic achievement and a negative on the relationship between planning and academic achievement. In the student model, intrinsic, identified and external regulation was positively related to most learning strategies. In addition, identified regulation, effort regulation, elaboration

and planning were positively related to academic achievement, while help-seeking was negatively related to academic achievement. These findings have two implications for educational research and practices. First, using a transmissive strategy is a double-edged sword that strengthens and weakens the positive relationship between learning strategies and academic achievement. Second, teachers' instruction that encourages students to develop and deepen their ideas effectively improves academic achievement across many cultures.

Teachers' attitudes towards their responsibility and perceived use of motivational factors
Keywords: Higher Education, Motivation, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Asta B Schram, University of Iceland, Iceland; **Co-Author:**Abigail Snook, University of Iceland, Iceland

Our study objective was to investigate our university teachers´ attitudes towards and perceived use of five factors that have been found to motivate students in the course environment. We were also interested in comparing these attitudes and perceived use across Schools. A survey was sent to tenured/sessional teachers´ email addresses (n=2087) that were obtained from HR. We received 555 responses (27% response rate). We used a 6-point Likert agreement scale to assess teachers´ attitudes towards and recent use of the five *MUSIC Model*^{SM} *of Motivation* components (eMpowerment, Usefulness, Success, Interest, Caring). We combined "strongly agree" and "agree" in the following percentages for attitudes and perceived use of the concepts, respectively, obtaining M (64%; 52%), U (90%; 77%), S (76%; 72%), I (95%; 78%), C (96%; 88%) Faculty seemed to place less value on and use fewer autonomy strategies, such as giving students some choices (M). The success component (S) was also lower, both regarding attitude and use. The other three components, especially the caring component, were highly valued and used. However, when the data results were split to focus on each school at the university, there were some distinct and significant differences between them. Specifically, the teachers at the School of Education and the School of Humanities valued and used autonomy strategies more than teachers in the School of Health Sciences and School of Engineering and Natural Sciences. We suggest that faculty development staff increase their efforts to work with faculty on motivational strategies, especially the importance of student eMpowerment.

Feeling Good while Motivating Students: The Role of Teaching Identity and Motivation to Teach
Keywords: Motivation, Teacher Professional Development, Teaching Approaches, Well-being
Presenting Author: Branko Vermote, Ghent University, Belgium; **Co-Author:**Maarten Vansteenkiste, Ghent University, Belgium; **Co-Author:**Bart Soenens, Ghent University, Belgium; **Co-Author:**Wim Beyers, Ghent University, Belgium

Teachers' motivation to teach serves as a critical resource, predicting professional well-being and intentions to drop-out (Fernet et al., 2016), and their teaching behavior (Aelterman et al., 2019). Although many novice teachers are motivated to teach when entering the profession, the challenge is to preserve one's motivation throughout the years. Presumably, the roots of teachers' sustainable motivation can be traced back to their professional identity development. In the present study, we considered teachers' professional identity as a precursor of their motivation to teach, their professional well-being, and their (de)motivating teaching style, with motivation to teach mediating between teaching identity and the outcomes. The results obtained in a cross-sectional sample of 324 secondary teachers (M_{age} = 37.97, *SD* = 11.95, 66% female) and 333 higher education teachers (M_{age} = 44.24, *SD* = 9.89, 82.5% female) showed first that both secondary and higher education teachers with a well explored and firmly anchored teaching identity reported more good quality (i.e., autonomous) motivation to teach, experienced more professional well-being and used more motivating and less demotivating teaching strategies in the classroom. The opposite was observed for teachers ruminating about their teaching identity. Motivation to teach partially mediated the relationship between teaching identity and diverse outcomes, with teaching identity also being directly related to teacher outcomes. Overall, the findings underscore the importance of teaching motivation and identity in predicting teachers' personal and interpersonal functioning.

Autonomy Support Begins with Understanding: Empathy and Students' Basic Psychological Needs
Keywords: Emotion and Affect, Motivation, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Jeff Vomund, George Mason University, United States; **Co-Author:**Angela Miller, George Mason University, United States

As a part of Self-determination Theory (SDT), Ryan and Deci (2020) suggest that understanding the perspective of students is critical to autonomy supportive instruction. Understanding another's perspective is a common definition of cognitive empathy (Murphy & Lilienfeld, 2019). As such, SDT would seem to suggest that instructors' cognitive empathy would predict the autonomy support satisfaction of students. To empirically test this hypothesis, our research used structural equation modeling to examine the relationships between students' perceptions of instructor cognitive and affective empathy and the satisfaction and frustration of their basic psychological needs (BPNSF; Chen et al., 2015). Results show cognitive empathy predicts BPNSF, and autonomy support satisfaction. Affective empathy positively predicts relatedness support frustration. This study highlights the importance of instructor cognitive empathy for needs supportive teaching and the complex role of affective empathy in classroom settings.

Predictive modeling of problem-solving behavior in an office simulation to identify weak students
Keywords: Computer-assisted Learning, Learning Analytics, Problem-based Learning, Vocational Education and Apprenticeship Training
Presenting Author: Sabrina Ludwig, University of Mannheim, Germany; **Co-Author:**Andreas Rausch, University of Mannheim, Germany; **Co-Author:**Viola Deutscher, University of Mannheim, Germany; **Co-Author:**Jürgen Seifried, University of Mannheim, Germany

Fostering learner's problem-solving competences requires an understanding of the cognitive problem-solving process in a simulation. Researchers increasingly show interest in predictive modeling in simulations with recorded learner behaviour data (stored as time-stamped log files) to be able to provide early adaptive instructional support. Therefore, the present study investigates the problem-solving processes of 197 vocational education and training (VET) students in a computer-based office simulation developed for valid learning and assessment in VET. After completing an onboarding scenario to become familiar with the open-ended office simulations, the participants worked on a comprehensive scenario that included a supplier selection based on manifold information and various calculations. This study follows a two-stage approach for (RQ1) identifying n-gram features from process data and (RQ2) predicting students' problem-solving success with machine learning models. Regarding RQ1, the n-gram analysis revealed that groups with different levels of problem-solving success differ in their problem-solving behavior. High-performing students opened relevant documents and calculated in the relevant spreadsheet table, while low-performing students rather opened irrelevant documents and used the reference book for additional information. Regarding RQ2, random forest showed an acceptable accuracy of .69, which is comparable with model performances of similar research studies. Machine learning models are therefore helpful to identify weak students early. Limitations of the research design and implications from the view of instructional support and simulation development will be discussed.

A step forward: How stakeholders envision overcoming learning analytics' current challenges?

Keywords: Educational Policy, Higher Education, Learning Analytics, Qualitative Methods
Presenting Author: Anceli Kaveri, University of Oulu, Finland; **Co-Author:**Hanni Muukkonen, University of Oulu, Finland

Learning analytics (LA) focuses on interdisciplinary research and development of data-based solutions and dashboards. In higher education context persistent challenges of LA relate to resources and institutional strategies. In this study, stakeholders of LA in one higher education institution gathered to discuss their perceptions on these issues. Problem and solution tree (PAST) workshops were conducted for 16 participants. The data includes transcribed discussion and notes written by participants. The stakeholders described the resource, strategic and technical inhibitors of LA. They suggested better communication related to LA development and implementation strategies as well as better data and tool integrability. The results call for better strategic and practical integration between LA stakeholders and the institutional and national level decision-making related to LA development to take the next step in developing LA for improved studying, teaching, guiding and decision-making in higher education context.

University Students Experience Learning as View-Turns
Keywords: Conceptual Change, Higher Education, Learning Analytics, Learning Strategies
Presenting Author: Kristina Ahlberg, University of Gothenburg, Sweden, Sweden

University Students Experience Learning as View- Turns Kristina Ahlberg Gothenburg University, Sweden Phenomenography as educational research approach is based on a definition of learning as changing one's way of seeing, experiencing, understanding something (Marton,1986). The purpose of this study was to examine: Do University Students experience learning as Changing Way of Seeing Something, View-Turns (Hermodsson, 1976)? If so - Can they describe the processes and what constitutes them? A narrative method, with an open-ended and dual-focussed question to students of Medicine, Nursing, Occupational Therapy and Physiotherapy in their final term, was used to obtain narratives of students' experiences of learning as View-Turns. The difficulty, pointed out by Husserl (1907/1995), regarding knowledge formation on one's own consciousness, is in this study successfully overcome by an open-ended and double-focussed interview question. The result reveals that all students, except one, described an experienced process of learning as a View-Turn. The narratives were analysed according to Phenomenography and two qualitatively different main categories were discerned: Addition of Something New, with subcategories Information and Result, and Restructuring of Awareness, with subcategories Figure/Ground, Difference/Similarity, Perspective and Whole/Part. An interesting secondary finding was a significant difference between the two main categories in accounts by students of Medicine and by students of Nursing, Occupational Therapy and Physiotherapy. Medical students' accounts were categorised predominantly as Addition of Something New, whilst accounts from Nursing, Occupational Therapy and Physiotherapy students were categorised almost exclusively as Restructuring of Awareness.

Students' physiological arousal and synchrony in the presence of a manipulated cognitive challenge
Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Joni Lämsä, University of Oulu, Finland; **Co-Author:**Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Márta Sobocinski, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

Successful self-regulated learning (SRL) and socially shared regulation of learning (SSRL) in collaborative learning settings can be a challenging task for learners. SRL and SSRL are not something that happens throughout the learning process; instead, within the learning process, there can be cognitive challenges, for example, that trigger the need for regulation. To support students in strategic regulation of oneself and the group collectively when they face these challenges, we need ways to detect those challenging events. There is empirical evidence that increasing physiological arousal and synchrony among collaborating students is temporally coupled with the challenges in collaborative learning. In this study, we investigated whether the physiological arousal and synchrony were associated with presenting a manipulated cognitive challenge during collaborative learning. Eleven small groups of three high school students (N = 33) worked with a collaborative learning task for 30-40 minutes. After the first half of the learning task, the manipulated cognitive challenge was presented to them. To study the physiological arousal and synchrony before and after the manipulated cognitive challenge, we detected the peaks of skin conductance responses (SCR) and investigated whether the SCR peaks occurred simultaneously among the collaborating students. We found groups with significantly more SCR peaks and moments of physiological synchrony after the manipulated cognitive challenge than before the challenge. In our presentation, we will draw from the findings of the contextual data (such as self-reports) to interpret (the lack of) students' physiological responses to the manipulated cognitive challenge.

Statistically Gauging Vital Subcomponents of Diagrammatic Competency
Keywords: Assessment Methods, Classroom Assessment, Learning Analytics, Quantitative Methods
Presenting Author: Shun Saso, The University of Tokyo, Japan; **Co-Author:**Yuri Uesaka, The University of Tokyo, Japan

Owing to the emerging importance of developing students' ability to utilize diagrams, there is a growing demand among schoolteachers to quantitatively assess the extent to which students have mastered the elements of diagram utilization. To address this need, previous studies have utilized a class of latent variable models called the Cognitive Diagnostic Models (CDMs), which can elucidate students' latent diagrammatic competency statuses; however, it does not consider the crucial subcomponents of diagrammatic competency (ability to interpret given diagrams, to image diagrams, and to use diagrams spontaneously, etc.). Therefore, this study aims to incorporate diagrammatic competency and its subcomponents into the analysis of CDMs to obtain useful information regarding what elements students are, or are not, acquiring. Using data from responses to a mathematical task to measure diagramming competency, statistical evidence shows that while more than 90% of students can interpret given diagrams, only a small number of students can use diagrams spontaneously.

Student summaries as performance predictors in online learning settings using NLP
Keywords: Artificial Intelligence, Assessment Methods, E-learning/ Online Learning, Learning Analytics
Presenting Author: Ilias Karasavvidis, University of Thessaly, Greece; **Co-Author:**Vasiliki Ragazou, University of Thessally, Greece; **Co-Author:**Charalampos Papadimas, University of Thessaly, Greece

While students produce a bulk of texts in E-learning environments (e.g. forum discussions), the potential of such texts for predicting student performance has been largely unexplored. The literature review indicated that only a handful of studies have employed Natural Language Processing (NLP) techniques for analyzing texts that students produce in various online settings. This study introduces a novel NLP-based approach that utilizes student-generated texts for predicting performance after viewing video lectures. One hundred and twelve student teachers participated in the study. The students were asked to view a series of six short video lectures and then write a brief summary for each one. The performance on each video lecture was measured using knowledge tests that comprised ten close-ended questions. This performance was subsequently split into low and high respectively using the median as a threshold. Five feature sets were extracted from the summaries and were used to train eight common Machine Learning (ML) algorithms. The objective was to test the classification accuracy using different combinations of feature sets and ML algorithms. The results indicated that the raw text feature set achieved higher average classification accuracy in two video lectures, while the engineered text feature set achieved higher average classification accuracy in two other video lectures. On the other hand, the ML algorithms that led to high average classification accuracy were boosting algorithms. Overall, the study findings suggest that student-generated texts are a very promising feature for predicting student performance when learning from video lectures.

Participative autism research: reaching social validity through the participatory research index
Keywords: Communities of Learners and/or Practice, Engagement, Learning and Developmental Disabilities, Synergies between Learning / Teaching and Research
Presenting Author: Katerina Dounavi, Queen's University Belfast, United Kingdom

Behavioural research has resulted in a wealth of evidence of effectiveness for educational interventions supporting people with autism spectrum disorders, especially when these are applied early in life. However, an important gap exists in the social validation of such interventions, resulting in recent critiques of applied behaviour analytic research and practice as a whole and more importantly in a reduced uptake of such interventions by the community.In the present paper, the fundamental principles of participatory research will be presented as the theoretical underpinning of a democratic approach that involves key stakeholders throughout the research process. A discussion of where behaviour analytic research for autism stands in terms of achieving social validity will be provided, based on a systematic review of the literature. Following this, the participatory research index will be introduced together with guidelines on how its use can enhance educational research practices that will result in increased impact on the lives of children on the autism spectrum, their family members, researchers, practitioners and the wider community.

Experiences with individual accommodation for students with dyslexia perceived needs in HE
Keywords: At-risk Students, Higher Education, Learning and Developmental Disabilities, Qualitative Methods
Presenting Author: Liv Håberg, Volda University College, Norway; **Co-Author:**beate farstad, Volda University College, Norway

This study's main aim is to enlighten how 6 students in higher education with the diagnosis dyslexia experience the access and quality of information on the institution's homepages. There are 32 homepages investigated in the sample, and it is the students experience with accommodation investigated, according to the students' perceived needs. There is a lot of research done and ongoing con young students, and less research so far is describing the HE- students with dyslexia. The student mass is increasing and students who apply for individual accommodation might increase with the search masses for their studies. The study is ongoing autumn 2022 through data collection from the homepages and individual qualitative interviews with the students. The analysis is based on an abductive approach through coding according to incremental deductive inductive strategy. The preliminary findings indicate a variety of individual accommodation offers, and students needs is not always met satisfactorily according to the Equality and Anti-discrimination Act. This variety in accommodation and experience might contribute to differences in offers depending on the institutions chosen. With this study discussions about equality will be relevant, discussing if this might be a threat to equality.

German Adaption and Psychometric Properties of the CERQ-kids
Keywords: Assessment Methods, Emotion and Affect, Primary Education, Quantitative Methods
Presenting Author: Taina Marisa Gabriel, Leibniz Universität Hannover, Germany; **Co-Author:**Moritz Börnert-Ringleb, Leibniz University Hannover, Germany

Emotion regulation has increasingly been in the focus of research across different disciplines. In educational contexts, previous studies describe an association of student's emotion regulation skills and dependent relevant constructs such as school performance, social inclusion and social behaviour of students. There is evidence that students start to learn to cognitively regulate their emotions as early as in primary school, which underlines the potential necessity of gaining insights into cognitive emotion regulation skills in younger children. At the same time, appropriate measures to address emotion regulation in young children are lacking. E.g., up to today, there is no measure available to assess the cognitive emotion regulation of children below the age of 12 in German. Hence, the goal of the study is to translate and adapt the Cognitive Emotion Regulation Questionnaire kids (CERQ-kids) into German. The CERQ-kids is a questionnaire that aims to gain insights into cognitive emotion regulation of students between the ages 9-11. It comprises 36 items associated with nine emotion regulation strategies (e.g. acceptance, rumination, self-blame). In our analysis, in a first step, we tried to replicate the original factor structure of the CERQ-kids. The results of the confirmatory factor analysis (N=255) indicated an adequate model fit. Some items showed poor factor loadings. In a second step, we examined the psychometric properties of shortened version of the CERQ -kids (27 items). This analysis further supported the validity of this short version.

ID-READ: Individual Differences in Reading Comprehension with Eye-tracking in AD(H)D and Dyslexia
Keywords: Cognitive Skills and Processes, Eye Tracking, Learning and Developmental Disabilities, Self-regulated Learning and Behaviour
Presenting Author: Ellen Kok, Utrecht University, Netherlands; **Co-Author:**Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands; **Co-Author:**Eliane Segers, Behavioural Science Institute, Radboud University Nijmegen, Netherlands

Learners with AD(H)D and dyslexia may experience reading comprehension difficulties. Their reduced attention span and/or decoding problems may not only directly impact comprehension, but also lead to not using the right strategies during reading. Indeed, an important aspect of reading comprehension is the ability to use appropriate reading strategies. A distinction can be made between selective reading and intensive reading. Since reading is a covert process and difficult to measure with self-reports, webcam-based eye-tracking can be used to objectively and accessible identify reading strategies. For future applications of such data in education, a better understanding is needed of which reading strategies can be distinguished with webcam-based eye-tracking, how these strategies relate to individual variation, and their relation with reading comprehension outcomes. Therefore, ID-READ focuses on three research questions: 1) To what extent can webcam-based eye-tracking be used to distinguish between selective and intensive reading strategies in primary school children? 2) To what extent does the reading process (strategies) mediate between individual variation (decoding, language skills, and attention) and reading comprehension outcomes? 3) To what extent does this differ for children with dyslexia and/or AD(H)D compared to typically developing children? In Spring 2023, 300 primary school children (grades 5 and 6) will participate in ID-READ. During the poster presentation, the first results will be presented and opportunities and challenges of using webcam-based eye-tracking in reading comprehension education will be discussed.

Speech intelligibility: A latent variable approach on utterances' transcriptions
Keywords: Assessment Methods, Inclusive Education, Learning and Developmental Disabilities, Quantitative Methods
Presenting Author: Jose Manuel Rivera Espejo, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium; **Co-Author:**Steven Gillis, Antwerp University, Belgium

Intelligibility is defined as "the extent to which a speaker's message is understood by the listener" [15]. Its attainment carries an important societal value, as it is a milestone in language development [4]. For its measurement, orthographic transcriptions of utterances are used to construct an entropy score, which express the degree of (dis)agreement in such transcriptions [2,22]. However, although the benefits of using transcriptions to (indirectly) quantify intelligibility are clear [1,2,7], the statistical procedures used to model such data are not as sophisticated as the measurement procedures.
Consequently, we propose a novel data analysis using a Bayesian implementation of the Generalized Linear Latent and Mixed Model (GLLAMM) [17,18,19,20,23]. The statistical procedure offers four benefits. First, it allows to model the bounded entropy data. Second, it 'constructs' a speaker's latent intelligibility scale. Third, it test our research hypothesis at the appropriate level. And fourth, it avoids 'manufacturing' false confidence in the parameter estimates, producing correct statistical inferences [11].
As a result we find that, not modeling the bounded nature of the data could lead us to an overestimation of the parameter estimates' precision. For our hypothesis, we see that HI/CI children with genetic etiology have similar levels of intelligibility as NH kids, at 'hearing ages' of five. However, children with other etiologies have a significantly lower levels of intelligibility, at same ages. Moreover, we find that NH children develop their intelligibility with each year of 'hearing age' at a higher rate than HI/CI kids, contrary to what was previously found [2].

Teaching sequences on spatial orientation using a virtual city on computer in grades 2-4 in Geneva

Keywords: Computer-assisted Learning, Educational Technologies, Learning Strategies, Teaching/Instructional Strategies
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device to attend and participate in this workshop.
Our research bears on the teaching and learning of spatial orientation in Primary schools in Geneva, in Grades 2 to 4. We will present this context and the way we have come to develop a virtual city on computer specifically conceived (see ICT Demonstration in this EARLI conference presented by Fatou Maty Diouf) to support a didactical engineering of about 8 teaching sequences for each of the three grades. We have experimented these sequences in 5 classes (around 100 students) over 3 years
The aim of the workshop is to present the essential elements of the didactical sequences we build, focusing on a few activities that we will present to the workshop participants. We will also share some of the results obtained in our experimentations, and confront some of our analyses to the participants' reaction to their own experience during the workshop.

ICT Demonstration
Instructional Design

Supporting teachers in designing (digital) teaching and learning with myScripting

Keywords: Educational Technologies, Higher Education, Instructional Design, Teacher Professional Development
Interest group: SIG 04 - Higher Education

Please bring your own device if you are attending this ICT demonstration.The trend toward digital learning is unbroken. During the Corona crisis, numerous face-to-face courses were transformed into blended learning and eLearning courses. The conception of didactically meaningful digital learning is a demanding process. Course designers face many challenges. Does the course have a balanced ratio of content transfer to activation or interaction? Does the planned workload correspond to the credit points? Is the formative and summative learning assessment appropriate? How can proven teaching strategies be integrated? And last but not least, they are faced with the question of which technical possibilities the selected LMS actually offers for the implementation of their concept. This is exactly where myScripting comes in. The online tool guides course creators step by step through the educational design process. The goal is to create a storyboard that can be used both as a rough overview and for further detailed planning, and from which a prototype in a LMS can even be created at the touch of a button. In this way, myScripting supports the design of context-specific, diverse digital learning environments. Additionally, the collaborative functions of sharing and commenting on educational design support the development and teaching of lessons in teams as well as in-depth reflection on educational design. In this demonstration, the functionality and possible pedagogical uses of myScripting will be explained and participants are guided to develop educational storyboards themselves. Additionally, possible ways of using myScripting in the teacher training will be discussed as well as initial results concerning educational design research are presented.

Invited Symposium
Motivational, Social and Affective Processes

The Potential of Biophysiology for Understanding Motivation, Engagement, and Learning

Keywords: Achievement, Anxiety and Stress, Cooperative/Collaborative Learning, Emotion and Affect, Feedback, Higher Education, Mathematics/Numeracy, Motivation, Primary Education, Social Interaction
Interest group:
Chairperson: Tim Mainhard, Leiden University, Netherlands
Discussant: Reinhard Pekrun, University of Essex, United Kingdom

Integrative models of human learning and performance emphasize the joint operation of biological, psychological, social, and educational processes to fully understand human functioning. Educational researchers have typically emphasized psycho-educational and psycho-social factors in motivation, engagement and learning, but do not often consider the biophysiological factors. This invited symposium showcases recent educational research that included

biophysiological measures and methods on cooperation in primary school students, the relation between stress and task persistence of early math learners, the role of challenge and threat in secondary level science testing, as well as the effects of immediate feedback when working with Adaptive Learning Technologies in higher education. Next to the presenting empirical findings, this symposium reflects on how the inclusion of biophysiological measures can provide a more rigorous basis for effective educational theory, research, and practice.

Cooperation in primary school children: Exploring cardiac vagal tone and cognitive control
Presenting Author: Benedetta Zagni, University of Padua - Italy, Italy; **Co-Author:**Libera Ylenia Mastromatteo, University of Padua, Italy; **Co-Author:**Sara Scrimin, University of Padova, Italy

Cooperating is important in the classroom, where pupils are required to interact in a positive pro-social way. Yet, what determines children's engagement in cooperation is still debated. Individual characteristics and cognitive skills may play a crucial role. Specifically, cardiac vagal tone (CVT), an index of physiological self-regulation and environmental adjustment, has been linked with pro-social acts. Proactive cognitive control, the ability to actively maintain contextual information in directing behaviors, is less studied in relation to pro-sociality, yet is particularly important in the classroom and may influence cooperation. This study aims to investigate the role of physiological self-regulation (indexed by CVT) and cognitive control (proactive and reactive) on the likelihood of cooperation.

A total of 109 primary school students (1^{st}-5^{th} grades) were enrolled (44 males) in the study. Children's heart rate was registered at rest and CVT was computed as an index of physiological self-regulation. An AX-Continuous Performance Task (AX-CPT) was used to assess cognitive control, as indexed by Proactive Behavioral Index (PBI) error rates. Last, cooperative behavior was assessed through a modification of a stag hunt game. Logistic linear regression revealed that overall children who favored reactive cognitive control engaged more in cooperation and that a moderated CVT favored cooperation. The interaction between CVT, PBI, and cooperation revealed that moderate physiological self-regulation is required to increase the probability of cooperation among children using proactive cognitive control. These results underline the importance of fostering both self-regulation skills, especially among students favoring proactive control to increase cooperative behaviors in class.

The effect of physiological stress on young students' achievement behaviour and learning
Presenting Author: Anna-Liisa Jõgi, Tallinn University, Estonia; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

It is proposed that some physiological stress is important for both social-emotional functioning and cognitive performance. Our aim was to study the effect of physiological stress on students' achievement behaviours, like task-persistence, and gain in math skills during the first school year. 277 Grade 1 students participated in the study. Salivary cortisol was used as an indicator of physiological stress. Latent variable formed by three day-time cortisol samples was used in the structural equation model. Task persistence was rated by class teachers. Math skills were tested at the beginning of the school year and in Spring of Grade 1, and were used as a latent change score in the model. Our results showed that students with higher physiological stress were typically more persistent and their math skills improved more during the first school year. Students may need some physiological stress as arousal for staying focused on their studies and develop their academic skills. However, more research is needed on this topic, especially for testing the sources of students' stress.

Students' Psychological Orientations to Science Tests: An Educational and Bio Psychological Study
Presenting Author: Andrew Martin, University of New South Wales, Australia; **Co-Author:**Roger Kennet, The University of New South Wales, Australia; **Co-Author:**Emma Burns, University of New South Wales, Australia; **Co-Author:**Rebecca Collie, University of New South Wales, Australia; **Co-Author:**Joel Pearson, The University of New South Wales, Australia

A student's appraisal of science tests, and associated psychological challenge and threat states, impact their experience and performance on these tests. The present investigation of 244 high school science students sought to identify salient psychological orientations to science tests that may provide insights into how to optimize students' experience of and outcomes in science. It did so by augmenting "traditional" psycho-educational challenge and threat measures with relatively novel physio-psychological and neuro-psychological measures. Latent profile analysis (LPA) was conducted using five psychological indicators: psycho-educational indicators of challenge and threat (via self-reports of self-efficacy and anxiety, respectively), neuro-psychological indicators of internal attention (via electroencephalogram-alpha, EEG-alpha) and working memory activity (via EEG-theta), and a physio-psychological indicator of sympathetic arousal (via electrodermal activity, EDA)—as shown in Figure 1. LPA revealed four profiles representing distinct groups of high school students' psychological orientations to science tests: *Confident Striders, Confident Battlers, Ambivalents,* and *Fearers*. Each of these profiles had distinct associations with students' test enjoyment and achievement. Findings provide important insights into the extent to which inclusion of bio-psychology indicators, alongside educational psychology indicators, contributes to our understanding of students' challenge-threat orientations to science.

University Students' Emotional Responses to Immediate Feedback in Adaptive Learning Technologies
Presenting Author: Anne Horvers, Radboud University Nijmegen, Netherlands; **Co-Author:**Tibor Bosse, Radboud University, Netherlands; **Co-Author:**Ard Lazonder, Radboud University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University, Netherlands

Emotions can have a major impact on students' learning performance. In particular, after students get feedback on their task execution, different emotional responses to this feedback can be triggered. Negative emotions, such as frustration, can impede learning, and positive emotions, such as enjoyment, can enhance learning. As empirical evidence for these relationships during learning with Adaptive Learning Technologies (ALTs) is limited, this study investigated university students' emotional responses to the immediate feedback these ALTs provide. Students' physiological, experiential and behavioural responses were measured. More specifically, their arousal was continuously measured by electrodermal activity (EDA) (physiological) and their self-reported valence (experiential) and observations of emotion types via facial expressions (behavioural) were recorded after every step in the solution process. The results showed that there were more peaks in EDA after immediate feedback than would be expected based on chance. Contrary to our expectations, feedback on failure (FOF) did not elicit stronger physiological responses than feedback on success (FOS). Students' experiential responses showed significantly more negative valence after FOF and positive valence after FOS. Behavioural observations showed significantly more negative emotion types after FOF and more positive emotion types after FOS. This study is the first step in assessing emotions through multimodal data streams and designing ALTs that take students' emotions into account.

Session Q 2

26 August 2023 08:00 - 09:30

Symposium
Culture, Morality, Religion and Education

Ecology of family-school partnership within socio-economically and ethnically diverse contexts

Keywords: Attitudes and Beliefs, Cultural Diversity in School, Early Childhood Education, In-service Teachers, Migrant / Refugee and Minority students, Parental Involvement in Learning, Parents' Beliefs and Affect, Primary Education
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Alexandra Karousou, Democritus University of Thrace, Greece
Organiser: Pauline Slot, Utrecht University, Netherlands
Organiser: Efthymia Penderi, Democritus University of Thrace, Greece
Discussant: Paul Leseman, Utrecht University, Netherlands

Children's "educational niche" is a theory-driven model describing the multidimensional and multilevel nature of family-school partnership in relation to diverse ecological factors. It gives emphasis to the role of culture in shaping parents' and teachers' behaviors and relationships. Culturally responsive relationships take into account sociocultural, linguistic and ethnic disparities to promote trust, rapport and collaboration between parents and teachers, as a means to tackle

inequalities and conflictual interactions to promote all children's school success. This is a priority for the European educational agenda, especially due to the major influx of migrants and refugees in the last few years. Three cross-national studies highlight ethnically diverse parents' and teachers' relationships, according to their personal experience with regard to children's ECEC and primary education, in eight European countries. The first study concerns 487 parents with a Turkish or Maghreb migration background in three European countries, while in the other two studies involved 449 early childhood and primary school teachers from six European countries reported on dimensions of family-school partnerships and a number of demographic and personal factors. Covering aspects of all the three components of the niche, results helped to explain some of the contradictory relevant findings reported in the literature by examining the way different macro and micro characteristics and micro and meso processes influence relationship building between socio-economically and ethnically diverse parents and teachers. Cross-country, within group and between ECEC and primary education differences are discussed, providing insights for relevant research, educational policy, transition processes and professional development programs.

Young children's "educational niche": Family-school partnership and culture responsive relationships
Presenting Author: Efthymia Penderi, Democritus University of Thrace, Greece

Although family-school partnership has been identified as one of ECEC quality indicators, there is a gap regarding a theory-based model to describe its multidimensional and multilevel nature, shaped by contextual factors. Combining Bronfenbrenner's bio-ecological theory and Super and Harkness "developmental niche" young children's "educational niche" is proposed to elaborate on the way parents and teachers' interact to promote children's school success, filtering ecological influences. The model gives emphasis on the role of culture in shaping parents and teachers' behaviors and relationships. Culture responsive relationships take into account sociocultural, linguistic and ethnic disparities to promote trust, rapport and collaboration as a means to tackle inequalities and conflictual interactions, so as to promote all children's learning, according to the sociopedagogical role of education. The need to develop culturally sensitive attitudes and practices towards people with different values and beliefs, is a high priority in the European educational agenda due to the major influx of migrants and refugees in the last few years. This is particularly important during the early years, when children and families transition to (pre)school, taking into account that the way parents engage in their child's education and interact with teachers, sets the stage for their later involvement and acknowledgment of their role.

Turkish and Maghreb parents' relations with ECEC teachers: Role of family and (country) context
Presenting Author: Ryanne Francot, University Utrecht, Netherlands; **Co-Author:**Katharina Ereky-Stevens, University of Oxford, United Kingdom; **Co-Author:**Martine Broekhuizen, Utrecht University, Netherlands; **Co-Author:**Hande Erdem-Möbius, Otto-Friedrich-Universität Bamberg, Germany; **Co-Author:**Paul Leseman, Utrecht University, Netherlands

Immigrant parents may encounter certain barriers when trying to establish a trustful relationship with teachers at Early Childhood Education and Care (ECEC) centers, although this can be related to a complex interplay of factors at various levels. The current study examined the differences in parents' relationship with teachers across immigrant groups and countries, and its associations with family, context and country characteristics, for parents with a Turkish or Maghreb immigrant background, living in Germany, France, and the Netherlands ($N = 487$). Multigroup regression analyses showed that across countries and groups, immigrant parents are in general positive regarding their personal relationship with the teacher. The direct associations with demographic characteristics were limited. Personal and cultural characteristics, such as parents' self-efficacy, acculturation attitudes and language proficiency in the national language, were found to be related to the parent-teacher relationship, though differences were found between the immigrant groups and between countries. The findings are discussed in the light of national educational and integration policies in a culturally diverse Europe.

Teacher-parent relationship in ECE and primary education. A Cross-National Study in Six Countries
Presenting Author: Valentina Pagani, Università di Milano Bicocca, Italy; **Co-Author:**Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Efthymia Penderi, Democritus University of Thrace, Greece; **Co-Author:**Helga Norheim, Faculty of Humanities, Sports and Educational Science, Norway; **Co-Author:**Olga Wysłowska, Faculty of Education, University of Warsaw, Poland; **Co-Author:**Krzysztof Bulkowski, University of Warsaw, Poland

Positive teacher-parent relationships act as a protective factor for all children but especially for those most exposed to the risk of academic failure (i.e., pupils with an immigrant background and/or coming from low-income families), favouring children's well-being and successful school functioning. Despite the importance of family-school partnerships throughout the children's (pre)school career, the nature of this relationship changes across grades as a reflection of distinctly different histories and cultures of the two institutions, which ultimately result in different understandings, expectations, values, and teaching practices. The present paper, gathering data from six European countries (i.e., England, Greece, Italy, the Netherlands, Norway, and Poland), explores the nature of teachers' relationship with low SES and ethnic minority parents focusing on the differences between ECEC and primary education. 449 early childhood and primary school teachers completed an online survey with questions on their background, their culturally sensitive classroom practices and classroom diversity, and their relationship with parents. Results show that early childhood teachers tend to report comparatively more positive and less negative relations with parents compared to schoolteachers. Implications for improving the teacher-parent relationship on the part of the teacher, especially in the primary school context, will be discussed.

What aspects contribute to parent-professional relationships in a diverse (pre)school context?
Presenting Author: Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Efthymia Penderi, Democritus University of Thrace, Greece; **Co-Author:**Helga Norheim, Faculty of Humanities, Sports and Educational Science, Norway; **Co-Author:**Valentina Pagani, Università di Milano Bicocca, Italy; **Co-Author:**Olga Wysłowska, Faculty of Education, University of Warsaw, Poland; **Co-Author:**Krzysztof Bulkowski, University of Warsaw, Poland

Teacher-parent relationships are important for children's well-being and school functioning, especially for children with an immigrant and/or low socioeconomic status (SES) background who are at risk of academic failure. This study examined positive and negative attributes of this relationship and possible determinants (i.e., teachers' educational level, work experience, diversity-related self-efficacy, adoption of culturally sensitive classroom practices and (pre)school diversity) among 449 early childhood and primary school teachers across six European countries with varying educational and inclusive policies (i.e., England, Greece, Italy, the Netherlands, Norway, and Poland). Teacher-parent relations encompassed four interrelated, but distinct aspects: *shared beliefs with parents*, *reciprocity*, *hierarchy*, and *problem-related contact*. Differential country patterns were visible that could, partly, reflect national policies or curricula. Despite these differences, the adoption of culturally sensitive classroom practices showed consistent associations with teacher-parent relations. Teachers who were more culturally responsive in their classroom showed more shared beliefs and reciprocity in the relation with parents and less hierarchy and problem-oriented contact. This supports the notion of 'culturally responsive partnerships' as specifically important when working with diverse parents. Implications for improving practice concern a stronger focus on developing intercultural competences in pre- and in-service education.

Symposium
Motivational, Social and Affective Processes

The Interplay of Motivation, Emotion, and Self-Regulation in Diverse Populations

Keywords: Achievement, Emotion and Affect, Engagement, Metacognition, Motivation, Self-efficacy, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Synergies between Learning / Teaching and Research, Teaching/Instructional Strategies
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Adar Ben-Eliyahu, University of Haifa, Faculty of Education, Israel
Chairperson: Lihi Sarfaty, University of Haifa, Faculty of Education, Israel
Discussant: Matthew Bernacki, United States

The role of emotion and motivation have been a subject of increased inquiry in the context of self-regulated learning (SRL) frameworks. Taking an integrative

approach and providing a lens from different models of SRL, the symposium seeks to create a shared language among different models and researchers. The symposium will present four studies that show the role that motivation and emotion play as they interact with other processes and influence SRL. Paper 1 highlights how motivation shapes emotion and subsequent intentions for engagement. Profiles of achievement emotions for White and Black American students are presented and analyzed in terms of the associations of science motivation with emotion and persistence. Paper 2 presents how motivation shapes students' self-evaluation – a critical component of SRL in post-secondary students. Paper 3 examined the association of metaprocesses (spanning cognition, emotion, and behavior) and SRL using latent profile analyses. The findings of this study emphasize that different groups of students may have different metaprocesses which are associated with different SRL strategies and perceived teacher achievement orientation. Paper 4 examines the interplay between teacher and student SRL using a complex dynamic systems approach. The findings show the affective, complex, dynamic, situated, and socially essence of teachers' self-regulation of their pedagogical practices. Taken together, these papers provide a range of methods and approaches to considering the interplay of motivation and emotions, self-perceptions, and self-regulation in different population of secondary and post-secondary students and teacher. Discussion will focus on modeling dynamic and interactive relationships within SRL.

Relations Among College Science Students' Motivation, Belonging, Emotions, and Intentions to Persist
Presenting Author: Arianna White-Levatich, Old Dominion University, United States; **Co-Author:**Anthony Perez, Old Dominion University, United States; **Co-Author:**Lisa Linnenbrink-Garcia, Michigan State University, United States

Framed within the Control Value Theory of Achievement Emotions (Pekrun & Perry, 2014), we investigated how students' appraisals of control, value, and belongingness related to the development of emotion profiles in an undergraduate science context. We evaluated how emotion profiles arose within the two largest racial/ethnic groups enrolled in the course – i.e., within a sub-sample of Black students and a sub-sample of white students – in an effort to challenge deficit perspectives and highlight unique results within groups. Five emotion profiles were identified in each demographic sample; appraisals of control, value, and belongingness significantly predicted likely profile membership, which was in turn associated with students' commitment to science. These results have significance for instructors and researchers who aim to foster inclusive, supportive environments, and to bolster students' success in STEM.

Students' Use of Self-Testing in STEM Programs: Interindividual Differences in Test Engagement
Presenting Author: Fani Lauermann, University of Bonn, Germany; **Co-Author:**Daria Katharina Benden, University of Bonn, Germany; **Co-Author:**Jeffrey DeVries, TU Dortmund University, Germany

Students' math ability and study skills are critical for their academic success in math-intensive study programs in science, technology, engineering, and mathematics (STEM). Thus, intervention efforts to increase students' participation and retention in these fields often target their math knowledge and study skills, for instance, via diagnostic self-tests. Self-tests are a critical self-regulation tool because they inform students' ability self-evaluations (i.e., metacognitive knowledge) and allow students to monitor their learning progress. However, students' subject-specific motivation and quality of engagement during self-testing are important prerequisites for the effectiveness of this learning strategy. Using data from an ongoing large-scale project, which was conducted with beginning postsecondary students enrolled in STEM fields (N = 3,217; 33% female), this study examined students' level of motivation and test engagement while taking a comprehensive and freely available digital math self-test provided by the state ministry of education. Drawing on expectancy-value theory, we explore interindividual differences in students' math-related motivations and test engagement in terms of their subjective evaluations of the tested math content (e.g., perceived relevance and self-reported engagement), test persistence (e.g., the proportion of seen but unanswered questions), and test performance. The analyses identify characteristics of students who are most likely to engage with the self-test and thus benefit from this type of intervention. The findings underscore the importance of considering differences in subject-specific and test-taking motivation in analyses of self-regulated learning behaviors such as self-testing.

Metaprocesses and Self-Regulated Learning Among High School Students: A Latent-Profile Approach
Presenting Author: Alla Hemi, Bar Ilan University, Israel; **Co-Author:**Adar Ben-Eliyahu, University of Haifa, Faculty of Education, Israel; **Co-Author:**Amit Meitar-Doron, University of Haifa, Faculty of Education, Israel; **Co-Author:**Kiril Shelachevitch, University of Haifa, Faculty of Education, Israel; **Co-Author:**Lihi Sarfaty, University of Haifa, Faculty of Education, Israel

Students that have knowledge (i.e., metacognition) on how to learn have been shown to have higher achievements. Using a broad lens to conceptualize metaprocesses, we investigated how metacognition, metaemotion and metabehavior combine with emotional, cognitive and behavioral self-regulated learning (SRL) for different groups of high school students using latent profile analyses. Participants consisted of Israeli high school students (N = 1025, 51% female, M_{age} = 16.53) who completed questionnaires assessing their metacognition, metaemotion and metabehavior, cognitive, behavioral, and emotional SRL, rehearsal, organization, elaboration, and perceptions of teacher achievement orientations. Seven metaprocesses-SRL profiles were identified which were associated with students' use of learning strategies and perceived teachers' achievement orientation. Profiles of students with lower levels of metaprocesses and most forms of SRL were associated with lower levels of cognitive strategy use as well as perceiving the teacher as low on mastery achievement orientation. Profiles with higher scores on indicators of metaprocesses and SRL were associated with higher levels of cognitive strategy use and perceiving the teacher as high on mastery achievement orientation. Interestingly, metaemotion seemed to be less associated with cognitive use outcomes than metacognition and metabehavior. The findings highlight that knowledge about learning may differ among groups of high school students, and that this knowledge is associated with on-task SRL strategy use.

A Complex Dynamic Systems Perspective on Teacher Self-Regulation of Instructional Practice
Presenting Author: Joseph Eisman, Temple University, United States; **Co-Author:**Avi Kaplan, Temple University, United States; **Co-Author:**Lightning Jay, University of Pennsylvania, United States; **Co-Author:**Abby Reisman, University of Pennsylvania, United States; **Co-Author:**Timothy Patterson, Temple University, United States; **Co-Author:**Wendy Chan, University of Pennsylvania, United States; **Co-Author:**Jenni Conrad, Temple University, United States

Teacher self-regulation of their instructional actions has received little scholarly attention. We note the dearth of research that goes beyond aggregated patterns of relations between constructs to explain teachers' situated self-regulation of their practice. In the current study, we use a complex dynamic systems approach to conceptualize the self-regulation undergirding the emergence of moment-by-moment teacher actions in particular classroom contexts. We investigate this self-regulation through an observation of a teacher's actions while she facilitates a discussion in a high school history classroom. The results highlight the cultural, complex, dynamic, situated, and socially-oriented nature of the cognitive, motivational, and emotional processes that undergirds the teacher's self-regulation of her unfolding decisions about specific instructional moves. The teacher's inferred appraisals, goals, self-perceptions, and consequent self-regulated actions shifted within particular activity systems within the lesson, in response to contextual factors, and through the social dynamics with the students

COGNITIVE PROCESSES IN CRITICAL READING

Keywords: Argumentation, Attitudes and Beliefs, Cognitive Skills and Processes, Comprehension of Text and Graphics, Critical Thinking, Eye Tracking, Reading, Reasoning, Self-regulated Learning and Behaviour, Writing/Literacy
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Alexandra List, United States
Organiser: Patricia Alexander, University of Maryland, United States
Discussant: Alexandra List, United States

Literacy research over the last quarter century has called for a broadening of our conceptions of reading, from a strictly decoding and comprehension process, to a process requiring students to critically evaluate texts, as a part of democratic citizenship (Garcia et al., 2021; Leu et al., 2004). Aligned with this view of reading as a critical process have been efforts to examine students' source and content evaluation online, when learning from multiple texts (Breakstone et al., 2021; Brodsky et al., 2021; Pérez et al., 2018). Papers in this symposium adopt varied lenses on critical reading. These include examining students' evaluations of source, determinations of evidence quality, identifications of narrative themes and marginalizing language in texts, and, even, students' regulatory self-assessments when completing a reading-to-write task. Unifying these papers is a focus on specifying the cognitive processes underlying critical reading. Methods employed include eye-tracking, think-alouds, surveys of strategy use, and key-logging. Based on the richness of the processing data collected, and their analysis, authors in this symposium are able to not only define the cognitive processes involved in critical reading, but also to suggest conditions under which critical reading is most likely occur. Authors' specification of the processes and conditions facilitating critical reading will be used as a basis for suggesting approaches to instruction and intervention as well as for recommending directions for future work.

COMPREHENSION AND EVALUATION: ARGUMENT TYPE, BELIEF CONSISTENCY AND READING GOALS

Presenting Author: Sylvia Maria Savvidou, University of Cyprus, Cyprus; **Co-Author:**Irene Anna Diakidoy, University of Cyprus, Cyprus; **Co-Author:**Lucia Mason, University of Padova, Italy

The present study examined the influence of argument type (science-based vs personal case-based), belief consistency, and reading goals (read to evaluate vs read to learn) in the comprehension and trustworthiness evaluations of multiple texts. Undergraduate students read four claim-conflicting texts about vegan nutrition that varied in terms of their argument type and completed single text comprehension and trustworthiness rating tasks before answering a question that asked them to list all the pro vs con arguments presented across all texts. Results showed that personal case-based texts that capitalized on real-life experiences were better comprehended (single and multiple text level) than science-based texts that relied on scientific evidence to support their claim. Nevertheless, reading with the goal to evaluate increased memory representation for the belief inconsistent texts at the multiple text level and lower trustworthiness ratings, overall. More importantly, an evaluation reading goal resulted in higher trustworthiness evaluations of the higher argument-quality science-based texts in comparison to the lower argument-quality personal case-based texts. The present study highlights the conditions that facilitate the influence of content-related factors, such as argument quality, in single and multiple text comprehension and trustworthiness evaluations.

THE RELATIONSHIPS AMONG VISUAL BEHAVIOR, MULTIPLE-TEXT PROCESSING STRATEGY USE AND TASK OUTCOMES

Presenting Author: An-Hsuan Wu, National Taiwan Normal University, Taiwan; **Co-Author:**Meng-Jung Tsai, National Taiwan Normal University, Taiwan

This study aims to explore the relationships among learners' visual behavior, multiple-text strategy use, and task outcomes (information integration, sourcing, and decision-making tendency). A total of sixty participants read multiple documents regarding Chinese and Western medical treatments. The reading process of each participant was recorded via an eye tracker. After the reading task, two self-report scales were administered to evaluate students' multiple text-processing strategies and medical decision-making tendencies. The task outcome consisted of information integration and sourcing, and were scored according to scoring frameworks. *Pearson*'s correlation analysis and hierarchical regression analysis were used to explore the relationships among visual attention distributions, multiple-text processing strategies, medical decision-making tendencies, and task outcomes. The results revealed that *the revisited fixation duration (RFD)* on Western medical treatment information significantly and negatively predicted multiple-text strategy use. Moreover, *the total fixation duration (TFD)* on the Western medical treatment information significantly and positively predicted the participants' information integration outcomes, while the RFD on the source information significantly and positively predicted sourcing outcomes. Furthermore, the TFD on the Western medical treatment information and the RFD on the background information served as the predictor of medical decision-making tendencies. The results indicated that learners' visual attention during a multiple-document reading task could reflect their multiple-text strategy use and could affect their task outcome regarding information integration, sourcing, and medical decision-making tendencies.

CRITIQUE, AND NOT SUMMARY, TASKS PROMOTE CRITICAL READING

Presenting Author: Gala Campos, The Pennsylvania State University, United States; **Co-Author:**Alexandra List, The Pennysylvania State University, United States; **Co-Author:**Lily A. Russell, The Pennsylvania State University, United States; **Co-Author:**Hongcui Du, The Pennsylvania State University, United States; **Co-Author:**Zheng Yao, The Pennsylvania State University, United States

We operationalize critical reading as students' abilities to recognize marginalizing narrative frames and language use in texts. Undergraduates (N=172) were presented with three texts about low birth rates, constructed to include subtly misogynistic themes (e.g., holding women individually responsible for low birth rates rather than recognitive these as a complex social issue). Students were randomly assigned to summarize or critique three complementary texts during reading, or were assigned to a control group. No differences in comprehension performance were identified. However, students' assignment to the critique condition was associated with improved critical reading scores, assessed via a set of open-ended questions directing students to identify narrative themes and recognize author intent across texts. Moreover, comprehension performance was significantly associated with critical reading. Thus, this study provides evidence for the ways that critical reading outcomes may be fostered. Additional results examining students' critical processing during reading will be introduced.

RECURSIVITY IN ARGUMENTATIVE WRITING BASED ON CONFLICTING SOURCES

Presenting Author: Christian Tarchi, University of Florence, Italy; **Co-Author:**Ruth Villalon, University of Cantabria, Spain; **Co-Author:**Nina Vandermeulen, Umeå University, Sweden; **Co-Author:**Lidia Casado Ledesma, University of Florence, Italy; **Co-Author:**Anna Paola Fallaci, University of Florence, Italy

Reading sources with conflicting information is a common activity at university. Students are often faced with multiple-text comprehension tasks with the goal of integrating information and producing an argumentative synthesis; an activity which involves the critical use of reading and writing. Recursivity is a self-regulatory cognitive process playing a very important role in these activities, as it supports the monitoring of the writer's behavior. However, as far as we know, there are no studies that have analyzed its contribution to multiple-text comprehension and argumentative synthesis writing using a multimodal approach.Our objectives were: 1) to describe recursivity behavior (based on keystroke logging data) in university students while reading conflicting sources and writing argumentative synthesis; 2) to investigate the association between the frequency of recursivity and the quality of essays and the recall of the sources; 3) to associate recursivity events with strategic behavior, assessed by think-aloud during reading.Forty university students participated in the study. Participants read four texts on a controversial topic with the goal of writing an argumentative essay. Students' reading activity was registered through a think-aloud protocol. During the writing task, students' recursivity was recorded with Inputlog. One week later they completed a recall task.We found an association between reading strategies manifested through think-aloud and recursivity. We also found an association between the level of recursivity and recall. We did not find an association between recursivity and the quality of the argumentative synthesis. Educational implications will be discussed.

Learning and Social Interaction

Processes and effects of teacher collaboration on school improvement

Keywords: Cooperative/Collaborative Learning, Pandemic, Social Interaction, Teacher Effectiveness, Teacher Professional Development
Interest group:
Chairperson: Andrea Wullschleger, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland
Chairperson: Katharina Maag Merki, University of Zurich, Switzerland
Discussant: Eva Kyndt, Swinburne University of Technology, Australia

Teacher collaboration is essential for successful improvement processes in schools (Muckenthaler et al., 2020; Nguyen & Ng, 2020). The core idea is that high-quality collaboration is an effective way for schools, teams, and teachers to develop professionally, thereby improving the quality of instruction and student

learning (Ronfeldt et al., 2015; Spillane & Louis, 2002). Although teacher collaboration has been widely researched, several shortcomings exist. Especially in understanding the processes and effects, previous work remains rather undifferentiated (Wullschleger et al., 2020).Considering these gaps, the overarching questions of the symposium are to what extent collaboration is effective for teacher professionalization and student learning, and which collaboration processes are particularly relevant for school improvement. Suter et al. explore the effects of teacher collaboration on teachers' perceived professionalization, the role of pre-pandemic collaboration experiences, and the mediating effect of schools' collective self-efficacy during the pandemic. Wullschleger et al. examine the impact of collaboration ties perceived as useful for school improvement on the development of 5th graders' math achievement and the mediating role of instructional quality. Warwas et al. research how vocational education teachers discuss didactic elements during collaborative instructional planning and how they arrive at didactic decisions. Finally, Baez et al. investigate the typology of class teams regarding the frequency, depth and focus of collaboration, relating it to context characteristics. This symposium extends previous research, clarifying different aspects of collaboration processes and effects by using different methods, focusing on different actors, and including different grade levels and school types.

Schools' collaborative practices during the COVID-19-pandemic and their longitudinal effects

Presenting Author: Francesca Suter, University of Teacher Education of the Grisons, PHGR, Switzerland; **Co-Author:**Tobias Feldhoff, Johannes Gutenberg University of Mainz, Germany; **Co-Author:**Katharina Maag Merki, University of Zurich, Switzerland; **Co-Author:**Falk Radisch, Institute of school education and educational research, Germany; **Co-Author:**Nina Jude, University Heidelberg, Germany; **Co-Author:**Stefan Brauckmann-Sajkiewicz, Alpen-Adria-University, Institute of instructional and school development, Austria

After the outbreak of the COVID-19 pandemic, schools needed to continuously adapt to pandemic-related regulations and challenges, including the ad hoc transition to remote learning. According to theories about school improvement and professionalisation, collaborative practice is helpful when dealing with related issues. As there have not been any studies analysing collaboration longitudinally during the COVID-19 pandemic, we investigated how schools' collaborative practices before and during the pandemic affected teachers' perceived professionalisation, and how schools' collective self-efficacy acted as a mediator. For this study, N = 280 school principals from Germany, Austria, and German-speaking Swiss cantons participated in two online questionnaires in 2020 and 2021. Results from the structural equation model reveal that schools' collaborative practices were positively related to schools' perceived professionalisation in the second year of the pandemic, but not in the first year. Pre-pandemic experiences were important predictors of collaborative practice during the pandemic. Schools' collective efficacy in dealing with the pandemic mediated the relationship between pre-pandemic experiences with collaboration and perceived professionalisation. However, the indirect effect via schools' collaborative practices during the pandemic was not significant. The results highlight the importance of collaboration and collective efficacy to navigate emergencies such as a pandemic. However, to be effective in professionalisation, the regulation of collaborative practices during the pandemic must be implemented for a longer time period. At the conference, implications for practice will be discussed.

How effective is a high amount of teacher collaboration that is perceived as useful?

Presenting Author: Andrea Wullschleger, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Katharina Maag Merki, University of Zurich, Switzerland; **Co-Author:**Urs W. Grob, University of Zurich, Switzerland; **Co-Author:**Beat Rechsteiner, University of Zurich, Switzerland

From a theoretical perspective, it can be assumed that teacher collaboration has a positive impact on the quality of instruction and, through it, ultimately on the quality of student learning (Spillane & Louis, 2002). So far, this logic of effects hasn't been empirically analyzed using mediating models. Therefore, the purpose of the present study is to examine the effects of the amount of teacher collaboration perceived as useful for school improvement on the development of student math achievement among 5th graders, and the mediating role of instructional quality development. Using social network data on collaborations of 128 teachers in their school teams, we applied multilevel structural equation models to investigate the effects of collaboration on instructional quality development and student achievement growth. Findings reveal no direct effect of teachers' amount of useful collaboration ties on student achievement development, but an indirect effect mediated by instructional quality. The results not only confirm the theoretically proclaimed indirect effect of collaboration on student achievement mediated by instructional quality, but they also support previous studies arguing that it is especially the implementation of higher quality collaboration that is effective.

Micro-processes of teacher collaboration: Professional communication related to teaching

Presenting Author: Julia Isabella Warwas, University of Hohenheim, Germany; **Co-Author:**Christian Schadt, University of Hohenheim, Germany

A profound dialogue on effective teaching counts among the critical success factors of teacher collaboration aiming at instructional improvement. Nevertheless, few empirical studies attend to these communicative micro-processes of collaborative work. To enhance scientific knowledge on these processes and to identify communicative features with the potential to foster professional learning and effective teaching of its participants, a systematic literature review of studies published in international journals following PRSIMA guidelines formed the basis of our research. A structured content analysis of the selected articles (N = 88) led to a classification of features that we label Professional Communication about Teaching (PCT) and that span two major areas, i.e. regulation of the course of conversation and content-related arguments. We adapted this general classification to construct a coding scheme to study communication about a central element of instructional planning, namely the selection of learning tasks for students. Implementing an expert-novice research-design, we recorded and analyzed discussions among prospective and practicing teachers (N = 14 'dyads'). All teacher-dyads were given a situational vignette together with three learning tasks from their future/actual instructional domain (business education) and prompted to choose the task that would stimulate student learning best. Results indicate superior performance of expert teachers in terms of the categories of PCT. Our comparative analyses further suggest that those teams that score high on these categories also come to the best joint decision among the learning tasks, supporting the important role of PCT in teacher collaboration.

Teacher Collaboration in Class Teams: Network characteristics and Typology

Presenting Author: Charlotte Baez, St.Gallen University of Teacher Education, Switzerland; **Co-Author:**Franziska Vogt, St.Gallen University of Teacher Education, Switzerland; **Co-Author:**Doris Kunz Heim, PH FHNW, Switzerland

Teacher collaboration plays a crucial role in the development of schools and the improvement of teaching. The collaboration amongst teachers teaching a given class (class team) has not yet been examined. The study aims to establish whether there is a typology of class teams regarding their collaboration, distinguishing frequency, depth and focus of the collaboration. As the teachers of the class team teach the same class in different subjects, a focus of collaboration on Classroom Management could be assumed to be more relevant for teacher collaboration than students' progress in the subject. Furthermore, the relations between collaboration and teacher stress is of interest. The study involves of 32 class teams teaching 5th grade primary classes, in total 122 teachers and 545 students. Measures include teacher and student questionnaires, teacher interviews and observation; for analysis, network analysis, cluster analysis and analysis of variance are employed. Five clusters of class teams were found, differing in frequency and focus of collaboration as well as teacher stress: (a) collaboration within standards set by the school, (b) little collaboration, (c) collaboration under pressure focusing on student performance, (d) moderate collaboration under no pressure, and (e) moderate collaboration under no pressure. The typology raises issues concerning teacher collaboration intensity and the focus of collaboration, as well as teacher perception of the class and their perceived stress. Future research is needed to entangle the relations between the situation in a school, the characteristics of teacher collaboration and their network, and teacher perceived stress.

How does teacher adaptability influence positive attitudes towards online teaching during COVID-19?
Keywords: Attitudes and Beliefs, In-service Teachers, Pandemic, Self-regulated Learning and Behaviour
Presenting Author: Mingyao Sun, The University of Hong Kong, Hong Kong; **Co-Author:**Xianhan Huang, The University of Hong Kong, Hong Kong; **Co-Author:**Chun Lai, The University of Hong Kong, Hong Kong; **Co-Author:**Caixia Sun, Huzhou University, China

During the COVID-19 epidemic, teachers' positive attitudes towards online teaching are necessary to ensure the quality of online teaching and students' academic performance. Based on self-regulated learning theory, teacher adaptability can be used as a predictor of the teacher's positive attitudes. Existing empirical studies have limited research on teacher adaptability, and nearly no research has explored its influence on positive attitudes towards online teaching. A questionnaire survey on 1,180 showed that the teacher's cognitive adaptability was positively and significantly related to their positive attitudes toward online teaching, however, the teacher's behavioural adaptability and emotional adaptability were not. The research can promote the theoretical construction of teacher adaptability and have practical significance for improving teachers' online teaching effectiveness.

Experiences of teachers with digital learning during the COVID-19 pandemic: an exploratory research
Keywords: Attitudes and Beliefs, E-learning/ Online Learning, Qualitative Methods, Well-being
Presenting Author: Adriaan Vervoort, UHasselt, Belgium; **Co-Author:**Katrien Struyven, Hasselt University / Vrije Universiteit Brussel, Belgium; **Co-Author:**Wendy Schouteden, Hasselt University, Belgium; **Co-Author:**Mario Gielen, Hasselt University, Belgium

The COVID-19 health crisis, in which distance and online learning became the norm, is a source of information in terms of experiences with digital education. Based on models of digital competencies and digital education, a conceptual model was used to gather these new experiences with digital education. Qualitative data was collected in online focus groups using a semi-structured interview guide based on the principles of appreciative inquiry. Four major themes and six associated topics were identified. Results show that the sudden transition to online distance learning had a noticeable impact on the emotional and mental wellbeing of teachers. Time is needed to make a durable transition to digital education guided by clear, uniform, stable, and transparent school policies.

Teaching online during the COVID-19 pandemic: an observational study
Keywords: Higher Education, Pandemic, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Carlos González, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Daniel Ponce, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Macarena Yancovic, Universidad Finis Terrae, Chile

Despite the prevalence of video-conferencing as a medium of instruction during the COVID-19 pandemic, there is extremely little observational research focusing on online interaction in this context. We present the results of a study of online classroom interaction during COVID-19 quarantine in Chile. 146 higher education teachers were observed twice over a period of two years. An adapted version of the well-known COPUS observation protocol was employed. Following suggestions by Hora, we calculated "practice triads" (a combination of codes simultaneously occurring in a two-minute observation segment). A hierarchical cluster analysis was carried out with them. Three emerged. Figure 1 presents its main features. The first one (n=43, 29,5% of the sample) represents a relatively higher use of technology, mainly when guiding the class and presenting content. The second (n=58, 39,7%) has high activity in connecting with the professional area. Most present codes are guiding the class and connecting with the professional area, and presenting information and connecting with the professional area. The third (n=45, 30,8%) represents a group focused mostly on guiding the class and presenting information. Results suggest that during the pandemic, higher education teachers made an effort to advance from simple information delivery to more interactive classes where the use of technology and connecting with the professional area became prevalent. These are important elements that should be encouraged in post-pandemic higher education teaching.

Portuguese teachers' adaptation and pupil level of participation during the COVID-19 pandemic
Keywords: Curriculum Development, In-service Teachers, Pandemic, Teacher Professional Development
Presenting Author: Maria A. Flores, University of Minho, Portugal; **Co-Author:**Alexandra Barros, University of Lisbon, Portugal; **Co-Author:**Ana Veiga Simão, Faculty of Psychology, University of Lisbon, Portugal; **Co-Author:**Eva Fernandes, University of Minho, Portugal; **Co-Author:**Paulo Flores, University of Minho, Portugal; **Co-Author:**Paula Costa Ferreira, University of Lisbon, Portugal

This paper draws on data from a broader piece of research focusing on Portuguese teachers' perceptions and experiences of remote teaching in times of COVID-19 pandemic. In total, 2638 teachers participated in the study. Data were collected through an online survey which included both closed and open-ended questions. Findings suggest that overall teachers experienced a positive adaptation process and were able to teach according to what they had planned. However, difficulties were also found. These relate to reconciling work with family life and extra workload in the context of remote teaching. In addition, findings show that pupils from lower socioeconomic backgrounds present a lower level of participation in learning tasks. Differences as a function of gender and age were identified. Implications of the findings are discussed.

Combining Physical and Mental Self-management Strategies in Multimedia Learning: Best of Both Worlds
Keywords: Comprehension of Text and Graphics, Instructional Design, Learning Strategies, Multimedia Learning
Presenting Author: Björn de Koning, Erasmus University Rotterdam, Netherlands

The self-management principle holds that higher learning performance is obtained when learners actively use instructional strategies to manage the working memory load imposed by a learning task. This principle is a relatively recent development within Cognitive Load Theory (CLT) and provides a new approach to support learning. Research on self-managed learning with spatially separated, but mutually referring, text and pictures shows that using a physical (e.g., dragging-and-dropping text to picture) or mental (imagining dragging-and-dropping text to picture) integration strategy improves learning. However, similar benefits were not obtained when trying to use two physical strategies together. It is likely that this is because of higher working memory demands due to cognitive costs associated with coordinating two physical movements simultaneously. The present study investigated whether combining a physical and a mental strategy better supports learning and is more effective than either of the individual strategies alone. Eighty-four university students studied a spatially separated text and picture about an electrical circuit (presented on paper) in one of four conditions (random assignment) resulting from a 2 (physical strategy: yes/no) × 2 (mental strategy: yes/ no) between-subjects design. Participants rated their cognitive load after learning and completed retention, comprehension, and transfer tests. Results showed that participants using the physical and mental strategies combined reported a lower cognitive load after learning than participants using the physical strategy. There were no significant differences between the conditions on retention, comprehension, and transfer tests. These results suggest that combining physical and mental strategies is most efficient for learning.

Effects of signaling in a collaborative virtual reality learning environment
Keywords: Cooperative/Collaborative Learning, Immersive Technologies for Learning, Instructional Design, Multimedia Learning
Presenting Author: Patrick Albus, Ulm University, Germany; **Co-Author:**Tobias Drey, Institute of Institute of Media Informatics, Ulm University, Germany; **Co-Author:**Tina Seufert, Ulm University, Germany

Virtual reality (VR) is a technology of increasing importance that offers great potential for collaborative learning, which can have a positive impact on learning outcomes and cognitive load. At the same time, virtual learning environments are highly visual and learners need instructional support. In this study, we therefore analyzed the effects of two different approaches of collaborative learning (symmetric vs. asymmetric) and additionally the effects of signaling on learning outcomes and cognitive load in a highly immersive VR learning environment. We analyzed *N*=148 learners who were randomized in pairs to the signaling or the non-signaling condition and to the symmetrical or the asymmetrical collaborative condition. We measured learning outcomes (recall, comprehension & transfer) and cognitive load (intrinsic, extraneous & germane cognitive load) as dependent variables. The signaling condition achieved significantly higher recall and comprehension performance compared to the non-signaling condition. There was also a reduction in extraneous cognitive load when signals were used. We found no significant differences in learning outcomes between the symmetric and the asymmetric condition, but we found higher intrinsic and germane cognitive load in the asymmetric condition than in the symmetric condition. The results highlight the importance of signaling in collaborative VR learning environments and also show that both symmetric and asymmetric collaborative learning approaches can be appropriate in VR learning environments in terms of learning outcomes.

Decreasing (passive) extraneous load without reducing (active) effort? - A signaling study
Keywords: Assessment Methods, Instructional Design, Multimedia Learning, Video-based Learning
Presenting Author: Swantje Tannert, University of Erfurt, Germany; **Co-Author:**Mathias Berg, University of Erfurt, Germany; **Co-Author:**Meret Hanses, University of Erfurt, Germany; **Co-Author:**Friederike Luise Hahmann, University of Erfurt, Germany; **Co-Author:**Katharina Ockl, University of Erfurt, Germany; **Co-Author:**Inga Glogger-Frey, University of Erfurt, Germany

Processing of videos can be highly demanding and might even exhaust cognitive resources (Guo et al. 2014, Mayer et al., 2020) due to a high amount of cognitive load (Sweller, 1988, 1998). Multimedia design-principles (Mayer, 2020) like signaling (vanGog et al., 2014) reduce extraneous cognitive load and lead to better learning outcomes (Alpizar et al., 2020; Schneider et al., 2018). However, in order to load-optimize learning material, one needs to access the load of different versions. Measuring extraneous cognitive load by self-report is not trivial (De Jong, 2010). When trying to find design principles in order to reduce processing costs of video material, one aims at reducing the material induced cognitive load, which is called passive cognitive load (Klepsch & Seufert, 2021). However, many studies also measure cognitive load by asking for the invested effort (active cognitive load). In the present study an active load measure is compared to a passive load measure in an application of the signaling principle. Therefore, 98 participants were presented with a video containing either spotlight signaling (n = 41) or no signaling (n = 57). Passive extraneous cognitive load was measured using an adaption of the usability scale from Moon & Ryu (2021), active extraneous load was measured using the single item of Paas (1992). Results show signaling effects on cognitive load only for active cognitive load measured by the Paas (1992) scale.

Multimedia Effects in Testing: A Systematic Review and Meta-Analysis
Keywords: Classroom Assessment, Comprehension of Text and Graphics, Instructional Design, Multimedia Learning
Presenting Author: Marlit Annalena Lindner, IWM - Leibniz-Institut für Wissensmedien, Universität Tübingen, Germany; **Co-Author:**Lauritz Schewior, IPN – Leibniz Institute for Science and Mathematics Education, Germany

This work addresses multimedia effects in the context of testing and problem solving with a specific emphasis on potential moderating factors at the task and test-taker level. We aim to reconcile the heterogeneity of findings across subject domains and research areas to improve our understanding of the existing empirical database in the field and to derive future research directions. To draw a broader picture than a previous meta-analysis in the field (Hu et al., 2021), we combine a systematic narrative review (to include as many relevant studies as possible) with a meta-analytic approach (which focuses on more homogeneous findings from comparable experimental designs) in order to optimally extract the inherent information from the database of *n* = 57 relevant primary studies, which we identified in a systematic literature search, to answer our research questions. The data analysis is currently ongoing and will be ready for presentation at the EARLI conference 2023.

Does reading help in choosing a career? A mixed-methods study in the vocational transition system
Keywords: At-risk Students, Mixed-method Research, Motivation, Vocational Education and Apprenticeship Training
Presenting Author: Jule Hangen, Goethe University Frankfurt, Germany; **Co-Author:**Julia Gorges, Philipps-Universität Marburg, Germany; **Co-Author:**Eveline Wuttke, Goethe-Universität Frankfurt, Germany

The goal of the transition system is to prepare students for vocational training and, ultimately, to get students into work. Looking at the previous school careers of these students, a widespread obstacle to entering vocational training seem to be a lack of reading competence and reading motivation. From the perspective of the Social Cognitive Career Theory the present study aimed to examine the role of reading for the career orientation of adolescents in the transition system. In a mixed-methods study set in the transition system in Hesse students completed a standardized questionnaire and participated in a guided interview. Results show that students in the transition system have a medium level of motivation to read; quite a few enjoy reading and do so for pleasure. Reading texts, for which students use a variety of sources and media, makes an important contribution to career orientation and seems to be relevant for the development of specific career plans, but also holds some challenges for students.

Macro-Scaffolding in Vocational Education: Coherence and Adaptivity of Instructional Design
Keywords: In-service Teachers, Instructional Design, Tool Development, Vocational Education and Apprenticeship Training
Presenting Author: Manon Heuer-Kinscher, Goethe University Germany, Germany; **Co-Author:**Gerhard Minnameier, Goethe-University Frankfurt, Germany; **Co-Author:**Rico Hermkes, Goethe-Universität Frankfurt, Germany; **Co-Author:**Benjamin Herbert, Goethe Universität Frankfurt a.M., Germany

Effective support of learning processes does not begin in the classroom, but with the coherent and student-adaptive structuring and sequencing of lessons. In the context of teaching quality research this is referred to as "macro-scaffolding". The paper presents a method for the assessment of scaffolding patterns and their coherence and adaptivity. Lesson plans of 30 classes of vocational schools in the German state of Hesse, in which a lesson on the topic of the quantitative and qualitative comparison of offers was held by the respective subject teacher, serve as the data basis.In the data analyzed so far (N= 15 lesson plans), typical patterns of lack of adaptivity or coherence emerge, which might lead to learning difficulties and thus an increased need for micro-scaffolding in class or deficiencies of the ultimate learning outcomes. Through the application of the newly developed method, omitted learning steps are made visible which are

decisive for the logical connection between content areas. Results so far indicate that active-constructive discussion rarely takes place.

Informal Learning Strategies in the Workplace: What they are and how to foster them
Keywords: Informal Learning, Metacognition, Self-regulated Learning and Behaviour, Vocational Education and Apprenticeship Training
Presenting Author: Katja Häußermann, Ulm University Institute of Psychology and Education, Germany; **Co-Author:**Anne Frieda Doris Kittel, Ulm University, Germany; **Co-Author:**Tina Seufert, Ulm University, Germany

Employees learn by 70-90 % informally because formal learning opportunities are not individual enough in times of constant change. Since informal learning processes as reflection are learner controlled, feedback on effective strategy use is mostly lacking and learners might not know how to use learning strategies adequately. Therefore, this study‘s aim was to promote effective use of informal learning strategies via a microlearning training approach. 57 employees participated in a 2x2 design with the factors prompts and strategy information. The randomized groups differed in the receipt of media strategy information aiming at closing knowledge gaps and prompts that tended to activate learning strategies. Additionally, synergetic effects of prompts and information were investigated. In a pre- and posttest and ten times over a month metacognitive strategy knowledge and strategy use were collected and compared between groups. Strategy use for the prompt groups were examined via time series analyses. Individual and external job characteristics were examined as moderators. Although information significantly increased strategy knowledge and prompts descriptively increased strategy use, no synergetic effects were found from their combination. However, positive cubic effects of informal learning strategy use emerged over time for the groups receiving prompts. Since the results raise further questions, an experience sampling study will be conducted to better understand when which informal learning strategies are used. Practical implication for companies already emerged: the microlearning approach was promising and contextual variables such as learning culture should be taken into account when designing informal learning environments.

Facilitator dialogical moves supporting learning and regulation in interprofessional teams
Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, Lifelong Learning, Problem Solving
Presenting Author: Amber Kornet, Saxion University of Aplied Sciences, Netherlands; **Co-Author:**Maaike Endedijk, University of Twente, Netherlands; **Co-Author:**Sebastian Dennerlein, University of Twente, Netherlands; **Co-Author:**Tijmen Schipper, Windesheim University of Applied Sciences, Netherlands

The Dutch installation sector is facing major challenges in of the energy transition. As a result, interprofessional teams consisting of students, teachers, and employees of the installation company are formed to take up these challenges. In these so-called learning communities (LCs) learning, working and innovating are integrated when they work on a joint challenge. Facilitators are appointed to support team learning (e.g., collaborative idea generation, seeking feedback) and regulation processes (planning, monitoring, evaluation) in these interprofessional teams. Although the role of the facilitator seems very similar to a supervisor supporting student teams, it remains unknown how facilitators support participants’ learning and regulation activities in interprofessional teams to achieve their goals. To investigate this, we used the five dialogical moves found by Warwick (2016) in an embedded multiple case study of five LCs. We analysed transcriptions of the video-recordings of the 15 meetings of these learning communities to study the relation between the dialogical moves and team learning and regulation activities. Findings show that facilitators differ in their use of dialogical moves. Some primarily use requesting information, opinion or clarifications and making positive and supportive contributions, where others also use expressing shared ideas and agreement, providing evidence and reasoning and challenging ideas and refocussing talk. Facilitators using primarily two moves seem to mostly support idea generation and discussing results and unexpected outcomes. This means that other activities are less supported which can have great consequences for team performance. These outcomes help understand how team learning can be triggered in interprofessional teams.

Learning through problem-based argumentation: the differential effects across educational levels
Keywords: Argumentation, Cooperative/Collaborative Learning, Peer Interaction, Science Education
Presenting Author: Antonia Larrain, Universidad Alberto Hurtado, Chile; **Co-Author:**Paulina Freire, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Valeska Grau Cardenas, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Marisol Gómez, Universidad Alberto Hurtado, Chile; **Co-Author:**Patricia López, Universidad Alberto Hurtado, Chile; **Co-Author:**Diego Cosmelli, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Hernán Cofré, Pontificia Universidad Católica de Valparaíso, Chile

Evolution is a key piece of knowledge that has been shown to be very hard to learn. Problem-based argumentation may be particularly powerful in fostering conceptual understanding. However: Is collaborative argumentation more effective than individual argumentation? Is there any difference in learning through argumentation in problem-solving settings across educational levels? We conducted three experimental studies to answer these questions. In study 1 sixth-grade students (N = 136) from seven public schools in [CITY, COUNTRY] solved weekly problems of organic evolution (six weeks) in a mixed within and between 2x2 factorial design with between-subject factor problem-based orientation (argumentation versus explanation) and interaction (collaborative versus individual). The students had no formal instruction about evolution. Pre- and post-test knowledge was administered. The results showed significant changes in conceptual understanding in all conditions from pre- to post-tests, except for collaborative non-argumentation. Moreover, the group argumentative discourse significantly predicted delayed-post tests. In study 2 tenth-grade students (N = 126) from three public schools participated in a similar design with the same materials and procedures as in study 1. Students had been taught evolution in the previous year. The results showed that students in the collaborative argumentation condition were the only ones to progress between pre- and delayed post-tests. Argumentative discourse did not predict post-tests. In study 3 pre-service teachers (N = 46) from eight universities participated in a similar design with only the argumentative conditions. The results showed that students in the collaborative condition were the only group that significantly gained from pre- to post-tests.

Analysing argumentation episodes: a case study from physics teacher education
Keywords: Argumentation, Higher Education, Pre-service Teachers, Science Education
Presenting Author: Maija Nousiainen, University of Helsinki, Finland; **Co-Author:**Karoliina Vuola, University of Helsinki, Finland

Learning argumentation and its skills are central goals for science education. Domain-general argumentation has noted to be important generic skill, but it needs to be practiced in domain-specific context. We discuss here how domain-specific argumentation and skills related to it can form part of learning science in higher education. There are abundance of argumentation analysis frameworks and most of them base on Toulmin’s account. For the goals of learning physics in higher education, the use of empirical evidence is central, but attention needs to be paid to deductive knowledge formation as well. In this study, we analyse pre-service physics teachers written reports (N=36). We introduce here four argumentative moves that can be used to analyse physics knowledge argumentation. The analysis allows us to detect what kind of argumentative episodes pre-service physics teachers use in their explanations. The analysis shows that the analysis method is capable to discern argumentative episodes and the results reflect that there are remarkable differences in between pre-service physics teachers’ abilities to construct coherent arguments. We conclude that explicit teaching of argumentation may help pre-service teachers to improve their abilities to construct coherent arguments.

Toulmin's argumentation model scaffolds the coordination class concept of force: a case study
Keywords: Argumentation, Conceptual Change, Dialogic Pedagogy, Science Education
Presenting Author: Costas Naoum, University of Thessaly, Greece; **Co-Author:**vassilis Kollias, University of Thessaly, Greece

Abstract This paper presents the results from analyzing the dialogues of 8th-grade students in a collaborative argumentative environment in a physics lesson on "motion and forces". Literature reports that argumentation can be an important means for improving learning in the sciences (Henderson and al., 2018). We implemented a dialogic learning environment in which students were presented with structural and cognitive support in the construction of arguments, towards a deeper conceptual understanding. The Microgenetic Analysis of dialogues was based on utilizing the theoretical constructs of the Coordination Class Theory (CCT) (diSessa & Sherin, 1998), and Quinian bootstrapping (Carey, 2009). The analysis highlighted intertwined processes of coordination and bootstrapping, which led to students' conceptual improvement in the coordination class concept of force. The explicit use of Toulmin's model (Toulmin, 2003) in such an environment acts as a cognitive tool that induces conceptual bootstrapping, enhances coordination processes between causal networks and data, and has a positive effect on students' conceptual development.

Teacher expectations: Contributions to student academic outcomes and beliefs
Keywords: Achievement, Attitudes and Beliefs, Primary Education, Teacher Effectiveness
Presenting Author: Christine M Davies, University of Auckland, New Zealand

Many earlier studies have established that students with high expectation teachers outperform those with low expectation teachers. The current New Zealand study was designed to investigate not just the academic outcomes for students with high or low expectation teachers, but also a range of beliefs (perceptions of teacher expectations and teacher support, academic competence, school satisfaction, and reading self-concept). The 31 teachers in this study were identified as having expectations for their class as a whole that were either 0.5 SD above or below students' actual achievement. Their 692 students completed a standardised reading test and a beliefs questionnaire at the beginning and end of the academic year. By the end of the year, controlling for beginning-year beliefs and reading achievement, students with high expectation teachers perceived that their teachers had higher expectations than those with low expectation teachers, they had more positive academic competence, school satisfaction, and reading self-concept, and their reading achievement was higher. Teacher education and professional development programmes need to encourage teachers to have high expectations for all students and to institute high expectation practices that will increase student achievement and foster positive beliefs in all students.

Teacher perceptions of student motivation: Contribution to differences in grades and achievement
Keywords: Achievement, Cultural Diversity in School, Migrant / Refugee and Minority students, Motivation
Presenting Author: Katharina Schnitzler, University of Potsdam, Germany; **Co-Author:**Cornelius Brandmiller, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Hanna Dumont, University of Potsdam, Department of Education, Germany

Whereas there is a vast body of research on the causes and consequences of teachers' perceptions of student achievement, far less is known about teacher perceptions of student motivation. Initial findings indicate that student sociodemographic characteristics predict teacher perceptions of student motivation and that teacher perceptions of student motivation affect student achievement. In the present study, we, therefore, focus on teacher perceptions of student motivation as a potential mediator between student sociodemographic characteristics and achievement. The longitudinal data of $N = 3400$ students and their 58 German and 50 mathematics teachers stemmed from a German large-scale study. We analyzed the effects of student gender, immigrant background and socioeconomic status on teacher perceptions at the beginning of grade 5 as well as the indirect effects of these sociodemographic characteristics (conveyed by teacher perceptions) on two indicators of student achievement – grades and standardized tests – one and two years later. The results showed that teachers in German and mathematics perceived boys to be less motivated than girls. Moreover, German teachers rated the motivation of students with an immigrant background lower than that of students without one. According to the indirect effects, teacher perceptions contributed to a disadvantage of boys in both German and mathematics grades after one and two years and to a disadvantage of students with an immigrant background in German grades after one year. With regard to performance in achievement tests, indirect effects of student sociodemographic via teacher perceptions played only a subordinate role.

A Systematic Review of Teacher or Coach Expectation Effects on Children's Motor Skill Learning
Keywords: Attitudes and Beliefs, Mentoring and Coaching, Mindsets, Social Aspects of Learning and Teaching
Presenting Author: Xiaoyu Zhan, University of Groningen, Netherlands; **Co-Author:**Anne de Bruijn, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Anneke Timmermans, University of Groningen, Netherlands; **Co-Author:**Esther Hartman, University Medical Center Groningen / University of Groningen, Netherlands

Physical education (PE) teachers' or coaches' expectations are potential essential factors to affect children's motor skill learning. Although existing research has focused on various aspects of PE-teacher or coach expectation effects, there is not yet a systematic review that ties them together. Therefore, this review aims to elucidate how expectations are formed, communicated, as well as how children react to and how children's motor skill learning is influenced by the expectations. A systematic literature search was conducted in four electronic databases and a total of 6,724 publications was retrieved. Two rounds of screening resulted in twenty-four included studies. The quality of included studies was evaluated using the guidelines of Law et al. (1998). Information on for example research design and findings was extracted and the results were synthesized according to the amount and consistency of the evidence. As the extraction phase hasn't been finished yet, the results are preliminary. First, PE-teachers and coaches relied on children's characteristics and their own stereotypical beliefs to form expectations. Then, PE-teachers or coaches showed differential treatment, like approaching high-expectancy children more frequently. Next, children's socio-psychological and behavioral outcomes were affected, such as self-expectations and learning time. However, not all children responded in a similar way to the expectations. Finally, only one study found that PE-teachers' expectations predicted students' final motor skill scores, and students' perceived ability played a mediating role. In the upcoming period, the evidence will be further synthesized and the final results will be presented at the conference.

Student Teachers´ Beliefs about Digital-enriched Inclusive Teaching and Learning
Keywords: Attitudes and Beliefs, Educational Technologies, Inclusive Education, Teacher Professional Development
Presenting Author: Felix Bernet, PH Weingarten, Germany; **Co-Author:**Stefanie Schnebel, University of Education Weingarten, Germany

Digital media are said to have an impact on the realisation of inclusive teaching and learning. Optimized accessibility and individualized learning are some of the central opportunities of digital instructional tools when handling diversity in the classroom. An intervention in teacher training aims to make future teachers use those possibilities of digital media when creating inclusive teaching and learning material. In the intervention group student teachers analyse digital tools for their inclusive didactical value and integrate them into their inclusive lesson planning. According to the Theory of Planned Behaviour effects of the intervention should

be found on the level of beliefs as well as planning activities. The impact of the intervention is observed assessing a questionnaire and analysing planning documents. In this contribution first results of the questionnaire data are reported. So far, the intervention has shown an effect on primary school student teachers' beliefs about the use of digital media but no effect on beliefs about inclusive teaching.

When to Measure? An Exploratory Study of the Predictive Validity of Student Ratings
Keywords: Mathematics/Numeracy, Primary Education, Qualitative Methods, Teacher Effectiveness
Presenting Author:sergios sergiou, University of Cyprus, Cyprus; **Co-Author:**Charalambos Charalambous, University of Cyprus, Cyprus

Although student ratings are increasingly accepted as a promising method for assessing teaching quality, the juncture at which students should be asked to rate the quality of teaching they experience (immediately after a lesson versus at the end of a unit/a school year) in order to obtain more valid data remains an open question. Aiming to address this gap, we report on an exploratory study that examined the predictive validity of student ratings under three scenarios: (a) using student ratings at the end of different lessons; (b) employing the average of student ratings at the end of different lessons; and (c) using student ratings towards the end of the school year. We compared the predictive validity of these scenarios using students' ratings of perceived cognitive activation and their performance in a cognitively demanding algebra test as a case in point. In particular, we used both the cognitive-activation individual items as well as their grouping into factors as exploratory variables. Employing multi-level modelling (542 students nested within 30 classes/teachers) and controlling for different student, teacher, and contextual background characteristics, we found that in both cases (individual items and grouping of items into factors), the first two scenarios consistently had higher predictive validity compared to the third scenario. In discussing these findings, we consider their methodological implications for using student ratings to capture teaching quality more validly.

Using Longitudinal Data from a Digital Learning Environment to Predict Algebra Understanding
Keywords: Assessment Methods, Cognitive Development, Computer-assisted Learning, Mathematics/Numeracy
Presenting Author: Markus Spitzer, Martin-Luther Universität Halle, Switzerland; **Co-Author:**Korbinian Moeller, Centre for Mathematical Cognition, School of Science, Loughborough University, Loughborough, United Kingdom, United Kingdom

Understanding algebra is one of the most critical but difficult mathematical skills for students to learn in school as it significantly predicts later mathematic achievements as well as job prospects. Thus far, longitudinal studies from face-to-face testing indicated that understanding algebra highly depends on prior achievements in mathematics (e.g., fraction skills). The objective of the current study was to evaluate whether such findings generalize to data obtained from a large-scale digital learning environment. Therefore, we examined whether prior mathematical achievements in a digital learning environment predicted students understanding of algebra in the same digital learning environment in a longitudinal approach. Data from over 5,000 students who solved over 1 million mathematical problem sets on basic mathematical skills, fractions, and algebra was analyzed. We observed that basic mathematical skills as well as fraction skills significantly predicted algebra understanding. In sum, our findings generalize results from face-to-face testing to the context of data from online learning environments. As such, this finding suggests that data from digital learning environments may well qualify to examine children's numerical development.

Eye-tracking as a tool to study student cognitive engagement and attention in the math classroom
Keywords: Engagement, Engineering Education, Eye Tracking, Higher Education
Presenting Author: Miitta Järvinen, University of Jyväskylä, Finland; **Co-Author:**Joni Lämsä, University of Oulu, Finland; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland; **Co-Author:**Janne Roslöf, Åbo Akademi, Finland; **Co-Author:**Sami Lehesvuori, University of Jyväskylä, Finland; **Co-Author:**Lauri Kettunen, University of Jyväskylä, Finland

Student engagement is associated with students' learning, retention and academic success in the field of STEM education. This study explores potentials of eye-tracking data for investigating students' cognitive engagement and attention in mathematics classroom. The study develops an understanding of students' cognitive engagement and attention and explore what kind of events make students engage on a deeper level, and how their visual attention varies during different engagement levels. The research questions are 1) What kind of students' cognitive engagement is present in the math demo sessions? 2) What kind of events trigger a student to shift to a deeper (active, constructive, or interactive) engagement level? 3) How is the students' visual attention distributed during different levels of engagement? This research includes multimodal data via eye-tracking, and classroom videos in two math demo sessions that are part of a basic university math course of engineering degree programme. The recordings from four students were used to code the students' engagement according to the interactive, constructive, active and passive engagement coding framework (ICAP) (Chi & Wylie 2014) within the Classroom Observation Protocol for Interactive Engagement in STEM (COPIE-STEM) protocol developed by Hsiao et al. (2022). Passive engagement was the most common engagement level in math demo sessions. Teacher's prompts, classroom structure and peers' prompts were triggering students to engage on a deeper engagement level. Distribution of attention varied at different levels of engagement and mainly focused on whiteboard except interactive level where attention was paid to other students more than on other levels.

Effects of formative assessment on motivation via perceived competence support in 3rd graders
Keywords: Mathematics/Numeracy, Motivation, Primary Education, Teaching Approaches
Presenting Author: Larissa Aust, University of Münster, Germany; **Co-Author:**Birgit Schütze, University of Münster, Germany; **Co-Author:**Jan Hochweber, St. Gallen University of Teacher Education, Switzerland; **Co-Author:**Ralf Benölken, University of Wuppertal, Germany; **Co-Author:**Elmar Souvignier, University of Muenster, Germany

Empirical studies on effects of formative assessment on motivational outcomes and underlying mechanisms are scarce. Ryan and Deci's self-determination theory considers the experience of competence as a prerequisite for intrinsic motivation. Therefore, we investigated whether students perceived formative assessment to be supportive of the development of their competencies (perceived competence support; PCS). In this way, we aimed to test whether PCS mediates effects of formative assessment on intrinsic motivation. 26 math teachers with a total of 588 third graders participated in the study. Formative assessment was realized using two slightly different approaches: While teachers in experimental group (EG) 1 (n=7) received a tool for learning progress assessment (LPA), teachers in EG2 (n=8) were provided with the combination of LPA and additional support consisting of materials for feedback and adaptive instruction (LPA+). The control group consisted of 11 teachers. Students' PCS and intrinsic motivation were assessed at the beginning (pre-test) and the end of the school year, math achievement was measured at pre-test. A path model for half-longitudinal designs was estimated. LPA (β=0.289, p=0.039, R^2_{incr}=0.012) and LPA+ (β=0.302, p=0.067, R^2_{incr}=0.013) positively influenced students' PCS compared to the control group. PCS at T1 significantly predicted motivation at T2. For both groups, however, no significant indirect effects on motivation via PCS were found. LPA and LPA+ seem to have similar effects on PCS suggesting that providing teachers with diagnostic information on their students' progress plays a key role. Results suggest that fostering PCS in school might be a promising way in motivation-enhancing teaching.

Students' assessment of authentic pedagogy when learning to evaluate the trustworthiness of sources
Keywords: Critical Thinking, Inquiry Learning, Interest, Social Sciences and Humanities
Presenting Author: Maartje van der Eem, University of Amsterdam, Netherlands; **Co-Author:**J.P. van Drie, University of Amsterdam, Netherlands; **Co-Author:**Saskia Brand-Gruwel, Zuyd, University of Applied Sciences, Netherlands; **Co-Author:**Carla Van Boxtel, University of Amsterdam, Netherlands

In this study, we compared two different approaches to authentic pedagogy in history classrooms where students learned how to evaluate the trustworthiness of sources. In both approaches, students answered the same complex historical questions, using multiple sources. Only the introduction to and the phrasing of these questions differed. In the first approach, the "historical inquiry approach", students were put in the role of historians, and only the historical context was used to introduce the questions. In the second approach, the "present-oriented historical inquiry approach", examples from students' lives and current events were used in the introduction, and students were asked to answer the questions as if they were, for example, judges in a historical trial. Since authentic pedagogy can enhance motivation, it is relevant to investigate how students evaluate these two approaches. A total of 1036 grade 9 students participated, randomized at school level. They filled out a pretest and posttest measuring how interesting, useful, and important they considered learning to evaluate the trustworthiness of sources. In between, they followed three 80-minute lessons. Students evaluated each lesson (scale 1-10) on how interesting and instructive they considered the lesson. Results showed that students in the historical inquiry approach were significantly more positive after two of the three lessons than the students in the present-oriented approach. In both approaches, there was a strong correlation between students' interest and their evaluation of the instructiveness of the lessons. On the posttest, we found no significant difference between the two approaches.

Belief updating when confronted with scientific evidence: Examining the role of trust in science
Keywords: Critical Thinking, Informal Learning, Lifelong Learning, Science Education
Presenting Author: Tom Rosman, Leibniz Institute for Psychology (ZPID), Germany; **Co-Author:**Sianna Grösser, Leibniz Institute for Psychology (ZPID), Germany

In an exploratory re-analysis of existing data, we found that the more individuals trust science, the more likely they are to change their beliefs on a medico-scientific issue when confronted with scientific evidence on this issue. Hence, trust in science seems to play a role in shaping beliefs on scientific issues. However, not much is known on whether individuals with high trust in science trust science "blindly", meaning that their trust in a claim's source prevents them of adequately evaluating the claim itself (i.e., in terms of a first-hand evaluation). To investigate this more closely, we preregistered five hypotheses, which were tested in a second randomized experiment with a general population sample of N = 1,100. Participants read eight descriptions of fictitious studies, which either presented mixed evidence (i.e., diverging information) or clearly favored acupuncture over massaging (evidence direction factor). In addition, the methodological quality of the fictitious studies was experimentally manipulated by, for example, reducing their sample sizes or degree of standardization (evidence quality factor). Trust in science was measured before reading; acupuncture-related beliefs were measured pre-post. After reading, scientific literacy as well as perceived evidence quality and direction were measured. Overall, results suggest that individuals with high trust in science do not trust science blindly, but, on the contrary, are better able to evaluate the quality of scientific studies, which, in turn, protects them from being manipulated by low-quality evidence. With regard to science communication, our findings underline the importance of allowing the public to conduct first-hand evaluations.

Promoting evidence-informed reasoning in student teachers through peer feedback
Keywords: Feedback, Peer Interaction, Pre-service Teachers, Problem-based Learning
Presenting Author: Julia Hornstein, University of Augsburg, Germany; **Co-Author:**Martin Greisel, University of Augsburg, Germany; **Co-Author:**Johanna Ott, University of Augsburg, Germany; **Co-Author:**Anna Weidenbacher, University of Augsburg, Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany

Evidence-informed reasoning is a crucial teacher competency that needs to be developed throughout the teaching studies. However, empirical research has revealed that teachers struggle with using evidence-informed reasoning. One possibility to support evidence-informed reasoning is through peer feedback. However, it can be challenging for students to provide high-quality feedback and to integrate multiple feedback messages from different peers without instructional guidance. This study therefore investigates the impacts of feedback provision prompts and feedback integration prompts on (a) feedback quality, (b) conceptual knowledge, and (c) competence acquisition. A 2x2 between-subject design was used to address the research question, and N=254 teacher students (average age M=22.56, SD=4.30, 4th semester) took part in the study. The findings demonstrate that feedback provision prompts had a positive effect on feedback quality. Additionally, neither feedback provision prompts nor feedback integration prompts exerted a main effect on the acquisition of knowledge or competence. However, there was an interaction effect for competence acquisition: feedback provision prompts had a beneficial impact only when they were employed without integration prompts. This interaction effect suggests that only part of the feedback process should be prompted at a time rather than all phases simultaneously. Future research is required to investigate these consequences.

Mapping student goal plans to scientific inquiry learning behaviors during inquiry-based learning
Keywords: E-learning/ Online Learning, Game-based Learning, Learning Analytics, Metacognition
Presenting Author: Megan Wiedbusch, University of Central Florida, United States; **Co-Author:**Alex Goslen, North Carolina State University, United States; **Co-Author:**Dan Carpenter, North Carolina State University, United States; **Co-Author:**Roger Azevedo, University of Central Florida, United States

Scientific inquiry skills are fundamental to learning the nature of science and science content by allowing students to apply, practice, and develop various scientific reasoning processes. Goal setting and planning can help learners regulate their learning as they engage with scientific inquiry, especially within investigative exploration. This paper presents the development of a new planning scaffold used by 144 middle school students during interactions with Crystal Island, a game-based learning environment designed to teach students about microbiology and through scientific inquiry. We have used this planning tool in a novel approach to map student goals and plans from the scaffold to a series of epistemic scientific reasoning activities. Using online traces of student behaviors logged within the game, we will be able to analyze student goal setting and planning constructed throughout the game. This work highlights that online-trace data should be contextualized to (sub)goals, and the design of intelligent and adaptive goal and planning tools should be dynamic to account for open-ended exploration that differs across learners.

Player profiles in a mathematics educational game based on eye gaze and game log data
Keywords: Computer-assisted Learning, Eye Tracking, Game-based Learning, Mathematics/Numeracy
Presenting Author: Diana-Elena Gratie, University of Turku, Alexandru Ioan Cuza University of Iasi, Romania; **Co-Author:**Erno Lehtinen, University of Turku, Finland

Educational games are used as pedagogical tools to improve student's outcomes and engagement with mathematics. Understanding the strategies that players devise to complete a task is important for enhancing students' adaptive strategies during game play. This study identifies and analyzes the player profiles of university students freely engaging with a digital mathematics game after a period of training, based on eye gaze and game log data. The participants played the Number Navigation Game, NNG, designed to promote adaptive number knowledge and flexible mathematical skills in schoolchildren aged 10-13 through game elements that are directly connected to mathematical content. We performed k-means cluster analyses (N=23) using variables computed based on eye gaze measures and game log data, and identified two playing profiles. The two data sources are complementary, the first offering insights into how broadly the players explored the game space, and the second containing the actual moves.The Navigators profile indicates fast decision-making, with low exploration of the game space, thus possibly not many alternative solutions were considered.The Explorers profile is characterized by larger exploration of the game space compared to the performed moves, which may indicate that more emphasis was given to finding alternative solutions, in order to choose the best one. No significant relationship was found between the player profiles and performance in the game, and the learning outcomes were not measured in this study, but the identified profiles relate to recent studies that show that a slow reflective process (Explorers, here) results in better game-based learning.

What was I doing? Gaze-display feedback to support students' monitoring and learning in radiology
Keywords: Eye Tracking, Feedback, Higher Education, Metacognition
Presenting Author: Ellen Kok, Utrecht University, Netherlands; **Co-Author:**Diederick Niehorster, Humanities Lab Lund, Sweden; **Co-Author:**Anouk van der Gijp, UMC Utrecht, Netherlands; **Co-Author:**Dik Rutgers, UMCU, Netherlands; **Co-Author:**William Auffermann, University of Utah, United States; **Co-Author:**Marieke van der Schaaf, UMCU, Netherlands; **Co-Author:**Liesbeth Kester, Utrecht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Monitoring task performance is difficult. This is particularly true in complex visual tasks such as radiograph interpretation, as few overt actions take place that can inform monitoring. Eye-tracking technology can be used to measure viewing behavior, which can provide information about visual search and decision making, and make it overt in a visualization. We hypothesize that such gaze-display feedback could potentially impact performance when learning to interpret radiographs. We investigated two types of gaze-display feedback: 1) Search displays, showing which part of the image is searched. All areas looked at for at least 100 ms were colored red. 2) Decision displays, showing which parts of the image received prolonged attention (i.e., where decision making was likely suboptimal), all areas looked at for at least 1000 ms were colored red. 78 medical students (54 female) were taught how to detect abnormalities on radiological images using a complete search strategy. After a pretest and instruction, they practiced this on 16 cases with gaze-display feedback (search display or decision display) after each case. The control condition did not receive feedback. Next, a 12-item posttest (without feedback) was made. Afterwards, participants reported on self-efficacy, perceived confidence, and perceived usefulness of the feedback. For both the practice and the posttest phase, participants made global and local item-by-item confidence ratings. In contrast to our expectations, Bayesian analyses showed no benefits of the gaze displays on score, local and global (absolute) monitoring accuracy, completeness of viewing behavior, self-efficacy, and perceived competence.

Uncovering learning from video: Cued-retrospective Reporting vs. Concurrent-Retrospective Reporting
Keywords: Cognitive Skills and Processes, Digital Literacy and Learning, Eye Tracking, Video-based Learning
Presenting Author: Marijn Gijsen, University of Antwerp, Belgium; **Co-Author:**Charlotte Van Tricht, University of Antwerp, Belgium; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium; **Co-Author:**David Gijbels, University of Antwerp, Belgium

Learning with the help of multimedia is gaining importance, the COVID-19 pandemic accelerated this rise stressing the importance for further insights into learning from video and the research methods that can be used to accomplish this like for example think-alouds. Therefore, this study investigated the amount and quality of cognitive processing information elicited by means of concurrent, retrospective, and cued-retrospective reporting in learning from video. A within-subjects design experiment with 26 participants was conducted in a lab setting, using interactive instructional videos of statistics to compare all three reporting methods. The method of cued-retrospective reporting used the original video and a superimposed record of the participants' eye-movements and fixations as a cue for retrospection. Qualitative and quantitative analyses revealed several differences between the retrospective, cued retrospective, and concurrent reporting. On the qualitative level, less information was detected in the concurrent reporting while more detailed explications were elicited during cued-retrospective reporting. On the quantitative level, cued-retrospective reporting showed significantly higher medians compared to concurrent reporting on the total amount of codes, the surface level strategies and the regulatory strategies. The same results were found when comparing the cued-retrospective condition to the non-cued-retrospective condition. No significant difference was found in the deep level strategies. Both qualitative and quantitative findings highlight the difference between both methods. The results show that cued-retrospective reporting could be an interesting method to use in further studies in the field of learning from video.

Investigating student gaze synchrony in the classroom as indicator of student engagement
Keywords: Cognitive Skills and Processes, Engagement, Eye Tracking, Quantitative Methods
Presenting Author: Babette Bühler, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Efe Bozkir, University of Tübingen, Germany; **Co-Author:**Patricia Goldberg, University of Tübingen, Germany; **Co-Author:**Peter Gerjets, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany; **Co-Author:**Enkelejda Kasneci, Technical University of Munich, Germany

Automated behavioral analysis of students in the classroom with the aim of estimating student engagement is very popular, for instance focusing on single student's gaze directions as a cue for attention. Because behavioral cues are very context-dependent and their meaning depends on the particular learning situation, we argue that the orchestration of all students' gaze in the classroom contains valuable information. In this study, we examine whether a student's gaze synchrony to their classmates during a lesson is related to their self-reported engagement. To assess this, we employ computer vision techniques for continuous student gaze estimation and introduce a new approach to measure gaze synchrony in real-world classrooms. The employed dataset consists of seven videos of real lessons with N = 73 student instances from grades 6 to 12 and corresponding engagement self-reports. We find a weak, non-significant positive relationship between engagement self-reports and the calculated gaze synchrony scores at the student level. In the next step, we plan to investigate temporal patterns of gaze synchrony, as well as class orchestration of further behavioral cues, such as pose estimation.

Ideally Easy and Scientific? Text Features, the Role of Reader Characteristics and Trustworthiness
Keywords: E-learning/ Online Learning, Quantitative Methods, Reading, Science Education
Presenting Author: Mark Jonas, Leibniz Institute for Psychology (ZPID), Germany; **Co-Author:**Martin Kerwer, Leibniz Institute for Psychology (ZPID), Germany; **Co-Author:**Anita Chasiotis, Leibniz Institute for Psychology (ZPID), Germany; **Co-Author:**Tom Rosman, Leibniz Institute for Psychology (ZPID), Germany

In a time characterized by an increasing availability of online science information and a growing prevalence of fake news, conspiracy theories and science denial, understanding factors contributing to the perceived trustworthiness of scientific publications is vital. Previous research demonstrated an effect of text easiness and scientificness on lay readers' trust in science. However, both the easiness- and the scientificness-effect have mainly been examined separately, without focus on potential interactions or confounds. Additionally, it is conceivable that individual variations of the easiness-effect and scientificness-effect arise from reader differences in epistemic justification beliefs or need for cognitive closure (NCC).To jointly examine both effects and explore the influences of readers' epistemic justification beliefs and NCC, we carried out a preregistered online study with N = 1,467 German general-population lay readers. Readers received four short research summaries based on published psychological journal articles that systematically varied text easiness and scientificness in a 2x2 design (low vs. high). After each summary, ratings of text and author trustworthiness were collected. In addition, participants completed questionnaires related to their individual epistemic justification beliefs and NCC. Mixed-model regression analyses revealed that higher text scientificness significantly predicted increases in text and author trustworthiness. Furthermore, an interaction effect between scientificness and personal justification beliefs as well as justification by multiple sources emerged. However, no significant effects were found regarding text easiness. Implications for future studies and for increasing the trustworthiness of lay-friendly research summaries in light of reader characteristics will be discussed.

Knowledge revision during reading – do pictures reduce the activation of outdated information?
Keywords: Comprehension of Text and Graphics, Misconceptions, Multimedia Learning, Reading
Presenting Author: Pauline Frick, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:**Panayiota Kendeou, University of Minnesota, United States; **Co-Author:**Anne Schueler, Leibniz-Institut für Wissensmedien, Germany

In this study, we investigated whether pictures can reduce the influence of outdated information during reading comprehension. Previous research suggests that outdated information (i.e., information initially believed to be true but then updated) is often automatically activated when reading content related to that information. This automatically activated outdated information can hamper comprehension. Drawing on the Knowledge Revision Components framework (Kendeou & O'Brien, 2014), we theorize that one core component of knowledge revision is the reduction of the activation of outdated information. Thus, we investigated whether illustrating the updated information with a picture can prevent the activation of outdated information during reading. In doing so, we adapted a version of the contradiction paradigm (O'Brien et al., 2010) in which participants (N = 421) read texts that contained solely information that was consistent with a later target sentence (i.e., consistent condition) or that contained information that was inconsistent with the target sentence but was updated before reading the target sentence (i.e., outdated condition). Additionally, we varied whether the texts were illustrated by pictures or not. Results only partly confirmed our hypothesis. As expected, for the outdated condition, results showed faster reading times for the target sentences if the texts were illustrated compared to when the texts were not illustrated. Unexpectedly, the same result was observed for the consistent condition. Further studies are needed to determine whether pictures can reduce the activation of outdated information.

Exploring students' use of self-constructed diagrams when writing answers to test questions
Keywords: Communication Skills, Higher Education, Learning Strategies, Student Drawings
Presenting Author: Emmanuel Manalo, Kyoto University, Japan; **Co-Author:**Mari Fukuda, Simon Fraser University, Canada

The ability to construct and use diagrams in demanding communicative situations is a valuable skill. However, there are few studies that have been conducted in this topic area. Our aim in this study was to find out the extent to which a group undergraduate students could construct and use diagrams to support/supplement the answers they wrote during a real course test. We were interested in whether they could adjust the kinds of diagrams they used to match the answers they were writing, and whether diagram use appeared to be beneficial. The option of using diagrams in test answers for extra points was included in the final test of an introductory educational psychology course. We analyzed the answers and diagrams produced by 26 students who agreed to the use of their test answers. Although 16 students produced at least one diagram, the rates of diagram inclusion in answers to the four questions were low (19-50%). However, the kinds of diagrams the students used varied between the questions, as did the functions the diagrams served, suggesting that generally the students were able to use diagrams in response to variations in question requirements. We also found that the qualities of completeness, integration, and correctness of diagrams related to the overall quality of their test answers. The answer quality scores of students who used a diagram were also significantly higher in two of the questions compared to those who did not, suggesting that the benefit of using diagrams may depend on the question requirements.

When is a scientist perceived to be credible? Trust and expertise in socio-scientific domains
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Reading, Science and STEM
Presenting Author: Victoria Johnson, University of Minnesota, United States; **Co-Author:**Rina Harsch, University of Minnesota, United States; **Co-Author:**Panayiota Kendeou, University of Minnesota, United States

As information from high-credibility sources is more readily integrated and believed compared to information from low-credibility sources, who conveys information to the public can have significant impacts on public health and safety. However, less is known about the conditions under which people perceive the credibility of scientists within the emotionally and morally-charged socio-scientific domains of climate change and health science. Therefore, in this study we examined how expertise (high vs. low) and trust (high vs. low) influence perceived source credibility of scientists. Results indicated that complex interactions between expertise and trust determined the perceived credibility of scientists. These findings shed light on the impact of changing perceptions of trust and expertise of health scientists and climate scientists.

Presenting Author: Marieke van der Schaaf, University Medical Center Utrecht / Utrecht University, Netherlands; **Co-Author:**Martine van Rijswijk, Utrecht University, Netherlands; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands

In university undergraduate programs alignment between study goals with the development of (future) professional expertise (i.e., performance in tasks within a domain) that is strived for, is essential to stimulate students' development. This study aims to identify differences and similarities in how sets of task-units are

developed and positioned as learning objectives in curricula aimed at developing (future) professionals' expertise. Task-units in terms of core practices (CPs) and entrustable professional activities (EPAs) within 2 programmes for teacher education and 2 programmes for medical education were structured by means of delphi studies and stakeholder meetings. A research team with a mixed background in teacher and medical education qualitatively compared the task-units. Results show that the approaches and procedure to arrive at CPs and EPAs can be similar, while the content of both differ. Though the most important goal of CPs and EPAs is to stimulate (future) professionals' development, it is not clear how they impact students' development. Although CPs and EPAs may contribute to flexibilization of a curriculum, they are not automatically aligned to how professionals as learners develop in the context of the workplace.

At the Core of Core Practices: Conceptual Knowledge as an Enabling Factor for Successful Teaching
Keywords: Higher Education, Pre-service Teachers, Teacher Professional Development, Teaching Approaches
Presenting Author: Julia Kienzler, Universität Freiburg, Germany; **Co-Author:**Tim M. Steininger, University of Freiburg, Germany; **Co-Author:**Thamar Voss, University of Freiburg, Germany; **Co-Author:**Joerg Wittwer, University of Freiburg, Germany

Preparing teachers for the complex work of teaching is challenging. A promising approach is to support student teachers in acquiring core practices of teaching. To successfully execute core practices, an understanding of its conceptual aspects is fundamental. One way to promote such an understanding is providing student teachers with multiple examples. In this presentation, two experiments are reported that examined the effectiveness of exampled-based learning for acquiring conceptual knowledge associated with the core practices of classroom management and using learning objectives. Experiment 1 revealed that student teachers who actively compared examples were more successful in acquiring conceptual knowledge when they received instructional guidance. In addition, student teachers with more instructional guidance also experienced more productive and less unproductive mental load. Experiment 2 showed that a blocked format helped student teachers to generate new examples more effectively than an interleaved format and that student teachers who learned with subject-specific examples taken from their individual subjects rather than from random subjects generated new examples more successfully—especially when learning in an interleaved format. A mediation analysis showed that the subject-specific task value mediated the effect of subject-specific examples. Overall, the results indicate that the way example-based learning is designed matters for the acquisition of conceptual knowledge required to use core practices in the classroom. More concretely, student teachers benefit from example-based learning that is designed with sufficient instructional guidance, a blocked presentation, and subject-specific examples.

A Learning Trajectory for Preservice Science Teacher Eliciting and Interpreting Student Thinking
Keywords: Higher Education, Pre-service Teachers, Teacher Professional Development, Teaching Approaches
Presenting Author: Courtney Bell, Univeristy of Wisconsin, United States; **Co-Author:**Mark Olson, University of Wisconsin-Madison, United States

In the United States, COVID-19 exacerbated already large inequities in access to certified science teachers who are able to nurture students' science learning and social-emotional development. This study takes a design-based research approach to developing a preservice science teacher learning trajectory for the core teaching practice of *eliciting and interpreting student thinking*(EIST). To develop a provisional trajectory, data from eighteen Pre-Service Science Teachers (PSST) enrolled in a post-baccalaureate teacher education program were analyzed. Data include assignment artifacts from methods courses as well as records and observations of EIST enactment from student teaching instructional experiences. The hypothesized learning trajectory is characterized by changes in PSSTs perceptions regarding student ideas serving primarily as motivational supports for engagement toward PSST skill in incorporating student ideas toward cognitive engagement and learning goals. The study contributes to our understanding of teacher learning by articulating a learning trajectory we can use to 1) test our understanding of teacher learning in preservice and early career populations, 2) develop a conceptual bridge between literatures on teacher-student relationships and the teaching of science, 3) elaborate the interactions between teacher education pedagogies and teacher learning.

Dilemma Managing as a Core Practice in Teaching
Keywords: Higher Education, Pre-service Teachers, Teacher Professional Development, Teaching Approaches
Presenting Author: Roland Ebert-Glang, Albert-Ludwigs-University Freiburg, Germany; **Co-Author:**Ai Miyamoto, University of Freiburg, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany

Core practices such as lesson planning or classroom management require awareness of the effects and side effects of one's own pedagogical actions. Teachers must often choose between equally desirable goals, even if choosing one goal reduces the possibility of achieving another. Student teachers need to become aware of these contradictions and understand that not all aspects of good teaching can be realized at the same time. Since contradictions, role conflicts and ambiguity are among the main sources of stress for teachers, it is important that prospective teachers have a proper understanding of the dilemmatic nature of teaching. Against this background, we developed a questionnaire to measure preservice teachers' perceptions of dilemmatic situations in teaching contexts. We are currently running a study ($N = 53$ so far) to test (1) if student teachers perceive structurally dilemmatic situations as dilemmatic, (2) if they perceive them as solvable and (3) to what extent the scenarios seem realistic to them. (4) We also developed a questionnaire to measure tolerance for ambiguity, since studies in the medical field have shown, that tolerance for ambiguity is related to dealing with contradictory situations. Preliminary results suggest that the developed instruments have a decent reliability and that most scenarios were seen as realistic. Results generally indicate an insufficient understanding of the dilemmatic nature of teaching among preservice teachers. There are also indications that preservice teachers with a high tolerance for ambiguity view dilemmatic situations as less conflictual than preservice teachers with a lower tolerance for ambiguity.

Future-oriented science education building sustainability competencies
Keywords: Competencies, Environmental Education, Science Education, Sustainable Development
Presenting Author: Antti Laherto, University of Helsinki, Finland; **Co-Author:**Tapio Rasa, University of Helsinki, Finland; **Co-Author:**Lorenzo Miani, University of Bologna, Alma Mater Studiorum, Italy; **Co-Author:**Sibel Erduran, University of Oxford, United Kingdom; **Co-Author:**Olivia Levrini, University of Bologna, Italy

The aims and pedagogies of science education are evolving amid the global upheaval of all education due to the growing realisation of global sustainability crises. Education plays a key role in the endeavour towards the Sustainable Development Goals (SDGs). Our theoretical contribution here elaborates the role of science education research and practice in responding to these demands. In particular, we discuss how some prevailing and emerging currents of science education cohere with the sustainability competencies identified in the novel GreenComp framework launched by the European Union in 2022. The GreenComp framework comprises four interrelated areas of competencies that should be cultivated across all learning contexts to support the action-taking and transformations required by the global ecological crises. We argue that science education has a significant potential to contribute to all these areas: 'embodying sustainability values', 'embracing complexity in sustainability', 'envisioning sustainable futures' and 'acting for sustainability'. After discussing the affordances of current frameworks in science education for fostering each sustainability competency area, we argue that there is a need for a coherent approach to connect the areas and utilise the synergies between them. We propose that it can be done within the Future-Oriented Science Education (FOSE) approach, where students learn to envision sustainable futures and take action toward them through understanding the complexity of science-technology-society-environment relations and negotiating values underlying societal and technological development. We illustrate the suggestions by reviewing some examples of approaches for teaching

and learning developed in an EU project.

Education in the Anthropocene.
Keywords: Citizenship Education, Environmental Education, Ethics, Sustainable Development
Presenting Author: Denis Francesconi, University of Vienna, Austria

The term “Anthropocene” is a recent invention in the field of geological sciences and largely used in the environmental and sustainability sciences. It is also having a certain impact in the educational science. With this paper, I discuss the meaning of the Anthropocene for education. First, I discuss how the Anthropocene should be better understood as a cognitive era more than a geological one. Then, I present a techno-scientific approach to the Anthropocene, which poses relevant challenges to education. In particular, this approach looks at education as a way to increase planetary systems self-governance by adopting participatory computing, big data and social learning on a large scale. Finally, I conclude by remarking the fundamental role of education in improving planetary identity, awareness and responsibility for the cognitive human power, which is at the roots of the Anthropocene.

How teachers (can) make a difference for students’ development of sustainability competencies
Keywords: Environmental Education, School Effectiveness, Sustainable Development, Teacher Efficacy
Presenting Author: Katja Scharenberg, University of Education Freiburg, Germany; **Co-Author:**Eva-Maria Waltner, University of Education Freiburg, Germany; **Co-Author:**Christoph Mischo, University of Education Freiburg, Germany; **Co-Author:**Werner Rieß, PH Freiburg, Germany

Education for sustainable development (ESD) is anchored in many educational curricula in Germany as students’ corresponding competencies represent an important educational goal. However, empirical evidence regarding effects of ESD in schools is scarce. In our study, we examined how students’ sustainability competencies develop over the course of one school year. We proposed a theoretical framework model of sustainability competencies and focused on (a) students’ sustainability-related knowledge, (b) their affective-motivational beliefs and attitudes towards sustainability, as well as (c) their self-reported sustainability-related behavioral intentions. Based on a sample of *n*=1318 students in 79 classrooms at different secondary school tracks (Grades 5–8) in Baden-Wuerttemberg (Germany), students’ sustainability competencies in our longitudinal study were assessed at the beginning and at the end of the school year after the introduction of ESD as a guiding perspective for the new education plan. Descriptive analyses showed an increase in students’ sustainability-related knowledge, but their affective-motivational beliefs and attitudes towards sustainability decreased over the course of one school year. Multilevel analyses showed that, at individual level, prior learning requirements and ESD-related characteristics (participation in activities and general knowledge of sustainability) were the strongest predictors of students’ development. At classroom level, teachers’ attitudes towards ESD and their professional knowledge were significant predictors of students’ development. The higher the commonly shared value of ESD at school and the higher teachers’ self-efficacy towards ESD, the higher was students’ development of sustainability-related knowledge and their self-reported sustainability-related behavioral intentions. The significance of the findings for ESD in schools is discussed.

FridaysForFuture as its Pedagogical Function. An Enactive Network for Sustainable Development.
Keywords: Citizenship Education, Critical Thinking, Environmental Education, Sustainable Development
Presenting Author: Denis Francesconi, University of Vienna, Austria; **Co-Author:**Evi Agostini, University of Vienna, Austria

On 20 August 2018, the then 15 year-old student Greta Thunberg posted an image of herself outside Sweden’s parliament holding a cardboard sign reading “School strike for climate”. Soon after, the hashtags #FridaysForFuture (FFF) and #SchoolStrikeforClimate went viral and became a worldwide social movement. FFF represents today one of the most relevant social phenomena in the world and carries relevant implications for education.In this talk, we present data from a quali-quantitative content analysis on Greta Thunberg speeches and FFF’s documentation and social media’s entries. We show the main categories that emerged from our work. In particular, we first introduce FFF, its structure and narrative. We focus especially on the techno-scientific language often used by FFF and on the strong connection that FFF entertains with the scientific community. Then, we present FFF’s pedagogical function, which we describe as knowledge sharing and identity formation. We conclude by remarking that FFF seems to have a strong normative agency aimed not only at increasing environmental literacy in young students but also promoting a new planetary identity based on active and responsible activism and citizens.

Teachers’ epistemic theories and their relations to work-related wellbeing in five countries
Keywords: Attitudes and Beliefs, Burnout, Engagement, In-service Teachers
Presenting Author: Heidi Lammassaari, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Rekar Abdulhamed, University of Helsinki, Finland; **Co-Author:**Markus Talvio, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland

The current flow of misinformation in the media calls for teachers to develop their understanding of the nature, certainty and justification of knowledge, and what reliable sources are. These questions are all related to epistemic cognition. Epistemic cognition covers epistemic beliefs which constitute epistemic theories. Teachers’ epistemic cognition mediates how teachers act and how they perceive their work. Our previous study showed the relations between teachers' epistemic theories and their work-related wellbeing. In the present study, we looked at teachers’ (n = 1116) two previously confirmed epistemic theories, reflective collaborative theory and knowledge transmission theory, and how they were related to teachers’ work engagement and burnout symptoms in five European countries. We also looked at the variation across countries. Results showed that reflective-collaborative theory was related to higher work engagement and lower burnout symptoms whereas knowledge transmission theory was related to higher burnout symptoms. Moderations by country concerning work engagement indicated that the slope of reflective-collaborative theory was significantly steeper among participants from Latvia, Lithuania and Slovenia compared to the Italian sample which was congruent with the Spanish sample. In the case of burnout, the slope of knowledge transmission theory predicting burnout symptoms was steepest in the Lithuanian sample. This effect differed significantly for all other country samples, except the Latvian sample. We discuss how we were able to replicate our previous results in new contexts, and it appears that our instrument works in different countries in a similar way. The reasons for the results should be further explored.

Development and interplay in teachers’ self-regulation and well-being: an intervention study
Keywords: Mixed-method Research, Self-efficacy, Teacher Professional Development, Well-being
Presenting Author: Christine Wolfgramm, University of Teacher Education Zurich, Switzerland; **Co-Author:**Simone Berweger, Zurich University of Teacher Education, Switzerland; **Co-Author:**Zippora Bührer, Zurich University of Teacher Education, Switzerland; **Co-Author:**Andrea Keck Frei, Zürich University of Teacher Education, Switzerland; **Co-Author:**Christine Bieri Buschor, Zurich University of Teacher Education, Switzerland

In the context of increasing global societal challenges, issues facing the teaching profession have become even more acute. Self-regulation is a central personal resource in dealing with job demands and coping with stress. Professional development (PD) training programs, including coaching, have been established worldwide to support self-management and well-being, and to retain teachers in the profession by preventing burnout. This study examines the effects of a self-management training course followed by online coaching (OC) designed to support the transfer from the course to practice. The aim of the study, based on a

mixed methods research approach, was to 1) analyse the effects of the training on stress and 2) assess how teachers implemented self-regulation strategies and goals in their teaching practice. In addition, the interplay between self-regulation, professional self-efficacy, commitment, and stress was analysed. The sample consists of 273 primary teachers who participated in a three-week PD program. The study comprises five measurement points, including one during the COVID-19 pandemic. In addition, 15 coaches were interviewed. Analyses revealed that when the training was combined with OC, a benefit with respect to goal orientation and implementation was observed. Additionally, the results illustrated the importance of self-regulation in reducing stress, whereas self-efficacy was found to be related to work engagement. The analysis of the data collected in the pandemic revealed that the same contextual factors can be experienced as stressful or relieving, depending on teachers' personal conditions.

Student Engagement and Teacher Wellbeing: A Longitudinal Examination of Within-Person Effects
Keywords: Emotion and Affect, Engagement, Quantitative Methods, Well-being
Presenting Author: Aleksandra Huic, Faculty of Humanities and Social Sciences, University of Zagreb, Croatia; **Co-Author:**Irena Buric, University of Zadar, Croatia; **Co-Author:**Izabela Soric, University of Zadar, Croatia

Although a lot is known about how teachers shape student motivation, less is known about how student motivation can shape teacher outcomes. In the present study we examined longitudinal associations between teacher perceptions of their students behavioral and emotional engagement and disaffection in class and their well-being, namely job satisfaction and emotional exhaustion. Specifically, we explored the relationship between student engagement/disaffection and teacher well-being indicators at the between-person level and at the within-person level (both concurrently and longitudinally) by testing the random-intercept cross lagged panel model (RI-CLPM). In total, 1141 secondary school teachers from 73 Croatian schools participated in the study and filled out questionnaires on four occasions separated by approximately 2.5-month intervals. Results at the between-person level showed that teachers who perceive their students as being more emotionally and behaviorally engaged, but less emotionally and behaviorally disaffected, tend to report higher levels of job satisfaction and lower levels of emotional exhaustion. At the within-person level, higher than expected levels of perceived student emotional engagement were concurrently associated with higher than expected levels of job satisfaction and lower than expected levels of emotional exhaustion. The opposite pattern was established for emotional and behavioral disaffection. Regarding the longitudinal spill-over effects, perceived emotional engagement and emotional and behavioral disaffection predicted teacher well-being over time, but not vice versa. These results highlight the importance of student motivation for shaping teacher occupational well-being and show that increasing student motivation can also benefit teachers. This work was supported by Croatian Science Foundation (Grant No. IP-2019-04-5472)

This Student Makes me Feel Burnt Out: Student-Specific Self-Efficacy, Classroom Demands, and Burnout
Keywords: Burnout, Classroom Assessment, Quantitative Methods, Self-efficacy
Presenting Author: Annika Koch, University of Bonn, Germany; **Co-Author:**Fani Lauermann, University of Bonn, Germany

Social-cognitive and resource theories suggest that teacher burnout is not a direct consequence of the demands teachers experience in the classroom, such as low student motivation and achievement, but rather the perceived inability to cope with these demands successfully. Numerous studies corroborate this assumption, as teaching self-efficacy has emerged as one of the key predictors and a protective factor against burnout. However, even though some studies suggest that teacher burnout may stem from negative experiences with individual students, rather than entire classes, no study to date has examined the associations between student-specific classroom demands, teaching self-efficacy, and burnout. To fill this gap, the present study used data from 60 teachers in language-focused classes (30 secondary school teachers and 30 adult education teachers in German-as-a-Second-Language classes) and their 610 students. Multilevel path analyses examined the within-class links between students' self-reported motivation and standardized performance (language proficiency), teacher-rated student engagement and ability, teachers' student-specific self-efficacy and enthusiasm for teaching individual students, and burnout (emotional exhaustion and depersonalization concerning individual students in the classroom). Negative within-class correlations between teacher burnout and students' motivation, teacher-rated engagement, and language proficiency indicated that these student characteristics can function as potential stressors. However, consistent with expectations, teachers' student-specific self-efficacy and enthusiasm were the strongest predictors of burnout. Not the existing classroom stressors per se but rather teachers' perceived capability to overcome these stressors in the classroom is critical for teachers' well-being. We replicated these findings in two settings: secondary-level and adult education language-focused classes.

Developmentally appropriate learning: the adaptation of Ages and Stages Questionnaire-3 in Greek
Keywords: At-risk Students, Developmental Processes, Early Childhood Education, Learning and Developmental Difficulties
Presenting Author: Maria Koushiou, University of Nicosia, Cyprus; **Co-Author:**Stavros Trakoshis, Unicaf University, Cyprus, Cyprus; **Co-Author:**Nina Michael, University of Cyprus, Cyprus; **Co-Author:**Fofi Constantinidou, University of Cyprus, Cyprus; **Co-Author:**Panayiota Dimitropoulou, University of Crete, Greece; **Co-Author:**Alexandra Klimentopoulou, Institute of Child Health, Greece; **Co-Author:**Antonis Jossif, "Paedi" Center for Specialized Pediatrics, Cyprus

Objective: The Ages and Stages Questionnaire – Third version (ASQ-3) is one of the most widely used developmental screening tests in young children. Despite its availability in many languages, there is no evidence of its psychometric properties in Greek. The present study aims to discuss the process of culturally adapting the ASQ-3 in Greek and examine its internal consistency, test-retest reliability and factor structure on a preliminary basis among Greek-Cypriot children aged nine to 66 months. Method: A total of 303 questionnaires were completed by parents for boys and girls representing two age categories, namely Toddlerhood (9-33 months) and Preschool (36-60 months). The tool's scale scores were analyzed per age category for each gender separately. Results: The subscales with the highest internal consistency based on the Chronbach's a (ranging from α =.71 to α= .88) are Communication and Gross Motor in the Toddlerhood age group for both genders and Fine Motor for male preschoolers. Regarding test-retest reliability, repeated mothers' completion of the questionnaire showed high and positive correlations in almost all domains. Exploratory factor analyses support the five-factor solution for questionnaires completed for male toddlers.Conclusions: Overall, results support the reliability and dimensionality of the ASQ-3 in Greek with improved psychometric properties shown for specific gender and age groups. Findings are discussed in light of the tool's potential contribution in developmentally appropriate learning in early childhood education and care.

No evidence that playing a number line game improves numerical skills: a randomised controlled trial
Keywords: Achievement, Early Childhood Education, Educational Attainment, Mathematics/Numeracy
Presenting Author: Ella James-Brabham, Loughborough University, United Kingdom; **Co-Author:**Tim Jay, Loughborough University, United Kingdom; **Co-Author:**Francesco Sella, Loughborough University, United Kingdom

Early numeracy skills predict mathematical outcomes at the end of school, as well as numerous life outcomes, including health, income, and quality of life. Therefore, it is important to support the development of numerical skills at the start of school, especially in children from a low socioeconomic background who are most at risk of falling behind. Some studies have highlighted the efficacy of linear number board games in improving early numerical skills, as well as the beneficial effect of counting forward and backwards. We designed a number board game which entailed placing number cards in order on a line either forward or

backwards while allowing children to play in small groups with minimal adult supervision. We evaluated the effectiveness of the game in a randomised control trial with four- to five-year-old children from schools located in low socioeconomic areas. Children were randomly allocated to one of three conditions: playing the number game only forward (n = 82), playing the number game forward and backwards (i.e., bidirectional condition;n= 82), or playing an alphabet game (n = 85). Children attended eight gameplay sessions across five weeks. Children's numerical skills and letter-sound knowledge were measured at baseline and post-test. Children improved between pre-test and post-test, but there was no significant effect of intervention condition. This indicates that neither the forward nor bidirectional version of the number game improved numeracy beyond regular teaching. Possible reasons for a lack of effectiveness and theoretical implications will be discussed.

Talk Matters in Shared Reading: The Role of Verbal Participation in Listening Comprehension
Keywords: Dialogic Pedagogy, Early Childhood Education, Engagement, Teacher Professional Development
Presenting Author: Janne Lepola, Univ. of Turku, Finland; **Co-Author:**Anu Kajamies, University of Turku, Finland; **Co-Author:**Molly Fuller Collins, Vanderbilt University, Department of Teaching and Learning, United States; **Co-Author:**Eero Laakkonen, University of Turku, Finland

The aim of the study was to examine children's listening comprehension during a two-semester-long intervention on dialogic reading. We were interested in children's responsiveness and explored the extent to which the development of listening comprehension was determined by initial listening comprehension and whether children's engagement and the amount and the level of verbal participation in shared reading contributed to their later listening comprehension. The role of the variability in the opportunities provided by teachers, such as closed and open-ended questions, was examined. A total of 60 five-year-old children participated in 15 story groups. Children's listening comprehension was evaluated in September and March. Teachers rated the children's behavioral and cognitive engagement in December. The children's verbal participation and the teachers' questions were video-recorded in February. A theoretical model involving direct and indirect pathways in the development of listening comprehension was proposed and analyzed by path modeling. Substantial stability in listening comprehension supported the direct pathway. In line with the hypothesis, the results also showed that the children's cognitive engagement and the amount of verbal participation were mediating the development of individual differences in their listening comprehension. Teachers' open-ended questions also contributed indirectly to listening comprehension via children's verbal participation. The findings highlight the benefits of children's active participation in discussions and talk-intensive reading aloud.

Long-term effects of the home literacy environment on reading development
Keywords: At-risk Students, Cognitive Development, Motivation, Reading
Presenting Author: Minna Torppa, University of Jyväskylä, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Pekka Niemi, University of Turku, Finland; **Co-Author:**Kenneth Eklund, University of Jyväskylä, Finland

This study examines long-term associations (age 2-15) between literacy activities at home and long-term language and literacy development. Of the 198 Finnish participants, 106 have familial risk for dyslexia due to parental dyslexia. The results supported the HLE model in that teaching literacy at home predicted stronger emerging literacy skills, whereas shared book reading predicted vocabulary development and reading motivation. Both emerging literacy and vocabulary predicted reading development. Familial risk for dyslexia was a significant moderator regarding several paths; vocabulary, reading fluency, and shared reading were stronger predictors of reading comprehension among children with familial risk for dyslexia, whereas reading motivation was a stronger predictor of reading comprehension among adolescents with no familial risk. The findings underline the importance of shared reading and suggest a long-standing impact of shared reading on reading development both directly and through oral language development and reading motivation.

Assessment and Evaluation, Teaching and Teacher Education

Teachers' Attitudes and Beliefs about Teaching and Assessment

Keywords: Attitudes and Beliefs, Classroom Assessment, Health-care Education, Higher Education, In-service Teachers, Inquiry Learning, Primary Education, Quantitative Methods, Teacher Professional Development, Tool Development
Interest group: SIG 01 - Assessment and Evaluation, SIG 04 - Higher Education, SIG 11 - Teaching and Teacher Education
Chairperson: David Zamorano, Universidad de Deusto, Spain

Medical teachers' beliefs about teaching and assessment: effects on challenges and teaching quality
Keywords: Health-care Education, Higher Education, In-service Teachers, Teacher Professional Development
Presenting Author: Javier Fernández, Universidad de Leon, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Eneko Balerdi, Universidad de Deusto, Spain; **Co-Author:**Gaizka Camarón Alonso, Universidad de Deusto, Spain; **Co-Author:**Elena Auzmendi, Universidad de Deusto, Spain; **Co-Author:**Lucía Barrenetxea-Mínguez, University of Deusto, Spain

This study analyzes the beliefs about teaching and assessment of 41 novice medical teachers. We employed validated questionnaires, semi-structured interviews, and students' evaluation of teachers to measure teachers' beliefs, challenges, and teaching quality respectively. Firstly, teachers reported having a student-centered approach to teaching, especially older and more experienced teachers. Secondly, teachers reported that assessment has bigger effects on teaching, accountability of teaching and certification of learning than on students' learning. Thirdly, teachers reported to understand assessment as a tool for formative regulation over societal control. Additionally, teachers with a student-focused approach to teaching tended to not see assessment as a tool for societal control. Interview data of teachers' challenges and student evaluation of teaching scores will be analyzed by the time of the conference. Our results contribute to the knowledge of teachers' professional development in higher education, having implications universities and their professional development programmes to train and support novice teachers.

Development and validation of a questionnaire on teachers' conceptions of Assessment Literacy.
Keywords: Attitudes and Beliefs, Classroom Assessment, Teacher Professional Development, Tool Development
Presenting Author: Kitty Meijer, HU University of Applied Sciences Utrecht; Open University of the Netherlands, Netherlands; **Co-Author:**Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Marjan Vermeulen, Heerlen Open Universiteit, Netherlands; **Co-Author:**Elly de Bruijn, Hogeschool Utrecht / OU, Netherlands

Teachers' conceptions of assessment literacy (AL) influence the enactment of AL in practice. However, little attention has been paid to teachers' conceptions about contemporary concepts of AL. In this study we developed and validated a questionnaire based on the results of an explorative study on teachers' conceptions of assessment literacy in which we identified seven aspects of AL, namely continuously developing AL, conscientious decision-making, aligning, collaborating, discussing divergent perspectives, improving and innovating and coping with tensions in the assessment practice. Data from prior research was used to draft the initial items. The items were further refined by consulting critical peers. A large-scale study, with a response of 510 Dutch higher professional educational teachers, was conducted to explore latent variables and retain the best items per variable. The results show nine latent variables, represented with at least three items. The seven aspects of AL, as identified in the explorative study, are represented in these nine variables, however, two aspects were divided. Three items were removed. The internal consistency of the final scales was considered good, based on a Cronbach's alpha greater than 0,8. The final questionnaire, with nine scales and 44 items, can be a good instrument to investigate teachers' conceptions of AL.

Development of elementary teachers' beliefs about history and history teaching in a PD-programme
Keywords: Attitudes and Beliefs, Inquiry Learning, Primary Education, Teacher Professional Development
Presenting Author: Yolande Potjer, University of Amsterdam, Netherlands; **Co-Author:**Marjolein Dobber, Vrije Universiteit Amsterdam, Netherlands; **Co-**

Author: Carla Van Boxtel, University of Amsterdam, Netherlands

This paper explores how beliefs about the nature of history and pedagogical beliefs about teaching history of nine elementary school teachers developed over the course of a two-year professional development programme (PD) 'Historical reasoning in inquiry-based history lessons'. Studies about epistemological beliefs of history teachers describe three stances, or levels, in which teachers can think about the nature of history. Teachers with copier stance beliefs view history as identical to the past, teachers with borrower stance beliefs see history as a matter of opinion and teachers with criterialist stance beliefs view history as a construct based on domain-specific criteria. Nine elementary school teachers were interviewed before and after the PD programme and filled in the Beliefs about Learning and Teaching history-questionnaire before, during and after the programme. Findings indicate that elementary teachers participating in the PD programme all develop a more nuanced belief of history, even if there is not always a complete switch to a higher epistemological stance. Although participants' understanding of history is enriched, more naïve (copier and borrower) ideas remain besides more nuanced (criterialist) beliefs. Participants mention inquiry activities they worked on during the meetings, group discussions, modelling by the PD facilitator, searching for historical sources and designing and teaching inquiry-based lessons as the most important sources of professional growth. In the paper, resulting implications for research, PD programmes and elementary teacher education are highlighted.

Teachers Trust Scientific Evidence - Especially if it Confirms Their Beliefs
Keywords: Attitudes and Beliefs, In-service Teachers, Quantitative Methods, Teacher Professional Development
Presenting Author: Kirstin Schmidt, University of Education Karlsruhe, Germany; **Co-Author:**Tom Rosman, Leibniz Institute for Psychology (ZPID), Germany; **Co-Author:**Colin Cramer, Eberhard Karls Universität Tübingen, Germany; **Co-Author:**Kris-Stephen Besa, Universität Münster, Germany; **Co-Author:**Samuel Merk, PH Karlsruhe, Germany

Teachers should increasingly consider scientific evidence in their school practice to improve school and teaching quality as well as student learning. However, teachers often receive little training in research methods, which is why evaluating the veracity of evidence (e.g., by evaluating the study design) is challenging for them. Thus, they tend to evaluate how trustworthy a source appears. This so-called second-hand evaluation can be influenced by less objective criteria like characteristics of the source itself or teachers' characteristics such as their own beliefs. In a representative study with N = 414 teachers, we experimentally investigated the extent to which trust in knowledge claims from educational science is influenced by different sources (scientific vs. anecdotal) and topic-specific beliefs in terms of confirmation bias (information that fits one's beliefs is perceived as more validating). Contrary to previous findings, Bayesian random intercept models provide evidence for higher trust in scientific evidence than in anecdotal evidence (d = .81). However, at the same time, teachers are subject to confirmation bias: They show higher trust in knowledge claims that are consistent (rather than inconsistent) to their beliefs (d = .40). Based on these results, it might not be a general lack of trust in educational science that impedes an adequate engagement with evidence, but the selection criteria teachers use to evaluate scientific evidence, which are, in turn, influenced by their prior beliefs.

Session Q 20

Teachers' and students' acceptance of digital personalised learning: a case study in Flanders.
Keywords: Computer-assisted Learning, Educational Technologies, Learning Analytics, Mixed-method Research
Presenting Author: Ine Windey, KU Leuven, Belgium; **Co-Author:**Stefanie Vanbecelaere, KU Leuven, Belgium; **Co-Author:**Fien Depaepe, KU Leuven, Belgium

Digital Personalised Learning (DPL) tools offer many opportunities for classroom practices. Previous studies have revealed that teachers' perceptions on the ease of use and usefulness of DPL tools (Technology Acceptance Model – TAM; Venkatesh & Davis, 2000) have an influence on their intention to use DPL tools in the classroom and their actual use. However, it is not clear if teachers' perceptions on the use of these tools are aligned with students' perceptions. Hereto, a case study was conducted in a secondary school where several teachers recently adopted a new digital platform supporting DPL in their classroom. We were interested in both the (1) teachers' perceptions on the use of a DPL tool to support their classroom teaching, as well as the (2) students' perceptions regarding the use of the tool. A mixed-method approach, including focus group interviews, log data derived from the portal and a quantitative survey, was adopted to investigate both research questions. The results indicate that whereas teachers' perceptions are positive about the added value of using DPL tools, students' perceptions are somewhat moderate and they often prefer a rather traditional teaching method in class. There is, however, still a lot of potential to improve students' perceptions by increasing their use of the portal and by facilitating more personalisation.

Designing for human-AI collaboration: the effects of elaborateness and adaptability of explanations
Keywords: Artificial Intelligence, Computer-assisted Learning, Instructional Design, Quantitative Methods
Presenting Author: Lenka Schnaubert, University of Nottingham, United Kingdom; **Co-Author:**Lydia Harbarth, University of Duisburg-Essen, Germany; **Co-Author:**Cora Weisenberger, Universität Duisburg-Essen, Germany; **Co-Author:**Daniel Bodemer, University of Duisburg-Essen, Germany

Artificial intelligence (AI) is increasingly used in many areas such as the workplace and can support informed and optimized decision-making. Human-AI collaboration is more successful, when individuals develop an understanding of the AI system, which can be achieved by designing explicit instructions that provide details or reasons to make the system's functioning easy to understand. To study the effects of different types of instructional material, we conducted an online experiment ($N = 109$) varying the elaborateness and adaptability of explanations regarding the provided system's recommendations, and investigated the influence on cognitive load and perceived appropriateness of the explanations to understand the system (system causability). Results show that elaborate explanations can help users to understand the explanations provided by the system and may do so without adding excessive load. However, we did not find any effects of providing users with the opportunity to flexibly adapt the level of explanations. Additionally, correlation analyses show a negative relationship between cognitive load and AI system causability, which may point towards potential negative effects of cognitive load. Altogether, the further integration of AI systems in society warrants a close look into the processes of introducing AI and respective effects on the workforce. Research on learning and instruction has the means to support this process by providing insights into relevant cognitive processes and supporting the appropriate (instructional) design of human-computer interaction.

Training teachers to promote self-regulated learning with digital media in the classroom
Keywords: Computer-assisted Learning, Metacognition, Secondary Education, Teacher Professional Development
Presenting Author: Sabrina Reith, Technical University of Munich, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

In order to support students to become self-regulated learners, teachers need the competence to foster the development of students' self-regulated learning. For this, teacher trainings can be an effective method (Moos & Ringdal, 2012). Hence, the aim of our study is to answer the research question to what extent a training on the promotion of SRL in the classroom can lead to increased performance among teachers regarding the promotion of SRL using digital media. In

more detail we are looking at the effects of the SRL training WITH input about digital media use vs. WITHOUT. Therefore, an experimental training study including pre- and posttests (four hours in total) was conducted. 43 teachers participated (EG = 24, CG = 19) in an online-training on the promotion of SRL. EG-participants had additional input on how to implement SRL with digital media while the input for CG-participants focused on general SRL implementation without explicit digital media use. Whereas we expect no treatment effects on general knowledge about strategy instruction (posttest), we assume that EG-participants report more use of digital media in the transfer task when describing the promotion for SRL in the classroom. As expected, the results show no difference between the treatment groups in the posttest ($t = .24$, $p = .82$). However, according to the qualitative analysis of the transfer task (currently in progress), preliminary analyses show distinctive frequencies in the expected direction. Comprehensive results will be presented and discussed in respect to implications for SRL trainings in this contribution.

Enhancing lasting learning by generative drawing through integration of retrieval practice
Keywords: Computer-assisted Learning, Instructional Design, Learning Strategies, Multimedia Learning
Presenting Author: Seokyoung Kim, Ruhr University Bochum, Institute of Educational Research, Germany; **Co-Author:**Detlev Leutner, University of Duisburg-Essen, Germany; **Co-Author:**Philipp Schmiemann, Biology Education Research and Learning Lab, University of Duisburg-Essen, Germany; **Co-Author:**Julian Roelle, Ruhr University Bochum, Germany

The present study aims to investigate how lasting learning by generative drawing can be enhanced through the integration of retrieval practice, which consolidates learners' mental representations. To integrate retrieval practice into the generative drawing procedure, the present study builds on recent studies that have incorporated retrieval practice into generative tasks by implementing the respective tasks in a closed-book format. In this format, learners cannot access the learning material while they perform the generative task and thus need to retrieve the knowledge that is needed to perform the generative task from memory. Specifically, in the present experiment, all learners first read an expository text and then are engaged in generative drawing. The generative drawing is either implemented in the established pure open-book format, in which learners can access the expository text on whose basis they are to construct their drawings all the time, or in a closed-then-open-book format, in which learners first must generate as much of their drawings as possible without access to the text. We hypothesize that because it integrates retrieval practice into generative drawing, the closed-then-open-book will yield better learning outcomes than the established open-book generative drawing after eight weeks. The data collection is not yet finished, but results will be available at the conference.

Learning to write in the digital age – differences between learning writing by hand or by computer
Keywords: Achievement, Computer-assisted Learning, Early Childhood Education, Writing/Literacy
Presenting Author: Vibeke Rønneberg, University of Stavanger, Norway; **Co-Author:**Wenke Mork Rogne, Volda University College, Norway; **Co-Author:**Eivor Finset Spilling, Volda University College, Norway; **Co-Author:**Per Henning Uppstad, Norwegian Reading Center, Norway; **Co-Author:**Siv M. Gamlem, Volda University College, Norway

Traditionally, children are first taught to write texts by handwriting. Now, however, technological advancements rapidly transform society, and in some educational settings, there is a move, toward students first learning to write by typing, without initial handwriting instruction. There is little research on the effects of writing by hand or typing on early writing outcomes, and the existing studies' findings are inconsistent (Wollscheid et al., 2016). We, therefore, investigated spelling ability, narrative text production, and handwriting after one year of school in three groups of first graders; one group learning to write by typing, one group learning to write with pencil and paper, and one group learning to write by hand and by typing in parallel. The study is a natural experiment, and participants are 572 Norwegian students learning to write by hand, typing on a computer, or a combination of both. We performed a linear mixed-effects analysis of the relationship between instructional modality and performance in spelling, narrative text production, and handwriting. Results suggest some differences in handwriting ability after one year of school, but no differences in spelling ability or ability to compose narrative texts. Implications are discussed. Wollscheid, S., Sjaastad, J., & Tømte, C. (2016). The impact of digital devices vs. Pen(cil) and paper on primary school students' writing skills - A research review. Computers and Education, 95, 19–35. https://doi.org/10.1016/j.compedu.2015.12.001

When to pose questions to promote learning from a science text?
Keywords: Comprehension of Text and Graphics, Computer-assisted Learning, Higher Education, Self-regulated Learning and Behaviour
Presenting Author: Ignacio Máñez, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Alba Rubio, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Marian Serrano-Mendizábal, University of Valencia / Interdisciplinary Research Structure for Reading (ERI Lectura), Spain; **Co-Author:**Eduardo Vidal-Abarca, Universidad de Valencia, Spain

This study is inspired by the paradigm of adjunct question research and aims at analyzing the question timing effect on students' processing and learning from science texts. Seventy-six freshmen studied two science texts answering ten adjunct questions, and then they were tested on learning five days afterward. Half of them answered the questions inserted into the text after reading the relevant information, whereas the other half completed all questions after reading the whole text. Students in both conditions could reread the text while answering the questions, so online behavioral data were recorded. Cognitive strategies (paraphrases, elaborations) while answering the questions were also collected. We hypothesized that inserted questions would enhance students' learning compared to post-reading questions, as inserted questions would assist students in inferential processes and discrimination of relevant information during the construction of the mental representation of the text. Results showed that students in inserted question condition read the text more carefully before reading the questions, discarded non-target information more effectively, and elaborated text ideas better than students in post-reading question condition. These processing differences may explain the higher post-test performance of students who answered inserted questions compared to students with post-reading questions.

The Complexities of Using Digital Social Networks in Teaching and Learning
Keywords: Higher Education, Mixed-method Research, Social Media, Teaching Approaches
Presenting Author: Enilda Romero-Hall, University of Tennessee-Knoxville, United States; **Co-Author:**Lina Gomez-Vasquez, The University of Tampa, United States; **Co-Author:**Laila Forstmane, University of Tampa, United States; **Co-Author:**Caldeira Ripine, University of Tampa, United States; **Co-Author:**Carolina Dias da Silva, University of Tampa, United States

Educational institutions at all levels (elementary, secondary, and higher education) are using digital social networks (DSN) to engage with stakeholders including learners, parents, their community, administrators, prospective students, and the general public. DSN are also being used by instructors as part of the learning experience or to engage with learners in less formal ways. In educational settings, there have been a decent number of investigations primarily related to how instructors and learners use DSN in their own learning experience. Researchers have also explored the use of specific DSN such as Twitter, Reddit, Instagram, Facebook, WhatsApp, and others by instructors in higher education. In this investigation, we wanted to gain a broad sense of the implementation of DSN for teaching and learning by instructors in higher education. We were particularly interested in examples of instructors' use of DSN in their courses, as well as, the usefulness and challenges of specific platforms for teaching and learning purposes. Last, our intent was to gain a sense of instructors' perspective on how DSN may have served them since the start of the COVID-19 pandemic.

The impact of epistemic beliefs and emotions on student teachers' views about educational research
Keywords: Attitudes and Beliefs, Curriculum Development, Emotion and Affect, Pre-service Teachers
Presenting Author: Gillian Peiser, Liverpool John Moores University, United Kingdom

It is internationally recognised that the highest quality initial teacher education (ITE) is underpinned by practical workplace learning, educational research, and the dynamic between these two elements. However, extant studies tell us that student teachers (STs) prioritise experiential over theoretical learning and struggle to connect these. In the English context, the status of educational research is further threatened by shifting governance of ITE from universities to schools. This paper will report on a study that sought to yield insights to address the theory practice divide. In contrast to previous research focussing on the influence of contextual factors, the enquiry took a social-psychological perspective, investigating reasons for resonance and dissonance of research with STs. An online questionnaire studied relations between ST's beliefs about knowledge (epistemic beliefs) and feelings whilst engaging with research (epistemic emotions), and how these differed by demographic groups (gender, students following university-led and school-based ITE routes, students who studied arts and science type courses prior to ITE, primary and secondary STs, and postgraduate and undergraduate STs). Semi-structured interviews developed an in-depth understanding of trends emerging from the questionnaire. The findings revealed considerable influences of prior educational experiences, personality and orientation to learning, the cognitive load experienced by primary/secondary and undergraduate/ postgraduate students and a relationship between the nature of the research task and emotions.

Promoting preservice teachers´ reflection with training using the critical incident technique
Keywords: E-learning/ Online Learning, Pre-service Teachers, Qualitative Methods, Quantitative Methods
Presenting Author: Veronika Anselmann, University of Education Schwäbisch Gmünd, Germany

Teachers and learners are affected by uncertain times and teachers´ ability to reflect is seen as a key competence to deal with these challenges. In this study, the training, based on the framework of reflective practice for teacher education, and using the critical incident technique, took place. Thirty-three student teachers participated in the online training. A study with a pre-post design was conducted using online questionnaires and learning logs. The online questionnaire included validated and self-developed scales on educational satisfaction and reflection abilities. In the learning logs, the students were able to describe their reflection processes. Data were analysed using descriptive statistical analysis and t-tests, as well as qualitative data analysis. The results show that students significantly improved teaching reflection abilities after participation in the training. The results of the learning logs indicate that most of the student do experience different dimensions of reflection. The implications of our study concern the design of learning environments that allows students to reflect on concrete experiences.

Effects of epistemic emotions on pre-service teachers' MCK and MPCK
Keywords: Emotion and Affect, Mathematics/Numeracy, Pre-service Teachers, Teacher Professional Development
Presenting Author: Robin Göller, Leuphana University Lueneburg, Germany; **Co-Author:**Lars Jenßen, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Katja Eilerts, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Michael Besser, Leuphana Universität Lüneburg, Germany

In this contribution we analyse the effects of the epistemic emotions curiosity and frustration on pre-service teachers' mathematical content knowledge (MCK) and mathematical pedagogical content knowledge (MPCK). Data of 145 mathematics pre-service teachers were analysed by conducting a structural equation model with test scores of a MCK and a MPCK test as endogenous variables and as exogenous variables curiosity and frustration as well as the number of semesters at university, gender, high school grade point average, and the last school grades in the subjects mathematics and German as control variables. The results show significant effects of curiosity and frustration on mathematical content knowledge and a positive effect of curiosity on mathematics pedagogical content knowledge. In addition, regarding the desired development of professional knowledge in teacher training, the role of the number of semesters, which has a significant effect on MPCK but none on MCK, is discussed. The results underline the importance of emotions for the professional knowledge of pre-service teachers, which may need to be given more attention in the discussion on the development of professional competencies of (future) teachers.

The role of health literacy and occupational self-regulation for teacher trainees' well-being
Keywords: Health-care Education, Pre-service Teachers, Quantitative Methods, Well-being
Presenting Author: Kira Elena Weber, Leuphana University Lueneburg, Germany; **Co-Author:**Elena Hohensee, Leuphana Universität Lüneburg, Germany; **Co-Author:**Stephan Schiemann, Leuphana Universität Lüneburg, Germany

The personal health-related resources *health literacy* and *occupational self-regulation* have already been independently associated with well-being. However, there are few empirical findings on teacher trainees' health literacy with the subdimensions and none in relation with their well-being, whereas occupational self-regulation have already been empirically investigated in many studies, but has so far only been associated with indicators of occupational well-being. From a public health perspective, research of teacher trainees' well-being will profit from taking both research aspects into account. In this study, we analyzed data from 407 teacher trainees in Germany. Latent profile analysis confirmed the four occupational self-regulatory types (healthy-ambitious, unambitious, excessively ambitious and resigned) which differed significantly on the health literacy dimensions *self-regulation*, *self-control*, *self-perception*, *proactive approach to health*, *communication and cooperation* and *dealing with health information*. The health literacy dimensions *self-regulation* and *self-control* were mainly related to occupational self-regulation. Independently of each other, the self-regulatory types and the health literacy dimensions *self-regulation*, *self-control* and *proactive approach to health* predicted teacher trainees' well-being. If both constructs are considered together, the health literacy dimensions explain more variance for teacher trainees' well-being than the self-regulatory types. Research oriented and practical implications are discussed.

Complex requirement situations - learning opportunities for student teachers
Keywords: Competencies, Lifelong Learning, Problem-based Learning, Teacher Professional Development
Presenting Author: Liana Pirovino, Pädagogische Hochschule Zürich, Switzerland; **Co-Author:**Annelies Kreis, University of Teacher Education Lucerne (PH Luzern), Switzerland

A student teacher is confronted with resistant pupils in the classroom. His routines and experiential knowledge are not sufficient to deal with the situation directly, he feels overwhelmed and unable to address the issue. After the lesson, he reflects on what he could have done differently. With Helsper (2018, 2020) and his remarks on the four areas of tension and the obligation to legitimize, I assume that such Complex Requirement Situations (CRS) offer learning opportunities in the professional practice training of student teachers. The aim is to show how CRS can be characterized from the perspective of experts in school-based teacher education and extent to which learning takes place from them. The role of educators and reflection seem crucial in learning support (Reusser, 2005; Schön, 1987).
In the transdisciplinary project EdgeLab (Kreis & Pehlke-Milde, 2020), experts of school-based teacher education were questioned in guided interviews about complex situations for student teachers and about learning support. The interviews were analysed deductively according to Kuckartz (2022) and on the basis of specific theories and models (Keller-Schneider & Hericks, 2014; Collins, 2006; Kunter & Baumert, 2006). Initial results show that different types of complex requirement situations can be identified. Furthermore, CRS seem to be pivotal for the development of competence (Weinert, 2001) and professional development (Terhart, 2011) of student teachers. However, specific forms of learning support are needed to stimulate learning from complex requirement situations.

Personality traits as determinants of early-career teachers' occupational well-being
Keywords: Engagement, In-service Teachers, Personality, Well-being
Presenting Author: Josip Šabić, Institute for Social Research in Zagreb, Croatia; **Co-Author:**Dora Petrović, Institute for Social Research in Zagreb, Croatia

Teachers' early-career phase is a critical period for the formation of professional identity and decisions related to remaining in the profession. However, there is

a lack of research on the relationships between early-career teachers' personality and measures of their occupational well-being other than burnout (e.g. Kim, Jörg and Klassen, 2019; Cramer and Binder, 2015). The aim of this study was to examine the role of personality traits in explaining different aspects of teachers' well-being in the first 5 years of service. The data were collected as part of a pilot study for the project "The role of personality, motivation and socio-emotional competences in early-career teachers' occupational well-being (TeachWell)". Analyses were conducted on the data of 118 early-career teachers from 37 randomly selected elementary schools in Croatia who filled out the online questionnaire. The questionnaire contained measures of the Big Five personality traits (extraversion, agreeableness, conscientiousness, neuroticism and openness to experience; John and Srivastava, 1999) and different indicators of occupational well-being (satisfaction with work and teaching profession, planned persistence in the teaching profession, and teacher's work engagement). Preliminary findings, based on path analyses, indicate potential protective factors for early-career teachers' well-being. Teachers who were more conscientious, agreeable, extroverted, open and emotionally stable on average had more favourable results on indicators of occupational well-being. These results are in line with meta-analytical findings on prediction of psychological and subjective well-being from personality (Anglim et al., 2020).

Session Q 22

Chairperson: Jean-Marc Meunier, Université Paris 8, France

Effects of students' metacognition on teacher judgments, and school track decisions
Keywords: Large-scale Assessment, Metacognition, Primary Education, Social Sciences and Humanities
Presenting Author: Markus Neuenschwander, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Sog Yee Mok, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Kathrin Lockl, Leibniz Institute for Educational Trajectories (LIfBi), Germany

Teacher judgments of students' learning and achievement highly influence students' educational trajectories. Teachers do not only evaluate student achievement but also other student competences such as metacognition, especially declarative metacognitive knowledge. A multilevel path model was tested that declarative metacognitive knowledge affects teacher judgments of student achievement in mathematics and written language skills, teacher recommendation of the highest track school (i.e., gymnasium), and the transition to gymnasium after 4^{th} grade in Germany. The sample consisted of 5870 children from kindergarten cohort in the German National Educational Panel Study (NEPS). Declarative metacognitive knowledge, achievement in mathematics and written language skills as well as reasoning were measured using standardized tests. Teacher judgments and track recommendation were assessed by teacher ratings. Transition to gymnasium and students' socio-economic status (SES) were measured by parent data. Findings showed significant direct effects of metacognition on teacher judgment of achievement in mathematics and written language skills. There were also significant indirect effects of metacognition on school track recommendation and transition to gymnasium, mediated by teachers' judgments of achievement in mathematics and written language skills after controlling for achievement in mathematics and written language skills, SES, gender, and reasoning. Metacognition is not an official criterion in the selection to gymnasium in Germany, but it influences teachers' track recommendations and transition to gymnasium. Thus, metacognition is not only important for fostering high achievement, but it also plays a role for students' transition to gymnasium. Findings should be discussed in teacher training.

Analyzing Self-Regulated Learning of Secondary School Students
Keywords: Artificial Intelligence, Metacognition, Secondary Education, Self-regulated Learning and Behaviour
Presenting Author: Shruti Athavale, Technical University of Munich, Germany; **Co-Author:**Lyn Lim, Technical University of Munich, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

Self-regulated learning (SRL) is related to better learning outcomes, especially for deep learning. The challenge of measuring and supporting SRL activities of learners, has been met by some researchers through educational process mining approaches, allowing a more fine-grained investigation of SRL processes through log data. Previous research has also outlined relationships between cognitive and metacognitive SRL activities with learning among higher education students and found improvements in learning outcomes. Data collection of the present study is currently in progress and will be collected and analyzed until January 2023. We focus on secondary school students and the assessment of their SRL strategies using a pre-post design within a AI-based digital learning environment. The aim of the study is investigating the relationship between metacognitive strategy knowledge, learning processes and learning outcome. Participating students learn about the topics of 'artificial intelligence' and 'school of the future' and have to write an essay in a digital learning environment within a 45-minute learning session. Results regarding a preliminary subset of five students indicate occurrence of learning gains in the domain knowledge and deep learning areas of essay and transfer test, with a cooccurrence of high metacognitive strategy knowledge. Post-hoc interviews reveal different SRL strategies used by secondary school students than higher education students and emphasize on the need to create effective online measurements of SRL activities for this age group. Implications lie within developing better metacognition skills among this age group by means of AI methods to enable better SRL strategies and enhance deep learning.

An in-depth analysis of students' approaches to transfer of trained self-regulated learning skills
Keywords: Example-based Learning, Eye Tracking, Problem Solving, Self-regulated Learning and Behaviour
Presenting Author: Jane Pieplenbosch, Utrecht University, Netherlands; **Co-Author:**Gesa van den Broek, Utrecht University, Netherlands; **Co-Author:**Vincent Hoogerheide, Utrecht University, Netherlands; **Co-Author:**Ewa Miedzobrodzka, Utrecht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Self-assessment and task-selection skills are crucial for effective self-regulated learning of problem-solving tasks. However, many students struggle to accurately assess their performance and to select a suitable next learning task. Recent research shows that self-assessment (SA) and task-selection (TS) skills can be trained through video examples (SATS-training), in which those skills are demonstrated, and that this improves self-regulated learning outcomes. However, the limited research available suggests that students struggle to transfer these trained skills to other problem-solving contexts, and it remains unknown which factors facilitate or complicate transfer. Therefore, this study aims to uncover potential conditions and obstacles for successful transfer through an in-depth analysis of students' approaches to assessment and task-selection in new problem contexts. Thirty adolescents receive the SATS-training, complete a recall task of the trained self-assessment and task-selection procedure, and a vignette task, i.e., short descriptions of fictitious performance data on the trained (biology) problems and transfer problems in a new problem context (math) with a different number of problem-solving steps and/or database structure, based on which they have to select a next task. Process-tracing techniques (think-aloud protocols, eye tracking) are collected while students work on the vignettes. Key conditions for successful transfer will be explored by examining how well students can recall the trained procedure, recognize key features of the new context, and adapt the rule to the new problem context. The results will be available before the conference. These findings will inform future research on how to improve the transfer of trained self-regulated learning skills.

Not motivated - How regulation of learning builds up students' will to learn
Keywords: Cooperative/Collaborative Learning, Mixed-method Research, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Tiina Susanna Törmänen, University of Oulu, Finland

Poor motivation for learning is increasingly recognized as a major challenge in education. Moreover, Covid-19 crisis put an extra burden to students' motivated learning. This poster presents a MotoR research project that aims to tackle this challenge by proposing that regulation of learning is a key mechanism for students to take charge of their own motivation. The main objective is to study how regulation during collaborative learning situations changes secondary school students' motivation in short and long term. The project implements a process-oriented approach and collects multichannel data from secondary school students through a two-step research design. First, the students' situational motivation and regulation of learning are followed. Focusing on regulation in authentic collaborative learning situations enables capturing how the students build up their motivation in interaction with their peers. Video, situated self-reports, stimulated recall interviews, and physiological data are collected. Second, the development of students' motivational trajectories in short and long term are tracked. This is done by relating situational motivation and regulation of learning with students' long-term motivational beliefs. Questionnaires and situated self-reports are administered. Together, the two-step research design accumulates multichannel data on motivation and regulation of learning on different time scales. The novelty of the project is that it combines data on different time and granularity levels to consider the relationship between regulation of learning and the development of motivation both on individual and group levels. It contributes to the research-based knowledge that is applicable in creating solutions for students' optimal learning motivation.

Sequential patterns between SRL processes and essay data in k-12 students.
Keywords: Artificial Intelligence, Learning Analytics, Secondary Education, Self-regulated Learning and Behaviour
Presenting Author: Inti Bistolfi, Radboud University, Netherlands; **Co-Author:**Susanne de Mooij, Radboud University, Netherlands; **Co-Author:**Joep van der Graaf, Radboud University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University, Netherlands

When trying to help learners develop their self-regulated learning (SRL) skills it can be helpful to use data on their learning processes. This data could be used by Artificial Intelligence (AI) to support learners during their SRL. However, students' SRL processes are difficult to measure and the measurements that are used for this are not always possible to use in every environment. Trace data is a useful and unobtrusive measurement of students' SRL process that can be used by AI. Trace data is currently already used in some capacity, however more research is needed concerning this data to find patterns between trace data and SRL processes. This poster elaborates on the use of essay data, textual data gathered in essay writing tasks, and links it to SRL processes. If useful patterns can be discovered in the sequence of measured SRL processes using trace data and written essay data, we can fine tune the SRL process measured when writing the essay. Additionally, in this poster an analysis will be presented of the association between these sequential patterns of SRL processes measured with trace data and essay data and learning outcomes. Data collection for this research is planned for November/December 2022. Furthermore, a research plan will be presented introducing a supplementary measurement of SRL using Natural Language Processing (NLP) models.

Learning how to Learn through Student-Engaged Design (LhL-SED): Effects on Learning and Engagement
Keywords: Engagement, Mixed-method Research, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Shannon King, George Mason University, United States; **Co-Author:**Haley McKeen, George Mason University, United States; **Co-Author:**Anastasia Kitsantas, George Mason University, United States; **Co-Author:**Beth Hosek, George Mason University, United States; **Co-Author:**Sahar Wahidi, George Mason University, United States; **Co-Author:**Asuka Nuwere, George Mason University, United States; **Co-Author:**Jerry Putt, George Mason University, United States; **Co-Author:**Roy Echeverria, George Mason University, United States; **Co-Author:**Jack Belkin, George Mason University, United States

The purpose of this study was to (1) determine the function and utility of a learning how to learn through student-engaged design course (LhL-SED) from the perspectives of teachers and students and (2) examine the effectiveness of this course on middle school (MS) students' engagement, task interest, self-efficacy for self-regulated learning (SRL), beliefs about intelligence, and mathematics performance as compared to a comparison group. Teachers (N = 9) who received a professional learning opportunity taught this course as part of the existing curriculum and participated in interviews approximately mid-way through the academic year regarding their perceptions of the course. Students in both the intervention (n = 111), and comparison group (n = 59), responded to four surveys regarding the targeted variables and participated in focus groups. Findings demonstrated that both teachers and students reported that the course fostered student collaboration and co-regulation. In terms of utility, students mentioned that the course helped them become self-directed learners, whereas teachers commented on students becoming responsible for their learning. Quantitative findings demonstrated that students enrolled in the LhL-SED reported higher levels of engagement, interest, and achievement compared to students who did not take this course. These findings show the importance of embedding LhL courses into the curriculum. They also demonstrate that students should have a choice and voice while engaging in projects to increase the likelihood of employing SRL strategies. Implications for practice are discussed.

The relation between the quality of university students' goal-setting and self-regulation.
Keywords: Goal Orientations, Higher Education, Quantitative Methods, Self-regulated Learning and Behaviour
Presenting Author: Heleen van Ravenswaaij, UMC Utrecht, Netherlands

Students are increasingly challenged to think about the professional they want to become and set their own goals accordingly. Goal-setting is an important factor in self-regulation and is linked to academic success and lifelong learning. The aim of the current study is therefore to investigate the relationship between goal-setting quality and graduate students' self-regulation and personal characteristics. Two data collection methods were combined: 1) an educational assignment in which all first-year life sciences students set a professional goal, and 2) a survey with SOL-Q and MSLQ self-regulation and personal characteristics questions, filled in by 145 students. Goal quality was coded based on the criteria of goal specificity, goal proximity, goal difficulty, and action planning. Students' goal quality varied. Goal difficulty was fair, but goal proximity and specificity appeared low. Although no direct relation between personal characteristics and self-regulation were found, it is expected that goal-quality can be explained to some extent by personal characteristics and self-regulation. This research study implies that more attention should be given in education to students' goal-setting skills. It furthermore provides insight in the relations between goal-setting quality and self-regulation and students' personal characteristics. These insights can help educators design interventions for specific groups of students in order to support their goal-setting skills development.

Session Q 23

26 August 2023 08:00 - 09:30
UOM_GYM
Roundtable
Instructional Design, Learning and Social Interaction, Motivational, Social and Affective Processes

Self-regulated Learning and Behaviour

Instructional knowledge: On an empirical road towards conceptual clarification
Keywords: Instructional Design, Misconceptions, Mixed-method Research, Self-regulated Learning and Behaviour
Presenting Author: Morane Stevens, KU Leuven - University of Leuven, Belgium; **Co-Author:**Jan Elen, KU Leuven, Belgium

A substantial body of research indicates that students' knowledge of (components of) learning environments is oftentimes limited. Moreover, the nature of students' so-called 'instructional knowledge' can hinder their use of learning environment components, which in turn may negatively affect their learning outcomes. Clearly, in understanding the actual effectiveness, considering instructional knowledge is highly relevant. Empirical findings regarding instructional knowledge are less clear, resulting in inconclusive indications on how to consider this type of knowledge in designing learning environments. This contribution

argues that results are most likely distorted due to conceptual ambiguity with respect to instructional knowledge. Furthermore, we aim to tackle this issue and gain a better idea of the structure of this construct by comparing outcomes of two data gathering methods based on different descriptions of instructional knowledge. Some remaining methodological as well as conceptual thresholds serve as a base for further discussion.

An intraindividual study to how students regulate their motivation across a Bachelor course
Keywords: Higher Education, Motivation, Quantitative Methods, Self-regulated Learning and Behaviour
Presenting Author: Linda Zenger, University Utrecht, Netherlands; **Co-Author:**Barbara Flunger, Utrecht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

University students often lack motivation to study. This is problematic because motivation is a key predictor of academic achievement. Therefore, it is important to identify strategies to boost motivation. When students cannot rely on motivational support from others (e.g., teachers, peers), they can apply motivation regulation strategies to enhance their motivation. Motivation regulation has been found to be positively associated with effort and achievement, and negatively with procrastination and dropout intentions. Motivation regulation has mainly been considered as an aspect of Self-Regulated Learning and effective strategies have been identified based on SRL research, expectancy-value theory, and achievement goal theory. However, research on Self-Determination Theory has highlighted several strategies that can promote motivation which could also be used as self-motivating strategies, such as displaying patience and acknowledging frustration. Considering additional strategies could complement existing inventories and help to identify which strategies are most effective in improving academic outcomes. Additionally, most research on motivation regulation is cross-sectional and cannot uncover whether motivation regulation indeed drives academic outcomes. Specifically, prior research mostly studied motivation regulation as a trait-like characteristic that is stable across time and situations. However, motivation regulation may be situation-specific, implying that students may use different strategies when preparing an exam or writing an essay. Therefore, this study follows university students' motivation regulation during a course, considering several new motivation regulation strategies. The following research questions are studied: (1) How do students regulate their motivation over time and across tasks? (2) How is motivation regulation over time associated with academic outcomes?

Building bridges between theory and automated methods to study collaborative learning interactions
Keywords: Computer-supported Collaborative Learning, Knowledge Construction, Mixed-method Research, Self-regulated Learning and Behaviour
Presenting Author: Kateryna Zabolotna, University of Oulu, Finland, Finland; **Co-Author:**Jonna Malmberg, University of Oulu, Finland; **Co-Author:**Daniel Spikol, University of Copenhagen, Denmark

Speech is an integral part of collaborative learning (CL) interactions that contains both verbal (e.g., content) and non-verbal (e.g., voice pitch) indicators of how students construct knowledge together and regulate their learning process together. However, the research that would combine the investigation of *what* the students talk about with *how* they talk about it is still limited. This is partly due to the labor-intensive qualitative methods that are being used to look at the speech content. This study explores how traditional video coding of group interactions can be combined with automated speech analysis to investigate how students engage in collaborative knowledge construction (CKC) and what role regulated learning (RL) at group level plays in it. The participants were 21 secondary school students (6 female; 15 male) divided into groups of 2 to 3. A showcase of contrasting (most and least engaged in CL) collaborating groups is presented. The task was to build and program a robotic arm. Groups' interactions were video- and audio-recorded; additionally, physiological data (electrodermal activity (EDA)) was measured with Shimmer 3GSR sensors. CKC and RL events were identified from video data by using qualitative interaction analysis schema (Malmberg et al., 2015; Zabolotna et al., 2023). An automated speech recognition analysis method is developed to identify indicators of CKC and RL in speech content and to measure convergence between group members' voice fundamental frequency. The results provide visualizations of groups' CL interactions to show the events where CKC and RL co-occur and the between-learner speech convergence within them.

Frequencies and effects of academic comparisons in everyday life
Keywords: Cognitive Skills and Processes, Higher Education, Quantitative Methods, Self-concept
Presenting Author: Alexandra Petrak, University of Koblenz, Germany; **Co-Author:**Jens Möller, Kiel University, Germany; **Co-Author:**Friederike Helm, Kiel University, Germany; **Co-Author:**Fabian Wolff, Universität of Koblenz, Germany

Students compare their achievements in one domain with those of their peers (social comparison), own achievements over time (temporal comparisons), own achievements in other domains (dimensional comparison), or with a set criteria (criterial comparison). The present study is the first to examine all four comparison types in everyday life and the first to examine the consequences of these comparisons for domain-specific self-concepts. Over one week, n = 131 university students recorded their spontaneous comparisons concerning the academic domain. We found mostly social and more temporal than dimensional comparisons and effects of comparison type and direction: Downward social, temporal, and criterial comparisons showed positive effects; upward social, dimensional, and criterial comparisons showed negative effects on self-concepts.

Understanding and alleviating difficulties in science learning: an intra-individual perspective

Keywords: Cognitive Development, Computer-assisted Learning, Conceptual Change, Eye Tracking, Game-based Learning, Instructional Design, Knowledge Construction, Mathematics/Numeracy, Misconceptions, Quantitative Methods, Science and STEM, Science Education, Teaching/Instructional Strategies
Interest group: SIG 03 - Conceptual Change
Chairperson: Garvin Brod, Germany
Discussant: Doug Lombardi, United States

Science learning (and, thus, teaching) is difficult. This is not primarily because scientific theories are complex, but because learners already have intuitive theories for understanding the phenomena covered by the scientific theories. To understand what difficulties learners face and how they can be alleviated, it is necessary to examine how individual learners go about revising their theories. Such an intra-individual perspective requires sophisticated experimental designs and new methods of analysis. The four papers in this symposium present studies that adopted this perspective. Using a Bayesian hierarchical diffusion model, Edelsbrunner and colleagues investigated how individuals' inhibitory abilities predicted their coping with interference between intuitive and scientific ideas. Using log-file data from a digital game, Kärki and colleagues examined how students transitioned from natural number to rational number reasoning, overcoming misconceptions such as "multiplication always makes bigger and division smaller". In a microgenetic intervention study, Bascandziev and colleagues examined how children revised their theory of matter and whether this depended on the children performing hands-on or thought experiments. In another microgenetic intervention study, Theobald and colleagues used Bayesian computational modeling and psychophysiological data to understand how making explicit predictions helped children revise misconceptions about water displacement. Finally, discussant Doug Lombardi will synthesize these findings and provide an outline for future research.

Does multiplication always make bigger? Exploring conceptual change in NanoRoboMath digital game
Presenting Author: Tomi Kärki, University of Turku, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Department of Teacher Education, Finland; **Co-Author:**Hilma Halme, University of Turku, Department of Teacher Education, Finland; **Co-Author:**Erno Lehtinen, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Many students face difficulties in learning rational numbers, since they tend to inappropriately apply natural number features in fraction and decimal tasks. Substantial conceptual change may be required to overcome these natural-number-biased (NNB) misconceptions. One example of NNB is a false belief that multiplication always makes bigger and division smaller. A digital game, NanoRoboMath, was designed to improve conceptual knowledge of rational numbers

and elicit conceptual change. Participants of this study were 103 seventh graders who played NanoRoboMath for five lessons. We explored indications of conceptual change through different game performance measures both at the group and at individual player levels. Results show that game performance predicts multiplicative operation knowledge with rational numbers. Furthermore, qualitative analysis of the individual player profiles show that the players were engaged in reasoning about the relation between rational number operations and magnitudes in versatile ways. Even though game performance varied considerably between the players, many indications of potential conceptual change could be detected.

Thought experiments as a tool for teaching scientific concepts
Presenting Author: Igor Bascandziev, Harvard Graduate School of Education, United States; **Co-Author:**Caren Walker, University of California, San Diego, United States; **Co-Author:**Elizabeth Bonawitz, Harvard Graduate School of Education, United States

The “child as a scientist” metaphor, suggesting that children learn as scientist do, has been a powerful idea that has shaped the research in child development and science education over many decades. The main focus of this broad research program has been to study the ways in which both children and scientists learn from data (i.e., from observations to theories and abstractions). However, as many have pointed out, both children and scientists also learn from thinking. A paradigm example of learning from thinking is learning from thought experiments. In the present study, we asked if young children could learn about the properties of matter by relying on thought experiments alone (i.e., without receiving any new data from the world). In a pre-training – training – post-training study, we tested 90 children (data collection is ongoing) who were assigned to three conditions: Baseline, Thought Experiments, and Real Experiments. We found that both children in the Real and the Thought Experiments conditions improved comparably well between pre- and post-training in comparison to the Baseline condition. These findings show that at least under some circumstances, observing new data from real experiments does not add any educational benefits over and above what can be learned from thought experiments.

Predicting promotes revision of misconceptions: Evidence from Bayesian models and pupillary surprise
Presenting Author: Garvin Brod, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Maria Theobald, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Joseph Colantonio, Harvard Graduate School of Education, United States; **Co-Author:**Igor Bascandziev, Harvard Graduate School of Education, United States; **Co-Author:**Elizabeth Bonawitz, Harvard Graduate School of Education, United States

The presented studies investigated the hypothesis that asking learners to generate a prediction before presenting conflicting evidence helps them to revise scientific misconceptions. In an exemplary study, we tested this hypothesis in children from 6-9 years of age (n = 94) and in the domain of water displacement. In the learning phase of a between-subject pretest–posttest–transfer test design, children saw pairs of spheres and had to generate predictions (prediction condition) or post-hoc expectancy ratings (postdiction condition) regarding which sphere displaces more water. We further leveraged behavioral and physiological data (i.e., pupillometry) from the learning phase to capture belief revision as it unfolds continuously, using Bayesian computationalmodeling. Children in the prediction condition exhibited a stronger improvement in performance from pretest to posttest and scored higher in the transfer test compared to children in the postdiction condition, indicating that generating predictions benefited the revision of misconceptions. At a computational level, this benefit could be captured as more optimal Bayesian learning. At a physiological level, this benefit was reflected in enhanced surprise about conflicting evidence, which was predictive of a successful revision of misconceptions. These results suggest that explicitly stating their beliefs helps learners to revise them.

What happens to conceptual knowledge during schooling? A Bayesian Hierarchical Diffusion Model
Presenting Author: Peter Edelsbrunner, ETH Zurich, Switzerland; **Co-Author:**Henrik Singmann, University College London, United Kingdom; **Co-Author:**Denis Dumas, University of Georgia, United States; **Co-Author:**Gidon Frischkorn, University of Zurich, Switzerland

Although conceptual change research traditionally has been concerned with modeling processes in individual learners, recent quantitative research in this area mostly models groups of learners and individual differences therein. We present a Bayesian hierarchical implementation of the Wiener diffusion model that is used to model both, processes within individuals and individual differences therein, in an integrated manner. Based on reaction time- and correctness-data from a statement-verification paradigm, we show that this approach is able to reveal individual differences in the process parameters of learners. We also provide new data showing that this model is able to capture effects of different kinds of inhibition on the ability to manage interference between intuitive and scientific conceptions that would remain hidden in more traditional models. We discuss implications of these findings and potentials as well as limitations of hierarchical diffusion modeling for research on conceptual change and other areas of education.

Invited Symposium

Roles and nuances of theoretical work in different domains of educational research

Keywords: Argumentation, Conceptual Change, Cooperative/Collaborative Learning, Dialogic Pedagogy, Emotion and Affect, Informal Learning, Instructional Design, Knowledge Construction, Learning Approaches, Mixed-method Research, Morality and Moral Development, Quantitative Methods, Social Aspects of Learning and Teaching, Tool Development
Interest group: SIG 25 - Educational Theory
Chairperson: Nina Bonderup Dohn, University of Southern Denmark, Denmark
Organiser: Alexandra Nordström, University of Helsinki, Finland
Discussant: Giuseppe Ritella, Italy

The aim of the symposium is to trigger reflection on the different ways in which theoretical work is addressed in the different domains represented by EARLI SIGs. Each presentation provides different perspectives and addresses different dimensions of theoretical work, for example, reflections on how theory and theoretical work have been developing in the domain of the SIG, a discussion of current or historical theoretical challenges within the domain, illustrations of how theoretical development has been conducted in connection with empirical research within the domain, or other topics that address the significance of theory within the domain of the SIG. The presentations will provide different perspectives on educational theory, on its role in empirical research, and on the kind of challenges that researchers face when using and further developing theoretical notions and approaches.

Longitudinal social networks: Towards a better understanding of selection and influence mechanisms
Presenting Author: Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:**Dominik E. Froehlich, University of Vienna, Austria; **Co-Author:**Carlos de Matos Fernandes, University of Groningen, Netherlands; **Co-Author:**Marc Sarazin, University of Edinburgh, United Kingdom

Longitudinal social networks: Towards a better understanding of selection and influence mechanisms in social capital buildingKeywords: social capital, longitudinal, RSiena, influence, selection
This paper discusses how stochastic actor-based modelling (SAOM) – as an advanced methodological tool – allows researchers to (i) investigate complete longitudinal network data and, (ii) by doing so, inform and develop (existing) theories, particularly social capital theory. For example, this tool allows us to assess whether and how students are able to build social capital within their peer networks. Students have various relationships: among others, most notably friendships, advice seeking relations, and collaborations. These peer relationships enable the flow of different resources, such as course summaries, which are necessary for obtaining individual goals, such as passing exams. Through longitudinal social network analysis, we can study what drives network change over time and how the underlying selection and influence mechanisms contribute to social capital formation (affecting performance or attitude changes). Selection (initiating contacts) and social influence (doing what your peers do) are crucial social network mechanisms, but these mechanisms are overlooked in social capital theory. The longitudinal social network data and SAOM approach enables us to disentangle selection from influence (and vice versa) by modeling both processes separately. Overall, SAOM can provide a better understanding of network dynamics, thereby advancing social theories, such as the social capital theory.

Some criteria for good theories, illustrated with research on moral and democratic education
Presenting Author: Jean-Luc Patry, Paris-Lodron University Salzburg, Austria

Educational research aims at developing good theories. However, this endeavor is confronted with a great number of problems. In the presentation, some of the problems which are rarely discussed in the literature are addressed and illustrated using an example from moral and democratic education, namely the research programs on V*a*KE (Values *and* Knowledge Education), which is a constructivist teaching-learning tool that permits to combine values education with knowledge acquisition. After a short presentation of these research programs, the first criterion is discussed: What is science? – with a focus on transparency as a condition for control. Next, the concept of theory is defined, with the distinction of scientific and subjective theories. Then, the need for good theories is justified. The following criteria will be briefly discussed: The domain of viability and generalizability (which is a central aim of theories!); large-scale studies and the suppression of innovations; theory-multiplism and transdisciplinarity; the INUS concept (cause as an Insufficient but Nonredundant part of an Unnecessary but Sufficient condition for effect; Mackie, 1974); and Is and Ought. The conclusions deal with the need for research programs and with explicitly addressing issues that usually are implicitly alleged but are problematic, particularly in moral and democratic education.

Nothing so practical as a good theory? Studying hybridizations of learning
Presenting Author: Larike Bronkhorst, Utrecht University, Netherlands; **Co-Author:**Sanne Akkerman, Utrecht University, Netherlands

Where learning takes place, who learns and what should be learned is increasingly diverse and to some extent unpredictable in 21st century societies. While it is increasingly recognized that learners differ, that learning can extend across multiple contexts and that learning does not or should not have predefined outcomes, how research designs account for these premises varies. Research designs that, implicitly or not, constrain the who, what and where of learning overlook essential dynamics of learning, resulting in only a partial understanding of learning. This paper first outlines an argument for person-centered research designs that are responsive to individual learners and to learning wherever and whenever it manifests itself, while recognizing that researchers themselves are part of that design. This argument is supported by a mixed-method study conducted during a summer school offered by the university. This study focusses on children's (dis)continuity in their engagement with science in different contexts, and how this relates to their attitudes toward and understanding of science. The discussion highlights the nuanced understandings of learning that can be revealed and urges the field to be accountable for the inherently partial understandings of learning being generated.

Dialogic and Argumentative Theoretical Foundations for Designing Educational Technology
Presenting Author: Claire Polo, ECP Laboratory, France; **Co-Author:**Rupert Wegerif, University of Cambridge, United Kingdom

Today's instructional design is largely based on educational technology, either to address effective remote teaching or to improve face-to-face pedagogy. As Massive Online Open Courses (MOOC) are emblematic of the possibilities offered by the use of technology in education, they first developed through traditional, authoritative teaching mostly relying on magistral monologic lectures. Nevertheless, such practices are contrary to the now paradigmatic view in education research that considers learning as a tripod, socio-cognitivo-emotional process (Baker, Andriessen, Järvelä, 2013, Polo & Lund, 2021). Notably, literature in Computer-Supported Collaborative Learning (CSCL) discusses how to foster high-quality talk in educational interactions that would promote learning (e.g. Firer et al., 2021). Still, educational technology designers usually lack an explicit theory of dialogue that would orientate their work. Moreover, most theories that have been applied to educational technology did not take the distinctive nature and possibilities of technology into account. Such approach does not work because the tools that we use make a big difference to the kind of education that is possible. Our contribution aims at specifying a model of dialogue through technology easy to apply to instructional design (Wegerif & Major, to come), and clarifying how it takes into account the social and cognitive functions of emotions in collective reasoning (Polo et al., 2016). Such presentation of a 'dialogic' theory of education technology associated with attention to socioemotional dimensions of the cognitive processes of teaching and learning provides potential responses to key current challenges such as reacting to climate change or discriminating misinformation.

Symposium
Cognitive Science

High mathematics achievement: recent advances and challenges in understanding its mechanisms

Keywords: Achievement, Cognitive Skills and Processes, Gifted and Talented Students, Mathematics/Numeracy
Interest group:
Chairperson: Roland Grabner, University of Graz, Austria
Organiser: Bert De Smedt, KU LEUVEN, Belgium
Discussant: Michael Schneider, University of Trier, Germany

Recent reviews on talent development have highlighted that there is still much to learn about the nature of high mathematics achievement (Preckel et al., 2020). The current symposium brings together recent research on the cognitive and motivational characteristics of high mathematics achievement at different stages of education: from kindergarten up to mathematical experts. Study 1 examines which mathematics-specific and more general cognitive abilities in kindergarten are predictive of later high mathematics achievement in primary school. Study 2 focuses on (older) primary school children and investigated via growth curve modeling to which extent motivational aspects predict future mathematics learning. This study also examined the impact of specific classes for gifted children on these motivational aspects. Study 3 examines the cognitive and motivational characteristics of high achievement in advanced school mathematics in (older) secondary school students. Study 4 investigates the characteristics of mathematical experts in advanced domain-specific processing tasks that deal with memory and creativity. Theoretically, these contributions will clarify, at various points in development, the potential roles of cognitive and motivational factors, both domain-specific vs. domain-general, for high mathematics achievement. All presenters will discuss what these findings on high achievement can tell us on the broader spectrum of learners. From an educational point of view, it will be highlighted how these findings can help to foster and design effective learning environments for individuals with high mathematics achievement as well as for all learners.

Can cognitive abilities before the start of school predict later high mathematics achievement?
Presenting Author: Bert De Smedt, KU Leuven, Belgium; **Co-Author:**Merel Bakker, KU Leuven, Belgium; **Co-Author:**Joke Torbeyns, KU Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium

Many studies have examined the cognitive characteristics of high mathematics achievement in adolescents and adults, but few have focused on primary school children and no study to date has investigated these characteristics even before the start of formal schooling. In a 5-year longitudinal study, we investigated 410 preschoolers' (aged 4-5 years) numerical abilities and more complex mathematical abilities as well as their general cognitive capacities. We followed these children into primary school and identified children with high (n = 31) and average (n = 114) mathematics achievement, via standardized math achievement tests in grade 1 (6-7 years) and grade 3 (8-9 years). We retrospectively analyzed to which extent there were differences in mathematics-specific skills and general cognitive abilities when these children were in preschool. Our findings revealed that already in preschool, high mathematics achievers performed significantly higher compared to average achievers with moderate to high effect sizes (*d*s = 0.63-1.63). A follow-up logistic regression revealed that numeral recognition ($p < .001$) and proportional reasoning ($p = .013$) in preschool emerged as the most critical and unique predictors of high mathematics achievement in primary school. The current data show that already before the start of primary school, high mathematics achievers show cognitive advantages in a variety of mathematics-specific and general cognitive abilities, with mathematics-specific abilities being the most critical and unique predictors of later excellence in mathematics.

The Role of Need for Cognition in Knowledge Acquisition in Mathematics in Regular and Gifted Classes
Presenting Author: Franzis Preckel, University of Trier, Germany; **Co-Author:**Julia Matthes, University of Trier, Germany

The personality trait of need for cognition (NFC) describes an individual's tendency to engage in and enjoy thinking. NFC can be understood as a general factor of investment traits that explain interindividual differences in the extent to which cognitive resources are invested in thinking and learning. NFC is positively related to knowledge and achievement in mathematics. However, findings for its relationship with knowledge *acquisition* in mathematics are lacking. We investigated whether NFC predicts knowledge gains in mathematics with and without controlling for students' prior knowledge and intelligence, and whether differences between different learning environments are evident in this regard. Longitudinal data were collected from *N*=922 high school students in grades 5-7 using Rasch-scaled mathematics knowledge tests, an intelligence test, and a NFC questionnaire (4 waves of measurement). Students attended either regular classes (RC; *n*=639; 44% female) or special classes for the gifted (GC;*n*=283; 34% female) at the highest track of the German secondary school system. Growth curve models and multigroup comparisons over class-type were used for analyses. Results indicate differences by learning environment. Knowledge gains in mathematics were predicted by NFC in gifted classes, and by prior knowledge and intelligence in regular classes. The findings can be embedded in previous research on NFC in learning and achievement contexts according to which the more complex tasks in gifted classes could lead to a stronger relationship between NFC and knowledge acquisition.

How can we characterise high-achieving students in advanced school mathematics?
Presenting Author: Simona Daguati, ETH Zurich, Switzerland; **Co-Author:**Elsbeth Stern, ETH Zurich, Switzerland

The aim of the current study was to characterise high-achievers in advanced school mathematics by studying differences in motivational and cognitive factors between high-achieving and under-achieving students as well as between subgroups within the group of high-achievers. Measures of general reasoning abilities, working memory functions, motivational aspects and math performance were applied. The 101 participants of the current study (Mage = 16.25 years) scored above average in reasoning ability in a sample of Gymnasium students. 67 students also scored above average in a curricular-valid mathematics test (high-achievers), while 34 students scored below average in this test (under-achievers). High-achievers and under-achievers did not differ regarding their interest in mathematics, while the high-achievers outperformed the under-achievers with respect to the working memory function of Storage-Processing. These results suggest that highly efficient working memory functions are required to excel in mathematics. On the other hand, the motivational variable of interest in mathematics came into play when comparing the subgroups of top scoring high-achievers and the subgroup of high-achievers with lower scores in mathematics. Overall, the results emphasised the importance of including different cognitive and motivational factors for explaining the preconditions for high-achievement in mathematics.

The role of mathematical expertise for memory and creativity
Presenting Author: Michaela A. Meier, Educational Neuroscience, Institute of Psychology, University of Graz, Austria; **Co-Author:**Stephan Vogel, University of Graz, Austria; **Co-Author:**Roland Grabner, University of Graz, Austria

While our knowledge about typical mathematical development has substantially increased in the past decades, we are still at the beginning of understanding the cognitive foundations of exceptional performance in mathematics. Previous studies have revealed that mathematics experts show a very similar ability profile as novices, in particular when matched for general cognitive ability. A central limitation of this research is the focus on rather basic mathematical tasks so that the role of the experts' knowledge base on more complex information processing is still unclear. This holds particularly true for memory and creativity, representing two types of processes that have not been investigated with respect to mathematical expertise. The aim of the present study was to fill this research gap. To this end, we compared 115 experts in mathematics with 109 gender, age, and educational level matched novices in their performance in (a) a newly developed mathematical memory task requiring encoding and recall of structured and unstructured information and (b) tasks drawing either on mathematical or on domain-general creativity. Consistent with other expertise domains, experts in mathematics (compared to novices) showed superior short-term memory capacity for complex domain-specific material when presented in a structured, meaningful way. Further, experts exhibited higher mathematical creativity than novices, but did not differ from them in their domain-general creativity. Both lines of findings demonstrate the importance of experts' knowledge base in processing domain-specific material and provide new insights into the characteristics of mathematical expertise.

Motivational, Social and Affective Processes

Situation- and Context-Specificity of Motivation and Emotions

Keywords: Emotion and Affect, Mixed-method Research, Motivation, Quantitative Methods
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Hanna Jarvenoja, University of Oulu, Finland
Chairperson: Hanna Gaspard, TU Dortmund University, Germany
Discussant: Hanke Korpershoek, University of Groningen, Netherlands
Discussant: Fani Lauermann, University of Bonn, Germany

Since decades, researchers have discussed the situation- and context-specificity of motivation and emotion. These discussions have experienced a new wave lately as novel methodological possibilities have emerged simultaneously with the development of versatile technologies. The developments have stimulated theoretical and empirical progress in motivation and emotion research in the field of education. This interest was boosted by the COVID-19 crisis, which highlighted the motivational and emotional challenges that students and teachers are facing, but also led to an increased use of digital technologies. The complexity of motivation and emotion simultaneously challenges the development and transfer of theories in the field as well as the methodologies and measures that are used. It is thus essential to promote constant dialogue between the theoretical and methodological developments. This symposium collects together different groups of researchers who have taken novel approaches to this theoretical-methodological association in their own research on different motivational and emotional phenomena in learning. Kaplan et al. propose a complex dynamic systems perspective to understand situated motivation and emotion. Bernacki et al. describe personalized learning as an approach that leverages digital technologies to improve motivation and learning. Lonka & Salmela-Aro summarizes their research on students' emotion and motivation by using various kinds of experience sampling methods using digital technology and advanced statistical analyses. Finally, Hascher discusses how research on well-being could benefit from a context-specific approach. The four presentations are followed by an interactive discussion stimulated by two discussants.

A Complex Dynamic Systems Perspective on Situated Motivation and Emotion: Implications for Research
Presenting Author: Avi Kaplan, Temple University, United States; **Co-Author:**Joseph Eisman, Temple University, United States; **Co-Author:**Joanna Garner, Old Dominion University, United States; **Co-Author:**Stephen Whitney, University of Missouri/Columbia, United States

While the primary purpose of motivation theory and research is to explain why people act the way they do, most motivational research does not focus on understanding individuals' actions in particular situations. Instead, motivational research has tended to focus on investigating the nomological networks of motivational constructs. In this presentation, we argue that construct-focused research cannot explain individuals' situated actions due to three main reasons: (1) the multitude of personal, interpersonal, cultural, contextual, and situational factors and processes involved in situated actions; (2) the complex interplay among these factors; and (3) the manifestation of these processes at the unit-of-analysis of the "person-in-situation." We follow to describe a complex dynamic system theoretical model that incorporates these assumptions about situated motivation and action—the Dynamic Systems Model of Role Identity (DSMRI). We then provide an illustrative example of a research project that employs the DSMRI to investigate the situated motivation, emotions, and actions of social studies teachers while they facilitate classroom discussions.

Student- and Task-Specific Factors Influence How Personalized Math Learning Affects Outcomes
Presenting Author: Matthew Bernacki, University of North Carolina at Chapel Hill, United States; **Co-Author:**Candace Walkington, Southern Methodist

University, United States; **Co-Author:**Vanessa W. Vongkulluksn, University of Nevada Las Vegas, United States

Personalized learning (PL) is an increasingly popular method of instruction that involves the collection or access of information about a learner and the adaptation of instruction to improve their ability to achieve a learning goal. However, implementations of personalized learning are highly context-dependent, and designs are tailored to accommodate the experiences, abilities and interests of learners, and the academic contexts and domains in which the PL designs are employed. Thereafter, the ways that personalized learning designs can accommodate learners who may vary in the characteristics to which the PL is responsive can themselves vary (e.g., match to students' prior knowledge vs. interests). Such complex learner by context interactions and variation in deployment of instruction from one learner to the next have implications for the ways that instruction can influence key learning outcomes such as interest and learning in academic domains like mathematics. In this presentation, we consider an extended line of inquiry into the personalization of math instruction to students' out-of-school interests and use a theory of *context personalization* (Walkington & Bernacki, 2014) to consider the ways that PL designs may differentially impact motivation and learning for individual students.

Using Contextual and Situational Methodologies to Investigate Student Emotion and Motivation
Presenting Author: Kirsti Lonka, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

The present paper summarizes our research on students' emotion and motivation by using various kinds of Experience Sampling Methods (ESM; Csikszentmihalyi & Larson, 1987; measuring flow). Such methods are similar to Ecological Momentary Assessment (EMA; e.g., Reis & Gable, 2000), and both provide ways of assessing *participants' contextual activities, events, and personal experiences.* Currently, various smartphone technologies capture such momentary experiences (e.g., Ketonen et al., 2019; 2022; Maksniemi et al., 2022). Usually, we ask participants several times a day about what they are doing, about their emotional experiences, their level of challenge/sense of competence. This methodology records the experiences *in situ* – when they are occurring. We looked at the daily dynamics of university students' and adolescents' activities inside and outside higher education and school, the related motivational and emotional experiences, and well-being. To capture situation-specific engagement and emotions, we assessed individual experiences of students in real-life settings with multiple assessments. With the long-term support by Academy of Finland since 2007, we aimed at revealing the effect of situational determinants, enhancing contextual closeness and reducing recall bias: unlike trait-like assessments that may reflect overall cognitive beliefs about emotions (see Goetz et al., 2013) we could capture the actual experiences, examining how emotions, task-value-expectations and engagement fluctuate over time. Recently, we also added the physiological measures in this picture and were able to challenge many common-sense understandings about the role of technology in the motivation and well-being of youth.

How Can Well-Being Research in Education Benefit from a Context-Specific Approach?
Presenting Author: Tina Hascher, University of Bern, Institute of Educational Science, Switzerland

Well-being in education has received increased research attention during the last years. While there is widespread agreement that well-being is beneficial for student and teacher functioning in schools, heterogeneity and dissents about the construct of well-being may hamper its sound scientific development and practical relevance. Two reasons for this divergence can be discussed: First, well-being is used as an umbrella term that includes a wide array of psychological constructs such as (absence of) stress, burnout, and negative emotions, or satisfaction, motivation, and resilience. This blurs the definition of the construct of well-being and consequently weakens the role and impact of evidence-based knowledge that would be needed to improve practice. Second, well-being is often strongly connected to the individual but only loosely associated with the context in which the individual exists. Studies examining the prevalence and causes of well-being typically use general instruments that fail to take into account that the nature of well-being may vary across contexts. This context-unspecific approach may also contribute to a poorly defined construct that fail to unfold its full potential for research and practice. In my presentation, I will argue how well-being research could benefit from a more nuanced, context-specific approach that considers both contextual and individual factors that contribute to well-being. My outlines are premised on the assumption that further research and practice that aims at fostering well-being in education suffer from the ambiguous and context-unspecific use of the construct of well-being.

Higher Education

What is a PhD worth beyond academia? Impact of the disciplinary field

Keywords: Competencies, Doctoral Education, Higher Education, Qualitative Methods, Quantitative Methods, Researcher Education, Social Development, Social Interaction
Interest group: SIG 24 - Researcher Education and Careers
Chairperson: Isabelle Skakni, Switzerland
Discussant: Montserrat Castelló, Ramon Llull University, Spain

PhD holders are increasingly working in sectors beyond academia, a fact universities worldwide are beginning to recognise. In turn, the nature and purpose of a PhD degree is shifting, evidenced by increased attention to doctoral training and a focus on PhD holders' careers in policy and research. However, preparation for careers beyond academia remains uneven across disciplines. For instance, it is not uncommon in STEM fields for doctoral candidates to enrol in PhD programmes in partnership with companies or in internships in industry, facilitating connections with industry employers. In contrast, doctoral candidates in the humanities and social sciences (HSS) tend to have fewer opportunities to engage with non-academic sectors during their doctorate. Moreover, the labour market does not offer the same opportunities depending on one's disciplinary background: A PhD in STEM tends to be valued more positively outside academia than a PhD in HSS. However, little is known about how PhD holders are perceived beyond academia. This symposium provides further insight into the PhD degree's value beyond academia in four countries. The first paper explores how PhD holders working beyond academia may act as knowledge brokers in the Spanish context. The second paper examines employers' views of the PhD benefit for their organisations, focusing on work sectors and PhD fields in Belgium. The third paper contrasts PhD holders' and employers' views of the PhD degree's value, with attention to differences across disciplines in Switzerland. The fourth paper focuses on stereotypes associated with PhD holders in France based on disciplinary fields.

Ph.D. holders beyond academia as knowledge brokers: Disciplinary-based differences
Presenting Author: Marina García-Morante, Blanquerna, Universitat Ramon Llull, Spain; **Co-Author:**Montserrat Castelló, Ramon Llull University, Spain; **Co-Author:**Anna Sala Bubaré, Ramon Llull University, Spain

An increasing number of Ph.D. holders develop their professional careers beyond academia. They are highly-skilled workers valued in knowledge economies, potentially able to straighten connections within innovation ecosystems. However, little is known about the relationships, if any, early career researchers following non-traditional academic careers maintain with academia. In this study, we aim to explore to what extent early career researchers from different disciplinary backgrounds maintain relationships with academia, and the motives and prospects surrounding these relations. We looked at identity trajectories (McAlpine, 2012) of 39 Spanish researchers (19 women and 20 men) across disciplines and professional sectors (NGOs, public and private companies). Qualitative data from interviews have been categorized through thematic content analysis. Results showed three types of trajectories: null collaborators, hybrid collaborators, and research partners. Moreover, results reveal the interaction between personal, disciplinary, and structural factors, and how they mediate early researchers' trajectories. PhDs holders from STEM differ from those in Social Sciences in maintaining sustainable relationships with academia. The study has several implications for multiple stakeholders in research and development since it reveals diverse ways to straighten innovation connections and inputs to promote them.

What is a doctorate worth for non-academic employers?
Presenting Author: Neda Bebiroglu, Observatory of Research and Scientific Careers-F.R.S.-FNRS, Belgium

This paper tries to uncover the added value of the doctorate for non-academic employers. In line with the knowledge-based view of organisations, we conceptualize the perception of the added value of the doctorate as characterized by a vector of organisation-related and employer-related factors that have been pointed to as potential determinants of the demand of doctorate holders in the non-academic sectors. Using data from a survey of 614 Belgian non-academic employers, we analyse different factors impacting (1) the perception of the added value for non-academic employers and (2) added value of the doctorate for R&D related activities. This study offers insight into the value of the doctorate for non-academic sectors by considering the role of multiple factors as well as the connections between them. It also sheds light on how to increase the added value of doctorate outside of academia.

Valuing the PhD degree in non-academic workplaces: PhD holders' and employers' perceptions
Presenting Author: Michaël Parmentier, University of Applied Sciences and Arts Western Switzerland, Switzerland; **Co-Author:**Nata Kereselize, University of Applied Sciences and Arts Western Switzerland, Switzerland; **Co-Author:**Laurence Fedrigo, University of Lausanne, Switzerland; **Co-Author:**Kelsey Inouye, University of Oxford, United Kingdom; **Co-Author:**Isabelle Skakni, University of Applied Sciences and Arts Western Switzerland, Switzerland

This paper emerges from an ongoing study on PhD holders pursuing careers beyond academia in Switzerland. Drawing on concepts of cross-occupational mobility and skills transferability, we conducted semi-structured interviews with PhD holders (n=32) and employers (n=9) from the private, public/para-public and so-called "third space" sectors. We intended to contrast PhD holders and employers' perceptions of a PhD degree's value with a focus on variation across disciplinary fields. The preliminary results suggest that PhD holders from STEM fields work mostly in the private sector, tend to report that their positions align with their subject matter knowledge and technical skillset and are often recruited for a very specific expertise that their employer seeks. In contrast, PhD holders from humanities and social sciences (HSS) fields generally work in the public/par-public and third space sectors where employers less understand a PhD degree's value. They tend to report that the nature of their work is not always aligned with the particular knowledge and skills acquired during their doctoral years, and that the main asset of their PhD is the credibility and legitimacy it confers on them in their workplace. However, regardless of the disciplinary field or employment sector, the PhD degree appears rarely to be a formal hiring criterion and employers hardly recognise it in terms of seniority and salary.

How is holding a PhD perceived outside academia? Stereotyping of PhD holders in the French context
Presenting Author: Alexandre Bran, Laboratory of Interdisciplinary studies on the Doctorate, Adoc Talent Management, France; **Co-Author:**Nicolas Lopes, Adoc Talent Management, France; **Co-Author:**Eric Bonetto, Adoc Talent Management, France

Studies show that PhD holders perceive they are subjected to negative stereotypes, for instance by reporting to be considered snobbish (e.g., Suomi et al., 2020). However, the actual prevalence of these stereotypes and their variations depending on factors such as gender or disciplinary field have not been investigated yet. In this paper, we present a study conducted in France with the aim of examining the stereotypes held by the French population, and the perceptions of these stereotypes held by PhD candidates and PhD holders. To do so, we draw on the integrative model of social evaluation (Abele et al., 2021), according to which stereotypes can be captured through four main dimensions: ability, assertiveness, friendliness, and morality. The data collection method combined a qualitative free association task and an experimental social evaluation task that enabled us to also consider the influence of disciplinary field and gender. Results suggest that spontaneous stereotypes of PhD holders in the French population are mostly positive and focus on their ability and assertiveness. However, PhD candidates and PhD holders had a more negative perception of these stereotypes on all dimensions. We also observed variations depending on gender and research field, with women being evaluated higher on the ability and assertiveness dimension than men, and PhD holders in STEM fields being evaluated higher on the ability dimension than PhD holders in Humanities and Social sciences.

Symposium
Teaching and Teacher Education

Evidence-informed reasoning of pre-service teachers

Keywords: Attitudes and Beliefs, Critical Thinking, Educational Policy, Ethics, Misconceptions, Pre-service Teachers, Qualitative Methods, Quantitative Methods, Reasoning, Social Sciences and Humanities, Synergies between Learning / Teaching and Research
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands
Organiser: Izaak Dekker, Amsterdam University of Applied Sciences (AUAS), Netherlands
Discussant: Ingo Kollar, University of Augsburg, Germany

In order to improve the quality of education, educational policies across countries stimulate evidence-based or evidence-informed education. These concepts differ in nuances and in how 'strict' they are perceived but share two ambitions. To improve the degree to which educational practitioners apply (findings from) educational research, and the degree to which educational researchers provide solid evidence for educational practice. The ambitions already imply that these interactions are not a commonplace, which their reception in both educational practice and research seems to confirm. This symposium brings together four papers about what might hinder or further these two ambitions. The first three papers will describe the degree to which pre-service teachers apply findings from educational research, while the fourth paper addresses the degree to which educational research provides useful evidence. Paper one presents the findings from two studies into the beliefs of pre-service teachers about the usefulness of educational science. The second paper describes the degree to which the presentation of scientific evidence, and its perceived pertinence and potency, can change the beliefs of pre-service teachers based on two experimental studies. Our third paper presents the outcomes of a scenario-study, which explored the degree to which pre-service teachers use scientific evidence in their everyday reasoning. Finally, the fourth paper categorizes and evaluates the criticisms against evidence-based and -informed education. Based on the criticism, this paper proposes adaptations of educational research that could make educational research more credible and informative for practice.

Not useful to inform teaching? Pre-service teachers' skeptical beliefs about education science
Presenting Author: Thamar Voss, University of Freiburg, Germany

A goal of teacher education is to promote future teachers' orientation towards the best available knowledge. However, a lack of evidence-based thinking among teachers is often observed. Teacher beliefs are assumed to act as facilitators or barriers to evidence-based thinking. In two studies, we investigated German pre-service teachers' beliefs about education science and their consequences and potential sources. On average, pre-service teachers judged general education science as less important for successful teaching than their subject didactics and as less complex than their subject disciplines. Furthermore, skeptical beliefs were associated with a lower engagement in education science courses. Lastly, results showed that the "soft" research methods typical of education science and unrealistic expectations about the education science curriculum might contribute to this devaluation.

The scientific impotence excuse in education: Disentangling potency and pertinence assessments
Presenting Author: Holger Futterleib, University of Erfurt, Germany; **Co-Author:**Eva Thomm, University of Erfurt, Germany; **Co-Author:**Johannes Bauer, University of Erfurt, Germany

When pre-service teachers face scientific evidence that contradicts their beliefs, they may attempt to maintain their personal beliefs instead of revising them. For this purpose, pre-service teachers resort to devaluation tendencies such as doubting the potency of science or having a decreased preference for scientific sources. By engaging in the scientific impotence excuse (SIE), individuals run the risk not only to uphold flawed beliefs but also to depreciate educational research as reliable source of knowledge. In two studies, we (a) replicated findings on the SIE in education and (b) disentangled the effects on the potency (i.e. epistemic capacity) and pertinence (i.e. normative ascription of relevant competence) of science to investigate educational topics to understand SIE-related devaluation more comprehensively. Both studies followed a 2 x 2 mixed experimental design: Pre-service teachers assessed their belief about the effectiveness of grade retention before and after reading either confirming or disconfirming scientific evidence concerning this topic. The direct replication (Study 1; N = 147

pre-service teachers) demonstrated the expected devaluation tendencies when facing belief-evidence conflicts. Hence, participants devalued the potency of science and indicated a declining preference for scientific sources. In contrast, in the follow-up study (Study 2; N = 152 pre-service teachers) these systematic devaluations of science diminished when disentangling the facets of potency and pertinence. Despite partial devaluation tendencies, both studies revealed that participants adapted their beliefs in direction of the evidence presented. Our findings suggest that the (perceived) soundness of evidence may be a relevant factor for eliciting science devaluation.

Unpacking pre-service teachers' beliefs and reasoning: A scenario-based approach
Presenting Author: Leila Ferguson, Kristiania University College, Norway; **Co-Author:**Ivar Bråten, University of Oslo, Norway

The beliefs teachers hold may provide information about their more or less evidence-informed reasoning about educational issues. However, gaining a clear picture of teachers' beliefs has proven difficult. A promising line of inquiry uses scenario-based approaches to assess teachers' enacted beliefs. Accordingly, we assessed 75 Norwegian pre-service teachers' beliefs about student ability, sources of teaching knowledge, and teacher efficacy by analyzing their written responses to authentic classroom scenarios, with these responses also providing information about participants' reasoning about the scenarios. While participants' responses seemed to be evidence-informed in many ways, there were also indications of the opposite, such as limited consideration of educational research in pedagogical decision-making. For example, most participants opted to rely on informal knowledge sources such as experienced colleagues, and hardly referred to educational research at all, neither as sources of teaching knowledge nor when justifying their choice of sources. The results contribute uniquely to an understanding of pre-service teachers' beliefs and reasoning about educational issues by showing the nuances of teacher beliefs about student performance, sources of teaching knowledge, and teacher-efficacy, and they provide further insight into pre-service teachers' limited consideration of research as evidence in pedagogical decision-making. As such, they may help researchers and teacher educators to better understand the beliefs preservice teachers hold, as well as to facilitate further development of these beliefs. Implications for future research and teacher education are discussed, such as a need for more qualitative investigations and the role of teacher educators in addressing pre-service teachers' beliefs.

Evidence-based and -informed education: Objections and future directions
Presenting Author: Izaak Dekker, Amsterdam University of Applied Sciences (AUAS), Netherlands; **Co-Author:**Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands

Over the past two decades, educational policymakers in many countries have favored evidence-based and -informed educational programs and interventions. However, Evidence-Based and -Informed Education (EBIE) have met with growing resistance from educational researchers. This essay reviews the objections against EBIE and its preference for randomized controlled trials (RCT). We conclude that the objections call for adjustments, but do not justify abandoning EBIE. Three future directions could make education more evidence-based whilst taking the objections against EBIE into account: 1) study local factors, mechanisms and implementation fidelity in RCTs, 2) utilize and improve the available longitudinal performance data and 3) use integrated interventions and outcome measures.

Symposium
Instructional Design

Problem-solving prior to instruction as an example of composite instructional designs

Keywords: Cognitive Skills and Processes, Example-based Learning, Feedback, Instructional Design, Learning Approaches, Problem Solving, Problem-based Learning, Quantitative Methods, Simulation-based Learning
Interest group: SIG 06 - Instructional Design
Chairperson: Katharina Loibl, University of Education Freiburg , Germany
Chairperson: Timo Leuders, University of Education Freiburg , Germany
Discussant: Ido Roll, Technion - Israel Institute of Technology, Israel

Instruction often includes multiple phases with different pedagogies and goals. Research on such composite instructional designs – e.g. problem-solving prior to instruction (PS-I) – often targets questions on the instruction level, such as: Which temporal order of the phases has the largest effect on learning outcomes? We argue that investigating composite instructional designs benefits from linking elements at all three levels and across all learning phases: knowledge structure, learning processes, and instructional design (Koedinger et al., 2012). More specifically, one should take into account the modification of the learning processes in the second phase due to the intermediate knowledge or the affective-motivational state resulting from the first phase (Fig. 1). Such work looks beyond main effects of "ideal" designs, and seeks to identify the role of cognition and context.
Four groups present their studies on PS-I and similar composite designs, focussing on the interaction of a problem-solving and an instruction-phase: Paper 1 compares the effect of different types of preparations in the first phase and their effects on learning in the second phase. Paper 2 investigates how the breadth of knowledge activation in the first phase prepares for learning in the second phase. Paper 3 investigates the influence of varied feedback timing during the problem-solving phase on learning mechanisms, and on the acquisition of medical knowledge and skills. Paper 4 investigates learning outcomes depending on the temporal order of problem solving and instruction for motor learning.
Koedinger, K., Corbett, A., & Perfetti, C. (2012). The Knowledge-Learning-Instruction framework. Cognitive science, 36(5), 757-798.

Open problem-solving, working on solved problems or fading to prepare for learning from instruction?
Presenting Author: Katharina Ockl, University of Erfurt, Germany; **Co-Author:**Christina Schulz, University of Freiburg, Institute of Psychology, Germany; **Co-Author:**Lennart Schalk, PH Schwyz, Switzerland; **Co-Author:**Inga Glogger-Frey, University of Erfurt, Germany

Open problem-solving (inventing) or working through a solved problem (worked example) can prepare students for learning from subsequent direct instruction. Both types of preparation could foster the acquisition of intermediate knowledge which, in turn, can facilitate learning from subsequent instruction. However, this effect may depend on the quality of the acquired intermediate knowledge which can be better controlled via worked examples. The present study aims at testing this assumption; that is, whether fading of support leads to better transfer than two phases of the same preparation activity. In an experiment, high-school graduates (N = 60) either invented twice (inventing condition), worked on a worked example twice (worked example condition), or worked first on a worked example followed by one inventing activity (fading condition). On a final transfer test, fading led to significantly better scores than inventing. The advantages of fading compared to worked examples failed to reach significance. Learners' need-for-cognition moderated the effect of experimental condition on transfer. Learners with high need-for-cognition showed better transfer performances if support during the preparation phase was faded. Therefore, especially learners with high need-for-cognition may benefit from faded support.

The role of students' breadth of prior knowledge activation in preparation for learning
Presenting Author: Charleen Brand, Ruhr University Bochum, Institute of Educational Research, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Nikol Rummel, Ruhr University Bochum, Germany

In problem solving prior to instruction, students' conceptual learning is afforded through an initial problem-solving phase, in which students deal with an unknown problem that prepares them for a following instruction. Activating prior knowledge during problem solving is assumed to be one learning mechanism that facilitates this preparation. Previous findings suggest that students' activated knowledge needs to be (1) conceptually broad and (2) relevant to the targeted principles. However, we lack systematic research on how and when knowledge activation in a problem solving phase affords learning during an instruction phase. Therefore, in the present study, we specifically prompted students' activation of knowledge by showing them erroneous solution attempts of other students. The solution attempts varied in the coverage of knowledge components of the targeted principles that were included. A high coverage of knowledge components aimed at a broad activation of prior knowledge and a low coverage at a more limited activation. An intermediate knowledge test after the problem-

solving phase served as a manipulation check for students' activation of knowledge during problem solving. To control for the testing effect, only half of the students answered this test. Thus, we implemented a 2x2-design with high versus low coverage solution attempts and present versus absence of the intermediate knowledge test. We did not find a significant difference in conceptual knowledge after instruction for high versus low coverage solution attempts, nor the intermediate knowledge test, or the interaction of both factors.

Formative feedback timing problem-solving in virtual environment simulations for medical education
Co-Author: Christian Fässler, Swiss Federal Institute of Technology ETH Zurich, Switzerland; **Co-Author:**Tanmay Sinha, Professorship for Learning Sciences and Higher Education, ETH Zurich, Switzerland; **Co-Author:**Christian Schmied, ETH Zurich, Switzerland; **Co-Author:**Jörg Goldhahn, ETH Zurich, Switzerland; **Co-Author:**Manu Kapur, ETH Zurich, Switzerland; **Co-Author:**Charlotte Müller, ETH Zurich, Switzerland

Despite acquiring vast content knowledge about the functioning of the human body through university teaching, medical students struggle to transfer that knowledge to one of the core disciplinary practices – differential diagnosis. The authors aimed to overcome this problem by implementing computer-based virtual environment (CVE) simulations in medical education courses. In our study, such simulations were implemented in the problem-solving phase of the problem-solving prior to instruction (PS-I) paradigm. The subsequent instruction phase was represented by a monologue video lecture. The major goals of the present study were to investigate how the timing of feedback in the computer-based virtual environment problem-solving phase (a) influence learning mechanisms of PS-I such as knowledge gap awareness and state curiosity and (b) learning outcomes after the instruction phase such as the acquisition and transfer of clinical knowledge and clinical reasoning skills. We found that no formative feedback provision resulted in significantly higher state curiosity after the problem-solving phase than delayed feedback provision. All other comparisons did not reveal significant differences in state curiosity and the remaining measurements of learning mechanisms. At what point of time – if at all – feedback should be provided during or after problem-solving in the computer-based virtual environment depends on the targeted learning outcome. Importantly, neither instant, delayed, or no feedback had detrimental effects on learning. However, the assessed learning mechanisms seem to play a minor role in learning outcome facilitation as they were triggered similarly among the various feedback timing in the problem-solving phase.

Problem-solving prior to instruction in motor learning – the case of javelin throwing
Presenting Author: Christian Leukel, University of Education Freiburg, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany

A question that many parents face when their child learns to ride the bicycle concerns the temporal order of instruction and self-determined practice. In physical education, where motor-learning plays an important role, a systematic evaluation of this temporal order on learning outcomes is so far missing. Therefore, in the present study, ninety 7th graders were tested on their ability to learn javelin throwing. They either received instruction on the technical movement features of javelin throwing before self-determined practice (I-PS), or they started with self-determined practice and received the instruction afterwards (PS-I). Learning-related changes in throwing distance were measured for javelin throwing. Javelin throwing distance increased and technical features of the throws improved in both PS-I groups, but not in I-PS groups. We discuss potential underlying mechanisms of this effect, in particular the role of awareness of knowledge gaps through initial practice that could be elaborated on during subsequent instruction, and the suppression of implicit learning processes with instruction.

Symposium
Teaching and Teacher Education

Teacher Professional Development: Digital simulation, Videos and Peer learning

Keywords: Communication Skills, Educational Technologies, Feedback, Higher Education, Peer Interaction, Simulation-based Learning, Teacher Efficacy, Teacher Professional Development, Video-based Learning
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Inga Staal Jenset, University of Oslo, Norway
Organiser: Katrine Nesje, University of Oslo, Norway
Organiser: Toril Aagaard, Norway
Discussant: Sigrun K. Ertesvag, University of Stavanger, Norway

This symposium investigates Scandinavian initiatives that aim to deal with the overall challenges of reducing the theory–practice gap in teacher education and preparing students better for their future careers as teachers. As discussed in the four presentations, all of the initiatives involve innovation and implementation of didactic designs in which students are assigned active roles and digital technologies are exploited. In the first presentation, virtual reality (VR) simulations are used for students' practice in leading developmental talks. In the second presentation, desktop simulations are used to train students in teaching math, specifically fractions, to a small group of virtual pupils. In the third and the fourth presentations, pre-service teachers' video-record their teaching and share a selected sequence in peer-mentoring conversations as the point of departure for further professional reflection. Across these qualitative studies, it is found that both digital simulations and the use of videos from students' teaching practices in schools can potentially tighten the links between theories and practices in teacher education if integrated in learning designs that are developed to promote coherence. Furthermore, all of the interventions show how digital technologies innovated for educational purposes, combined with didactic designs, can be used to expose students to authentic situations and tasks close to what they will face in schools. Hopefully, this knowledge will inspire other teacher educators to engage in preparing students better for the great societal responsibilities that lie ahead in schools and classrooms.

CANCELLED: Using immersive virtual reality simulation for and with students (...)
Presenting Author: Lynn Dittrich, University of South-Estern Norway, Norway

This presentation has been cancelled and will not be presented at EARLI 2023.There have been widespread calls for higher education programmes to offer more active, innovative approaches to learning, particularly in the teacher education field. One innovative approach is provided by using immersive technologies, such as virtual reality (VR) for students to develop work-relevant skills in collaboration with peers. However, little is known about the role of peer-facilitation in simulated learning environments since most simulation experiences are educator-led. This study addresses this gap by exploring how VR simulations might support pre-service teachers' professional development. In this study, pre-service teachers engaged in parent-teacher meetings by means of a scenario-based VR simulation. This task was led by student facilitators who had previously undergone the same simulation experience themselves. In the context of peer-facilitated learning, this study focuses on the student facilitators' experiences. Thus, this study aims to explore both how these students' parent-teacher communication competence is supported by the VR simulation, and how the facilitator role enhances their professional development. The data include individual qualitative surveys (n=11) and focus group interviews (n=3) with student facilitators. The data will be analysed using thematic analysis. Preliminary findings indicate that the facilitators valued experiencing the varied ways different students enact and reflect upon parent-teacher conversations. Further, they report that VR simulations are beneficial for training on scenarios that are difficult to emulate in real-school settings that they suggest more content should be developed to better prepare student teachers for facing challenging situations.

Improving teaching skills with simulation training: Pre-service teachers' retrospect
Presenting Author: Marcus Samuelsson, Department of Behavioural science and learning, Sweden; **Co-Author:**Anja Thorsten, Department of Behavioural Sciences and Learning, Sweden; **Co-Author:**Cecilia Sveider, Department of Behavioural Sciences and Learning (IBL), Sweden; **Co-Author:**Joakim Samuelsson, IBL, Sweden

One possible way to challenge the well-known fact that pre-service teachers have limited opportunities to realistically practice teaching and develop skills and strategies was handled with the help of simulation- training. Two cohorts of pre-service teachers, in total 104, were given the opportunity to teach mathematics, specifically fractions, to a small group of virtual pupils. Within the framework of a course in mathematics didactics, the students in groups of three planned and

conducted lessons, where they alternated between acting and observing each other under the supervision of two instructors, with expertise in mathematic didactics and classroom management, respectively. After each lesson, the instructors gave feedback and feedforward concerning aspects that were good and aspects to consider and modify in the future. To find out what the pre-service teachers remembered from the simulation training, group interviews were conducted 6 months and 18 months, respectively, after the simulation -training. The analyses of the interviews revealed that the pre-service teachers found the training realistic and useful, as well as gave them thechance to practise teaching in a '"safe"' setting. They also learned a lot from watching peer students teach the virtual pupils and being able to '"pause"' the lesson and reason with their peers. They also mentioned the instructors' feedback that they received, directly connected to their lesson. The simulation-training emotionally affected the students as no other form of teacher training had done so far. Simulation-training seems to be a productive complement to traditional forms of teacher education.

The use of authentic practice videos in peer-mentoring of preservice teachers
Presenting Author: Katrine Nesje, University of Oslo, Norway; **Co-Author:**Torunn Strømme, University of Oslo, Norway

This study investigates the use of authentic practice videos (APVs) in peer-mentoring conversations with pre-service teachers (PTs) in university-based teacher education. PTs' use of APVs can contribute to professional development through reflection, providing a connection between canonical knowledge of teaching and learning presented in course work, as well as experience in fieldwork when practising teaching. However, video-based reflection will benefit from a guide in order to facilitate deeper reflection. We developed a guide for peer-mentoring, containing a set of exploratory questions and introducing theoretical concepts of teaching and learning. This study's particular interest lies in *how* PTs used the guide in structuring and supporting peer-mentoring conversations, as well as in their positioning in the conversations. The sample consists of 16 PTs discussing their APVs in small peer-mentoring groups and using the guide as a common starting point. In the analysis, 'conceptual framing' and 'positional framing' are taken as points of departure. The findings show that theoretical concepts introduced in the guide (related to classroom conversations) helped PTs connect theory to the practice unfolding in the APVs. The guide was also used actively and contributed to the structure of the peer-mentoring conversations. The PTs took different positions in the conversations related to how they used the guide. They used the word 'reflection' when describing their experiences with using APVs in peer-mentoring conversations. The findings indicate that the link to theory and the discussion with peers drive the reflection process.

Peer-feedback on classroom-videos: A hope for coherence in teacher education?
Presenting Author: Toril Aagaard, University of Southeast Norway, Norway; **Co-Author:**Lene Joensen Kjær, University of South-eastern Norway, Norway

Two challenges are approached in the didactic design discussed in this session. The first aims to reduce the theory–practice gap in teacher education (TE), and the second to provide better support for professional development of pre-service teachers enrolled in an online TE programme. The design includes using video recordings from students' school practice to professionalize in peer groups. The video-app and didactical design was first innovated by the University of Oslo (UiO), before University of South-Eastern Norway (USN) joined to investigate how the app and the didactic design could be integrated across institutions. This presentation focuses on lessons learned from this. To prepare this intervention, we first analysed video data from UiO to find that these indicate the design's great potential to link theories and practices. However, the shared video sequences came across as efforts to enact theories in practice. As we at USN wanted the students to discuss challenges with peers, we explicitly asked them to do so and highlighted that the intention with design was professional development, not evaluating skills. In the presentation, the following questions are answered: What are the USN students' perspectives on the learning design introduced to promote coherence and professional development in their online TE programme? What characterises their efforts to engage in joint knowledge creation in peer groups? 'Coherence' and 'trialogues' are applied as analytical concepts, and the study is significant as it reveals the potentials of peer-feedback of classroom-videos as means for coherence and professional development in TE.

Identification of parental dyslexia and its influence on how children's dyslexia is predicted
Keywords: Assessment Methods, Learning and Developmental Difficulties, Learning and Developmental Disabilities, Reading
Presenting Author: Daria Khanolainen, University of Jyväskylä, Finland; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Kenneth Eklund, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Minna Torppa, University of Jyväskylä, Finland

By investigating children whose parents have dyslexia, family risk (FR) studies are expanding our understanding of the intergenerational transmission of dyslexia. These studies, however, vary in their identification of FR, and how the use of different identification methods influences research findings and conclusions is yet to be systematically investigated. This study aims to evaluate the association between two FR identification methods—parental self-reports and direct skill assessments—and their unique contributions in the prediction of children's reading.The study draws on two longitudinal data sets that include parental questionnaires, parental tests, and child assessments. The first data set had a prospective FR sample (half of the parents in the sample had dyslexia and the remaining half did not). The second data set had an unselected sample. Both samples include approximately 200 families. To analyse data, we constructed hierarchical regressions and longitudinal path models.Parental self-reports and direct skill assessments correlated strongly (.60) in the prospective FR sample and moderately (.42) in the unselected sample. Both identification methods were almost equally predictive of children's reading fluency in the prospective FR sample. At the same time, in the unselected sample, parental skills were not predictive of children's reading, whereas self-reports were. The two FR identification methods seem to have equally high predictive power when the variability in parental data is high. Parental self-reports demonstrated higher predictive power than we expected. They can be effectively used to screen parents ensuring early identifications of children at risk for dyslexia and facilitating early targeted interventions.

The Relation between Spelling and IQ: A meta-analytic review
Keywords: Cognitive Development, Learning and Developmental Difficulties, Learning and Developmental Disabilities, Writing/Literacy
Presenting Author: Sietske van Viersen, Utrecht University, Netherlands; **Co-Author:**Elise de Bree, Utrecht University, Netherlands; **Co-Author:**Jolijn Vanderauwera, UC Louvain, Belgium

The role of IQ in diagnosing a spelling deficit is nowadays limited to IQ >70, but implicit assumptions about the relation between spelling and intelligence continue to influence both research and clinical practice. This study addresses existing issues by determining the relations between spelling ability and intelligence and potential moderators. Two separate meta-analyses were conducted, one on 59 correlational studies involving 63 independent typically developing (TD) samples and one on 62 subgroup studies involving 78 independent samples of children with a spelling deficit (e.g., dyslexia or dys[ortho]graphia). The results showed that spelling is moderately related to verbal IQ (r = .35, 95% CI [.29, .41]), weakly to nonverbal IQ (r = .26, 95% CI [.22, .31]), and moderately to total IQ (r = .48, 95% CI [.39, .57]). Group differences between children with a spelling deficit and TD control groups are medium for verbal IQ (d = .52, 95% CI [.41, .64]), small for nonverbal IQ (d = .24, 95% CI [.16, .31]), and medium for total IQ (d = .50, 95% CI [.39, .62]). Moderators include those related to the measurement of spelling (task format/complexity/length, stimulus type/length) and intelligence, as well as sample characteristics and general covariates. These moderator analyses are currently conducted. The findings of both meta-analyses are discussed in light of current practices surrounding

research into and clinical diagnosis of children with a spelling deficit.

Comparison of different settings in the support of graphomotor skills in first graders
Keywords: Inclusive Education, Learning and Developmental Difficulties, Primary Education, Writing/Literacy
Presenting Author: Judith Sägesser, University of Teacher Education Bern, Switzerland; **Co-Author:**Michelle Maurer, University for Teacher Education Berne, Switzerland; **Co-Author:**Lidia Jana Truxius, PHBern, University of Teacher Education, Switzerland; **Co-Author:**Joséphine Schwery, University for Teacher Education Berne, Switzerland; **Co-Author:**Michael Eckhart, University of Teacher Education Bern, Switzerland

Graphomotor and visuomotor skills, as well as fine motor skills, play a key role in children's transition to school. In this project, which is funded by the Swiss National Science Foundation, three different settings of support and multiprofessional collaboration between teacher and psychomotor therapist were compared. The graphomotor skills of first grade children (N=1334) were measured with a paper and pencil test and with digital measures. We will analyze the impact of the different settings on fine- and graphomotor performance progress across 1.5 years. First longitudinal results are expected by the end of the year and will be available for the conference.

Being well in academia: A systematic literature review on operationalizing wellbeing.
Keywords: Anxiety and Stress, Engagement, Higher Education, Well-being
Presenting Author: Aisha Miren Iqbal Ruiz, Maastricht University, Netherlands; **Co-Author:**Wim Gijselaers, Maastricht University, Netherlands; **Co-Author:**Simon Beausaert, Maastricht University, Netherlands; **Co-Author:**Inken Gast, Maastricht University, Netherlands

Higher education institutions (HEI) are workplaces with high occupational health risks. Academics face high rates of burnout, stress, and mental illness, making monitoring faculty wellbeing imperative. Wellbeing at work is a complex construct with many different conceptualizations and measures. The lack of consensus on operationalizing wellbeing creates difficulties in interpreting research findings, with consequences for practice.
This systematic review provides an overview of how wellbeing is defined and measured in the academic setting. Current research shows that definitions for wellbeing are frequently implied rather than stated and sometimes omitted altogether. This lack of clarity in definitions can create misalignments with measures and the conceptualizations implied in the definitions used. In studies with explicit definitions, wellbeing operationalizations ranged from affect and positive emotion-based ones to more holistic ones with multiple conceptualizations and measures.

Motivational orientation profiles and study well-being among higher education students
Keywords: Higher Education, Motivation, Quantitative Methods, Well-being
Presenting Author: Satu Laitinen, University of Turku: Department of Teacher Education, Finland; **Co-Author:**Ari Kaukiainen, University of Turku, Department of Psychology and Speech-Language Pathology, Finland; **Co-Author:**Tiina Tuominen, University of Turku, Study and Work Well-being Services, Finland

A person-centered approach was applied to identify the motivational orientation profiles in a representative sample of 1,533 higher education students in Finland at different stages of their studies. We also explored the extent to which study engagement, burnout, and academic achievement served as indicators of a student's identification with a particular motivational orientation profile at the individual level. Three groups of students with distinctive motivational orientation profiles—s*tudy-oriented*, *moderately-oriented*, and *avoidance-oriented*—were identified using latent profile analysis. The results showed that increased study engagement and academic achievement, in terms of study credits, were associated with belonging to the *study-oriented* group. Students showing increased study burnout were associated with the *avoidance-oriented* group. The *moderately-oriented* students reported average levels of motivation relative to the two other groups. The study also considered the importance of assessing motivational orientation, study well-being, and academic achievement across different stages of study, seeing this as potentially beneficial to academic careers.

Supporting student reflection by using a survey on learning processes and wellbeing
Keywords: Feedback, Learning Approaches, Metacognition, Well-being
Presenting Author: Anne Haarala-Muhonen, University of Helsinki, Finland; **Co-Author:**Mirja Ruohoniemi, University of Helsinki, Finland; **Co-Author:**Anna Parpala, University of Helsinki, Finland

The present study examines the variance in the first-year law students' experiences and reflection of the counter feedback they have gained from filling in a survey focusing on their learning processes and risk of study-related burnout. Altogether 101 students provided open-ended answers. The data were analysed by using a qualitative content analysis. The results showed that the counter feedback offered students an organised and guided opportunity for reflection, and students' responses indicated that this increased their awareness of their learning processes and wellbeing. The students paid particular attention to the organising and time management skills, as well as the impact on their wellbeing. The majority of students found the counter feedback useful, and with the use of concrete examples, they expressed how they will develop their learning processes and what concrete actions they would take to improve their wellbeing. The results imply that counter feedback on students' learning processes and wellbeing is an effective way of supporting students' metacognitive awareness and further, guidance for reflection is needed to help them to get full benefit of their personal feedback to improve studying, learning and well-being.

University students' study progress and study success related to their well-being profiles
Keywords: Burnout, Engagement, Higher Education, Quantitative Methods
Presenting Author: Elisa Vilhunen, University of Helsinki, Finland; **Co-Author:**Noona Kiuru, University of Jyväskylä, Finland; **Co-Author:**Anne Mäkikangas, Tampere University, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Johanna Rantanen, University of Jyväskylä, Finland

This study examines, first, university students' well-being profiles utilizing the circumplex model of occupational well-being, and second, how students' well-being profiles are related to their self-reported study success and study progress. A total of 316 Finnish university students participated in a two-wave longitudinal study, in which they filled in an e-survey containing a set of study-related well-being measures. Student well-being profiles and transitions between the profiles were analysed with latent profile analysis and latent transition analysis. Four latent classes were identified: "Ordinary", characterized by close to average values in all well-being measures; "Engaged and satisfied", characterized by high values of engagement and satisfaction; "Engaged holists", characterized by relatively high levels of engagement, studyholism and burnout; and "Bored and burned out", characterized by high levels of boredom and burnout. Transitions were mainly from better well-being to worse. Further, the relations between the profiles and study success and progress were analysed using a Kruskall-Wallis test. Both "Engaged and satisfied" and "Ordinary" were found to experience better study success than "Engaged holists" and "Bored and burned out". Similarly, both "Engaged and satisfied" and "Ordinary" experienced better study progress than "Engaged holists" and "Bored and burned out". Thus, similarly as workholism also studyholism should be avoided even though it might seem as something to be pursued. Overall, the findings of this study widen the understanding about study well-being not only as a one-dimensional but multidimensional phenomenon which has its equivalence in occupational well-being.

Construct Validation of an Instrument to Measure Student Well-Being in Academic Settings

Keywords: Assessment Methods, Self-regulated Learning and Behaviour, Tool Development, Well-being
Presenting Author: Ramin Rostampour, University of Victoria, Canada; **Co-Author:**Meg Kapil, University of Victoria, Canada; **Co-Author:**Allyson Hadwin, University of Victoria, Canada

Academic Wellbeing, the subjective sense of how well students feel about and perform in their academic contexts, has gained attention as an important student success factor. This study introduces a scale for assessing well-being in academic settings, the Academic Well-Being Scale (AWBS). The AWBS provides a measurement solution to the shift in conceptualizations of student success towards flourishing and thriving and away from outcome markers alone. The AWBS is informed by extant research on mental health and well-being and current approaches to student success that include both psychosocial and academic elements. This scale is an adaptation of the Mental Health Continuum Short Form (MHC-SF; Keyes, 2009), tailored for the academic context. Findings support validity, reliability, and improved predictive capacity of the AWBS over the MHC-SF for a sample of university students (N=221). Analysis for concurrent validity shows strong positive associations with (a) MHC-SF, (b) self-regulated learning (SRL) practices, (c) foundational academic behaviours, and (d) students' expected GPA. Comparing the predictive power of the AWBS to the original MHC-SF shows the AWBS predicts a wider range of academic challenges compared to MHC-SF and is associated with students' expected GPA while the MHC-SF is not. Findings highlight the potential application of this measure in research regarding adaptive student learning and student success outcomes. Further, in the current context of global change and uncertainty, the AWBS is consistent with student success trends that integrate psychological processes alongside academic processes in the study of learning, supporting students to not merely survive but thrive.

Profiling Pre-service Early Childhood Teachers' Perceptions of Learning Management Systems
Keywords: Computer-assisted Learning, Early Childhood Education, Higher Education, Pre-service Teachers
Presenting Author: Rohnii Tse, Yew Chung College of Early Childhood Education, Hong Kong; **Presenting Author:**Elaine Lau, Yew Chung College of Early Childhood Education, Hong Kong; **Co-Author:**Fred Chan, Yew Chung College of Early Childhood Education, Hong Kong

Despite the vast availability of studies on teachers' technology adoption using variable-centered approaches, research that focuses on pre-service early childhood education (ECE) teachers' technology adoption from a person-centered perspective is scarce. Drawing on a sample of 220 pre-service ECE teachers in Hong Kong, this study employed latent profile analysis to identify three distinct profiles of students' endorsement of LMS features/interfaces: skeptics, moderate users, and enthusiasts. Skeptics displayed the lowest perceived LMS learning benefits, followed by moderate users, and LMS enthusiasts were associated with the strongest perceived benefits. Gender, immigrant status, and LMS usage frequency were all significant predictors of students' LMS endorsement profile membership. Implications of findings are discussed.

Pre-service primary school teachers' beliefs on interactive book reading in multilingual contexts
Keywords: Attitudes and Beliefs, Foreign and Second Language Acquisition, Pre-service Teachers, Primary Education
Presenting Author: Eline Decraene, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

Increasingly more children grow up in a region where the dominant language does not correspond to their home language. Despite the highlighted importance to create rich language learning environments in schools, second language learners still experience major difficulties in acquiring the language of instruction. In this regard, interactive book reading (IBR) has been put forward as a promising approach in view of language development. Despite the advantages of IBR for (multilingual) children in both pre- and primary school, only a limited number of studies focuses on IBR in the primary grades. To get insights in potential underlying barriers that teachers experience with implementing IBR in their practice, the present study focuses on pre-service primary school teachers' beliefs on implementing IBR in multilingual contexts. Semi-structured interviews were conducted with 36 pre-service primary school teachers. Preliminary results of the thematic analysis reveal that behavioral, normative, and self-efficacy beliefs, as distinguished by Ajzen (1991), were found in teachers' responses. Moreover, the answers show superficial pedagogical content knowledge on IBR in multilingual contexts since various IBR characteristics, which are found in the research literature as effective elements responsible for the added value of IBR for students' language development, are not (in depth) referred to by the participants. The findings highlight important themes to consider and revisit in view of optimizing pre-service teacher education and in-service teacher professionalization.

Preschool Teachers' Beliefs Towards the Importance of Diagnostics in Early Science Learning
Keywords: Attitudes and Beliefs, Early Childhood Education, Mixed-method Research, Science Education
Presenting Author: Mirjam Steffensky, University of Hamburg, Germany; **Co-Author:**Laura Venitz, University of Koblenz-Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany; **Co-Author:**Ilonca Hardy, Goethe-Universität Frankfurt, Germany; **Co-Author:**Anika Bürgermeister, University of Leipzig, Germany; **Co-Author:**Katharina Junge, University of Hamburg, Germany; **Co-Author:**Henrik Saalbach, University of Leipzig, Germany

Diagnosing children's prior knowledge, developmental affordances, and learning processes is a highly demanding task for preschool teachers. Professional competencies, in particular knowledge and beliefs, are an important prerequisite for a productive implementation of diagnostic measures. However, studies have shown that preschool teachers are not sufficiently trained in science teaching and have limited knowledge or inadequate beliefs regarding children's science learning. Thus, they lack important prerequisites for the diagnosis of key competencies that are important for children's learning in the context of science. Beliefs, as a central facet of professional competence, act as a filter for interpreting classroom situations. On this basis, they might be understood as a precursor of teacher's behavior. In this framework, we conducted a study examining preschool teachers' beliefs about effective science education, the importance of diagnostics, their use of diagnostic measures and their interrelationship. Our data consisted of $N = 20$ preschool teachers. Their self-efficacy beliefs about diagnosing and promoting children's science learning as well as learning beliefs were assessed using a questionnaire. Guided interviews were conducted to measure beliefs about effective early science learning and towards the importance of diagnostics in preschool. The results of the questionnaire indicate, that they have high self-efficacy beliefs with regard to diagnosing and fostering children's science learning and that they mainly agree with the co-constructive and self-directed learning beliefs. However, the interview results show that they do not value the use of diagnostic measures for fostering children's science learning and that early science education is primarily seen as self-education.

When judgements are biased by students' immigrant background, intervention can counteract
Keywords: Competencies, Migrant / Refugee and Minority students, Pre-service Teachers, Quantitative Methods
Presenting Author: Christin Laschke, Leibniz-Institute for Science Education (IPN), Germany; **Co-Author:**Bettina Roesken-Winter, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Lars Jenßen, Humboldt-Universität zu Berlin, Germany

Teachers' judgements bear the risk being biased by implicit stereotypes. A few evidence on how judgement biases can be reduced point to the relevance of immersing (pre-service) teachers in an intensive examination of both the relevance of stereotypes and consequences for students. Further evidence by

mathematics education research studies revealed different judgement profiles, ranging from focusing on subject-specific aspects such as understanding and procedural aspects or non-subject specific such as motivation. Moreover, it could be shown, that engaging with students' products led teachers to focus less on subject-independent aspects and more on students' understanding. Our study examines whether different profiles of pre-service teachers' diagnostic judgements can be identified and if the immigrant background of the students whose products are assessed determines whether pre-service teachers belong to a certain profile before and after an intervention on subject-related assessments as well as stereotypes and their consequences for students. The study was conducted as a randomized controlled trail (n = 209). The experimental group received a six hours intervention on subject-related assessments based on student products as well as on stereotypes and their consequences for learners. According to the results of *Latent Transition Analyses* the immigrant background of the students predicted the belonging to the group that judged below average before the intervention in both groups, after the intervention only the control group. The results suggest that the intervention helped to minimize the judgement biases caused by students' immigrant background. Further analyzes regarding additional student characteristics are needed.

Leadership in inclusive ECEC cultures
Keywords: Early Childhood Education, Educational Policy, Inclusive Education, School Leadership
Presenting Author: Kati Sormunen, University of Helsinki, Finland; **Co-Author:**Raisa Ahtiainen, University of Helsinki, Finland; **Co-Author:**Arto Kallioniemi, University of Helsinki, Finland; **Co-Author:**Tapio Lahtero, University of Helsinki, Finland; **Co-Author:**Anni Loukomies, University of Helsinki, Finland

The recent reforms regarding the legislation and curriculum in the Finnish early childhood education and care (ECEC) have been aimed at ensuring the realisation of inclusion from the early years. Previous studies indicate that leaders play a significant role in creating and fostering a culture of inclusiveness and developing and implementing practices based on the principle of inclusion. This research examines how the ECEC centre leaders see inclusion and leadership in an inclusive educational context. We aim to clarify how inclusive education is constructed in ECEC leaders' discourses and examine what actions and procedures promote effective implementation of inclusion. The data were collected from thirteen ECEC leaders. We employed a focus group method to stir the participants to look at the phenomenon from different perspectives and reflect on barriers to change and opportunities for novel solutions. The interviews were studied by applying conventional content analysis. The results indicate that ECEC leaders perceive the legislation and ECEC curriculum as a tool to ensure child and human rights. However, there are differences in the quality of ECEC settings within the same municipality; not all centres have qualified staff, and there is a variation between different regions. In our presentation, we will elaborate and discuss our results in more depth.

The composition of pre-service teacher teams and children's competencies in inclusive education
Keywords: Inclusive Education, Pre-service Teachers, Primary Education, Science Education
Presenting Author: Frank Hellmich, Paderborn University, Germany; **Co-Author:**Fabian Hoya, Paderborn University, Germany; **Co-Author:**Jan R. Schulze, Paderborn University, Germany; **Co-Author:**Eva Blumberg, University of Paderborn, Germany

Team-teaching is regarded as an important prerequisite for children's successful learning processes in inclusive schools. Inclusive learning processes mastered by teachers cooperatively in teams are correlated to the best possible support of all learners in the classroom. However, studies give evidence that there are various challenges if teachers cooperate in inclusive classrooms. For instance, teachers evaluate team-teaching as not successful, if personal relationships are difficult. Currently, there are hardly any studies concerning the role of the composition of teams for students' competence development. Thus, we investigated children's competence development depending on a variation of the team composition.In our study, N = 142 pre-service primary school teachers and pre-service special needs teachers participated in a training to acquire competencies concerning their cooperation in inclusive education. Afterwards, they were assigned to one of our study groups. While half of the pre-service teachers could choose their tandem partners, the other half was arranged in pairs randomly. The pre-service teachers planned in tandems science lessons on the subject of renewable energies and taught groups of children over a period of three lessons. On the basis of pre- and post-tests, we investigated N = 804 children's development. Children who were taught by pre-service teachers in freely selected teams showed significant knowledge growth in a test on the subject of renewable energies compared to children who were taught by pre-service teachers in not freely selected teams.

Do we preach what we are? Studies on the antecedents of teachers' instructional goals
Keywords: Learning and Developmental Disabilities, Motivation, Special Education, Teaching/Instructional Strategies
Presenting Author: Panagiotis Varsamis, University of Macedonia, Greece; **Co-Author:**MELPOMENI TALLIDOU, University of Macedonia, Greece; **Co-Author:**Georgios Katsanis, Experimental Senior High School of University of Macedonia, Thessaloniki, Greece, Greece

Within the framework of Self-Determination Theory (SDT), educators' instructional goals refer to intrinsic vs extrinsic representations for preferred outcomes concerning their students' psychological development. Research on the antecedents of instructional goals remains scarce, especially in the realm of special needs and/or disability. In order to explore this issue, two cross-sectional studies were conducted. Participants responded to a video vignette, which presented a young boy with physical disability. In the first study, 475 in-service teachers, school-based care practitioners and undergraduate senior university students stemming from pedagogical departments participated. According to the results, state empathy and state recognition of the boy's basic psychological needs, as well as their combination, significantly mediated the path between participants' intrinsic life goals and intrinsic instructional goals, namely goals for personal growth and relationship growth. However, empathy and needs recognition did not statistically differ between each other regarding the strength of their mediating effects on instructional goals. In the second study, 321 elementary and secondary in-service teachers took part, from both general and special education schools. The results of the second study were similar to those of the first one. Additionally, state mindfulness significantly moderated the link between intrinsic life goals and needs recognition, particularly in participants presenting high mindfulness. The results shed light on the association between participants' life goals and instructional goals. Clarity about this structural entity may provide valuable information for disability studies and teacher training.

The relationship between quality and equity in education at system level: Secondary analyses of PISA
Keywords: Educational Policy, Large-scale Assessment, Quantitative Methods, School Effectiveness
Presenting Author: Leonidas Kyriakides, University of Cyprus, Cyprus; **Co-Author:**Maria Eliophotou, University of Cyprus, Cyprus; **Co-Author:**Evi Charalambous, University of Cyprus, Cyprus

Socioeconomic inequalities in education are an important issue for researchers and policymakers, since student achievement was found to be associated with students' socioeconomic status (SES). Educational effectiveness research investigates not only factors associated with student achievement (quality dimension of effectiveness), but also whether effective teachers/schools/systems can reduce the initial differences observed in student achievement which can be attributed to student background characteristics that are unlikely to change (equity dimension of effectiveness). This paper aims to explore the relationship between these two dimensions at the country level. To achieve this, secondary analyses of data from PISA 2015 and 2018 are conducted. Specifically, it is first explored whether educational systems which appear to be effective in relation to promoting student learning outcomes (quality) are also effective in relation to the equity dimension of effectiveness. Subsequently, it is examined whether improvement in the effectiveness status of countries in relation to one dimension of effectiveness can lead to the improvement of the other dimension. The results reveal a strong relationship between quality and equity at the country level since the achievement gap (in Mathematics, Science, and Reading) based on SES tends to be smaller in countries which achieve better results. It is also shown that the great majority of countries that can be considered as among the most effective in terms of the quality dimension are also among the most effective in terms of the equity dimension. Implications of the findings for promoting quality and equity are drawn.

Differences between countries in guessing behavior in international large-scale assessments
Keywords: Achievement, Large-scale Assessment, Quantitative Methods, School Effectiveness
Presenting Author: Jonas Dockx, KU LEUVEN, Belgium; **Co-Author:**Rianne Janssen, KU LEUVEN, Belgium

This study's aim was to assess whether differences between countries' average achievement in international large-scale assessments (ILSAs) are affected by differences in guessing behaviour on multiple-choice items. This research goal was prompted by the concern that ILSAs do not investigate differences in guessing behaviour between countries, while such differences could introduce construct-irrelevant variance in the achievement estimates. Accordingly, we used the data of the last two cycles of PIRLS, TIMSS and PISA to describe differences between countries in guessing behaviour. We used three types of IRT-models to assess these differences: a multiple-group 3PL-model with a unique guessing parameter per country, a multilevel 3PL-model where the guessing parameter was specified as a random country-level parameter, and a multiple-group 1PL-AG model with a different relationship between ability and guessing probability per country. Our interest was not in finding the best-fitting model, but whether differences between countries in the average disposition to guess correctly was stable across the models. The results showed that countries differ in their average disposition to guess correctly, with the different models showing similar results. We also found that countries' average disposition to guess correctly was positively related across ILSAs. However, the effect on countries' average achievement was limited.

ICT-skills of Flemish young adults according to PIAAC: the role of formal and non-formal education
Keywords: At-risk Students, Large-scale Assessment, Lifelong Learning, Pandemic
Presenting Author: Lisa Dewulf, Ghent University, Belgium; **Co-Author:**Lisse Van Nieuwenhove, Ghent University, Belgium; **Co-Author:**Fien De Smedt, Ghent University, Belgium; **Co-Author:**Bram De Wever, Ghent University, Belgium

Unqualified school leavers - the group of young adults who exit without a secondary education diploma - are more vulnerable in society. Frequent and productive use of ICT-skills at home is a prerequisite for efficient and effective problem-solving in today's society. The aim of this study is researching to what extent young school-leavers are mastering ICT-skills at home and to what the role formal and non-formal education is in relation to these ICT-skills. Based on the results of the linear regression analysis, using the PIAAC CY1 data of Flanders (Belgium, $n = 4340$), young school leavers were found to perform weaker for ICT-skills at home. Moreover, when they do not pursue formal or non-formal learning for job-related reasons, these performances are even weaker. We discuss that the impact of the COVID-19 pandemic threatens to widen the gap between highly skilled workers and low skilled workers & young school leavers for ICT-skills at home.

The Impact of Cognitive and Motivational Resources on Engagement with Automated Formative Feedback
Keywords: Attitudes and Beliefs, E-learning/ Online Learning, Engagement, Feedback
Presenting Author: Veronika Barkela, RPTU Kaiserslautern-Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany

Formative automated feedback has proven to be a supportive tool in online-learning-environments. However, the effectiveness of such feedback highly depends on cognitive, affective, and behavioral engagement. Research has shown that engagement is largely determined by learners' cognitive and motivational resources. Yet, most studies have only investigated either cognitive resources, such as mental effort, or motivational resources, such as expectancy-value-cost variables. When jointly modeled, the relationship between motivational beliefs and invested effort is ambiguous: (1) Motivational resources can influence cognitive, affective, and behavioral feedback engagement both directly and moderated by invested effort. (2) Previously invested mental effort can affect situational motivational resources which in turn affect feedback engagement. Therefore, the purpose of this study is to clarify the role of invested mental effort by identifying the model which best explains our empirical data.Data consists of 330 participants who worked in an online-learning-environment with automated formative feedback. Cognitive feedback engagement was indicated by the change in text quality in one session, affective feedback engagement by feedback acceptance, and behavioral feedback engagement by the number of feedback iterations. With SEM, we compared two models to clarify the role of invested mental effort. Results showed, that students who invested lower mental effort in the previous session have higher expectancy for success in the current session. Higher expectancy for success translates into lower feedback acceptance and more feedback iterations which in turn lead to higher achievement. This matches theoretical considerations that students' behavioral engagement is higher with higher expectancies for success.

Using Automated Individualized Feedback to Alter Learner Behavior in an Online Learning Environment
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Feedback, Learning Analytics
Presenting Author: Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Beate Eichmann, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Daniel Bengs, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Hendrik Drachsler, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Frank Goldhammer, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany

We investigated the effect of prompts from an automated individualized feedback on learner behavior in a digital learning environment. For this purpose, we

used trace data from an online course for pre-service teachers and examined whether the presentation of a specific feedback prompt leads to a change in the learning behavior addressed by the prompt. The online course consisted of five consecutive learning units. Process indicators related to multiple document processing were derived from trace data for each participant in each learning unit. Based on the process indicators, an automated individualized feedback dashboard was presented to the participants at the end of a learning unit. The feedback dashboard contained prompts on how to improve the individual learning behavior with regard to students' multiple document processing. Linear mixed models were estimated to investigate the relationship between the occurrence of specific feedback prompts and changes in the corresponding behavioral indicators in the subsequent learning unit. Our results show great variation between the effects of different feedback prompts, including effects in the intended direction, the reversed direction, and null effects. Implications for the use of feedback prompts will be discussed.

A Conceptual Framework of Learning Analytics Role in Feedback Practices in Higher Education
Keywords: Conceptual Change, Feedback, Higher Education, Learning Analytics
Presenting Author: Seyyed Kazem Banihashem, Open University, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Omid Noroozi, Wageningen University and Research Centre, Netherlands; **Co-Author:**Stan van Ginkel, Universiteit Utrecht / Hogeschool Utrecht, Netherlands; **Co-Author:**Leah P. Macdadyen, The University of British Columbia, Canada; **Co-Author:**Harm Biemans, Wageningen University, Netherlands

AbstractPrevious studies have shown a great potential for learning analytics (LA) to support and enhance feedback practices, especially within higher education contexts. However, a few studies have tried to provide an comprehensive overview and a conceptual framework of LA role in supporting feedback activities to better guide future LA users for feedback purposes in higher education. This review study followed PRISMA method to review and analyze studies. In addition, we adopted a well-known LA model as a theoretical framework to report current state of LA role for promoting feedback practices in higher education and then we proposed a framework conceptualizing four dimensions of LA for feedback including who (stakeholders), why (objectives), what (types of data), and how (methods). The results of this study provide a clear picture of LA role in supporting feedback practices within higher education contexts and it can help with effective adoption of LA-based feedback. Furthermore, the results of this study can be used as a starting point for future empirical studies in LA-based feedback. Keywords: Feedback, higher education, LA-based feedback, learning analytics, review study

Does individual feedback on learning behavior derived from digital traces improve learning?
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Feedback, Learning Analytics
Presenting Author: Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Daniel Bengs, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Daniel Biedermann, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**George Ciordas-Hertel, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Beate Eichmann, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Julia Mendzheritskaya, Goethe-Universität Frankfurt, Germany; **Co-Author:**Julia Mordel, Goethe-University Frankfurt, Germany; **Co-Author:**Marc Winter, Goethe-University Frankfurt, Institute of Psychology, Germany; **Co-Author:**Monica Onofrei, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Ilka Wolter, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Cordula Artelt, Leibniz Institute for Educational Trajectories, Germany; **Co-Author:**Hendrik Drachsler, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Holger Horz, Goethe-University Frankfurt, Institute of Psychology, Germany; **Co-Author:**Frank Goldhammer, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany

We investigated the effectiveness of dashboard feedback on learning behavior in an asynchronous online course, comparing two groups of teacher students who received individualized feedback derived from digital traces of learning behavior (treatment group) or generic feedback based on historical data of an earlier cohort (control group). For both groups, the feedback covered aspects of self-regulated learning, learning engagement, and multiple document processing. The hypothesis that individual feedback leads to greater gains in an outcome performance measure and learning-related motivational aspects is tested using two-group SEM. Preliminary results indicate that overall gains in learning-related motivational aspects are found. However, the data does not support the hypothesis of greater performance gains in the treatment group.

University teachers' conceptions on teaching and learning: a structural equation modeling study
Keywords: Conceptual Change, Higher Education, Misconceptions, Teacher Professional Development
Presenting Author: Neea Heinonen, University of Helsinki, Finland; **Co-Author:**Nina Katajavuori, University of Helsinki, Finland; **Co-Author:**Elina E. Ketonen, University of Helsinki, Finland; **Co-Author:**Mari Murtonen, University of Turku, Finland; **Co-Author:**Trang Nguyen, University of Turku / Faculty of Education, Finland; **Co-Author:**Ilona Södervik, University of Helsinki, Finland

The expertise in one's own subject knowledge has been one of the most respected features of a university teacher. In recent years, however, the need to improve university teachers' pedagogical awareness and education is acknowledged. This study aimed to investigate the relationship among university teachers' (mis)conceptions of teaching and learning, and the role of previous teaching experience and pedagogical studies in relation to teachers' (mis)conceptions were examined. Additionally, the effect of a short pedagogical training was investigated. A total of 127 life science university teachers from the University of Helsinki filled in a questionnaire, and a pre-test / post-test design was utilized. Data were analyzed using Structural Equation Modeling (SEM) and a paired t-tests. The results implicated that teachers who did not have previous pedagogical studies (PPS) had more transmissive beliefs compared to teachers with previous pedagogical studies. The paired t-tests revealed the potential effect of the pedagogical training on the development of teachers' conceptions of teaching and learning to a more constructivist direction. The findings provided evidence on the positive effect of the pedagogical training on fostering teachers' (mis)conceptions from more-traditional towards more-sophisticated direction. However, not everyone benefited from the training and further analysis with person-oriented approach will be made to examine the reasons affecting the phenomenon. Plausible explanations for the results and implications for theoretical and educational significance are also discussed.

Does irrelevant information reduce the quality of teacher judgments of student motivation?
Keywords: Achievement, Misconceptions, Motivation, Teacher Professional Development
Presenting Author: Jan Beck, Psychology of Learning in Education and Instruction, University of Münster, Germany; **Co-Author:**Stephan Dutke, Psychology of Learning in Education and Instruction, University of Münster, Germany; **Co-Author:**Till Utesch, Department of Educational Sciences, University of Münster, Germany

Teachers utilize information for motivation judgments inappropriately – commonly relevant information is ignored (Dicke et al., 2012) while irrelevant information is utilized (Brandmiller et al., 2020). We were interested if the mere availability of rather irrelevant information reduces utilization of relevant information when judging motivation. *N* = 150 pre- and in-service teachers judged eight fictitious students either based on relevant information (mastery goal orientation, and work avoidance; with three levels: "low", "average", or "high") or based on the same relevant information accompanied by gender (male; female) and academic

achievement (below-average; above-average). Prior to motivation judgments, participants' primary task was to remember student characteristics to assign students to heterogeneous working groups later. The intention was to simulate a realistic school setting in that participants needed to remember student information, but judged motivation after information was no longer available. Whereas participants utilized students' mastery goal orientations when solely relevant information were available (η^2 = .206), they neglected students' mastery goal orientations when irrelevant information was additionally available (η^2 = .023). Furthermore, academic achievement was utilized instead (η^2 = .157). These results show that academic achievement is a leading source of information for judging motivation even when motivation-relevant information is equally available. Thus, it should be discussed how to minimize the importance of academic achievement when teachers think of motivation as a central prerequisite for learning.

Understanding Teachers' Perceptions of Representations in Elementary Science Classrooms
Keywords: In-service Teachers, Primary Education, Science Education, Teacher Professional Development
Presenting Author: Cindy Hmelo-Silver, Indiana University, United States; **Co-Author:**Xintian Tu, Indiana University, United States; **Co-Author:**Joshua Danish, Indiana University, United States; **Co-Author:**Megan Humburg, Indiana University, United States; **Co-Author:**Meredith Park Rogers, Indiana University, United States; **Co-Author:**Adam Bell, Vanderbilt University, United States; **Co-Author:**Sarah Lee, Vanderbilt University, United States

Representations are essential to science education because they are central to science itself, and students need to be able to produce and interpret representations to engage deeply with scientific practices (Coleman et al, 2011). However, most research focuses on how learners engage with representations, with few studies exploring teacher understanding of their implementation. To support teachers in learning about using representations in elementary science classrooms, we designed the [Project], which includes professional development activities such as workshops and one-on-one coaching sessions. This paper explores teachers' perceptions of science representations and how the [Project] supports teachers in collaboratively building their practice of using representations in their elementary science classrooms. We analyzed eight participants' post-interviews and investigated how their understanding was formed through professional development workshops.

Collaborative problem solving and online inquiry: Skills, processes and neural basis
Keywords: Cognitive Skills and Processes, Computer-supported Collaborative Learning, Digital Literacy and Learning, Problem Solving
Presenting Author:Päivi Häkkinen, University of Jyväskylä, Finland; **Co-Author:**Johanna Pöysä-Tarhonen, University of Jyväskylä, Finland; **Co-Author:**Shupin Li, University of Jyväskylä, Finland; **Co-Author:**Jarkko Hautala, Niilo Mäki Institute, Finland; **Co-Author:**Susannah Otieno-Leppänen, University of Jyväskylä, Finland; **Co-Author:**Otto Loberg, Bournemouth University, United Kingdom; **Co-Author:**Paavo Leppänen, University of Jyväskylä, Finland

In the current digital age, online inquiry and collaborative problem solving are among the critical competencies to be mastered. Our multi-disciplinary research project provides knowledge and explains differences in collaborative problem solving (CPS) and online inquiry (OI) as well as the related underlying processes. Participants are sixth-grade students (aged from 11 to 12 years), from urban and suburban environments in Finland. The research was conducted in interconnected, multidisciplinary studies varying from a large-scale assessment at classroom level to eye-tracking and neurocognitive studies. The project has combined social, cognitive and neural level research aiming at understanding the interactions of CPS and OI processes and skills across these different levels. In this poster presentation, we will highlight the main results of the project.

Critical thinking in teacher education: A systematic review
Keywords: Critical Thinking, Higher Education, Pre-service Teachers, Qualitative Methods
Presenting Author: Jarmila Bubikova-Moan, Oslo Metropolitan University, Norway; **Co-Author:**Leila Ferguson, Kristiania University College, Norway; **Co-Author:**Anette Andresen, Kristiania University College, Norway

Critical thinking (CT) is a notoriously illusive concept. Despite its complexity, CT has attracted much attention in recent years. A growing body of research has looked to teacher education and addressed the question of pre-service teachers' training in teaching CT. The aim of this systematic review was to shed light on these issues by asking: 1) How is CT and its teaching conceptualized in international scientific literature? and 2) How do preservice teachers themselves conceptualize CT? To address our research questions, we conducted a qualitative meta-synthesis of international research literature, initially searching the research databases ERIC and PsychINFO and supplementing this with hand search in thematically relevant reviews. This initial search gave a total of 1060 studies, the abstracts of which were screened according to selected inclusion criteria. The removal of duplicates and irrelevant studies then gave 498 studies which are included in the full-text review. Preliminary findings suggest that CT has become a buzzword with insufficient definitions and that it is used interchangeably with other concepts, such as problem-solving, creative thinking, and self-regulated learning by authors of scientific papers. Also, few of the studies investigated teachers' own conceptualization of critical thinking that attest to similar patterns as for RQ1. There also seems to be an assumption that teaching teachers to think critically about their own practice will automatically translate into a capacity to teach CT to their students. We will discuss the implications of our findings for an education in changing and uncertain times.

Argumentative design capacity: post-practice reflection, more than instruction, makes a difference
Keywords: Argumentation, Pre-service Teachers, Qualitative Methods, Teacher Professional Development
Presenting Author: Gabriel Fortes, Universidad Alberto Hurtado, Chile; **Co-Author:**Sylvia De Chiaro, Universidade Federal de Pernambuco, Brazil; **Co-Author:**Dayane Silva, Universidade Federal de Pernambuco, Brazil; **Co-Author:**Felipe Chaves, Universidade Federal de Pernambuco, Brazil; **Co-Author:**Nathalia Teofilo, Universidade Federal de Pernambuco, Brazil; **Co-Author:**Rodrigo dos Santos, Universidade Federal de Pernambuco, Brazil

Pedagogical design refers to the ability of teachers to recognize and use educational resources to compose activities to meet educational goals. Teaching, then, is designing because teachers are required to anticipate, adapt, and assess students content learning to different forms of instructional practice. When it comes to argumentation studies much attention has been put on learn to argue and argue to learn and recently learn to teach through argumentation, however, less has been investigated on how teacher plan to use argumentation in classrooms. To understand how progressive reformulations of classroom strategies, carried out from the subsequent analysis of their practices, can contribute to the development of the capacity of an argumentative pedagogical design, we analyze potentially argumentative strategies developed by teachers in training throughout a Development Program of 440 hours called "Pedagogical Residence" for Pedagogy undergraduates. In all, there were 29 undergraduate students who produced, in groups, several versions of an argumentative lesson plan (ALP). We carried a qualitative research to evaluate the ALP in three categories: 1) What (content related); 2) How (strategy related); and 3) Why, (post-practice reflection). The results indicate that pedagogical content-knowledge instruction was not enough for teachers to understand and design ALP, moreover, it is noticed that classroom practice was associated with increasing the argumentative potential of ALP through revisions, which proved to be a powerful tool of teachers' development design capacity. In this sense, we argue that argumentative pedagogical design capacity refers to practicing the potentiality of ALP and not just an abstract knowledge.

The influence of guidance and on-the-fly scaffolding in scientific inquiry
Keywords: Inquiry Learning, Instructional Design, Primary Education, Science Education
Presenting Author: Heide Sasse, RPTU Kaiserslautern-Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany; **Co-Author:**Timo Reuter, Rheinland-Pfälzische Technische Universität Kaiserslautern - Landau, Germany; **Co-Author:**Anke Maria Weber, University of Luxembourg, Luxembourg

Elementary school children differ in their ability to practice scientific inquiry processes (Schiefer et al., 2021). Some students need high guidance to accomplish scientific inquiry tasks, as in structured-inquiry, while others need low guidance, as in guided-inquiry (Parsons et al., 2018). However, to match the amount and type of guidance according to momentary students' needs teachers need support strategies, such as on-the-fly scaffolding (Corno, 2008; Van Leeuwen & Janssen, 2019). We conducted a pre-posttest design with 164 elementary school children (M = 9.9 years, SD = .66, 57 % female). We researched the influence of different sequential orderings of structured-inquiry and guided-inquiry with the aspect of on-the-fly scaffolding strategies. We measured the children's conceptual knowledge, process knowledge and science self-concept, as well as the perceived amount of on-the fly scaffolding. Mixed effects models revealed no differential learning effects depending on the order in which the children had guided-inquiry or structured-inquiry first. However, z-tests of proportions revealed that children were less likely to require a high amount of on-the-fly scaffolding strategies during guided-inquiry if they had guided-inquiry second. Furthermore, mixed-effects models showed that problematizing scaffolds are positively related to children's process knowledge. Our findings suggest that both structured-inquiry and guided-inquiry support children's science learning. However, different sequential orderings of high and low guidance influence children's autonomy during guided-inquiry. Furthermore, Scaffolds that stimulate deeper thinking processes have a positive influence on process knowledge.

Studying preservice teachers' evaluation of evidential support in arguments about educational topics
Keywords: Argumentation, Pre-service Teachers, Reasoning, Science Education
Presenting Author: Andreas Lederer, University of Erfurt, Germany; **Co-Author:**Eva Thomm, University of Erfurt, Germany; **Co-Author:**Johannes Bauer, University of Erfurt, Germany

When future teachers inform themselves about educational topics, they often come across diverse arguments including research-based and anecdotal evidence. In these situations, it is important to select reliable information and identify well-founded claims. While anecdotal evidence is frequently valued for its authenticity and practical implications, evidence of educational research can provide information based on systematic investigation and may therefore be more reliable in supporting claims about educational topics. Though both types of evidence are important resources to later professional practice, already pre-service teachers are shown to prefer anecdotal evidence. This study addresses pre-service teachers' evidence evaluation and examines whether they acknowledge differences in evidential support or maintain general preferences for anecdotal evidence though it may provide insufficient support for a given claim. To control for floor and ceiling effects due to training in research methods, we compare their evaluations with those of psychology. Accordingly, the experiment follows a 2x3 mixed design with the between-participant factor field of study (teacher education, psychology) and within-participant factor evidence type (anecdotal, correlational, experimental): Pre-service teachers and psychology students read arguments on educational topics that are supported by either anecdotal, correlational or experimental evidence. Participants assess their claim agreement, the convincingness of the argument and the strength of the evidential support. We expect pre-service teachers to agree more with anecdotal evidence, consider it to be more convincing and stronger evidential support than both scientific evidence and compared to psychology students. The findings contribute to recent research on pre-service teachers' reasoning and understanding of educational research.

Lessons learned from applying Project-Based Learning: The Educator perspective
Keywords: Inquiry Learning, Problem-based Learning, Qualitative Methods, Teacher Effectiveness
Presenting Author: Tina Papathoma, Code University of Applied Sciences, Germany

This study set out to answer the following research question: How do educators experience Project Based Learning (PjBL) in the context of teaching bachelor students of software engineering? To do this it touches upon theories of inquiry-based learning which places learners in the center, having control of their own learning. To this end, a case study was conducted with a focus on how educators applied PjBL with their bachelor students studying Software Engineering (SE). The data comprised 20 interviews with educators who were involved in four knowledge areas around SE. The interviews were thematically analysed. Preliminary findings show that PjBL can be an effective approach when combined with direct instruction. Educators' evidence also shows that it has been a challenge for some courses to approach them with PjBL. The findings can help institutions and educators to design better study programs applying PjBL. Drawing on this evidence, this study supports that PbL is a well needed approach that has the potential to bridge the gap between theoretical studies and the workplace however, it should not be the sole teaching approach but it should be combined with strong instructional teaching methods especially when dealing with novice learners.

Learning with multiple solutions - more promising in homogeneous or in heterogeneous teams?
Keywords: Cooperative/Collaborative Learning, Instructional Design, Mathematics/Numeracy, Problem Solving
Presenting Author: Cornelia S. Große, Johannes Kepler University Linz, Austria, Austria

Learning with multiple solutions in mathematics is promising in order to foster deep insight and understanding. However, it is often very difficult for students to generate just one solution, let alone more than one. The aim of this study is to investigate whether collaboration fosters the acquisition of modeling competencies, and whether learning in homogeneous or in heterogeneous teams is more promising. In an experiment, students learned alone, in homogeneous dyads, or in heterogeneous dyads, and they were prompted to generate one or multiple solutions in the learning phase (N = 193 seventh and eighth graders). Learning in homogeneous dyads was most beneficial with respect to the acquisition of modeling competencies. Being prompted to generate a second solution was beneficial only for learners with high prior knowledge; however, overall, generating multiple solutions had positive impact.

Evaluation of initial aritmetic skills: adaptation and validation study of TEMA-3
Keywords: Achievement, Assessment Methods, Early Childhood Education, Mathematics/Numeracy
Presenting Author:RAQUEL WEBER, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**Fabiana de Miranda Rocha Luna, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**Luciana Vellinho Corso, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil; **Co-Author:**Amanda Oliveira Meggiato, Universidade Federal do Rio Grande do Sul, Brazil

The initial aritmetic skills are part of the number sense construct and its early evaluation is of fundamental importance since such competencies are strong predictors of later mathematical performance. This research aimed to adapt and validate the Test of Early Mathematics Ability (TEMA-3) to investigate the initial arithmetic abilities in Brazilian children. The pilot study included 204 children, between 3 and 8 years of age, from public schools of the state of Rio Grande do Sul, Brazil. The initial arithmetic abilities were evaluated by TEMA-3 and the Number Sense Brief (NSB), both translated into Portuguese. To verify the internal

structure of the instrument, a confirmatory factor analysis was performed. The reliability of the scale was verified, alongside tests of differences of means between genders, analysis of variance for difference of means between schools and Spearman correlations between the performance scores in the TEMA-3 and the other variables involved: age, mother's schooling, income, intellectual performance, and NSB performance scores. The results show the possibility of using the TEMA-3 for the evaluation of initial arithmetic abilities in Brazilian children, filling gaps in this context. This instrument showed the potential to become an important tool for diagnosing early difficulties in mathematics and to enable the development of appropriate intervention programs, seeking to minimize future difficulties in this area. The study has implications for the fields of research, education, and clinical practice.

Pre-service teachers' diagnostic competences: Development of accuracy, sensitivity, and specificity
Keywords: Competencies, Mathematics/Numeracy, Pre-service Teachers, Quantitative Methods
Presenting Author: Stephanie Kron, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Daniel Sommerhoff, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

Even though diagnostic competences of (pre-service) teachers gain more and more research interest, evidence on the development of diagnostic competences is rare, in particular if different instructional conditions are compared. Moreover, diagnostic judgements are primarily investigated in terms of accuracy, meaning the match between a diagnosis and an independent diagnosis, for example measured by a standardized test. We suggest to separate diagnostic performance in terms of identifying students' misconceptions (sensitivity), from the diagnosis in terms of identifying students' competences (specificity).Aiming to investigate the development of diagnostic competences with a focus on performance measures, we conducted a longitudinal study based on simulated diagnostic one-on-one interviews, comparing a role-play and a video simulation format. We report data of pre-service mathematics secondary school teachers, who participated in one of the two presentation formats (role-play or video) four times, taking over the role of a teacher. Moreover, we investigated how accuracy, sensitivity, and specificity were related to participants' content knowledge and pedagogical content knowledge as assessed by written tests.Findings show that accuracy and sensitivity relate to participants' professional knowledge, leading to the question why higher professional knowledge does not support diagnosing students' competences (specificity) in particular. Acc uracy, sensitivity, and specificity increased over repeated participation in the simulation, but the development was not related to the presentation format of the simulation.

Assessing Critical Thinking of Mathematical Literacy
Keywords: Assessment Methods, Critical Thinking, Mathematics/Numeracy, Secondary Education
Presenting Author: Kai-Lin Yang, National Taiwan Normal University, Taiwan; **Co-Author:**Chien-Heng Chen, Taipei Municipal Dali High School, Taiwan; **Co-Author:**Wan-Rou Wu, National Taiwan Normal University, Taiwan; **Co-Author:**Yun-Zu Chen, Taipei Municipal Nanhu High School, Taiwan

Critical thinking, one higher-order thinking, has been increasingly emphasized in the information-rich age. Researchers recognize that critical thinking can be articulated and instilled in learning content knowledge (Ellerton, 2022). Programme for International Student Assessment (PISA) 2022 mathematical framework explicitly highlights critical thinking as one of eight crucial 21st century skills embedded in mathematical literacy (OECD, 2018). Accordingly, a framework for assessing critical thinking of mathematical literacy is beneficial to clarify the specific meaning of critical thinking in mathematics and to shed light on the development of mathematics literacy and itself. This study aims to propose a two-dimensional framework of assessing students' critical thinking of mathematical literacy and, based on the framework, design an online questionnaire for assessing students' critical thinking of quantitative literacy. The first dimension captures key components of critical thinking, which can not only keep the core features of critical thinking but also be differentiated from other skills. The other involves the three components of solving real-world problems in PISA mathematics framework. Exemplary test questions of the nine categories will be presented, and strategies to design test questions based on the framework will be provided. The framework contributes to an immersion approach, developing thinking skills naturally in disciplinary classrooms, to fostering critical thinking of mathematical literacy.

Screening early subitizing abilities in preschool classes – comparison of tests
Keywords: Assessment Methods, Classroom Assessment, Early Childhood Education, Mathematics/Numeracy
Presenting Author: Mona Holmqvist, Lund University, Sweden; **Co-Author:**Damon Tutunjian, Malmö university, Sweden; **Co-Author:**Catarina Wästerlid, Malmö University, Sweden

The focus in this study is methods for screening young children's, subitizing abilities. *Subitize* is in this project defined as identifying the number of things in a set simply by quickly looking at them and without counting them one by one. The aim of the study is to compare two different screening instruments for identifying children's subitizing abilities, individually and in groups of children, in a Swedish preschool class context. In total, data from 44 children is collected, who have taken one group test (Ability to Quickly See Quantity - AQSQ), and an individual test (Number Set Test - NST). The research question was if the children's results correlate with each other, or not, no matter of test conditions (individual/group). The results show a moderate to strong positive correlation, using Pearson and T-test Pair Samples Correlation (r=.559 p=

Solving word problem: the choice of an algorithm depends on non mathematical world semantics
Keywords: Cognitive Skills and Processes, Developmental Processes, Mathematics/Numeracy, Teaching/Instructional Strategies
Presenting Author: Jean-Pierre Thibaut, Université de Bourgogne / Lead - CNRS, France; **Co-Author:**Fatimah Alhashem, College of Arts & Sciences Gulf University for Science & Technology (GUST), Kuwait., Kuwait

The algorithms that are used in arithmetic problem solving do not depend on the nature of the objects that are featured in the problem. Combining sets of apples or sets of seconds rests on the same basic operations. In the present study, we suggest that the way people use algorithms might depend on the nature of the manipulated objects. We illustrate this claim with word distributive problems that can be solved either by factorization or by development. Our contention is that the strategy participants choose might on the semantic distance between the objects that are featured in the problem. 115 hundred fifth and sixth graders and 110 adults.
Design : Objects featured in the problems were from the same basic level category (apples and apples) or from distant superordinate categories (e.g. apples and computers). The other factor was the presence or absence of a structuring element (e.g. fruit baskets, or presents)Materials: Five experimental problems per condition and 5 filling problems.
Procedure: children were seen in their classroom and adults received and answered via internet (google forms).ResultsOverall, there was more factorizations in adults than in children and, importantly, a main effect of semantic distance (more factorization for apples and apples than for apples and computers). The solving procedure – factorization or development –depended on the semantic distance as close objects elicited more factorization than distant objects. Interestingly, the effect of semantic factors increased rather than decreased with age, thus are not correlated with a lack of competence.

Reducing Educational Inequality by Means of Equity Funding Policies? Findings from Germany
Keywords: Economics of Education, Educational Policy, Migrant / Refugee and Minority students, Mixed-method Research
Presenting Author: Denise Demski, Ruhr-University Bochum, Institute of Educational Sciences, Germany; **Co-Author:**Norbert Sendzik, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Marcel Helbig, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Gabriele Bellenberg, Ruhr-University Bochum, Institute of Educational Sciences, Germany

(Inter)national empirical findings repeatedly prove that both socioeconomic status and contextual factors at the level of the learning group, the school and the social space are decisive for educational opportunities. Equity funding policies might be an effective way to reduce educational inequalities. Following this approach, schools in challenging circumstances can receive additional staff, funding, or further support. However, empirical evidence of the effectiveness of this approach is rare. In Germany there are hardly any findings regarding the extent, the concrete design and the effects of equity funding schemes. In a current project funded by the German Federal Ministry of Education and Research we address these desiderata by (1) systematically analyzing and typologizing the different equity funding policies in the field of K-12 education in German municipalities and federated states, (2) conducting in-depth research of sensemaking processes of actors involved in these policies in four selected municipalities on the basis of interviews, and (3) analyzing the effects of equity funding in a quasi-experimental approach using difference-in-differences estimates. The design of our project, first results, and implications for policy and practice will be discussed in the roundtable.

Reducing gender segregated educational choices with pedagogical work life visits
Keywords: Gender Issues, Secondary Education, Self-efficacy, Tool Development
Presenting Author: Jenni Kunnari, University of Oulu, Finland; **Co-Author:**Satu Kaleva, University of Oulu, Finland; **Co-Author:**Kati Ilkka, City of Oulu, Finland; **Co-Author:**Hanni Muukkonen, University of Oulu, Finland

In many countries, education and work life is strongly segregated by gender (Van Soom & Donche, 2014) and, hence, it is needed to gain knowledge on how to encourage secondary education (SE) students to make educational choices atypical to their gender. In this project we aim to find new ways to implement work life visits by developing visit schemes, a web page as a communication tool, and training and preparatory material for school staff and the work life representatives. The representatives are, in terms of gender, selected for presenting counter stereotypical role models: females from ICT and males from education. We evaluate the effectiveness of actions taken in the project with pre- and postquestionnaires to be answered by the SE students and implement workshops for the counsellors, teachers, and work life representatives. In the roundtable session we will provide an insight to the latest results of our project, present our thoughts for developing work life visits, and lay a foundation for a discussion on research and developmental work on work life visits.

Promoting Intercultural Group Work: Lecturers' Strategies, Self-Regulation and Required Support
Keywords: Cultural Diversity in School, Higher Education, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies
Presenting Author: Weiwei Li, University Groningen, Netherlands; **Co-Author:**Swati Vartak, University Groningen, Netherlands; **Co-Author:**Robert Coelen, University Groningen, Netherlands; **Co-Author:**Sabine Otten, University Groningen, Netherlands

AbstractResearch highlighted intercultural competence in students' preparedness for changing local and global environments in both personal and professional life. Although there is consensus surrounding the need for students to develop intercultural communication skills, there is a paucity of research exploring how educators can foster student intercultural learning. This study examines the teaching practices, beliefs and experiences of educators that foster student intercultural learning in cross-cultural group work, across a range of disciplines. It explores the characteristics of teaching that foster intercultural learning, and the influences on educator approaches. Semi-structured interview data from 19 lecturers were subjected to thematic analysis. The findings identified 4 types of teaching strategies used to foster intercultural learning in student groups. This study illuminates the conditions that support educators to foster intercultural learning, as well as the challenges they face. Educators' self-regulation, often made visible to students, played a key role in supporting students.

Individualising Swedish for Immigrants: Tensions and innovations in teachers' professional practice
Keywords: Lifelong Learning, Migrant / Refugee and Minority students, Social Aspects of Learning and Teaching, Teacher Professional Development
Presenting Author: Dimitrios Papadopoulos, University of Gothenburg, Sweden

Individualising processes in adult education contexts have emerged over several decades as all-embracing solutions to identified societal challenges. One such example is Municipal Adult Education in Swedish for Immigrants, in which key policy documents set individuals' needs and conditions as education's point of departure. SFI teachers are thus expected to enact innovative pedagogies in supposedly flexible educational frameworks which, nevertheless, provide limited margins of manoeuvre. The purpose of this paper is to examine the ways in which adult education teachers enact individualising processes in the context of SFI and the implications for their professional practice. Cultural-historical activity theory serves as the conceptual and theoretical framework of the study. Therefore, teachers' professional conduct is considered to be interwoven in networks of interactions between different stakeholders (e.g., principals, labour-market representatives, policy makers), which often have conflicting interests and expectations about SFI. The empirical base of the paper consists of individual and focus group interviews with SFI teachers from eight Swedish municipalities. Preliminary results show that tensions in the professional practice of SFI teachers result in the emergence of new pedagogical practices regarding individualising processes with immediate effects on the structure and content of the program.

A Practical Approach to Authentic Assessment in Higher Education

Keywords: Assessment Methods, Creativity/Divergent Thinking, Higher Education, Instructional Design
Interest group: SIG 04 - Higher Education

Higher education in the post-COVID period faces significant challenges due to the pace of technological innovation and increased demands from governments and industry globally for job-ready graduates. The skills and knowledge expected from graduates have shifted and industry reports reveal a requirement for what have been described as '21st century skills' – collaboration; communication; Information and Communication Technology (ICT) literacy; and social and/or cultural competencies (Lai & Viering, 2012). Also, of note are creativity, critical thinking and problem-solving skills. Developing and evidencing these skills has proven to be a challenge for higher education institutions. One way to facilitate the evaluation of these desired skills is to ensure the learning activities and assessment tasks are 'authentic'.
A discussion relating to authentic assessment should necessarily consider constructive alignment (Biggs, 1996), which highlights the intrinsic link between learning outcomes (what the students should know or be able to do at the end of the learning) and the assessment tasks (the evidence of learning). Learning outcomes should be carefully crafted to include language that adequately describes the level of attainment required to demonstrate mastery and the degree of complexity required in the assessment task. In this workshop participants will be guided through discussion and activities that will enable them to use the principles of constructive alignment to identify and develop learning outcomes that facilitate authentic assessment activities and students' development of 21st century skills.

A Practical Approach to Authentic Assessment in Higher Education

Workshop
Learning and Social Interaction

What is failure anyway? Dealing with uncertainty in (the replicability of) adaptive instruction

Keywords: Cognitive Skills and Processes, Emotion and Affect, Synergies between Learning / Teaching and Research, Teaching/Instructional Strategies
Interest group: SIG 10 - Social Interaction in Learning and Instruction

Adaptive face-to-face instruction, support provided at the point of need, is often mentioned as an important feature of good teaching. Although adaptive teaching is considered effective, empirical evidence of its effectiveness is scarce and weak. A possible reason for this scarcity might arise from a lack of clarity about the ways in which adaptivity is conceptualized, operationalized and analyzed. Research literature about adaptive instruction has focused on various dyadic behaviors that might be viewed as *related* behaviors or *responsive* behaviors or a combination of both. A replication study is a well-suited research design to address possible (un)clarities in our current understanding of adaptive instruction. Our preregistered replication study tests whether contingent instruction, a specific conceptualization and operationalization of adaptive instruction, can be carried out by trained tutors and whether claims about the effectiveness of the contingent instruction still hold. Contingent instruction in this study was operationalized as intervening at the point of failure. Whenever a child failed, the tutor had to provide more support, whenever the child succeeded, the tutor had to offer less support. The judgment of what constitutes failure resulted in a fundamental debate about the question: what is failure to teach adaptively or failure to replicate anyway? This workshop will address and explore the role of uncertainty and imprecision in human judgment in educational research.

What is failure anyway? Dealing with uncertainty in (the replicability of) adaptive instruction
Presenting Author: Nienke Smit, Utrecht University, Netherlands; **Presenting Author:**Renske de Kleijn, UMC Utrecht, Netherlands; **Co-Author:**Jelte Wicherts, Tilburg University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands

Adaptive face-to-face instruction, support provided at the point of need, is often mentioned as an important feature of good teaching. Although adaptive teaching is considered effective, empirical evidence of its effectiveness is scarce and weak. A possible reason for this scarcity might arise from a lack of clarity about the ways in which adaptivity is conceptualized, operationalized and analyzed. Research literature about adaptive instruction has focused on various dyadic behaviors that might be viewed as *related* behaviors or *responsive* behaviors or a combination of both. A replication study is a well-suited research design to address possible (un)clarities in our current understanding of adaptive instruction. Our preregistered replication study tests whether contingent instruction, a specific conceptualization and operationalization of adaptive instruction, can be carried out by trained tutors and whether claims about the effectiveness of the contingent instruction still hold. Contingent instruction in this study was operationalized as intervening at the point of failure. Whenever a child failed, the tutor had to provide more support, whenever the child succeeded, the tutor had to offer less support. The judgment of what constitutes failure resulted in a fundamental debate about the question: what is failure to teach adaptively or failure to replicate anyway? This workshop will address and explore the role of uncertainty and imprecision in human judgment in educational research.

Yellow-Red: Playful Tablet based executive function test for children between 6 and 12

Keywords: Assessment Methods, Classroom Assessment, Cognitive Development, Cognitive Skills and Processes
Interest group: SIG 01 - Assessment and Evaluation

Please bring your own device if you are attending this ICT demonstration.Executive Functions are psychological processes of great importance for the proper functioning in various areas of human development, including academic performance. For this reason, from both clinical and educational perspectives, there is great interest in how they are assessed. This ICT will show Yellow-Red, an instrument for directly assessing executive functions in children between 6 and 11 years of age, in a playful format using a digital support. The test is based on a 3-factor model of executive functioning: Inhibition, Working Memory, and Cognitive Flexibility. Yellow-Red comprises six subtests: cognitive inhibition (2), behavioral inhibition (1), working memory (2), cognitive flexibility (1). The ICT will focus on showing in detail the six subtests of the test, learning how to interpret individual reports and learning how to access the tool free of charge for research purposes. The test is standardised for Chile, is in the process of being standardised for Germany and has versions in Norwegian, Hungarian, Romanian, Chinese and English.

Animated videos in social science didactics for pre-service teacher education

Keywords: Social Sciences and Humanities, Teacher Professional Development, Tool Development, Video-based Learning
Interest group: SIG 11 - Teaching and Teacher Education

Please bring your own device if you are attending this ICT demonstration.Social Science teachers must develop professional skills to arrange learning opportunities that foster political literacy among students. There is growing evidence that the usage of videos in university teacher education is beneficial to the pedagogical knowledge and the professional vision of pre-service teachers. There is however a severe lack of studies on video usage in Social Science teacher education and its effects on professional development, not least because there are even less freely accessible video resources of civic education lessons. As part of a joint research project, we developed 22 animated videos of civic education lessons based on authentic video recordings, with the goal to close this gap in supply of freely accessible videos of civic education lessons and to strengthen the theory-practice link in university teacher education. Each video is fully subtitled in English language, created barrier-free and published open access. As the first freely accessible video representations of authentic North-Rhine-Westphalian civic education lessons, our videos open up a wide range of research questions, e.g. regarding a potentially domain specific professional vision of Social Science teachers or the effects of a video-based learning environment on the pedagogical content knowledge of pre-service teachers. We demonstrate how to use animated videos and related learning tasks in higher education seminars to foster the professional vision of pre-service teachers.

Invited Symposium
Teaching and Teacher Education

Non-Convincing Effects in Research on Teaching Quality: Reasons and Possible Solutions

Keywords: Quantitative Methods, Teacher Effectiveness, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Charalambos Charalambous, University of Cyprus, Cyprus
Chairperson: Anna-Katharina Praetorius, University of Zurich, Switzerland
Discussant: Alexander Renkl, University of Freiburg, Germany

Past educational effectiveness research has been successful in empirically corroborating the role of teaching for student learning and uncovering teaching dimensions conducive to this learning. Yet, a critical inspection of this body of work suggests that the effects of different dimensions of teaching quality on student learning are neither very consistent nor very convincing in terms of effect sizes (cf. Evans & Yuan, 2022; Scheerens, 2016). In this symposium, we therefore ask: *What is contributing to the often small or even nonexistent effects obtained when trying to link teaching quality to student learning? What can be done in the future to address this challenge?* To systematically address these questions, the four papers in this symposium offer four complementary angles to do so. The first paper (Muijs et al.) explores how conceptualizing teaching quality contributes to such findings. Focusing on the learning outcomes, the second paper (Vieluf et al.) questions the alignment between how teaching quality and learning outcomes are conceptualized. The third paper (Praetorius et al.) identifies several potentially important contextual factors and illustratively discusses how two (subject matter and classroom composition) might be contributing to the non-convincing findings. The fourth paper (White et al.) explores how current measurement approaches might be contributing to such findings. As a whole, the four papers highlight potential reasons for the non-convincing findings and offer possible solutions for addressing this problem that lend themselves to redirecting future research in this field.

Conceptualizing Teaching Quality: Problems, Prospects and a Proposed Way Forward
Presenting Author: Charalambos Charalambous, University of Cyprus, Cyprus; **Co-Author:**Daniel Muijs, Queen's University Belfast, United Kingdom; **Co-Author:**Ariel Lindorff, University of Oxford, United Kingdom

Empirical studies of the contribution of teaching quality to student learning have often found only small effects. In this paper we argue this is at least partly due to how teaching quality has been conceptualized in teacher effectiveness research (TER). We propose four factors that, if addressed, could contribute to more convincing and substantial findings in TER in the future. These factors are: 1) existing difficulties and dilemmas in defining teaching and its quality; 2) current approaches to conceptualizing teaching quality; 3) a narrow perspective on content and context; and 4) restrictions on current conceptualizations of teaching quality due to limited conceptualizations of student learning. We propose that more collaborative work in the future and a broadening of current conceptualizations of teaching quality will contribute towards addressing some of these open issues.

Challenges in Conceptualizing the Outcomes and the Linkage between Outcomes and Teaching
Presenting Author: Svenja Vieluf, Technische Universität Braunschweig, Germany; **Co-Author:**Alexander Naumann, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Kirsti Klette, University of Oslo, Norway

This paper addresses the conceptualization of (a) the outcomes and (b) of the linkage between teaching and outcomes in teaching effectiveness research. Conceptualization is of central relevance in the critical rationalist paradigm, as it links theory with empirics. In particular, the outcomes and the linkage between teaching and the outcomes need to be rigorously conceptualized, because the teaching effectiveness paradigm rests on two assumptions: First, teaching is considered effective when normatively defined outcomes are observed. Second, it is assumed that learning outcomes can be explained by teaching. With regard to both, the conceptualization of the outcomes and the conceptualization of their linkage with teaching, considerable advances have been made during the past decades, but also several challenges remain. In particular, research is challenged by the multiplicity of relevant learning outcomes, a lack of justification for the outcome-choices made within each study, a lack of agreed-upon nominal definitions of these outcomes, insufficient alignment of nominal and operational definitions, and study designs that do not allow for modeling the whole theoretically assumed complexity of the causal link between teaching and learning. Our presentation will discuss these challenges using examples from empirical teaching effectiveness studies, discuss how these issues might be resolved and point to future research directions.

Context Effects in Teaching Quality Research: Bringing a Complex Term Into Focus

Presenting Author: Anna-Katharina Praetorius, University of Zurich, Switzerland; **Co-Author:**Benjamin Fauth, Institute for Educational Analysis and University of Tübingen, Germany; **Co-Author:**Armin Jentsch, University of Oslo, Norway; **Co-Author:**Stefan Keller, Zürich University of Teacher Education, Switzerland

Contextual variables are highly relevant for research on teaching quality as they might influence empirical findings and thus hamper the validity of studies. The most frequently mentioned are content, class composition, school type, curriculum, and national particularities. Referring to the instructional triangle, we focus on content and class composition as two particularly important elements of teaching quality in this paper. First, we summarize empirical evidence on the relevance of content and student composition for teaching quality. Second, we discuss the challenges of treating them as contextual variables, arguing that two elements which form an integral part of teaching quality cannot at the same time be considered a contextual variable. Instead, we suggest that future research should focus on the interplay between teachers, students and content to do justice to the complexity of teaching quality. We end by discussing the implications for our argument for future studies in this field.

Measuring Teaching Quality: Dilemmas and Tradeoffs
Presenting Author: Richard Goellner, University of Tuebingen, Germany; **Co-Author:**Mark WHite, University of Oslo, Norway; **Co-Author:**Thilo Kleickmann, Kiel University, Germany

Research has highlighted many complexities in the measurement of teaching quality. These complexities provide one explanation for the low and inconsistent correlations between measures of teaching and learning. This presentation discusses dilemmas and tradeoffs in the measurement of teaching quality. These dilemmas exist in the way that teaching quality is operationalized, in the choice of raters, and in the unit of analysis. Balancing these dilemmas is necessary to align measurement approaches to study goals. No measurement of teaching could ever be perfect. Rather, there is a need to clearly identify one's priorities to guide decisions that balance between the dilemmas and tradeoffs highlighted here. The explicit discussion of the dilemmas that we discuss here will help support researchers in doing this.

Invited Symposium

Creative, inclusive and equitable play and learning environments: Children's participation in focus

Keywords: Art Education, At-risk Students, Attitudes and Beliefs, Creativity/Divergent Thinking, Early Childhood Education, Gifted and Talented Students, Inclusive Education, Pre-service Teachers, Social Development, Special Education, Sustainable Development, Teaching Approaches, Well-being
Interest group:
Chairperson: Heidi Harju-Luukkainen, University of Jyväskylä, Finland
Chairperson: Eva Staffans, Finland
Discussant: Eva Staffans, Finland

Participation, a fundamental right of all children, is prominent in Nordic discussions regarding early childhood education and care (ECEC). The concept is evident in Nordic policy, steering documents and curricula. Planning for children's participation should be intentional, and opportunities created for children to share voice and to influence. The Nordic countries have a strong commitment to the UN Convention on the Rights of the Child; articles 12, 13, 14 and 15 have particular relevance for this symposium. Complexity surrounding the phenomenon of children's participation seems to be universal across studies. However, there are some general aspects that our collective research highlights, including that relationship between teacher and child are crucial for children's participation and engagement and hope for the future. Furthermore, marginalised children including those with special educational needs are more vulnerable than children are in general and might have challenges in participation and getting their voices heard. Striving for equitability among all children is a demanding task for teachers and they need to be aware of effects arising from their way of supporting, allowing or denying children to express themselves. The present symposium aims to highlight and discuss children's participation from differing angles and perspectives. We share studies that span early childhood centres, community settings, and examination of guiding documents. The contributions are from Finland, Norway and Sweden.

CANCELLED: Young children's participation and voices in city planning
Presenting Author: Terese Wilhelmsen, University of South-Eastern Norway, Norway; **Co-Author:**Steinar Ovreas, University of South-Eastern Norway, Norway; **Co-Author:**Simen Thorrud, University of South-Eastern Norway, Norway; **Co-Author:**Hege Roll-Hansen, University of South-Eastern Norway, Norway; **Co-Author:**Anne-Line Bjerknes, University of South-Eastern Norway, Norway

Scarce knowledge exists on how to involve the youngest children in city planning. The aims of this study were to develop, test and research methods to promote young children's interests, participation, and voices in city planning. The project is based on a collaboration between a municipality and researchers. The theoretical frame incorporates children's rights perspectives and research on child-friendly environments considering children's independent mobility and affordance. We used a multi-method and multi-perspective approach. The participants were children (aged 3-6), parents (14), and early childhood education (ECE) teachers (N=3) from three ECE institutions. Teacher students acted as co-researchers and, together with ECE teachers, involved three groups of children in exploration of available play areas and children's wish for improvement of the areas with the use of guided tours, field conversations, drawing and constructive play. Parents participated by marking on a map their preferred places to play and walk in the neighbourhood with their children, and a structured survey was used to identify what the parents liked and disliked about their neighbourhood, and their wishes for further development. The project was approved by the Norwegian Center for Research Data. In the presentation we discuss five main characteristics of good play areas as emphasized by children and parents: 1) allowing creative and challenging play, 2) safety, 3) green city lungs, 4) area for the whole family, and 5) child friendly transitions between areas.

Teachers' perspectives on children's creativity in Swedish preschools
Presenting Author: Valerie Margrain, Karlstad University, Sweden; **Co-Author:**Alexandra Guseva, Karlstad University, Sweden

Though widely accepted, the notion of creativity is often misinterpreted and, regarding the educational context, unreflected by the practitioners, which potentially restrains pedagogical practice. The aim of this study is to explore teachers' perspectives on children's creative participation in Swedish preschools as well as to contribute to the broader understanding of creativity as a social constructed notion. Csikszentmihalyi's (2006) system model for creativity is used as the theoretical framework for the study with some adjustments made to be applicable to the preschool context. Four preschools in the middle of Sweden are participating in the study. The project includes focus group interviews with 4-6 participants from the same preschool in each group. After the first focus group interviews the practitioners were encouraged to digitally write down their reflections about children's creative participation observed in their preschool practice. The reflections were then followed up in a second meeting of the focus groups. Analysis of the material gathered during the focus group interviews focused on the relationships and tensions between the preschool as a domain, practitioners as experts and children as creative individuals. The study is part of current doctoral research conducted and approved by Karlstad University in Sweden. The findings of the study are expected to contribute to a broader understanding of creativity in Swedish preschool contexts and therefore provide some guidance on the development of pedagogical practice.

Participation and inclusion on the margins: Disabled and gifted children in ECE
Presenting Author: Valerie Margrain, Karlstad University, Sweden

Participation, a fundamental right of all children, is prominent in Nordic discussions regarding early childhood education and care (ECEC). The concept and hope is evident in Nordic policy, steering documents and curricula, including the UN Convention on the Rights of the Child. Although there is a strong commitment to children's participation in ECE, this is problematic for at-risk and marginalised children. In this presentation parallels are drawn between the needs and rights of those with disabilities, and the needs and rights of gifted children. For both groups it is important to engage in early identification, observe and get to know the children, to create a supportive and responsive learning environment, to utilise partnership with parents, and to differentiate the curriculum. Striving for equitability among all children is a demanding task for teachers and they need to be aware of effects arising from their way of supporting, allowing or denying

children to express themselves. This study is guided by ecological systems theory. The Swedish data shared will include a document analysis of policy and steering documents, interview data and family records. Within the document analysis, recent curriculum updates highlight concepts of 'an equitable education', and appropriate stimulation opportunities in their learning. Parallels from case study data of a gifted child and a child with disability are presented, with findings of these case studies highlighting the importance of respect, openness and flexibility to facilitate participation. Barriers to participation include misunderstanding, financing and normativity.

Early childhood education teachers' views on children's participation during transitions
Presenting Author: Eva Staffans, Faculty of Education and Welfare Studies, Vasa, Finland; **Presenting Author:**Johanna Hirvi, Åbo Akademi University, Faculty of Education, Finland; **Presenting Author:**Kaisa Pihlainen, University of Eastern Finland, Finland

Children's learning path starts in the early years and during this time, children take part in several educational transitions, such as transitions from early childhood education and care (ECEC) to preschool classes or to comprehensive school or transitions within ECEC settings within different groups of children. Children with special educational needs (SEN) might experience these transitions to be more challenging. The aim of this paper is to examine how teachers perceive and offer children with SEN a voice during educational transitions. Data is collected via an online questionnaire in autumn 2022 and analysed using content analysis. The descriptive comparison allowed similarities and differences between teacher's approaches to appear. The preliminary results indicate that there are differences in teachers' views on possibilities of children with SEN to participation during educational transitions. The paper concludes with a broader discussion on steering documents in early childhood education and care regarding children with SEN and their right to participate in decisions affecting their learning path.

Symposium
Teaching and Teacher Education

New Theoretical and Methodological Perspectives on Teacher Professional Vision

Keywords: Cognitive Skills and Processes, Communities of Learners and/or Practice, Competencies, Eye Tracking, In-service Teachers, Learning Analytics, Pre-service Teachers, Qualitative Methods, Social Aspects of Learning and Teaching, Teacher Professional Development, Teaching/Instructional Strategies, Video-based Learning
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Rebekka Stahnke, Leibniz Institute for Science and Mathematics Education, Germany
Discussant: Thorsten Scheiner, Australia

In recent years, the majority of studies on teacher professional vision took a cognitive perspective by investigating how teachers identify important aspects of a situation and how they make sense of what they notice. These studies often asked individual teachers to analyze video excerpts and state their thoughts in interviews or more or less standardized written surveys (König et al., 2022). However, to gain new insights that can support the design of teacher education and professional development innovative theoretical and methodological perspectives are needed. This symposium presents two contributions on new theoretical ideas as well as two contributions demonstrating the potential of new methodologies. The first contribution proposes returning to Goodwin's (1994) notion of professional vision by considering not only the cognitive, but also the social and political aspects of professional vision. The second contribution presents a new model of visual expertise, called the cognitive theory of visual expertise, that can be used to analyze the professional vision of expert teachers. In the third contribution, preservice teachers' weaknesses and strengths regarding their professional vision are analyzed with epistemic network analysis, a novel tool from quantitative ethnography. The final contribution demonstrates the potential of discourse analysis as a new method for research on teachers' learning to notice in professional development courses. The contributions presented in the symposium broaden both theoretical and methodological perspectives with the aim to develop a deeper understanding of the cognitive but also the social and political dimensions of professional vision.

Professional Vision and Teacher Noticing: Different pieces of the same puzzle?
Presenting Author: Jennifer Richards, Northwestern University, United States; **Co-Author:**Miriam Sherin, Northwestern University, United States; **Co-Author:**Sarah Larison, Northwestern University, United States

One perspective that intrigues us is the use of "teachers' professional vision" to describe teacher noticing. From the start, the notion of professional vision, introduced by anthropologist Charles Goodwin (1994), appeared to have powerful implications for teaching. It seemed that use of the term could help distinguish "everyday noticing" from the work of "professional noticing." In addition, professional vision highlighted the importance of considering noticing with regards to the phenomena of interest to a given profession. This prompted a focus on how teachers see and make sense of classrooms and the cognitive resources used to do so. Yet, studies of teachers' professional vision did not typically emphasize the collaborative, social nature of professional vision, nor the ways in which professional vision is connected to broader political considerations — both central aspects for Goodwin. Here, we revisit the notion of professional vision and explore its relationship to teacher noticing. In particular, we consider what differences between these constructs might mean for our understanding of what is involved in teacher noticing and in learning to notice.

Towards a Cognitive Theory of Visual Expertise: Methods of Inquiry
Presenting Author: Andreas Gegenfurtner, University of Augsburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany; **Co-Author:**Özün Keskin, University of Augsburg, Germany; **Co-Author:**Erno Lehtinen, University of Turku, Finland; **Co-Author:**Tina Seidel, Technische Universität München, Germany; **Co-Author:**Kathleen Stürmer, Univerity of Tübingen, Germany; **Co-Author:**Roger Saljo, University of Gothenburg, Sweden

A cognitive theory of visual expertise is proposed to model the visual information processing of domain experts. During theory development, we integrated empirical evidence from multiple methods of inquiry—including qualitative observations, qualitative interviews, eye tracking, and neuroimaging—used in research on learning and instruction in the professions. Devoted to understand expert teachers' skilled perception, interpretation, and evaluation of visual information in schools and classrooms, the theory is based on three underlying assumptions: extended capacity, knowledge-based processing, and practice-based interaction. The professional vision of expert teachers is described as a set of eight processes in the visual register and long-term working memory; these processes are selecting visual information, ignoring visual information, knowledge-based noticing, extending the visual field through parafoveal processing, organizing image chunks, integrating, using visual practices to interact with the environment, and monitoring. We discuss educational and methodological implications of the theory as they relate (a) to the expertise development of pre-service teachers through training and deliberate practice in real and virtual classrooms and (b) to the use of mixed methods when studying teacher professional vision.

Visualizing Preservice Teachers' Descriptions of Noticed Tutoring Events with Epistemic Networks
Presenting Author: Meg Farrell, Technische Universität München, Germany; **Co-Author:**Monika Martin, University of Education Freiburg, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany; **Co-Author:**Werner Rieß, PH Freiburg, Germany; **Co-Author:**Karen Könings, Maastricht University, Netherlands; **Co-Author:**Jeroen Van Merrienboer, Maastricht University, Netherlands; **Co-Author:**Tina Seidel, Technische Universität München, Germany

Practice-based teacher education calls for application opportunities to learn core teaching practices, like professional vision (PV). This multidimensional skill of attending to (i.e., noticing) important teaching and learning moments and using professional knowledge to make sense of them (i.e., reasoning) for further action, can be facilitated with video-based training. To better understand the strengths and deficits of preservice teachers' PV within the setting of another core practice, small-group tutoring instruction, the present study investigated the video analysis responses of 41 preservice teachers participating in a 90 min. video analysis training in this context. We examined their PV skills in describing noticed events by analyzing their written responses on significant content (i.e., actors, topics) and quality (i.e., level of information sophistication) indicators informed by PV literature. After evaluating their skills with descriptive statistics, we used,

epistemic network analysis (ENA), a novel tool from Quantitative Ethnography, to further investigate the interconnected structure of preservice teachers' descriptions of noticed events. Findings indicated that most preservice teachers noticed aspects of the tutor and his/her general pedagogical strategies at a vague level, while content-specific strategies were noticed less often. With ENA, we observed the frequent co-occurrence of the tutor, general pedagogy, and group of students within most responses, as well as a small cluster of participants with a content-specific and dialogic instructional focus. These findings speak to the added value of ENA to demonstrate complex, multifaceted relationships within PV skills, and help to illuminate areas of proficiency and needs for support from multiple grain sizes.

CANCELLED: Teacher Noticing Discourse: Understanding Mechanisms of Teacher Learning
Presenting Author: Elizabeth van Es, University of California, Irvine, United States; **Co-Author:**Melissa Luna, West Virginia University, United States; **Co-Author:**Miray Tekkumru-Kisa, Florida State University, United States

This presentation has been cancelled and will not be presented at the EARLI conference.Professional development focused on the analysis of artifacts of practice can support teachers developing their noticing of student thinking to enact responsive practices in the classroom. This study examines whether and how the discourse structure in video-based professional development supports changes in teachers' noticing of student thinking for responsive teaching. Informed by situative learning theory, we conducted a discourse analysis of participants' talk in a video-based professional development context, as well as teachers' discourse in whole class and small-group discussions. This analysis resulted in identifying four features of generative talk for teacher learning and noticing, that we describe as a *Noticing Discourse*. We propose that teacher learning constitutes developing discursive practices that embody building awareness of and inquiry into students' thinking and support teachers learning to attend to and interpret the substance of students' thinking. These findings have implications for how we theorize teacher learning in professional development and for designing and studying professional development that is generative for teacher and student learning.

Session S 4

26 August 2023 12:00 - 13:30
AUTH_DC1
Symposium

Climate change – addressing knowledge, action and hope

Keywords: Attitudes and Beliefs, Conceptual Change, Curriculum Development, Educational Policy, Emotion and Affect, Engagement, Environmental Education, Goal Orientations, Reasoning, Science Education, Secondary Education, Social Sciences and Humanities, Teaching/Instructional Strategies
Interest group: SIG 03 - Conceptual Change
Chairperson: Cecilia Lundholm, Stockholm University, Sweden
Organiser: Cecilia Lundholm, Stockholm University, Sweden
Discussant: Gale Sinatra, University of Southern California, United States

The aim of the symposium is to address the climate crises, knowledge, action and coping, and education. The papers report empirical findings of students' conceptions and learning about climate change, causes and actions, and curricula supporting action and hope, including research from Australia, Sweden and the US. The symposium aligns with the conference title 'Education as Hope in Challenging Times'. The first paper shows that adolescent students who engaged in more autonomy-supportive instruction had greater levels of scientific reasoning than those who engaged in less-autonomy supportive instruction, suggesting that student agency to think and reason about the climate crisis can be facilitated. The second paper presents results on how senior high-school students cope with conflicts when trying to live in a climate-friendly way. Results show both constructive and less constructive ways of coping. In alignment with a focus on climate and action, the third paper report results of 15–17-year-olds students' conceptions of actions, such as policy support, to mitigate climate change in relation to how they conceptualize causes to climate change, and effectiveness of policies (tax, subsidies, legislation and bans). The fourth paper presents insights on whether subject domains curricula for year 16-19 offer sufficient scaffolds and affordances for teachers to develop students' understandings, skills and values regarding climate change with an example from Victoria, Australia. The findings are relevant for education and teaching as the papers address curricula support, and instruction for learning about climate change, climate polices, and instruction which promotes constructive coping strategies.

Scaffolded Instruction to Facilitate Learning about the Climate Crisis and Extreme Weather
Presenting Author: Doug Lombardi, University of Maryland, College Park, United States; **Co-Author:**John Robertson, University of Maryland, United States; **Co-Author:**Nancy Gans, University of Maryland, College Park, United States; **Co-Author:**Joshua Jaffe, University of Maryland, United States

Making scientific connections between extreme weather events and the climate crisis is a considerable learning challenge. Instructional scaffolds, such as Model Evidence Link (MEL) diagrams, can help students with complex, scientific reasoning, thereby facilitating learning about these topics. However, questions remain about how to facilitate students' deep learning such that they can use their knowledge outside the classroom context (i.e., increasing students' autonomy to act scientifically in the face of climate change). In this quasi-experimental study, we compared two different forms of the MEL scaffold models in terms of students' levels of scientific evaluations, plausibility shifts toward the scientific, and knowledge gains about the connections between extreme weather events and climate change. Results revealed that the more autonomy-supportive MEL model facilitated greater levels of evaluation and stronger plausibility shifts, with both scaffold forms resulting in knowledge gains. Overall, the results suggest that more autonomy supportive scaffolding may deepen students' scientific thinking and knowledge to facilitate their actions on the climate crisis.

CANCELLED: Promoting action competence and hope in education for a sustainable future
Presenting Author:MARIA OJALA, Örebro University, Sweden

Many young people experience helplessness concerning the global future and problems like climate change. At the same time, it is vital that the young generation becomes prepared for taking part in the societal transformation that is needed to handle different sustainability problems. Hope and action competence are therefore vital to promote in education. According to hope theorist Snyder, hope consists of the ability to set up clear goals, to come up with pathways to reach these goals, and to be able to motivate oneself to use these pathways, i.e., agency thinking. This survey study focuses on one pathway to fight climate change, namely, to make climate-friendly food choices. The focus is on how senior high-school students (mean-age 17.9 years; N=474) cope with conflicts experienced in relation to climate-friendly food choices. In a theoretical sense this coping is seen as agency thinking in line with Snyder's hope theory. The empirical aim is to explore how ways of coping relate to climate-friendly engagement, behavioral intention, outcome efficacy, reported knowledge, and climate-change hope, all vital aspects of action competence. The result shows that to cope through dialectical thinking is positively related to all these aspects, while black-and-white thinking, another way to cope, is negatively related to the same aspects. The theoretical aim is to discuss these results in relation to theories about experiential learning and educating for action competence in educational science. It is argued that it is vital to in education promote constructive coping strategies and to critically discuss non constructive ones.

Understanding the role of knowledge and action in combating climate change
Presenting Author: Cecilia Lundholm, Stockholm University, Sweden; **Co-Author:**Anna Bendz, University of Gothenburg, Sweden; **Co-Author:**Caroline Ignell, Stockholm University, Sweden

Previous research in environmental education has called for attention to the impact of knowledge on action, where action is seen as 'direct' and 'indirect' (Kollmuss & Agyeman 2002). Indirect action is for example supporting climate policies that lead to change of behaviour at a collective level. We report a study that is part of project focusing on the impact of social science knowledge on indirect action, with the aim of investigating students' understanding of causes to climate change (e.g., consumption), conceptions of effectiveness of policies – tax, subsidies and regulations and bans – and if this may impact on indirect action;

support for the aforementioned policies. Preliminary results show students who find policies effective, support policies, but support bans to a lesser degree than tax, subsidies and regulations. This is interesting as bans is an effective way of changing markets; reducing production of climate impacting goods and increasing climate friendly goods and services. We also find that students believing that the cause to climate change is lack of information do not support policies. Further research investigating if beliefs in policy being effective/functioning are due to education or other sources of information at a national/international level is a next step. Teachers interested in designing climate education with a focus on solutions at the societal level and policies need to pay attention to students' conceptions of anthropogenic causes as it may impact how relevant they find such a focus, and attention to students' conceptions of policy as they may differ in relation to product/service.

A quality climate education in Victorian schools? A cross-case comparison of pre-university subjects
Presenting Author: Karen Marangio, Monash University, Australia; **Co-Author:**Alan Reid, Monash University, Australia

Our paper analyses the changing affordances for climate learning in select curriculum for the Victorian Certificate of Education (VCE). Current education policy has created two main clusters for learning about climate within STEM and HASS VCE subjects. We argue these offer both core and peripheral areas for quality climate teaching and learning—i.e. that might engender hope and action—for 16-19 year olds, even as they present diverse opportunities for advancing learning and competence development in cognitive, socio-emotional and behavioural domains. The STEM cluster includes: Environmental Science, Biology, Chemistry, Physics, Psychology; and HASS: Geography, History, Australian and Global Politics, and Outdoor and Environmental Studies. Students will not take all of these VCEs (neither are any compulsory), while VCE subject teachers do not know what is expected or experienced within other subject designs beyond their field of expertise. Extending Dawson et al (2022)'s recent international comparative study of middle years climate-related curriculum, we examine the breadth, depth and quality of learning affordances in the current and next generation versions of VCEs to present an analysis of patterns of possible learning within and across subjects. Findings suggest continued fragmentation within some study designs, innovation and depth in others, and significant differences in emphasis and approach across each cluster. Our findings add to ongoing questions as to whether pre-university courses provide sufficient scaffolds and affordances for learners to develop their understandings, skills and values within a 'quality climate education'. We also discuss prospects for addressing them to better equip learners in challenging times.

Higher Education

Exploring the Why?, What?, and How? of Student Learning in Challenge-Based Learning

Keywords: Competencies, Higher Education, Learning Approaches, Mixed-method Research, Motivation, Problem-based Learning, Qualitative Methods, Self-regulated Learning and Behaviour, Sustainable Development, Teaching Approaches
Interest group: SIG 04 - Higher Education
Chairperson: Karolina Doulougeri, Eindhoven School of Education, Netherlands
Organiser: Kerstin Helker, Eindhoven University of Technology, Netherlands
Organiser: Karolina Doulougeri, Eindhoven School of Education, Netherlands
Discussant: Kirsti Lonka, University of Helsinki, Finland

Challenge-based Learning (CBL) responds to calls for a more modern, student-centered education, that prepares them for the increasing uncertainty in their future. Compared to traditional pedagogy, CBL intends to bridge the real world and students' learning by exposing them to complex real-life challenges that require the acquisition and application of disciplinary and also transversal competencies. These unique characteristics of CBL require rethinking student learning processes and outcomes. Nevertheless, research on student learning in CBL is scarce. The researchers in this symposium will share insights on how characteristics of CBL influence student learning process and outcomes. Furthermore, this symposium provides a platform for advancing our theoretical understanding and practical insights for implementing and researching CBL.Our symposium consists of one conceptual and three empirical contributions. Firstly, it will discuss conceptual approaches and methodological insights about how to study and analyze students' learning in CBL. Secondly, it will present empirical findings from a mixed-methods study focusing on students' motivation to participate in CBL. Thirdly, it will present insights from a qualitative study focusing on students' regulation of learning in CBL, including regulation of cognitive, metacognitive, affective, and social aspects. Finally, it will discuss the empirical findings of a mixed-method study evaluating students' experiences with participation in CBL and students' reported learning gains. Taken together, this symposium will contribute to the scientific understanding of antecedents, processes, and implications of students' learning in CBL. Furthermore, it will provide suggestions for future research and the successful implementation of CBL that promotes students' active learning.

Creating the foundation for studying student learning in CBL – A heuristic framework
Presenting Author: Jan Vermunt, Eindhoven University of Technology, Netherlands; **Co-Author:**Kerstin Helker, Eindhoven University of Technology, Netherlands; **Co-Author:**Jasmina Lazendic-Galloway, TU/e innovation Space, Eindhoven University of Technology, Netherlands; **Co-Author:**Isabelle Reymen, Eindhoven University of Technology, Netherlands; **Co-Author:**Miguel Bruns, Eindhoven University of Technology, Netherlands

Challenge-Based Learning (CBL) has become increasingly popular in higher education as it responds to calls for learning environments that allow for students to take the lead in their own learning and acquire and apply disciplinary and transdisciplinary knowledge and skills. Prior research on CBL has mostly focused on identifying commonly agreed characteristics of the educational concept and capture the variety of its implementations. Nevertheless, work on how CBL influences student learning is scarce.
This work presents a first attempt to integrate prior research on student learning into the emerging field of CBL by developing a framework of student learning in CBL. This framework suggests an interplay between students' personal factors, learning patterns and learning gains at the core, being embedded in several levels of context, each with specific formal, social, and physical content that affect student learning.
In a second step, the proposed framework was tested with interview data collected from CBL teachers in order to explore its exhaustiveness and usefulness to describe learning processes in CBL. Results showed that teachers addressed all parts of the framework when reporting their deliberations for CBL implementation and course design. Results also suggested that the framework will be useful to systematically relate the various aspects of the CBL process and context in future research on student learning in CBL as well as education innovation.

Exploring participation motivation in Challenge-based learning using a mixed methods approach
Presenting Author: Selina Michel, Technical University Munich, Germany; **Co-Author:**Manuel Förster, Technical University Munich, Germany

Studying situative incentives, personal dispositions and expectations is key to understand students' motivation in Challenge-based learning (CBL). This study uses a mixed methods approach for describing motivation to participate in CBL-courses according to the extended cognitive model of motivation from Heckhausen and Heckhausen (2018). The results from surveying participants in the beginning of a CBL-course (N = 43) with different response formats (e.g. open questions, standardized items, raking item) (study 1) and qualitative interviews with the target group (N = 9) (study 2) provide an overview of situative incentives (e.g. interdisciplinary and escape from daily routine and traditional courses), personal dispositions (e.g. interest in learning about sustainability) and expectations on desired consequences (e.g. learning gains and competence development in the area of project management and generating societal impact) relevant for students' motivation in CBL. Also, efficacy expectations seem to be relevant for motivation in CBL. The findings presented has implications for future studies with regard to motivation in CBL and a design of CBL-courses that promotes motivation and active learning processes. University faculty should take into account which situative incentives, personal dispositions and desired consequences can influence motivation in CBL. For future research, this study offers implications regarding the selection of instruments to study motivation in CBL and which determinants of motivation should be studied in more detail.

Understanding students' regulation of learning in Challenge-based courses
Presenting Author: Karolina Doulougeri, Eindhoven School of Education, Netherlands; **Co-Author:**Gunter Bombaerts, Eindhoven University of Technology, Netherlands; **Co-Author:**Michael Bots, Eindhoven University of Technology, Netherlands; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands

Self-regulated learning (SRL) is one of the key pedagogical principles of Challenge-based Learning (CBL). Students in CBL have the primary responsibility for planning, implementing, and evaluating their effort and progress. Challenge-based learning (CBL) exposes students to the complexities of open-ended and real-life challenges and encourages them to be in the lead of their learning. Still, the way students regulate their learning remains largely unknown, and existing literature suggests that students struggle to regulate their learning within CBL. This study explores how first-year engineering students regulate their learning during an 11-week CBL course in ethics and data analytics. Thirty-nine students completed a weekly diary for the duration of the course. In total, we analyzed 380 student reflections. A thematic analysis was conducted and we identified four themes related to students' experience with open-ended and real-life challenges, including challenge definition, learning and working process, solution development, and dissemination. Within each theme, we identified reported cognitive, metacognitive, affective, and social activities that students engage in to regulate their learning. The frequency of mentioned regulation activities varied across the four identified themes. Results suggest that students constantly regulate their learning at multiple levels when facing an open-ended challenge. In addition, a strong social component in student regulation in CBL was identified. Building on the insights of this research, we make recommendations for further research and educational practice.

Students' experiences with challenge based learning in interdisciplinary and international courses
Presenting Author: Simon David, Ghent University, Belgium; **Co-Author:**Tijs Rotsaert, Ghent University, Belgium; **Co-Author:**Tammy Schellens, Ghent University, Belgium

Little is known about students' experience in challenge based learning (CBL) approaches, especially in courses outside the STEM-domain. This study addresses this gap by studying students' perspective in two interdisciplinary and international courses organized within a European university network. A mixed-methods design was utilized combining a thematic analysis of focus groups and a pre-post questionnaire. The preliminary results suggest that students found CBL to be an enriching experience that also strengthened their general competencies such as critical thinking, problem solving and interpersonal skills. However, the knowledge gains reported by the students were limited. Recommendations for future iterations of challenge based courses with international students and non-STEM topics are made.

Recent research pointed out the importance of building and integrating theories of emotions for learning (Moreno & Woodruff, 2022; Pekrun & Marsh, 2022) and regarded emotion as an integral part of presumably rational processes of argumentation and reasoning together (Aoyama Lawrence & Weinberger, 2022; Polo, Lund, Plantin & Niccolai, 2016). In this symposium, we aim to discuss different perspectives on how to conceptualize emotional processes' role in learning, how to measure emotions, and how to regulate and facilitate emotions productively in dialogic and collaborative learning scenarios. Regarding *conceptualization*, multi-faceted emotions would co-develop and mutually reinforce among partners in collaborative learning scenarios, which would either indicate motivational and cognitive breakdowns of group processes, e.g., misunderstandings or open conflicts (Polo & Lund, 2021; Baker, Andriessen & Lund, 2009), or be indicative of shared moments of positive excitement of sharing understanding and joint breakthroughs towards task solution (Aoyama Lawrence & Weinberger, 2022). Regarding *measurement*, we present ways of capturing emotions in collaborative learning through analysis of videos of learners' gestures and mimics (e.g., Lobczowski, 2022; Schmitt & Weinberger, 2019), analysis of discourse (e.g., Rogat & Linnenbrink-Garcia, 2011), retrospective surveys (e.g., Järvenoja, Volet, & Järvelä, 2013), and physiological measures such as electrodermal activity (e.g., Törmänen, Järvenoja, Saqr, Malmberg, & Järvelä, 2022; Aoyama Lawrence & Weinberger, 2022). Regarding *regulation and facilitation*, we investigate influences of prior assessments and scaffolds for collaborative learning, e.g., for joint attention and engagement, as well as forms of regulating emotions for fostering collective reasoning on disruptive ideas in dialogic pedagogy.

Exploring Social Contagion in a CSCL Environment with a Social Robot
Presenting Author: Nikki Lobczowski, McGill University, Canada; **Co-Author:**Yuya Asano, University of Pittsburgh, United States; **Co-Author:**Chloe Dahan, University of Pittsburgh, United States; **Co-Author:**Teresa Davison, University of Pittsburgh, United States; **Co-Author:**Timothy Nokes, University of Pittsburgh, United States; **Co-Author:**DIane Litman, University of Pittsburgh, United States; **Co-Author:**Adriana Kovashka, University of Pittsburgh, United States; **Co-Author:**Erin Walker, University of Pittsburgh, United States

In collaborative learning environments, students are often influenced by their peers, which can shape their learning, behaviors, and emotions. Nevertheless, not much is known about how and why social contagion occurs in learning. Thus, for this study, we explored how social contagion emerged in a human-human-robot learning environment. In this representative case study, we chose four dyads of undergraduate students who rated their attitudes towards collaboration as high and similar, high and dissimilar, low and similar, and low and dissimilar before engaging in teaching a social robot how to solve ratio problems. Then, we coded for socioemotional analysis and sentiments using a text-mining technique to support our qualitative analysis of patterns in the students' interactions and speech. Our preliminary findings highlight how students can engage in both positive socioemotional interactions and negative speech, which can then negatively shift the

tone of the conversation. Moreover, we found how attitudes about collaboration, as well as other factors such as interest and efficacy, may contribute to social contagion. Finally, we found that both formal and informal norms constructed at the beginning of an activity often set the stage for the duration of the task. These findings have research implications for continued exploration and testing in this area and practical considerations for group formation and interventions for maladaptive interactions.

Does physiological synchrony vary when we guide collaborative learners where to look at?
Presenting Author: Armin Weinberger, Saarland University, Germany; **Co-Author:**Lena Aoyama Lawrence, Saarland University, Germany

Learners' emotion plays a central role, especially in co-present, collaborative forms of learning. Previous studies show that learners' engagement, motivation, and task performance are strongly affected by their emotions in the learning process (Pekrun, 2006). Besides traditional emotion evaluations, i.e., subjective ratings via questionnaire items, physiological indicators such as electrodermal activity (EDA), heart rate (HR), and blood volume pressure (BVP) have been introduced as indicators of leaners' emotions (Pijeira-Díaz et al., 2016). Dyadic physiological coupling has been applied for investigating emotional synchrony in collaborative learning. In this proposal, we first present the analysis of joint emotional shifts of 28 dyads with non-linear methods, i.e., recurrence quantification analysis (CRQA). We then compare the results of CRQA with correlations and discuss the advantage of applying CRQA. From the result, no difference has been found among the three conditions, given different gaze instructions. CRQA and correlation showed similar results on indicating dyads synchrony.

How do students' emotional expressions and regulation dialogue intertwine in collaborative learning?
Presenting Author: Sara Ahola, University of Oulu, Finland; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Tiina Susanna Törmänen, University of Oulu, Finland; **Co-Author:**Jonna Malmberg, University of Oulu, Finland

In collaborative learning, socially shared regulation of learning (SSRL) is embedded in group interaction. Gradually, it is built up in a dialogue between group members aiming to ensure progress towards shared goals. While research has shown that SSRL within groups vary, we have relatively little understanding of what defines the quality of this variation. We claim that the nature of regulation dialogue is defined by group members' contributions to the interaction and affected by their socio-emotional interactions, and that this relationship is yet to be empirically discovered. The complex situated relations between the group members' constantly reshaped emotional experiences and the qualitatively varying nature of regulation dialogue call for methodological approaches that can capture both emotional and interactive components in the situation. To this end, the current study committed to a process-oriented approach that integrates students' situational emotional expressions with in-depth investigation of the group members' contributions to the regulation dialogue. The participants were 7th graders (n=54, 18 groups) videotaped during their collaborative work across four science lessons to capture the contributions to regulation and the valence of simultaneous emotional expressions. The observable emotional expressions were further complemented with group members' physiological emotional activation data. The analysis combined the different data channels to investigate the contributions to regulation in relation to the groups' emotional valence and activation in the situation. The results shed light into the complexity of collaborative group process as it is characterized by the intertwining of both the regulation dialogue and the socio-emotional interactions of the group.

The emotional capture of kairos during philosophical group discussions with children
Presenting Author: Claire Polo, ECP Laboratory, France; **Co-Author:**Kristine Lund, CNRS & Ecole Normale Supérieure de Lyon, France

An essential gesture of animating C*ommunities of Philosophical Inquiry* (CPI) consists in identifying and grasping within children's talk, an opportune word or turn of phrase, the *kairos*, and bouncing off it to advance collective reasoning. Such*kairos*'s grasping may occur directly between peers, one reacting to other's disruptive idea, but it often requires more or less extensive teacher guidance. Based on the analysis of expert teacher practices, we propose a typology of the emotional grasp of *kairos* that reflects a double bind for both teachers and students. This double bind illustrates the tension between two communicative contracts, one for philosophy discussions and the other for classroom practices. On the one hand, playing the game of philosophical exploration implies that children step out of their role as learners in the typical classroom. On the other hand, the teacher must find a path between facilitating the group investigation of the philosophical problem and scaffolding the pursuit of understanding the conceptual notions under discussion. Beyond the effect of surprise, we describe how teachers model regulation that makes it possible for children to welcome and share their emotions and to make them evolve into wonder, astonishment or doubt. Such trajectories are decisive for the future of the new idea embodied as a *kairos*. But other, also frequent, teacher reactions show missed facilitation opportunities. Future teacher training can thus be based on both the identification of pedagogical and philosophical opportunities, and the effects of diverging facilitating practices regarding the emotional grasping of *kairos*.

PhD graduates' preparedness for careers beyond academia: The role of support communities
Keywords: Doctoral Education, Higher Education, Researcher Education, Social Interaction
Presenting Author: Nata Kereselidze, University of Geneva and HES-SO (University of Applied Sciences and Arts Western Switzerland), Switzerland; **Co-Author:**Isabelle Skakni, University of Applied Sciences and Arts Western Switzerland, Switzerland

This paper addresses PhD holders' perception of their doctoral training's relevance for non-academic careers and the institutional support they received to prepare for such careers. Drawing on the concept of support communities, we analysed the responses to an online questionnaire and interview accounts of 36 PhD holders working in the private, public/para-public and so-called "third space" sectors in Switzerland. Our findings suggest that doctoral training in its current form does not always prepare PhD holders to seek and hold positions beyond academia, especially those with a linear path. Regardless of the discipline, most participants reported having received little to no institutional support and encouragement to prepare for anything outside of an academic career. However, for those who did report some degree of support, the main source remains the *doctoral community*, in particular discussions and information sharing among peers and, to a lesser extent, the *in-between community*, especially through discussions with PhD holders who have made the transition from academia to another sectors and career development workshops offered by non-profit organisations. These findings contribute to the current global debate about doctoral education's value in preparing PhD graduates for diverse career paths.

Variation in humanities and social sciences PhD holders' careers beyond academia – the Finnish case
Keywords: Doctoral Education, Higher Education, Researcher Education, Social Sciences and Humanities
Presenting Author: Laura Sundström, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland; **Co-Author:**Lotta Tikkanen, University of Helsinki, Finland; **Co-Author:**Henrika Anttila, University of Helsinki, Finland

Over the past decade PhD careers have diversified and careers both within and outside the academia have transformed (Brechelmacher, et al., 2014), and this has involved the academic career becoming less prominent career for PhD graduates (Enders, 2004). For example, in Finland only 27% of STEM PhDs report committing to academic careers, while 66% of humanities and social sciences (HSS) PhDs stayed in academia. The private sector is the largest employer of STEM PhDs beyond academia, while HSS PhDs are suggested to work primarily in public and para-public sectors. Yet research on HSS PhD careers has been limited, leaving us ill-prepared to support HSS PhD candidates who strive to pursue careers outside academia. This study focuses on mapping Finnish HSS PhD

degree holders' employment profiles, job profiles and the sectors they work in by using national PhD career monitoring survey (Aarresaari, 2019). Altogether 291 HSS PhD degree holders answered the survey. Preliminary results suggest that HSS PhDs work in several different sectors, including private, para-public and public organizations and companies. In the next phase of the study, employment and job profiles will be analyzed. The results of the study will provide novel research-based understanding on HSS careers outside academia that can be used in developing doctoral education. Also new directions for research will be provided.

Foreign early career academics' well-being profiles at workplaces: A person-oriented approach
Keywords: Higher Education, Quantitative Methods, Researcher Education, Well-being
Presenting Author: Yusuke Sakurai, Hiroshima University, Japan

The well-being of foreign early career academics (FECAs) has been the subject of research attention in relation to present demanding academic milieux in general and to those unfamiliar workplace settings in particular. A traditional variable-oriented approach that focuses on mean scores can easily gloss over the diverse nature of the group under study. Our study, conducted in Japan, took a person-oriented approach and identified FECAs' distinct well-being profiles and the associations of their personal attributes with the profiles. Most (64%) were classified as having the highest stress scores and moderate scores for a sense of belonging, control of workload and career development engagement. The second-largest profile (29%) included FECAs characterised by the lowest stress score and a strong sense of belonging, control of workload and career development engagement. Those in the smallest profile (8%), who had moderate levels of workload control and stress, lacked a sufficient sense of belonging and career development engagement. Among FECAs' personal attributes, contract type was significantly associated with their distribution across the three well-being profiles, whereas no attributes of FECAs' unique nature significantly pertained to their distribution. Our results suggested that support for well-being may be important regardless of background. Our investigation, using multifaceted well-being subscales over a composite scale, offers analytical, strategic support for academics in globalised higher education.

Educational and occupational pathways of persons who withdraw from teacher education programs
Keywords: At-risk Students, Educational Attainment, Higher Education, Pre-service Teachers
Presenting Author: Sebastian Franz, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Steffen Schindler, University of Bamberg, Germany

A lack of qualified teachers is a common problem in many European countries. Investigating reasons for non-completion in teacher education programs and examining, which alternatives seem to attract former teacher education students, is hence important to understand the origin of teacher shortage. Based on data from the National Educational Panel Study (NEPS), we examined career pathways of about 350 persons who not completed teacher education with a university degree that qualifies for teaching. We assume that former teacher education students chose a career that exceed the benefit-cost calculus of becoming a teacher and offer a higher chance of success. Preliminary results reveal that 60% of respondents were still studying at a university one month after leaving their teacher training program and, hence, remain in higher education. Sequence analyses are planned to identify career patterns. Findings are discussed in terms of their implications.

Reciprocal Relations Between Facets of Study Satisfaction, Procrastination, and Dropout Intentions
Keywords: Higher Education, Quantitative Methods, Self-regulated Learning and Behaviour, Well-being
Presenting Author: Anne Scheunemann, Ruhr-University Bochum, Germany; **Co-Author:**Theresa Schnettler, Mannheim University, Germany; **Co-Author:**Lisa Bäulke, University of Tübingen, Germany; **Co-Author:**Daniel Thies, Ruhr-University Bochum, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany; **Co-Author:**Stefan Fries, University of Bielefeld, Germany; **Co-Author:**Detlev Leutner, University of Duisburg-Essen, Germany; **Co-Author:**Joachim Wirth, Ruhr-University Bochum, Germany; **Co-Author:**Carola Grunschel, University of Münster, Germany

Student dropout is a multi-causal and dynamic process (Heublein, 2014). Although reciprocal relations of important predictors for actual student dropout are conceivable, our knowledge is limited. Moreover, the scarce empirical findings, for example on study satisfaction, procrastination, and dropout intentions, are inconsistent (e.g., Fleischer et al., 2019; Scheunemann et al., 2021). Some of the inconsistencies concerning the results on study satisfaction may be explained by not considering the facets of study satisfaction (e.g., satisfaction with study content (S-content), coping with study related stress (S-coping); Schiefele & Jacob-Ebbinghaus, 2006). The aim of the current study was to examine the reciprocal relations between two facets of study satisfaction (i.e., S-content and S-coping), procrastination, and dropout intentions more differentiated. In the three-wave panel study over the course of one semester $N = 1435$ undergraduate students participated. We analyzed data with cross-lagged panel models (Geiser, 2013). Model 1 (S-content) indicated that S-content mediated the relation between procrastination and dropout intentions and revealed negative reciprocal relations between dropout intentions and S-content. In model 2 (S-coping), S-coping and procrastination were not significantly related longitudinally. However, it revealed negative reciprocal relations between dropout intentions and S-coping. Our study advances the understanding how different facets of study satisfaction longitudinally relate to procrastination and dropout intentions. It underlines the importance to differentiate between the facets of study satisfaction (Wach et al., 2016). Students with dropout intentions could benefit from training to increase interest in study content or to deal with perceived study stress (e.g., Rosenzweig et al., 2020).

Study satisfaction and drop-out intention of mathematics pre-service teachers from EVT perspective
Keywords: Mathematics/Numeracy, Motivation, Pre-service Teachers, Self-efficacy
Presenting Author: Robin Göller, Leuphana University Lueneburg, Germany; **Co-Author:**Lara Gildehaus, Paderborn University, Germany

Pre-service mathematics teachers are currently in high demand in Germany, but face high study drop-out and low study satisfaction. Taking into account the subject-specific characteristics of mathematics teacher training, we investigate study satisfaction and drop-out intentions of mathematics preservice teachers from an expectancy-value theory perspective. More specifically, we examined what effects mathematics-specific expectancies, values, and perceived costs have on mathematics pre-service teachers' study satisfaction and drop-out intention, by analysing data of 257 students with a structural equation model. Results show significant effects on study satisfaction for self-efficacy, intrinsic value, mathematics content-related attainment value, mathematics teaching-related attainment value, and effort cost. Significant effects on students' drop-out intention were found for mathematics teaching-related attainment value and effort cost. Utility value has no significant effect on either study satisfaction or drop-out intention. These results suggest that in order to counteract dissatisfaction and drop-out, interventions should rather focus on self-efficacy, intrinsic and attainment values and on keeping costs within limits, than focusing on utility value.

The influence of test anxiety on indicators of dropout and study delay
Keywords: Anxiety and Stress, At-risk Students, Higher Education, Quantitative Methods
Presenting Author: Nikolai Zinke, Deutsches Institut für Erwachsenenbildung Leibniz-Zentrum für Lebenslanges Lernen e.V., Germany; **Co-Author:**Martin Merkt, Deutsches Institut für Erwachsenenbildung, Germany; **Co-Author:**Hannes Schröter, German Institute for Adult Education - Leibniz Centre for Lifelong

Learning, Germany; **Co-Author:**Natalia Reich-Stiebert, FernUniversität in Hagen, Germany; **Co-Author:**Stefan Stürmer, FernUniversität in Hagen, Germany; **Co-Author:**Sina Lenski, Deutsches Institut für Erwachsenenbildung, Germany

To support students in their university careers, education policy makers and universities need insights into the role of different variables that influence dropout risk, extended duration of study, and academic failure. In particular, early indicators of academic performance such as exam performance, exam postponement, exam failure, and exam non-participation after registration have proved to be good predictors of dropout. The present study examined how different facets of test anxiety affect these early warnings signs of dropout. Therefore, survey data and administrative data from $N = 542$ students enrolled in their first semester at a distance university were examined using multiple regression analyses. Results showed a significant negative association between the cognitive and the motivational facets of test anxiety and the behavioral intention to participate in the first exam as well as exam performance. A direct association of test anxiety with the postponement of the first exam was not found. Overall, the present study identified test anxiety as possible factor that could influence dropout and study delay. This finding could help to identify students at risk and to establish suitable interventions.

Visuospatial working memory explains associations between early math abilities and ANS
Keywords: Cognitive Development, Cognitive Skills and Processes, Early Childhood Education, Mathematics/Numeracy
Presenting Author: David Munez, National Institute of Education / Nanyang Technological University, Singapore; **Co-Author:**Josetxu Orrantia, University of Salamanca, Spain; **Co-Author:**Rosario Sánchez, University of Salamanca, Spain; **Co-Author:**Laura Matilla, Univeresity of Salamanca, Spain; **Co-Author:**Rebecca Bull, Macquarie University, Australia

It has been suggested that associations between non-symbolic quantitative skills and symbolic quantitative skills are stronger at early stages in development. Nonetheless, few studies have considered preschool and kindergarten children to investigate such associations. In this study (n=340, M_{age}=70 months, SD_{age}=4; 46% females), we explored kindergarteners' acuity of the approximate number system (ANS). Specifically, we investigated associations between ANS acuity and math achievement and whether such associations simply reflected shared variance with domain-general skills (indexed as spatial, verbal, and non-verbal aspects). Results from a path analysis revealed that associations between math achievement and ANS acuity in kindergarteners were fully intermediated by domain-general variables that included spatial, verbal, and non-verbal aspects. Results from a generalized mixed model to investigate individual differences in a non-symbolic discrimination task further supported that finding. Only the child' spatial WM explained the probability of triggering a correct response. Indeed, the size of the ratio effect (only) varied as a function of that capacity. Findings call attention to theoretical and applied approaches that have underscored the role of ANS on children's development of symbolic quantitative knowledge.

Developmental relations between manual dexterity and mathematical cognition
Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Mathematics/Numeracy
Presenting Author: Venera Gashaj, Loughborough University, United Kingdom; **Co-Author:**Dragan Trninić, Swiss Federal Institute of Technology ETH Zurich, Switzerland

Embodied cognition frameworks argue that cognition is embodied in some fundamental way, although the nature and development of this relationship remain poorly understood. We present data from ongoing research into the development of mathematical reasoning in younger children—examined through an analysis of fine motor skills development. Results indicate that fine motor skills positively relate to mathematics development, and that this relation decreases with age, as expected. A novel contribution of the study is that dominant and non-dominant handedness further differentiates the relation between fine motor skills and mathematical ability. This finding on handedness opens a novel avenue for educational interventions.

Supporting or Restricting Mathematical Communication and Reasoning in Teaching 6-year olds
Keywords: Early Childhood Education, Mathematics/Numeracy, Primary Education, Teaching/Instructional Strategies
Presenting Author: Jessica Elofsson, University of Gothenburg, Sweden; **Presenting Author:**Anna-Lena Ekdahl, Jönköping University, Sweden

Communication and reasoning in mathematics is described as important for student learning. Hence, teachers have a central role to invite students to engage in reasoning and collective problem solving. One common way to promote this is for the teacher to ask questions. However, there is limited knowledge of how teachers make use of the input provided by students on the asked questions in their mathematics teaching to support further learning and mathematical inquiry. In the present study, we investigated qualitative differences in how preschool class teachers responded to and incorporated 6-yearold students' input in teaching about numbers and arithmetic. The data gathered for analysis consisted of fieldnotes collected through observations of 145 mathematics teaching episodes in 95 classes. To make it possible to map the qualitative different ways teachers responded to and incorporated students' input in their teaching, the Mediating Primary Mathematics framework was used as an analytical tool. The results show that teachers responded to and incorporated student input in different ways in their teaching. In almost 2/3 of the teaching episodes, teachers stopped at only briefly confirming the input given as right or wrong, or just gave generally encouraging responses to the student. In just under 1/3 of the teaching episodes, teachers took advantage of and incorporated student input in their teaching to advance and verify their mathematical reasoning. This highlights that teachers may develop their ways of responding to and elaborating on students' input in teaching, which could improve students' opportunities for learning mathematics.

Are Late-Emerging Reading Problems Truly Late- or Gradually Emerging?
Keywords: At-risk Students, Early Childhood Education, Reading, Self-concept
Presenting Author: Julie Arntzen, The Norwegian Reading Centre (University of Stavanger), Norway; **Co-Author:**Oddny Judith Solheim, The Norwegian Reading Centre, Norway; **Co-Author:**Njål Foldnes, The Norwegian Reading Centre, Norway

Children who struggle with language comprehension but have adequate decoding skills often go under the radar in the first years of reading instruction and are over-represented among so called late-emerging poor readers. Consequently, little is known about the early development of reading skills and reading self-beliefs for this student group. In the present study we identified risk groups based on decoding and language comprehension scores in a large sample of first graders (N = 1142). We then compared latent growth curve models for reading comprehension and reader self-concept between children starting out with low scores in language comprehension (risk-LC, n = 609) and students starting out with low scores on decoding (risk-DC, n = 533). Students in the risk-LC group started out with higher reading comprehension scores, but progressed less than students in the risk-DC group. By Grade 3 there was no difference between the two groups in reading comprehension score. For reader self-concept, students in the risk-LC group started out higher than students in the risk-DC group, but experienced a greater decrease over time. These results suggest that students with low language comprehension at an early stage are at-risk for a negative development in both reading comprehension and reader self-beliefs, and that early identification and intervention might be meaningful to prevent this from happening.

Computer-based development of reading skills to bridge learning gap of disadvantaged students
Keywords: Achievement, Computer-assisted Learning, E-learning/ Online Learning, Reading
Presenting Author: Renáta Kiss, University of Szeged Institute of Education, MTA-SZTE Digital Learning Technologies Research Group, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:**Katalin Szili, Hungarian University of Agriculture and Life Sciences, Institute of Education, Hungary; **Co-Author:**Dora Mokri, Szeged Center for Research on Learning and Instruction!, Hungary; **Co-Author:**Gyöngyvér Molnár, University of Szeged, MTA-SZTE Digital Learning Technologies Research Group, Hungary

An adequate level of reading comprehension is a prerequisite for successful learning. Numerous studies have shown that without a solid foundation, there can be severe difficulties in learning to read as well as in case of reading comprehension. That drawback in the first years of schooling can determine attitudes to learning. The study presents the effect size of an online game-based intervention program implemented in the eDia online system. The primary goal of the study is to develop fluency in reading and reading comprehension in Grades 3–4 which can be integrated into both classroom-based lessons and extracurricular activities outside of class. The quasi-experimental research involved 276 3-4 Graders, 68 were disadvantaged students. Propensity score matching was used to increase the validity of the results. The effect size of the training program proved to be good on sample level (d=.51). It was high among disadvantaged students (d=.72) and extraordinary high in the low-skilled disadvantaged group of students (d=2.04). The study provided evidence that a well-designed online training program is suitable for developing reading comprehension and overcoming disadvantages, even without the presence of the teacher.

Effects of handwriting and typing on learning new words in typically developing and dyslexic readers
Keywords: Cognitive Development, L1/Standard Language Acquisition, Reading, Writing/Literacy
Presenting Author: Tania Cerni, University of Padova, Italy

Today, during literacy development, handwriting and typing often coexist. As they allow different writing movements, they probably contribute differently to forming lexical representations with integrated motor information. The present study was designed to understand the effects of the two writing modalities in supporting the memorization of orthographic and semantic information of new words. A group of 18 Italian middle school students with a diagnosis of developmental dyslexia (DD) and a group of 18 age-matched typically developing readers (TD) learned a set of pseudowords paired with images by typing or handwriting. Then, they were asked to spell under dictation the same words with both writing modalities and to pair the images with the correct corresponding words. Accuracy in all the tasks, but also chronometric measures during writing were collected. Results suggested that the writing modality during learning was equally determinant in reproducing the correct spelling regardless of the group. On the contrary, handwriting training supported the memorization of the word referent more than typing for TD, but not for DD. Experiencing the motor aspects of writing could interfere with word memorization in dyslexic readers who have difficulties in constructing an integrated lexical representation.

Need Satisfaction and Frustration Profiles: Stability over Time and Associations with Motivation
Keywords: Motivation, Quantitative Methods, Secondary Education, Self-determination
Presenting Author: Christa Krijgsman, Fontys Hogeschool/Kenniscentrum Youth Education for Society, Netherlands; **Co-Author:**Tim Mainhard, Leiden University, Netherlands; **Co-Author:**Lisette Hornstra, Utrecht University, Netherlands; **Co-Author:**Leen Haerens, Ghent University, Belgium; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands; **Co-Author:**Lars Borghouts, Fontys University of Applied Sciences, Netherlands; **Co-Author:**István Tóth-Király, Concordia University, Canada

Satisfaction and frustration of students' need for autonomy, competence, and relatedness represent independent yet related dimensions, indicating that these dimensions can co-occur in different combinations. Few studies have examined the interplay between the different need dimensions, thereby leaving unanswered which combinations of these dimensions occur in practice and if high levels of satisfaction (or low frustration) in one or two dimensions can compensate for a lack of satisfaction (or high frustration) in another dimension. More insight into such combinations of needs – and their temporal stability – is needed as different combinations may yield different motivational gains. Therefore, using a person-centered approach, the current study identified subpopulations of physical education students characterized by combinations (i.e., profiles) of need satisfaction and frustration, and assessed the extent to which such profiles remained stable over two months. We also examined how these profiles associated with motivational outcomes. Students (*N*=490) completed measures twice. A four-profile solution appeared to be most optimal at both time points and demonstrated high levels of profile similarity across time: Average Fulfilled, Moderate Fulfilled, Highly Fulfilled and Highly Unfulfilled. These profiles differed across almost all outcomes. The Highly Fulfilled profile was associated most strongly with autonomous motivation. The Highly Unfulfilled profile was associated most strongly with amotivation. The specific needs dimensions in the Highly Fulfilled and Highly Unfulfilled profiles operated similarly: no single specific dimension defined the profiles. This might indicate that needs collectively vary or that students did not have a differentiated experience of autonomy, competence and relatedness satisfaction and frustration.

Does basic psychological need support lead to increased self-concept and int. motivation in PE?
Keywords: Motivation, Quantitative Methods, Self-concept, Self-determination
Presenting Author: Felix Kruse, University of Teacher Education St. Gallen, Switzerland; **Co-Author:**Sonja Büchel, University of Teacher Education St. Gallen, Switzerland; **Co-Author:**Christian Bruehwiler, University of Teacher Education St.Gallen, Switzerland

Physical education partly has different goals than the more cognitive subjects. Accordingly, an important basic idea concerns participation in the culture of movement and sport and, associated with this, an ongoing active lifestyle. Therefore, different goals that serve less to achieve the highest possible performance of the students are of special importance. In particular, intrinsic motivation as well as self-related cognitions could be identified as significant factors for children and adolescents dropping out of organized sports. In this paper, based on self-determination theory, the effects of teacher support of the three basic psychological needs on the development of intrinsic motivation and physical self-concept of specific sports over a period of about six weeks are examined. Unlike most other self-determination theory based studies for physical education, the focus is not exclusively on autonomy support, but also includes support for competence as well as relatedness, which has received little attention in physical education so far.

Latent student profiles based on agentic engagement and teacher autonomy support
Keywords: Attitudes and Beliefs, Engagement, Quantitative Methods, Secondary Education
Presenting Author: Luisa Molinari, University of Parma, Italy; **Co-Author:**Valentina Grazia, Università degli studi di Parma, Italy; **Co-Author:**Consuelo Mameli, University of Bologna, Italy

Research on student participation in school has provided evidence that student agentic engagement and teacher autonomy support are two crucial features of the interactional learning environment that may be considered as interdependent and complementary dimensions (Matos et al. 2018). In the present study we adopted a person-oriented approach to identify latent profiles of adolescents characterized by unique patterns of agentic engagement and perceived teacher autonomy support. Moreover, based on previous research results (Mameli et al. 2019; Molinari & Mameli 2018), we investigated whether perceived interpersonal justice could predict profile membership and compared different profiles on sense of responsibility. Participants were 545 Italian secondary school students (55% boys, 94% born in Italy, M_{age} = 14.24, SD_{age} = .53) who completed self-report questionnaires at the beginning, middle and end of the school year. Latent Profile Analysis indicated that five different adolescents' profiles existed: *disengaged* (24%), *average students* (34%) and *committed* (28%), with low, mean and high scores, respectively, in both teacher autonomy support and agentic engagement; *resistant* (5%), with low scores in teacher autonomy support and high scores in agentic engagement; *compliant* (9%), with high scores in teacher autonomy support and low scores in agentic engagement. Perceptions of interpersonal justice significantly predicted profile membership in the comparison of almost all profiles. Several significant differences among profiles in responsibility also emerged.

Self-Supportive Strategies to Regulate Autonomy and Motivation
Keywords: Attitudes and Beliefs, Motivation, Quantitative Methods, Self-determination
Presenting Author: Barbara Flunger, Utrecht University, Netherlands; **Co-Author:**Lau Lilleholt, Aarhus University, Denmark; **Co-Author:**Robert Böhm, Universität Wien, Austria; **Co-Author:**Ingo Zettler, University of Copenhagen, Denmark; **Co-Author:**Anouk Verdonschot, University Utrecht, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

People regularly encounter situations in which they have to engage in tasks they find boring or irrelevant, in which case their need to act in ways that are meaningful for oneself (i.e., their need for autonomy) is challenged. In the many situation in which no motivational support is available, individuals need to find ways to overcome this challenge by themselves. With a large sample (N = 1,779), we investigated whether people apply self-supportive strategies to boost their feelings of autonomy and motivation. The self-reported use of autonomy regulation strategies was strongly positively associated with intrinsic and internalized types of motivation, weakly positively correlated with negative introjection, and not associated with extrinsic motivation. Thus, our findings highlighted that the quality of motivation (extrinsic versus intrinsic motivation) may depend on the relative autonomy individuals achieve to create for themselves.

In-Service Primary Teachers' Feedback Perceptions and Essential Learning Moments: Feedback Agency?
Keywords: Feedback, Foreign and Second Language Acquisition, In-service Teachers, Primary Education
Presenting Author: Michel Cabot, Western Norway University of Applied Sciences, Norway

The value of written and oral corrective feedback in English as a foreign language has been acknowledged in the research literature for decades. Yet, we know little about perceptions of meaningful grammar feedback in courses of further education for in-service primary school teachers (grades 1-7). Thus, the aim of the present qualitative case study is to analyse in-service teachers' reasons for favouring certain feedback types and modes and the role of such feedback in their learning ecologies. This study used a qualitative multimethod design. Three data collections served to answer the main research question. One comprised an analysis of four essays written by seventeen in-service teachers during the autumn and spring terms, the other involved three classroom observations and individual stimulated recall interviews with these informants. While the interviews followed thematic analysis, the feedback analysis drew upon a more variable-oriented approach (descriptive quasi-statistics). Surprisingly, all in-service teachers liked unfocused and direct feedback because they expected feedback to be like real-world writing with a high degree of accuracy. Furthermore, the findings indicate a lack of oral classroom feedback and a generally high appreciation of metalinguistic feedback that helped them know the causes of the errors. Theories on agency and learning ecologies were integrated with feedback and language development theories. The findings demonstrate the importance of a varied use of feedback types and modes, which create important moments in in-service teachers' learning trajectories. Combining theories on learning ecologies with language development theories, this study broadens discussions on how to improve feedback quality.

Up and Downsides of an Austrian Language Screening Instrument - Findings from Teachers' Perspective
Keywords: Assessment Methods, At-risk Students, Foreign and Second Language Acquisition, Migrant / Refugee and Minority students
Presenting Author: Sepideh Hassani, University of Vienna, Austria; **Co-Author:**Marie Gitschthaler, University College of Teacher Education Vienna/Krems, Austria; **Co-Author:**Susanne Schwab, University of Vienna, Austria

Given the increasing number of students with migration biography and the educational inequality they face, models for promoting the language of instruction have become popular. In Austria, in 2018 'German support classes' and 'German support courses' have been installed as language support models in order to respond to this need. To decide if a child needs this specific support, students have to be tested using the MIKA-D screening instrument. The presentation offers insights into teachers' and school principals' perceptions of the MIKA-D screening. Within study 1.716 participants in a quantitative survey. Results indicated that participants' perception of MIKA-D is rather ambivalent. Study 2 included interview data from 13 teachers. The results of the thematic analysis analyses emphasized these ambivalences. Teachers reported certain benefits of the language screening instrument, but criticized the long-term educational and social disadvantages for students with migration biography.

Using Qigong mind-body intervention to reduce culturally diverse students' foreign language anxiety
Keywords: Anxiety and Stress, Foreign and Second Language Acquisition, Migrant / Refugee and Minority students, Well-being
Presenting Author: Wai Ming Cheung, The University of Hong Kong, Hong Kong; **Co-Author:**Wing Yan So, HKJC Centre for Suicide Research and Prevention, Hong Kong; **Co-Author:**Hector Wing-hong Tsang, The Hong Kong Polytechnic University, Hong Kong

Background: A growing number of ethnic minority families, many of whom do not speak Chinese, are immigrating to and residing in Hong Kong. To fully succeed in school and participate in school activities, culturally diverse children must gain competence in the Chinese language. However, many of these children experience foreign language anxiety. Aims: To help culturally diverse students reduce foreign language anxiety in learning Chinese through the use of qigong as a mind-body intervention.Sample: A total of 50 Grade 4 to 6 students from South Asian countries participated in the study. Methods: A randomized controlled trial was conducted in a school setting, where culturally diverse students were placed at random into an intervention group or a control group. The intervention group took part in an innovative qigong program, while the control group continued with their usual routine. Assessments were conducted at baseline, post-

intervention, and 6 months after intervention.Results: This study did not identify significant differences in foreign language anxiety or academic achievement in the Chinese language between or within the groups. However, a significant within-group difference in salivary cortisol level was noted for the intervention group. No significant differences were identified for stress-related physiological outcomes. Conclusion: This study provides evidence that qigong has an effect on the Hypothalamic-Pituitary-Adrenal (HPA) axis. This suggests that qigong can help children to regulate their emotions.

Code-Switching Behavior Indicating Heritage Language Attrition in Dual Language Learning Children
Keywords: Bilingual Education, Developmental Processes, Early Childhood Education, Foreign and Second Language Acquisition
Presenting Author: Leila Teresa Schächinger Tenés, Faculty of Psychology, University of Basel, Switzerland, Switzerland; **Co-Author:**Jessica Carolyn Weiner-Bühler, Faculty of Psychology, University of Basel, Switzerland; **Co-Author:**Alexander Grob, University of Basel, Switzerland; **Co-Author:**Robin Klaus Segerer, Faculty of Psychology, University of Basel, Switzerland

Multilingualism is (becoming) a desirable characteristic relating to various cognitive, communicative, and career benefits. Nevertheless, dual language learning children often struggle to develop both languages at a similar competence level. Particularly, after entering the educational system the language input in the societal language increases, while the heritage language input decreases leading to a language dominance shift with the societal language getting more pronounced and the heritage language becoming less developed. In extreme cases this may even lead to heritage language attrition. A marker for an unfavorable language development might be the code-switching phenomenon, which describes the ability to switch between different languages. This study aims to better understand to what extent code-switching represents an indicator for underlying dual language abilities and, whether code-switching serves as a predictor for later dual language development. Participating dual language learners (N = 107, age-range = 32-78 months) are part of a longitudinal study. At three measurement time points, parallelized and standardized language tests assess children's expressive language abilities in both languages. Their code-switching behavior is reported via parental questionnaires at the first measurement time point. Cross-sectional findings suggest children's code-switching to indicate their underlying dual language abilities (all ps.10), but to predict subsequent heritage language skills (all$p$s

Perceptions of assessment: An interview study of being assessed in Swedish adult education colleges
Keywords: Classroom Assessment, Feedback, Lifelong Learning, Self-regulated Learning and Behaviour
Presenting Author: Anders Jönsson, Kristianstad University, Sweden

Assessments have been shown to influence students' learning and motivation. To avoid negative consequences, different strategies have been proposed, such as making a distinct separation between assessments for summative and formative purposes. In this way, situations are created that are exclusively formative, in which students may focus on learning without worrying about test scores or grades. This study investigates perceptions of such a context, where grading is kept separate from assessment for formative purposes. Semi-structured interviews were conducted with 19 participants at five Swedish so-called "adult education colleges." At these colleges, students' "grades" are determined as a joint decision by all the teachers together at the end of the academic year, and no grades are communicated to the participants beforehand. Data from the interviews were analyzed with qualitative thematic analysis, identifying four themes related to participants' perceptions of assessment. The results suggest that participants perceive that there is a lack of feedback on overall progress, limiting their possibilities to regulate their learning. The results also suggest that the participants do not always know when, or on what grounds, they are being summatively assessed, leading to less productive study strategies. The consequences of this particular assessment context, therefore, seem similar in several respects compared to those reported for the conventional Swedish school system, although the latter is greatly influenced by numerous summative assessment events.

Towards ethical standards for employing user-generated data in educational assessment
Keywords: Classroom Assessment, Ethics, Large-scale Assessment, Learning Analytics
Presenting Author: Fazilat Siddiq, University of South-Eastern Norway, Norway; **Co-Author:**Damian Murchan, University of Dublin, Ireland

Educational assessment has evolved profoundly during the last decade and keeps developing due to the increased potential enabled by new technologies. In particular, computer-based assessments can generate process data that record examinees' digital traces. In other words, such data can potentially provide information not only about students' competences (correct/in-correct answers or quality of responses) but also their behavior (how they respond and come to the solution). Whereas advances in analyzing such data accelerate (aided, for example, by learning analytics, machine learning, artificial intelligence/AI), ethical and legal concerns persist. This study relates the paucity of information about ethics in user-generated data in educational measurement to existing test standards that have, in part, become outdated. We conducted reviews of six widely used test standards internationally to investigate to what extent they target issues related to ethics in utilizing user-generated data. These standards acknowledge ethical issues in assessment; however, they do not address user-generated data in assessment and ethics. Consequently, we also reviewed and analyzed ethical codes and frameworks developed within the wider field of user-generated data (process data, learning analytics, AI, etc). Thematic analysis was applied to propose a draft code of ethics for including user-generated data in educational assessment.

Quality of Italian preschool. The why, how and what of preschool evaluation in Italy.
Keywords: Competencies, Early Childhood Education, Mixed-method Research, School Effectiveness
Presenting Author: Cristina Stringher, Istituto Nazionale per la Valutazione del Sistema Educativo di Istruzione e di Formazione (INVALSI), Italy

This paper presents aims, methodology and findings of a project for the development of a self-evaluation form for preschool settings in Italy. This research trajectory intended to respond to one major mandate: develop a tool and build consensus around self-evaluation in this level of education. This massive operation involved >3700 preschools in a national consultation and additional >1800 preschools in a national experimentation. Quali-quantitative data have been produced during this research journey and allow to shed light on the quality of preschools in Italy. Results of the experimentation show that preschools in Italy consider themselves of good quality: the percentage of preschools positively self-evaluating their quality ranges from 65% on the rubric concerning school-family relationships, to 84% on the wellbeing of children rubric. Considerations are made on a complex self-evaluation process and on its theoretical framework, which may be useful also for other countries undertaking a similar effort.

Enlarging space for curriculum research within citizenship education: Whole-school approach
Keywords: Citizenship Education, Cultural Diversity in School, Curriculum Development, Teacher Professional Development
Presenting Author:Özge Karakuş Özdemirci, Middle East Technical University, Turkiye; **Presenting Author:**Hanife Akar, Middle East Technical University, Turkiye

This study aims to analyse the citizenship education curriculum of Turkiye through a whole-school approach in the context of differences and diversity utilizing a multi-layered critical inquiry. The 4th-grade Human Rights, Civics, and Democracy curriculum (HRCD), including the content analysis of other 4th-grade courses, were analysed. In addition, the lived experiences and opinions of school members were obtained through semi-structured interviews and in-class and in-school observations. Interviews were conducted with 4th-grade teachers (*n*=16), school managers (*n*=10), and counsellors (*n*=10), and observations were realized in the interviewed teachers' classrooms (*n*=7) from a selection of six schools located in multicultural neighbourhoods of a Southern city in Turkiye. Findings illuminated the dominance of nationalist, authoritarian, and statist perspectives to citizenship which blocks the paths to create a democratic classroom environment where all students feel accepted regardless of their identity. However, adopting a whole-school approach and going into schools and classrooms provided a ground to see the counter-discourses, eventually used to enlarge the curriculum research in the context of citizenship education.

Views on Holocaust and Citizenship: Israeli and German Civics Teachers
Keywords: Citizenship Education, Mindsets, Qualitative Methods, Teaching Approaches
Presenting Author: Tim Zosel, University of Duisburg-Essen, Germany

The Holocaust has been described as "a rupture in *civilization" (Diner 1988), since never before* had anything like this taken place. Its commemoration takes on prominent and particular functions within the political cultures of Israel and Germany (Zuckermann 1998). These functions are related to specific official values of contemporary citizenship and democracy that are also mirrored at school, especially in citizenship education. In both countries the Shoah is of considerable importance in justifying a specific citizenship education that strengthens democracy. On the level of concrete teaching practice, it remains yet unclear, how the historical reference Holocaust is connected with citizenship conceptions of civics teachers.
The paper presents the results of an empirical qualitative and internationally comparative study intending to take a closer look at teachers' citizenship conceptions in interrelation with the views on the Shoah. Therefore, extended focus groups ("group workshops", Bremer 2004) were conducted and habitus-hermeneutically analyzed (Bourdieu 1982, Bremer & Teiwes-Kügler 2013). Overall, the results suggest that the teachers' views on the Holocaust correspond to certain group-specific citizenship experiences and moral attitudes. The findings of the study further suggest that the citizenship conceptions are accompanied by specific pedagogical goals for the future ideal citizens, which include specific pupils to citizenship and exclude others. Teachers 'make use' of the Shoah as a historical reference and projection in order to pursue their own contemporary educational goals. In Israel and Germany, however, this takes place according to different logics which will be explained in further detail in the paper.

Neutrality in times of war: Russian school in the early days of the invasion of Ukraine
Keywords: Attitudes and Beliefs, Citizenship Education, Qualitative Methods, Teaching Approaches
Presenting Author: Evgeniia Efimova, Uppsala University, Sweden

The study addresses the problem of teachers' neutrality in discussions of controversial issues in the face of extreme polarization and external political pressure. Based on 26 interviews with Russian teachers and school leadership from the first month of the invasion of Ukraine, I investigate how they made professional judgments about avoiding or engaging with the issue of the invasion, framing it, disclosing their views, and dealing with 'recommended' pro-war content. In my presentation I will show the complexities of teachers' situational decision-making and its factors, as well as highlight some predicaments of the discourse of teachers' neutrality and depoliticization of teaching.

Democratic Pedagogy: vision, perceptions and practice - principal's perspectives
Keywords: Citizenship Education, Curriculum Development, Qualitative Methods, Teaching Approaches
Presenting Author: Yifat Filo, Tel Aviv University, Israel; **Co-Author:**Benzi Slakmon, Tel Aviv University, Israel

Thirty-five years after the establishment of the first democratic school in Israel in 1987, the democratic school movement in Israel has flourished. Yet, its underlying pedagogy has not been sufficiently researched. In this study, we ask to what extent genuine democratic pedagogy can be identified. How is democratic teaching and learning perceived? What constitutes a democratic curriculum, and how does it differ from a curriculum in a non-democratic school? What type of democracy is pursued and how does it manifest in democratic structures, visions, and values? In this paper we analyze principals' perspectives regarding these issues in order to understand the ways in which their educational agendas shape their practice and how their perspectives shape the specific kind of democracy they portray. Based on thematic analysis and a democratic dimension framework we analyzed interviews with veteran democratic school principals in Israel. Our findings point to a humanistic existentialist perception and to the fact that there is ambiguity regarding democratic pedagogy, teaching and learning. The Israeli democratic schools are within the liberal civic education tradition (Sant, 2019), a derivative of liberal democracy, which is currently undergoing a global crisis. Implications of the findings for democratic schools and for democratic education for new visions of democracy are discussed.

Chairperson: Nikolaos Fachantidis, Greece

University students' stress during the pandemic: Longitudinal evidence from two academic years
Keywords: Anxiety and Stress, Higher Education, Pandemic, Quantitative Methods
Presenting Author: Elisabeth Höhne, Leibniz Universität Hannover, Germany; **Co-Author:**Jannika Haase, Leibniz University Hannover, Germany; **Co-Author:**Lysann Zander, Leibniz University Hannover, Germany

With the rapid shift to online teaching and contact restrictions, the COVID-19 pandemic has had a large impact on university students worldwide. Although there is plenty of evidence regarding the negative effects of the pandemic on students' mental health at the onset of the pandemic, research on the medium- and long-term effects of the pandemic remains scarce. In the present study, we thus examined students' perceived stress at seven time points during the pandemic from June 2020 to June 2022 in Germany, with a specific focus on the period when universities returned to in-person classes in the winter semester of 2021/22. Our results show a decrease in students' stress levels upon their return to in-person classes at university in our overall sample (*N*=2,920). In a longitudinal subsample (*n*=205), however, we found no significant intraindividual changes from our first time point to the six subsequent time points. We discuss potential explanations for our findings and future research directions.

Psychological distress, anxiety and depression in university students during the COVID-19 pandemic

Keywords: Anxiety and Stress, Emotion and Affect, Higher Education, Well-being
Presenting Author: Maria Koushiou, University of Nicosia, Cyprus; **Co-Author:**Alexandros Kapatais, University of Nicosia, Cyprus; **Co-Author:**Nuno Ferreira, University of Nicosia, Cyprus; **Co-Author:**Marios Adonis, University of Nicosia, Cyprus

Objective: Recent assessments among university students have shown an increase in their anxiety and depression levels during the COVID-19 pandemic (Liu, et al., 2020; Alam, et al., 2022). The aim of this study is to estimate the prevalence rates of depression, anxiety and distress symptoms in university students and further explore the influence of gender, age, level of studies, psychological flexibility, and fear for contracting COVID-19 in the expression of these symptoms.
Method: A total of 339 students completed a battery of questionnaires in the context of a campus-wide campaign conducted between October 10, 2020 - May 1, 2021. Multiple regression analyses were run to examine the above-mentioned predictors separately for distress, anxiety and depression as measured via the Depression Anxiety and Stress Scale-21 (Brown, et al., 1997).
Results: Based on the results, 57.2% of the students reported mild to extremely severe depression, 67.3% reported mild to extremely severe anxiety and 69.6% reported mild to extremely severe distress. Level of studies and psychological flexibility systematically appeared as significant predictors for all three-symptom categories. Fear of contracting COVID-19 significantly predicted distress levels among students.
Conclusions: Undergraduate students and students with lower psychological flexibility report higher levels of depression, anxiety and distress. Future research should focus on delineating the emotional processes that are associated with these symptoms during times of uncertainty that students currently face due to COVID-19's unpredictability. Further study and evidence-based interventions, targeting psychological flexibility, should proceed to reduce more severe risks among vulnerable university students.

Strivings and concerns during the pandemic: University students' perfectionism, stress, and coping
Keywords: Anxiety and Stress, Higher Education, Pandemic, Well-being
Presenting Author: Heta Tuominen, University of Eastern Finland, Finland; **Co-Author:**Riikka Hirvonen, University of Eastern Finland, Finland; **Co-Author:**Henriikka Juntunen, University of Helsinki, Finland; **Co-Author:**Jaana Viljaranta, University of Eastern Finland, Finland; **Co-Author:**Markku Niemivirta, University of Eastern Finland, Finland

The rapid transition to remote teaching due to the COVID-19 pandemic affected university students' studies and well-being. Despite the similar circumstances, students likely reacted differently to the challenges of this unprecedented situation and coped with it using different kinds of strategies. As this new situation was presumably reflected also in the level of goals students set for themselves and in the related self-evaluations and concerns, we assumed that examination of students' perfectionistic tendencies might provide added value. First, we investigated the level of Finnish university students' (N = 737) stress, coping strategies, and recovery after the transition to remote teaching in Spring 2020. Next, employing a person-oriented approach and latent profile analysis, we examined how students' differential emphasis on perfectionistic strivings and concerns (i.e., perfectionistic profiles) link with these. On average, students reported more challenge stress than hindrance stress. The most typical coping strategies were acceptance and positive framing, while seeking others' support was least typical. However, these somewhat varied in relation to the four perfectionistic groups identified: *ambitious* (36 %), *perfectionists* (25 %), *non-perfectionists* (24 %), and *concerned* (15 %). Most stress was reported by perfectionists and concerned. Ambitious and perfectionists favoured active coping and planning, while ambitious and non-perfectionists emphasised acceptance and positive framing. Perfectionists reported inferior recovery compared to other students. Our findings suggest students' differential emphasis on their goals and related concerns to be linked with their stress experiences during the pandemic. Particularly a combination of high strivings and concerns seems to threaten university students' well-being.

COVID-19 and University Students: Development of the Robust - Pandemic Coping Scale (R-PCS)
Keywords: Emotion and Affect, Higher Education, Pandemic, Quantitative Methods
Presenting Author: Daniela Raccanello, University of Verona, Italy; **Co-Author:**Giada Vicentini, University of Verona, Italy; **Co-Author:**Emmanuela Rocca, University of Verona, Italy; **Co-Author:**Roberto Burro, University of Verona, Italy

The COVID-19 pandemic has provoked an increase in both psychopathological symptoms and negative emotions. Examining how university students coped with the pandemic can give indications about how to intervene to support them. Coping is a multi-component process referring to all the actions marshaled to face the traumatic impact of stressful events. We studied how university students coped with the first wave of the COVID-19 pandemic, by developing the Robust – Pandemic Coping Scale (R-PCS), deputed to measure coping strategies related to epidemics/pandemics. We involved 2,987 Italian university students who participated to an online survey, including the R-PCS and the Power to Live with Disasters Questionnaire (PLDQ). We conducted exploratory and confirmatory factor analyses, which supported the goodness of a 4-factor model (i.e., Despair, Adjustment, Proactivity, Aversion) for the R-PCS, invariant across gender and age. Then, we applied the Rasch analysis. The correlations with the PLDQ supported also the criterion validity of the scale. Therefore, we described the development of a new, brief, and psychometrically sound instrument to assess students' coping strategies related to epidemics/pandemics. Our study revealed also gender and age differences: Scores were higher for Despair, Adjustment, and Proactivity for females; for Aversion for males; and for Proactivity for students older than 23 years. At the applied level, the R-PCS could be used to investigate the efficacy of evidence-based interventions aiming at supporting students during the pandemic or to monitor their reactions. And it could also be a basis for developing further scales for assessing coping related to other disasters.

Assessment and Evaluation, Cognitive Science, Instructional Design, Learning and Instructional Technology

Metacognitive Processes and Self-regulated Learning and Behaviour

Keywords: Achievement, Assessment Methods, Cognitive Skills and Processes, Computer-assisted Learning, E-learning/ Online Learning, Health-care Education, Metacognition, Motivation, Primary Education, Problem Solving, Reading, Secondary Education, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Elisa Vilhunen, University of Helsinki, Finland

Revision and psychometric properties of the Metacognitive Awareness scale MARSI-2fR
Keywords: Assessment Methods, Metacognition, Reading, Secondary Education
Presenting Author: Aristea Mavrogianni, University of Crete, Greece; **Co-Author:**ELENI VASILAKI, University of Crete, Greece; **Co-Author:**Ioannis Spantidakis, University of Crete, Greece

The learning process urgently needs to be redefined and therefore reformed. For that to happen, we must think critically about how students study. Thus, in the current study, we formed a new alternative factorization of the internationally acknowledged MARSI (Metacognitive Awareness of Reading Strategies Inventory) scale for the Greek secondary population. We shed new light on how Greek students read academic or school-related material. In the revised version of MARSI-2fR, the new structure consisted of two factors comprised of eight items: the textor subscale for text-oriented reading strategies (F1) and the textout subscale for extratextual reading strategies (F2). These two factors (F1 & F2), referring to students' reading habits, tend to be associated with the Greek national curriculum. The results shed new light on how students read academic or school-related material and provide evidence to facilitate redefining learning. The confirmatory factor analysis and the psychometric evaluation of the MARSI-2fR scale resulted in a valid and reliable tool. Such tools are needed to clarify the learning process and ease the way for the necessary educational transformations.

Metacognitive Awareness Activation and Effortful Problem Solving
Keywords: Achievement, Cognitive Skills and Processes, Metacognition, Motivation
Presenting Author: Ines Zeitlhofer, University of Salzburg, Austria; **Co-Author:**Joerg Zumbach, University of Salzburg, Austria; **Co-Author:**Judith Schweppe,

University of Passau, Germany

Research on cognitive load suggests that novice learners should be confronted with tasks that keep cognitive load low rather than with complex tasks that increase cognitive load. Nevertheless, learning approaches like the desirable difficulties framework or productive failure show that effortful processing can lead to improved learning outcomes. In an experiment, we investigated whether the degree of metacognitive awareness activation and learners' motivation affect the impact of effortful learning on learning outcomes. Therefore, ninety-eight university students completed the Tower-of-Hanoi (ToH) problem-solving task with variating difficulty levels. After each subtask metacognitive awareness activation was assessed. Results support the central role of metacognitive awareness activation for deep cognitive processing.

Get a Cue! How Metacognitive Prompts Affect the Role of Mental Effort in Generative Activities
Keywords: E-learning/ Online Learning, Health-care Education, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Valentin Riemer, Ulm University, Germany; **Co-Author:**Simona Weber, Ulm University, Germany; **Co-Author:**Tina Seufert, Ulm University, Germany

Mental effort invested in generative activities can serve as a cue for learners to make judgements of learning (JOL). However, whether mental effort is diagnostic for actual learning performance (cue diagnosticity) and, thus, facilitates JOL accuracy, largely depends on what that effort is aimed at. Effort actively invested in metacognitive monitoring may predict actual learning, whereas effort invested to cope with passively experienced load is less diagnostic. In this study, metacognitive prompts were used to guide learners to actively invest effort into metacognitive monitoring during generative activities of varying complexity. In a quasi-experimental between-within design, $N = 72$ medical and non-medical apprentices engaged in an online endoscopy training and were either assigned to a prompting or a control condition. In both conditions, learners engaged in generative activities of high (mapping) and low complexity (keyword generation). Results showed that prompting led to an increased cue diagnosticity of actively invested effort. However, this did not result in increased JOL accuracy in the prompting condition. Instead, JOL accuracy varied between generative activities and was higher for mapping than keyword generation. Possible explanations lie in the patterns of cue diagnosticity and learners' cue utilization of active effort and passive load.

The Structure of Procedural Metacognition in Middle Childhood: An Argument for a Unitary Factor
Keywords: Metacognition, Primary Education, Problem Solving, Self-regulated Learning and Behaviour
Presenting Author: Mariette van Loon, University of Zurich, Switzerland; **Co-Author:**Ulrich Orth, University of Bern, Switzerland; **Co-Author:**Claudia Roebers, University of Bern, Switzerland

The present study aimed to obtain insights into the structure of procedural metacognition (i.e., the capacity to monitor and control learning) in middle childhood. Children (151-second graders and 174 fourth graders completed three tasks: A Kanji memory recognition task, a text comprehension task, and a secret code memory recall task. Monitoring accuracy, control accuracy, and performance scores for these tasks were used to create latent factors in structural equation models, to compare various hypothetical structures of metacognition. Firstly, we addressed whether monitoring, control, and performance are shared across tasks (i.e., indicate generalizable skills) or whether there is evidence that these skills are also task-specific. Findings show evidence for both generalizable and task-specific components. Moreover, we investigated to what extent metacognitive skills are (in)separable from primary task performance. A one-factor model, with monitoring, control, and performance all loading on the same factor, provided a good fit. Moreover, we investigated to what extent monitoring and control are unitary or distinguishable skills. The 2-factor model, in which monitoring and control indicators loaded on a metacognition factor, and performance indicators loaded on a performance factor, fitted the data better than the 3-factor model, with different factors for monitoring and control. However, the 1-factor model still appeared to be the best-fitting model for our data, and the factor loadings did not differ between age groups. This may indicate that metacognitive skills and cognitive skills are, to a large extent, unitary. Possibly, training performance may support metacognition and vice versa. Future research could investigate this.

Metamotivational scaffolding in a digital learning environment
Keywords: Computer-assisted Learning, Metacognition, Motivation, Self-regulated Learning and Behaviour
Presenting Author:Jörg Zumbach, University of Salzburg, Austria; **Co-Author:**Simone Reitstaetter, University of Salzburg, Austria; **Co-Author:**Bettina Mann, University of Salzburg, Austria; **Co-Author:**Ines Zeitlhofer, University of Salzburg, Austria; **Co-Author:**Hermann Astleitner, University of Salzburg, Austria

We investigated the influence of metamotivational prompts on performance in a digital learning environment. Prompts represent forms of metacognitive scaffolding that help learners to deal with topics more intensively. Following Self-Determination Theory, our experimental study examines whether metamotivational prompts affect externally and self-controlled motivation, intrinsic and germane cognitive load as well as knowledge acquisition. 70 high school students participated in the study, where they had to work self-regulated with web-based training. In the experimental condition, participants received two metamotivational prompts during learning. The results show that participants only had higher self-controlled motivation and slightly achieved better learning outcomes when prompts were used sensibly. Discussions concern future research on the adaptivity of metamotivational prompts in relation to learners´ traits.

Social inclusion and teacher-student-relationship quality at the lower secondary level
Keywords: Emotion and Affect, Inclusive Education, Secondary Education, Social Aspects of Learning and Teaching
Presenting Author: Giuliana Pastore, Zurich University of Teacher Education, Switzerland; **Co-Author:**Reto Luder, Zurich University of Teacher Education, Switzerland; **Co-Author:**Andre Kunz, Zurich University of Teacher Education, Switzerland; **Co-Author:**Ariane Paccaud, Pädagogische Hochschule Zürich, Switzerland

Inclusive schools should create a learning environment, which allows a healthy cognitive and psychosocial development of all students through both optimal learning support and effective school engagement and participation, regardless of individual performance, language, learning and behavior disposition or disability. The subjectively perceived inclusion in the everyday school life of students can be regarded as a key determinant of successful school inclusion. For this goal, the relationship between teachers and students (T-S-R) may be crucial. Research in this area emphasizes the significant role of emotional aspects of these relationships as strong predictors of learning achievement and well-being. Hence, emotional aspects can be considered as a key aspect of quality of T-S-R. Nevertheless, in the context of research on inclusion, they have been rarely examined and a theoretically sound conceptualization for empirical research is still missing. The present project investigates the link between T-S-R quality and students' social inclusion in Swiss secondary schools that currently shift to inclusive settings. For this goal exploratory and confirmatory factor analysis with two different samples were used to first support the theoretical structure of the measurement of T-S-R quality. In a second step autoregressive models (ARM) answered the question of whether the quality of the relationship with the teachers can explain the students' perception of their own social inclusion. Finally general linear models (GLM) traced out the development of both social inclusion and the T-S-R quality during the secondary school years in relation to the SEN-status of the students.

Inclusive education of students with emotional and behavioral disorders: A systematic review
Keywords: Cognitive Development, Inclusive Education, Social Development, Special Education

Presenting Author: Sonja Krämer, Christian-Albrechts-University of Kiel, Germany; **Co-Author:**Julia Becherer, Christian-Albrechts-University of Kiel, Germany; **Co-Author:**Friederike Zimmermann, Kiel University, Germany

This systematic review examined outcomes of students with emotional and behavioral disorders (EBD) and their peers in more inclusive educational settings compared with more segregated ones. Cognitive (e.g., results in standardized achievement tests) and psychosocial outcomes (e.g., self-concept, anxiety) were considered. We searched relevant databases and conducted a backward and forward search of relevant articles and previous reviews. Only studies that compared students with and without EBD in more inclusive settings to a comparison group of students with and without EBD in segregated educational settings were included. In total, we summarized the results of $k = 19$ primary studies with $N = 37{,}689$ students and $n = 198$ effects. Evidence suggests that students with EBD benefit slightly from inclusive education compared with segregated education in terms of cognitive outcomes. Regarding psychosocial outcomes for students with EBD, the results are less consistent but indicate neutral to positive effects in favor of inclusive education. For the peers without EBD, concerning cognitive outcomes, there were predominantly no differences between the educational settings or slightly positive effects in favor of inclusive education. Regarding psychosocial outcomes, there were some neutral but also negative effects for more inclusive settings. We consider a possible selection effect with students diagnosed with mild to moderate EBD being more likely to be educated inclusively compared to students with severe EBD, and discuss the current state of research.

Social participation of students with behavior problem – a peer group perspective
Keywords: At-risk Students, Peer Interaction, Social Development, Social Interaction
Presenting Author: Marleene Rytioja, University of Eastern Finland, Finland; **Presenting Author:**Kristiina Lappalainen, University of Eastern Finland, Finland; **Presenting Author:**Hannu Savolainen, University of Eastern Finland, Finland

Peer relationships are a significant social environment in children's life and children spend an enormous time to interacting with their peers during school days. Earlier study with same data with 3th graders revealed that children's sociometric status is connected to their behavioral and emotional problems. Children in rejected and controversial status groups assessed to have more behavioral and emotional problems compared to their more popular counterparts. The purpose of this study was to explore are the members of children's peer groups similar on the basis of their behavioral and emotional characteristics, behavior at school or academic achievement. Results show that the members of children's peer groups resemble each other by their behavioral and emotional strengths and teacher rated behavior at school but not by their academic achievement or behavior problems. The within peer-group similarity in behavior is not explained by children's behavioral and emotional strengths but by their gender. The members of girls' peer groups get better behavioral assessment from their teachers compared to the members of boys' peer groups.

Social participation of children and adolescents with intellectual disabilities in sport clubs
Keywords: At-risk Students, Peer Interaction, Social Development, Social Interaction
Presenting Author: Carmen Zurbriggen, University of Fribourg, Switzerland; **Presenting Author:**Simone Schaub, University of Teacher Education in Special Needs, Switzerland; **Co-Author:**Mireille Audeoud, Hochschule für Heilpädagogik Zürich, Switzerland; **Co-Author:**Matthias Lütolf, University of Teacher Education in Special Needs HfH Zurich, Switzerland; **Co-Author:**Anne Stöcker, University of Luxembourg, Luxembourg; **Co-Author:**Christina Arn, University of Teacher Education in Special Needs HfH Zurich, Switzerland

The Unified programme of Special Olympics unites athletes with and without intellectual disabilities and supports the inclusive sport clubs in adapting their training accordingly. The pilot study aimed to investigate the social participation of children and adolescents who train in Unified sports clubs in one Swiss Canton, both from the perspectives of the children and adolescents themselves and from the perspective of significant adults. Social participation was assessed by means of the Experience Sampling Method. Ten children and adolescents with intellectual disabilities, their parents, Unified trainers, and sports teachers in school provided daily information on the momentary subjective experiencing of involvement and participation-related characteristics in various situations during eight weeks, with 413 measurement occasions in total. The results of the pilot study will be presented and discussed in terms of their significance for inclusion.

Chairperson: Anna-Lena Godhe, Jönköping University, Sweden

The benefits of self-efficacy for interest in the short and longer-term.
Keywords: Emotion and Affect, Foreign and Second Language Acquisition, Interest, Self-efficacy
Presenting Author: Luke K. Fryer, The University of Hong Kong, Hong Kong; **Co-Author:**Nicholas Bovee, Kyushu Sangyo University, Japan; **Co-Author:**Kaori Nakao, Seinan Gakuin University, Japan; **Co-Author:**Shuichi Ozono, Kyushu Sangyo University, Japan

The linkages between students' self-efficacy beliefs and interest are well established by both theory and a growing body of empirical research. This firm foundation and the inherently developmental nature of learning in classrooms necessitates a deeper look at how changes in students' self-efficacy beliefs impact their interest in learning both across a course of study and in the longer-term. This study tests the longitudinal contribution of students' self-efficacy beliefs' latent growth for their interest in studying in a specific domain in the shorter- (36-weeks) and longer-term (80-weeks). This study was conducted across four semesters (two academic years) of compulsory foreign language courses at one private Japanese university. In total, data was collected across eight time points, primarily within weekly e-learning exercises. Attendance, longitudinal standardised achievement, and domain interest were modelled as outcomes of a latent structural equation model which included a latent curve for self-efficacy beliefs for the course of study (four data points, 36-weeks). Results confirm the paired roles of baseline and growth rate of self-efficacy beliefs within the growth of students' domain interest. Over the longer-term, the relative importance of growth rate increased indicating its importance and highlighting its under-theorised role within important learning outcomes such as interest.

Effectiveness of Instructional Design Focusing on Sentence Construction and Ambiguity
Keywords: Foreign and Second Language Acquisition, Instructional Design, Motivation, Self-efficacy
Presenting Author: Mika Igarashi, Hosen College of Childhood Education, Japan

In this study, we conducted classes aimed at developing the metalinguistic ability of 66 sixth-grade elementary school students and verified the effectiveness of the instructional design. All the students participating in this study were native speakers of Japanese. Metalinguistic ability refers to the ability to become aware of the structure and function of language itself and has been shown to play an important role in foreign language learning. Teachers in charge of English and Japanese at the school conducted the intervention classes. The intervention mainly dealt with word order, sentence structure, and ambiguity, and was conducted in five classes (each session was 45 minutes long) on separate days. The classes were conducted in Japanese, and foreign language expressions, including English, were introduced as necessary. The participants answered a metalinguistic ability test and a questionnaire on language learning (motivation and beliefs) before and after the intervention. Pre- and post-comparison results showed a significant increase in metalinguistic ability test scores, while no significant positive change was found in motivation and beliefs. The result suggests that the present instructional design contributed to the improvement of the students' metalinguistic ability.

Developing contextualised oral language assessments: mapping the local within the local
Keywords: Assessment Methods, Early Childhood Education, Multicultural Education, Tool Development
Presenting Author: Joshua McGrane, The University of Melbourne, United Kingdom; **Co-Author:**Athina Ntalli, University of Oxford, United Kingdom; **Co-Author:**Usha M N, The Promise Foundation, India; **Co-Author:**Sanjana Nagendra, The Promise Foundation, India; **Co-Author:**Megha K, Manipal Academy for Higher Education, India; **Co-Author:**Siyu Ma, University of Oxford, United Kingdom; **Co-Author:**Gideon Arulmani, The Promise Foundation, India; **Co-Author:**Sonali Nag, University of Oxford, United Kingdom

Innovations in the localising of language assessments have been slow relative to other areas such as math assessment. This may be attributed to a challenge that is more acute in language assessment - the need for a coherent test construction framework for tests to capture well the features of a language and be sensitive to the setting, especially when there are dialects and multilingualism. In this paper six tests of oral language are presented as exemplars of the challenges to localisation in language assessment: tests of vocabulary, morphosyntax and narrative expression. Test localisation is examined in the context of four domains: a) construct b) context c) meaningfulness and d) psychometric properties. The results are mapped against robustness at the level of psycholinguistic characteristics of the target language (construct definition), context (languages in the setting and medium of language instruction), meaningfulness (user engagement, and usability) and psychometric properties (factoring in the local social stratifiers *within* the local context). Taken together, a proposal is made for developing oral language assessments that acknowledges the multi-faceted nature of both the language domain and the localisation process. This work is of particular relevance to assessment in the less-studied languages of low- and middle-income countries.

Scaffolding plurilingual students' learning through a functional writing roleplay in grade 1
Keywords: Migrant / Refugee and Minority students, Primary Education, Teacher Professional Development, Writing/Literacy
Presenting Author: Kimberly Norrman, Uppsala University EDU, Sweden

The aim of the study is to create knowledge on how a functional writing approach in a teacher professional development intervention creates teaching and learning opportunities for plurilingual students. Functional writing here is understood as writing used as a means of learning and communicating. The purpose and audience of the writing is just as important as learning the alphabetic code for writing development (Hall, 2013). The study analyzes six forms of interaction in a writing focused, roleplay activity (teacher-student, teacher-class, teacher- group, student-student, student-artifact, teacher+ artifact). This study is interested in both how teachers provide support and meaning making opportunities but also instances where plurilingual use their own linguistic agency and strategies to communicate, complete the roleplay task or make meaning. The research questions addressed are: What do Swedish teachers do to facilitate meaning making in interaction for plurilingual students during a functional writing intervention?What do plurilingual students do in order to create meaning in interaction during a functional writing intervention? The preliminary results emerging from the inductive thematic analysis are that roleplay allows for teachers to support plurilingual students' learning in a seamless and effective manner. Roleplay opens up meaning making opportunities for plurilingual students through encouraging interaction and allowing for scaffolding from teachers, peers and the plurilingual students themselves.

Intercultural interpreter-mediated parent-educator talks in childcare centres
Keywords: Early Childhood Education, Migrant / Refugee and Minority students, Multicultural Education, Qualitative Methods
Presenting Author: Fabienne Bohler, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Franziska Vogt, St.Gallen University of Teacher Education, Switzerland

The participation of children with a migration background in early childhood education can facilitate integration into society (Edelmann, 2018). However, educators can experience cooperation with families, who do not speak the local language well, as challenging (Sulzer, 2013). Through language "power imbalance, social asymmetries and norms" are discursively produced (Panagiotopoulou, 2017). Intercultural interpreters can act as a link between parents and educators and contribute to balancing the asymmetrical power imbalance (Moreno, 2018).There is almost no existing research on parent-educator talks supported by intercultural interpreters in early childhood education. The study therefore seeks to explore the structure, content, and social interaction of the talks. The study is embedded within a large project promoting language fostering in childcare centres for second language learners. Experiences show that many childcare centres do not focus educator-parent cooperation systematically and have difficulties to address complex topics due to language barriers.The qualitative study is based on audio recordings of the talks. For data analysis, Grounded Theory Method is employed. The results will provide evidence on the characteristics of interactions between parents and educators supported by intercultural interpreters in childcare centres.

Improving children's visual search for answer to questions in a text through induction tasks
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Eye Tracking, Reading
Presenting Author: Sabine FEVIN, Centre de Recherches sur la Cognition et l'Apprentissage (CeRCA) - CNRS - Université de Poitiers - Université de Tours, France; **Co-Author:**Christine Ros, Centre de Recherches sur la Cognition et l'Apprentissage (CeRCA) CNRS - Université de Poitiers - Université de Tours, France; **Co-Author:**Delphine Oger, Centre de Recherches sur la Cognition et l'Apprentissage (CeRCA) CNRS - Université de Poitiers - Université de Tours, France; **Co-Author:**Nicolas Vibert, Centre de Recherches sur la Cognition et l'Apprentissage (CeRCA), CNRS, Université de Poitiers, Université de Tours, France

Visual search for verbal information is a complex activity for young readers. This study focused on whether asking 10 years old children to elaborate on the meaning of a question before to search for the answer could foster access to the meaning of words during text processing, and whether this manipulation might increase children's question-answering accuracy. Children were asked to memorize a question before performing an induction task involving either the spelling ("perceptual" task) or the meaning ("semantic" task) of the words used in the question. Then, they searched for the answer through short texts. Both surface questions and inferential questions were used. After performing the semantic rather than the perceptual induction task, children made fewer errors (14.5% versus 21.5%, $\chi^2(1)=3.88$, p

How does structured notes in the form of a graphic organizer influence students' achievement?
Keywords: Higher Education, Instructional Design, Multimedia Learning, Quantitative Methods
Presenting Author: Tiphaine Colliot, CeRCA UMR7295 Université de poitiers, France; **Co-Author:**Karima Mekki, Université de Poitiers, France

The purpose of the present study was to assess the effects of different instructional designs of a pedagogical document on students' achievement and note-taking activity. 81 students studied a pedagogical document in one out of four condition: document-only, document accompanied by a graphic organizer, document accompanied by a partial graphic organizer to be completed, document with the instruction of generating a graphic organizer. No difference of cognitive load and on the time spent studying the document were observed. Overall, results showed no significant effect of receiving a readymade graphic organizer or generating totally or partially a graphic organizer on students' achievement. Complementary analyses revealed that the quantity of notes was

significantly and positively linked to students' achievement.

Reading accuracy threshold on reading comprehension
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Reading, Writing/Literacy
Presenting Author:NATALIA CALVO BLÁZQUEZ, Universidad de Salamanca, Spain; **Co-Author:**J. Ricardo García Pérez, Universidad de Salamanca, Spain; **Co-Author:**Emilio Sánchez, Facultd de Psicología, Spain

The full development of reading competence requires achieving different challenges (Alexander et al., 2012, Sánchez and García, 2021). In a language such as Spanish, the first of these challenges is to achieve reading accuracy, based on phonological awareness and the knowledge of grapheme-phoneme correspondences. Achieving this challenge is vital and supports the subsequent achievements. In a previous study it has been identify the minimum accuracy threshold that learners must reach so that the relation between oral and reading comprehension is significative. In other words, to be able to benefit from the oral comprehension skills they have. This threshold is equivalent to reading accurately 72% of a list of 40 pseudo-words. The aim of this study is to identify the number of students who are (or not) reaching this threshold in a sample of Spanish students initially assessed in 1st grade and followed up to 3rd grade, to explore the consequences of reaching (or not) this threshold in a given grade on basic comprehension skills measured in 3rd grade. Regression analyses show that reaching this threshold in 1st grade (but not in 2nd or 3rd) significantly predicts later comprehension success even controlling oral comprehension ability. Using reference thresholds can be useful for creating reader profiles and facilitating interventions to ensure subsequent success.

The role of sources in single text comprehension.
Keywords: Comprehension of Text and Graphics, Critical Thinking, Reading, Secondary Education
Presenting Author: Javier Rosales, University of Salamanca, Spain; **Co-Author:**María García Serrano, University of Salamanca, Spain; **Co-Author:**J. Ricardo García Pérez, Universidad de Salamanca, Spain

To successfully read texts and manage with the large amount of information provided now a days specially with the use of internet, being aware of the way the information is organised and the source the information comes from to interpret and manage the information seem to be important. In this line, the main goal of this study was to explore the effect of the presence of sources in single-text comprehension. 284 seventh- to tenth-grade students were divided into two groups by grades: students at lower grade levels (seventh and eighth grade), and students at higher grade levels (ninth and tenth grade). The students read a sequence and a cause-effect text and made a summary of each text. Four different text version were created for each text manipulating the signals and the sources (text with signals and without source, text with signals and source, text without signals and with source, and text without signals and without source). The results reveal that the presence of an authority source in single text does not impact directly on its comprehension but depends on the attention of reader to them and the type of texts. When the text contains organizational signals, the source can reinforce the function of those signals for the readers that pay attention to them.

Home environment factors and children's and adolescents' critical reading skills:A systematic review
Keywords: Comprehension of Text and Graphics, Critical Thinking, Parental Involvement in Learning, Reading
Presenting Author: Maria Psyridou, University of Jyväskylä, Finland; **Co-Author:**Jenni Ruotsalainen, University of Jyväskylä, Finland; **Co-Author:**Mari Manu, University of Jyväskylä, Finland; **Co-Author:**Elizabeth Balch-Crystal, University of Jyväskylä, Finland; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Leena Paakkari, University of Jyväskylä, Faculty of Sport and Health Sciences, Finland; **Co-Author:**Minna Torppa, University of Jyväskylä, Finland

One of the main challenges of our times is the wide and rapid spread of misinformation and disinformation. Therefore, critical reading is considered essential, and it is vital to identify factors that affect its development and foster them. Critical reading refers to the ability of the reader to identify, interpret and evaluate information from written texts that they encounter. Home environment plays a crucial role in critical reading. The aim of the current review is to synthesize the existing research on the relationship between home environment and critical reading development among children and adolescents. We also examine how critical reading skills and home literacy environment factors were defined and measured in the studies. The electronic databases Web of Science, PubMed, ERIC, EBSCO (all databases) were searched, and 4,787 records were identified. To be considered for inclusion in the review, articles had to conform to the following criteria: a) to be written in English (with no restrictions on the language of the assessment itself), b) to report empirical data, c) to be published in a peer-reviewed journal, d) participants age was from 6/7 years old (Grade 1) until 17/18 (end of school), e) to assess critical reading, f) to include home environment measures, g) to assess the association between home environment and critical reading. The analysis is still ongoing. Home environment factors that are associated with children's and adolescents' critical reading skills as well as limitations and suggestions for future work are discussed.

Comprehension of Multiple Digital Texts: a longitudinal study in third-grade primary school children
Keywords: Comprehension of Text and Graphics, Digital Literacy and Learning, Eye Tracking, Reading
Presenting Author: Anouk Bakker, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Aurora Troncoso-Ruiz, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Liesbeth Crajé-Tilanus, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Naomi Bergen, van, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Marco Ven, van de, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Jos Keuning, Cito Institute for Educational Measurement, Netherlands; **Co-Author:**Eliane Segers, Behavioural Science Institute, Radboud University Nijmegen, Netherlands

The digitization of society has instigated questions about digital reading comprehension. Many challenges and opportunities arise when trying to Comprehend Multiple Digital Texts (CMDT). It is unclear whether children can focus on what they read and reach deep levels of reading comprehension when confronted with the many opportunities and challenges accompanying digital reading. We are conducting a longitudinal study into the complex task of CMDT in children in middle and upper primary grades. The main focus of our study is the predictive value of cognitive linguistic abilities and digital exposure to CMDT, as well as the development of CMDT. Our poster will show the preliminary findings of our study's first and second waves. By gaining a better understanding of CMDT, we hope to inform and improve educational practice regarding digital reading comprehension.

In the mind of an easy-to-read author – an explorative case study of metalinguistic reasoning
Keywords: Comprehension of Text and Graphics, Motivation, Reading, Special Education
Presenting Author:Åsa Wengelin, University of Gothenburg, Sweden

Easy readers (novels) have been argued to have a positive impact on young people's reading development and are increasingly used in Swedish educational contexts, especially for demotivated teenagers and for students who are considered poor readers. (Nordenstam & Olin-Scheller, 2021). However, our knowledge about the underlying principles, structure and effectiveness of easy readers is scarce. An increased understanding of how various structural and content-related text characteristics interact in such novels is of essence for understanding the possibilities and limitations of using them for enhancing reading development, motivation and instruction. We therefore carried out an exploratory case study, focusing on metalinguistic reasoning by an experienced author of easy readers, and two editors, during the production of a new original easy reader. We were particularly interested in (a) the relation between text linguistic and structural features, and (b) and to what extent easy readers should target specific groups. Data was collected mainly by means of text-based interviews and analyzed through a hybrid process of deductive and inductive thematic analysis, that took its point of departure in three categories of potential obstacles to reading comprehension suggested by Beck et al (1984): surface structure, background knowledge needed for comprehension, and the nature, ambiguity, or confusability of the text's content. Our main results were that the participants focused more on providing the reader with necessary information in the right order and removing "redundant" information, to reduce requirements of inference making and "detours" from the main plot to environmental descriptions. Educational implications will be discussed.

Assessing the skill to solve technical problems in everyday life
Keywords: Assessment Methods, Cognitive Skills and Processes, Learning Approaches, Problem Solving
Presenting Author: Marcus Schrickel, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Carolin Hahnel, DIPF | Leibniz Institute for Research and Information in Education, Centre for International Student Assessment (ZIB), Germany; **Co-Author:**Jennifer Stemmann, Pädagogische Hochschule Freiburg, Germany

Using everyday home automation and appliances can lead to situations where users do not possess routine actions yet to use a device in a particular way. Required skills in technical problem solving (TPS) include acquiring relevant operational knowledge and its purposeful application. TPS can be affected by a problem solver's prior knowledge and metacognitive abilities. To investigate adults' TPS, we used and refined a simulation-based computer test by Stemmann (2016) to assess the behavior of knowledge acquisition using system exploration and/or operating manuals as well the performance in knowledge application tasks. The present study focuses on validating the resulting TPS test score. We analyze the test's dimensionality and problem characteristics of complexity and transparency, which are expected to influence the items' solution probability. Further analyses concern the association of the TPS test score with the extent of knowledge acquisition via system exploration and reception of operating manuals, prior knowledge, and metacognitive accuracy. Data collection is currently ongoing, aiming at a sample of n = 280 adults. Results will be available and presented at the time of the EARLI 2023 and serve to discuss the similarities and differences between TPS and other forms of problem solving.

Assessing Collaborative Problem-Solving Skills in Higher Education: Evidence from a Case Study
Keywords: Assessment Methods, Cognitive Skills and Processes, Competencies, Higher Education
Presenting Author: Anna Trikoili, Technical University of Munich, Germany; **Co-Author:**Despoina Georgiou, Utrecht University, Netherlands; **Co-Author:**Daniel Pittich, Technische Universität München (TUM), Germany

Collaborative problem-solving (CPS) is a key competency for 21st-century learners and professionals. It is related to the way we think, learn, and work and draws upon cognitive and social domains. Although the construct has been extensively assessed in large-scale, international projects, the instruments utilized are not applicable to small-scale educational settings. The aim of the current study, which is in its preliminary phase, is first to evaluate the reliability and validity of a pilot collaborative problem-solving assessment tool. Second, to conduct an inductive content analysis of students' responses about their CPS skills, in order to investigate their development during a Master's degree program. For this case study, participants are postgraduate students in a program designed to foster 21st-century skills. We video-record students working on group assignments at the beginning and toward the end of the program. To measure the results, we utilize Hesse's et al. (2015) assessment framework. Two scorers independently assess the video recordings, using the framework's rubric. We plan to measure the pilot instruments' reliability and validity and also students' CPS scores longitudinally, to assess the program's effectiveness. Findings may have implications for other competencies development assessment tools and curriculum design.

Challenge-Based Learning in Educational Sciences: Mapping Students and Lecturers' Experiences
Keywords: Competencies, Higher Education, Mixed-method Research, Teaching/Instructional Strategies
Presenting Author: Despoina Georgiou, Utrecht University, Netherlands; **Co-Author:**Dimitra Mousa, Utrecht University, Netherlands

In our changing and diverse world, universities need to focus not only on knowledge transfer to students but also and mainly on helping them develop the necessary competencies to confidently navigate through this world. Challenge-based learning (CBL) in higher education is a transdisciplinary teaching and learning approach aiming to enhance university students' transferable competencies and skills while working on authentic and socially relevant problems. This study focuses on the development of a CBL-oriented course in educational sciences aiming to explore students' and lecturers' experiences during the course. In detail, we map lecturers' needs to successfully adopt such innovative teaching practices and explore university students' self-reported learning gains. We employed a mixed-methods design and collected data from N = 75 university students and N = 6 lecturers. Preliminary results suggest that most students experience the CBL course positively (81%), feel supported to make better connections between theory and practice (71%), and develop their professional skills (67%) and academic skills (53%). Similarly, lecturers share positive experiences about their involvement in the course but report the need to attend professional development courses on innovative teaching practices to be able to better understand their role and further support students learning. Implications about the role of university structures and future steps that are necessary to support lecturers' and students' learning will be discussed.

Workshop
Learning and Instructional Technology

Developing Questioning Literacy with the Question Compass

Keywords: Inquiry Learning, Instructional Design, Teacher Professional Development, Teaching/Instructional Strategies
Interest group: SIG 20 - Inquiry Learning

Student questioning is an important self-regulative strategy which has multiple benefits for teaching and learning. However, teachers need support to help students develop their questioning literacy. In this workshop participants will be introduced to the Question Compass, a visual representation of the concept of Hypothetical Question Trajectories. Hypothetical Question Trajectories are a scaffold for teachers to develop students' questioning literacy by exploring possible questions from the perspectives of various research methodologies and learning outcomes. The hypothesis was that by exploring Hypothetical Question Trajectories, teachers would be better able to anticipate on potential student questioning and to encourage students to raise relevant, feasible questions which contribute to deeper understanding of the topic under study. To validate the hypothesis, a design-based study was conducted in which 30 teachers, ranging from kindergarten to grade 6, used the question compass to prepare and implement social science projects in their classrooms. In this highly interactive workshop an hands-on experience with the Question Compass will be alternated with the presentation of the outcomes of design-based research and the discussion of the potential of Hypothetical Question Trajectories for developing questioning literacy.

Assessment and Evaluation

Smart CAT - A Smart Configurable Software Tool for Assessment

Keywords: Artificial Intelligence, Assessment Methods, Educational Technologies, Learning Analytics
Interest group: SIG 01 - Assessment and Evaluation

Please bring your own device if you are attending this ICT demonstration.Digital education provides new opportunities for active learning and can effectively support the development of complex competencies. Nevertheless, assessing such competencies require the development of assessment tools that rely on methodologies which hold educational value. One of the most promising assessment methodologies is Stealth Assessment (SA). Although SA is a proven methodology, its application is a complex, laborious, and time-consuming process that requires hardcoded solutions. To resolve this issue, a Smart Configurable Assessment Tool (Smart CAT) was developed to act as a stand-alone software solution that relies on the principles of the SA methodology. As such, Smart CAT facilitates the application of easy and flexible data-driven assessments using machine-learning (ML) technology. In specific, (a) it allows the use of numerical datasets, (b) it allows the easy arrangement of different statistical models, (c) it offers a wide range of built-in ML functions, and (d) it includes automated built-in functions for validating and verifying assessment outputs. Smart CAT has already been proven to be operational robust and empirically valid and reliable in several studies. To this end, Smart CAT can (a) be utilized on a large scale for the application of assessments in digital education, (b) it advocates the use of SA, which is a principled assessment methodology, and (c) it allows for the processing of large volumes of rich learner data for assessing competencies in digital learning environments.

Session T 1

26 August 2023 14:45 - 16:15
AUTH_DC2
Invited Symposium
Instructional Design

Instructional practices for enhancing literacy skills across educational contexts

Keywords: Feedback, Instructional Design, Learning Approaches, Teaching Approaches, Vocational Education and Apprenticeship Training, Writing/Literacy
Interest group: SIG 12 - Writing
Chairperson: Liana Konstantinidou, Zurich University of Applied Sciences, Switzerland
Discussant: Ioannis Dimakos, University of Patras, Greece

In a digitized society, writing-based communication is becoming ever more important in learning, professional and every day-life contexts. At the same time, writing itself is increasingly based on quick and easy access to sources and information, which are to be understood, critically selected, combined, and transformed into a reader-oriented text. Thus, writing processes tend to more frequently include reading processes, requiring competent writers to be competent readers. The relevance of literacy skills and the integration of reading and writing is reflected in curriculum reforms that have put greater emphasis on synthesis writing and integrated reading and writing instruction across educational contexts. Concurrently, there is increased interest in writing research on the relationship between reading and writing processes and the effects of integrated reading and writing instruction on text quality. This symposium presents three studies conducted in different educational contexts: 10^{th}-grade students, Vocational Education and Training students, and undergraduate students. The first study presents the effect of feedback on synthesis writing processes and added modeling instruction on text quality and writing and reading behaviors. The second study discusses the effects of contextualized reading-to-write-tasks on students' text quality. The third study compares the efficacy of guides and rubrics as aids to the process of writing an argumentative text. The last presentation gives an overview of major distinctions in synthesis writing research and the diversity of theoretical orientations and theoretical approaches among the first three studies and beyond, and discusses how diversity and contradiction can contribute to a more complete theoretical understanding.

Effect of feedback on the processes and modeling instruction on text quality and literacy behaviors
Presenting Author: Elke Van Steendam, KU Leuven, Belgium; **Co-Author:**Gert Rijlaarsdam, University of Amsterdam, Netherlands; **Co-Author:**Nina Vandermeulen, Umeå University, Sweden; **Co-Author:**Marije Lesterhuis, UMC Utrecht, Netherlands; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium

Writing a synthesis text involves the comprehension of source texts of which relevant information needs to be selected, combined and integrated into a reader-friendly and accurate synthesis text. To master these processes, writers need to acquire an insight into both their own and others' (effective) processes. One way of achieving that is by providing them with feedback on their synthesis writing processes and by having them compare these to processes which have been shown to be (more) effective (Vandermeulen et al., 2023). In the present study we replicated and extended the effect of Vandermeulen et al. (2023) by providing writers with feedback on their keystroke-logged synthesis writing activities both with and without instruction. In a within subjects' design 173 10th grade students were randomly assigned to a process feedback condition and such a condition with additional instruction with peer models of effective synthesis writing processes. The feedback was designed in line with the tenets of effective feedback (Panadero et al., 2019) and observational learning (Rijlaarsdam et al., 2008). Results show that students in both conditions significantly improved the quality of their syntheses from a first to a final writing session ànd compared to a national baseline (n=600) the effect is one year of schooling. Regarding the process data, the main finding is that students in the feedback-instruction condition had a more prominent focus on the sources as they spent more time in them and switched more often between text and sources, also compared to the baseline.

Scenario-based literacy education: effects of integrated reading and writing tasks on text quality
Presenting Author:CURTIS GAUTSCHI, Zurich University of Applied Sciences (ZHAW), Switzerland; **Co-Author:**Karin Madlener-Charpentier, Zurich University of Applied Sciences (ZHAW), Switzerland; **Co-Author:**Elsa Liste Lamas, Zurich University of Applied Sciences (ZHAW), Switzerland; **Co-Author:**Joachim Hoefele, Zurich University of Applied Sciences (ZHAW), Switzerland; **Co-Author:**Liana Konstantinidou, Zurich University of Applied Sciences, Switzerland

Many students in vocational education and training (VET) have difficulties with reading and writing. To date, there is little research on whether and how the development of VET students' writing skills may benefit from teaching approaches that integrate reading and writing. This presentation reports results from a semester-long intervention study conducted in Switzerland in 2018/19 (N = 285) in which we investigated the impact of a scenario-based integration of reading-to-write-tasks on the development of VET students' text quality. In the approach, problem-solving processes are set in motion by scenarios representing real- or work-life situations. Reading-to-write tasks form part of the student-initiated problem-solving process and result in situated argumentative writing. A positive experimental intervention effect was found, as text quality developed significantly better in the experimental group than in a matched control group ($F1,178 = 7.40$, $p < .01$, Cohen's $f = 0.20$), as measured in a pretest-posttest design. Outcomes suggest tangible benefits may result when applying this approach to literacy education in VET, particularly for academically weaker as well as for multilingual students.

How to improve argumentative synthesis writing using guides and instructional rubrics
Presenting Author: Lidia Casado Ledesma, Universidad Autónoma de Madrid, Spain; **Co-Author:**Isabel Cuevas, Autonoma University of Madrid, Spain; **Co-Author:**Mar Mateos, Universidad Autónoma de Madrid, Spain; **Co-Author:**Elena Martín, Universidad Autonoma de Madrid, Spain; **Co-Author:**Miriam Granado Peinado, Autonomous University of Madrid, Spain; **Co-Author:**Maria Luna, Universidad a Distancia de Madrid (UDIMA), Spain; **Co-Author:**Juan Antonio Nuñez, Universidad Autonoma de Madrid, Spain; **Co-Author:**Ricardo Olmos, Universidad Autonoma de Madrid, Spain

Undergraduates often struggle performing tasks such as writing argumentative syntheses from conflicting sources. To help with these difficulties, we are interested in evaluating the effectiveness of different instructional aids. Written guides help in the different phases of the process involved in these tasks, and have been employed in many studies focused on writing syntheses and argumentative texts. The effectiveness of a guide improves when accompanied by explicit strategy instruction. Besides, although rubrics have been used primarily to assess the quality of the texts, they may also be used to facilitate the use of integration strategies and self-regulation during the synthesis writing process. Objectives. (1) To compare the efficacy of a guide and a rubric as aids to the process of writing an argumentative synthesis – argument selection and integration; (2) To determine whether explicit strategy instruction enhances the effects of both tools during the intervention and after removing the aids. Method. We asked 120 university students to read four pairs of texts on controversial topics, with the objective of writing argumentative syntheses. After a pre-test, the participants received instruction according to their assigned group (explicit instruction vs. traditional). Afterwards, they wrote two new syntheses with the aid provided (Guide/Rubric). Finally, they wrote a post-test synthesis. Results. The guide facilitated the selection of arguments. Both guide and rubric promoted integration, improving the quality of syntheses. Their impact was greater when the students received explicit instruction on their use.

The Both/And of Research into Synthesis Writing
Presenting Author: Nancy Nelson, Louisiana State University, United States

Over four decades but especially in recent years, research into synthesis writing has expanded extensively. This expansion has been not only in numbers of studies but also in disciplinary affiliations of those conducting the research and locations where the research is conducted. Research into synthesis writing, also called discourse synthesis, reading-to-write, and writing from sources, is both interdisciplinary and multidisciplinary and is both international and transnational. It is characterized by diversity in theoretical orientations and concomitant diversity in research approaches. This paper, which is a historical review of this research, has two aims: (1) to describe major distinctions (either/or) in methodologies that have predominated in the specialism of synthesis writing and (2) to consider how the diversity of approaches and orientations benefits the research (both/and). A dialectical approach is employed, beginning with either/or and concluding with both/and. Foci are four major dialectical elements, which are often portrayed as contradictions or oppositional dichotomies: naturalistic context or experimental context; sources provided or sources located by writers; sources available or not available during writing; and this genre or that genre (usually report versus argument). The either/or analysis is followed by both/and, which highlights the complementary nature of the dialectical elements—the "unity in diversity." Contact between paradigms can be generative, and it can also lead to strengthening of one's own approaches. But most important is the benefit that diverse orientations and approaches give to the specialism itself: a fuller and more complex body of knowledge.

Session T 2

26 August 2023 14:45 - 16:15
AUTH_DC3
Invited Symposium

Education: Societal Change, Hope and the State of the Discipline

Keywords: Educational Policy, Emotion and Affect, Higher Education, Social Aspects of Learning and Teaching, Synergies between Learning / Teaching and Research, Well-being
Interest group:
Chairperson: Vivienne Baumfield, University of Exeter, United Kingdom
Discussant: Dominic Wyse, United Kingdom

The symposium addresses the theme of education as a hope in uncertain times by focusing on the structures and conditions impacting on how educators themselves are educated in our changing world. We present the outcomes of two research projects sponsored by BERA to provide empirical evidence to support advocacy for education as a discipline in Higher Education. The focus is on how the health of the discipline is subject to issues arising from inequalities in the recruitment and retention of staff in universities working in conditions of increasing precarity. The projects presented in the symposium form part of the 'State of the Discipline' initiative examining how the next generation of educators can be encouraged to continue to grow the size, influence, and impact of research in education. Insight into the current state of education as an academic discipline in the higher education systems of the four devolved nations of the United Kingdom facilitates analysis of the intersection of global, national and local factors of interest to the international educational research community.

Education: Societal Change, Hope and the State of the Discipline
Presenting Author: Vivienne Baumfield, University of Exeter, United Kingdom

The session will open with an overview of the issues the 'State of the Discipline' initiative seeks to address based on the contextual information provided by a systematic scoping review of the literature on the structures and processes that influence the activities of educators in higher education. This will be followed by two papers exploring inequalities in Education as a discipline in higher education. We conclude the session with the critical reflections of our discussant drawing out the points of convergence and divergence with the situation of educational researchers in European contexts and an invitation for the sharing of international perspectives on the 'State of the Discipline' amongst participants in the symposium. In providing empirical evidence on the contemporary situation of educators working in universities, the symposium makes an important scientific contribution to contemporary debates on education as an academic discipline, as a field of practice, and as a central element of social and political policy.

Exploration of In/Equalities Shown in Statistical Data of Academic Staffing in Higher Education
Presenting Author: Joanne O'Keeffe, Queen's University, Belfast, United Kingdom; **Co-Author:**Dina Zoe Belluigi, Queens University Belfast, United Kingdom; **Co-Author:**Jason Arday, University of Glasgow, United Kingdom

The study was informed by an analysis of existing statistical data on academic staffing collected by higher education institutions. Conducted in the interests of addressing inequalities, as researchers we paid attention to where the markers of sameness and difference of staff – in terms of age, sex, ethnicity/ race,

disability, religious belief and nationality – seem to have impacted on staff employment within the discipline of Education in the period from 2015-2020 in each devolved nation of England, Northern Ireland, Scotland and Wales, and how this compared with statistics of UK higher education in general. Analysis of the numbers, percentages, proportions and changes captured in the HESA data, enabled some identification of the differential and, where possible to ascertain, intersectional impacts on staff access, positioning, attainment, progression and attrition. In this presentation, highlighted findings will be shared about specific aspects of the composition of the heterogeneity of Education's academic staff members, in addition to their employment conditions. Approaching the data through the specific 'entry points' of sex, ethnicity, and nationality, findings about each grouping, intersectional impacts and related employment conditions will be shared using data visualisation. The study evidences the homogenous state of Education in the United Kingdom; the marginalisation of academic staff recorded as Black Asian and Minority Ethnic (BAME); the exclusion of academics from the majority world (or Global South); continued inequalities when it came to the flourishing of female staff; and concerns about the conditions for younger staff. Questions are raised about areas of insufficient and problematic growth in Education generally and in relation to certain social groups. While some of the patterns were consistent across the UK, differences were observed between the devolved nations which suggests care should be exercised in representations made by scholars of higher education in the United Kingdom.

The State of the Discipline: findings from a survey of education researchers
Presenting Author: Jess Pilgrim-Brown, University of Warwick/University of Bristol, United Kingdom; **Co-Author:**Tom Perry, University of Warwick, United Kingdom; **Co-Author:**Rebecca Morris, University of Warwick, United Kingdom; **Co-Author:**Emma Smith, University of Warwick, United Kingdom

Shifts in attitudes towards and support for education research from government, universities, policymakers and practitioners has seen new actors involved in the production and use of education research, and enhanced debates about its status, value and contribution to society. However, there have only been limited recent attempts to understand the characteristics and perspectives of those engaged in education research in UK universities. The HE Education Research Survey gathered information from over 1500 respondents about their experiences and perceptions to provide robust and rich data about the state of education as an academic discipline. In this session we present findings on the following key areas: the demographic characteristics of education researchers in the UK; participants' research areas, interests and aspirations; views on their institution, workload and conditions; methodological approaches; and engagement with networks and subject associations. These analyses are also complemented with the presentation of data and findings from the open response items in the survey which encouraged participants to share their views on current debates such as cultures of performativity, 'what works' research, the research impact agenda and to describe what it is like to be an education researcher in HE today.

Session T 3

Symposium
Teaching and Teacher Education

Promoting Self-Regulated Learning: The Effect of Teachers' Competences and Teaching Practices

Keywords: Competencies, Conceptual Change, Example-based Learning, In-service Teachers, Learning Strategies, Metacognition, Motivation, Secondary Education, Self-regulated Learning and Behaviour, Teacher Professional Development, Teaching/Instructional Strategies
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Johannes Jud, University of Zurich, Switzerland
Discussant: Franziska Perels, Saarland University, Germany

Competencies in self-regulated learning (SRL) are crucial for successful learning and thriving in life. In the past, research proposed many theoretical frameworks and findings on why teachers do or do not promote SRL and what impact teaching practices have on the development of students' competencies in SRL. However, there is still a lack of empirical evidence for the complexity of this educational process including many variables. Therefore, the contributions of the present symposium draw attention to different aspects and levels within the process of promoting SRL. This includes analyses of various teacher competences in promoting SRL, the effects of different ways to promote SRL and teacher-student relations. The first contribution investigates how pre-service teachers' own competences in SRL can be trained, conducting an experiment using modelling videos. The second contribution analyzes the effects of a two-year in-service teacher training program on various teachers' competences and their teaching practices. In the third contribution, a quasi-experimental study was conducted to investigate the effects of different ways how teachers promote their students' capability to transfer metacognitive learning strategies to various learning contexts. The final contribution analyzes the relation between teachers' motivation, their promotion of SRL and effects thereof on students' motivation to apply learning strategies. The results highlight the theoretical and practical importance of focusing on different teacher competences, stages of teacher training and a holistic way of promoting SRL. They contribute to the validation of theoretical concepts and reveal insights on how to best support teachers in promoting SRL.

Using video-based modelling examples to foster pre-service teachers' SRL competences
Presenting Author: Antonia Fischer, Institute for School Development Research, TU Dortmund University, Germany; **Co-Author:**Charlotte Dignath, TU Dortmund University, Germany

Self-regulation of learning (SRL) is an important skill for both learners and teachers. During their studies, prospective teachers are learners themselves. Developing SRL skills during their education seems to be an important goal for future teachers, but also for university students in general. To this end, we aimed at fostering teacher students' SRL by showing short instructional videos using modelling examples of SRL. We conducted an experiment with a pre-, post- and follow-up design and three groups (mastery group, coping group and active control group). $N = 157$ university students answered questionnaires about their SRL competences and then proceeded to work on a complex problem-solving task that assessed their SRL strategy usage by other means than self-report questionnaires and provided a measure for performance. Afterwards, participants watched one of three intervention videos, again filled out questionnaires and worked on another complex problem-solving task as part of the posttest. After four weeks, participants filled out an online questionnaire ($N_{follow\text{-}up} = 137$) as a follow-up measure. Preliminary results indicate that participants' beliefs (namely, their utility beliefs and beliefs inconsistent with SRL theory) and own SRL usage can be fostered by watching the modelling videos. Further analyses will be conducted after the coding of the remaining data and will be available at the conference. Fostering university (and teacher) students' SRL competences with instructional videos seems to be a worthwhile venture for some SRL competences. The follow-up results indicate that some students need additional support to avoid the development of inconsistent beliefs about SRL.

The impact of an in-service teacher professionalization on teachers' SRL competences
Presenting Author: Lies Backers, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

Teachers play a key role in supporting students with self-regulated learning (SRL) at all school levels. Yet previous research shows that teachers, like students, struggle with SRL and SRL implementation. To support school leaders and their team of teachers to implement SRL, a two-year school-wide professionalization program was designed. This study focuses on the evolution of primary and secondary school teachers' SRL competences (i.e., teachers' content and pedagogical content knowledge, teacher consistent and inconsistent beliefs with SRL theory, teacher self-efficacy to implement SRL, and SRL promotion in class) after a year of participation in the professionalization. Respectively 201 and 330 primary and secondary school teachers completed self-report questionnaires to study their SRL competences. The intervention is currently ongoing. After the post-test (planned in April 2023) ANOVA will be used to analyze differences between pre- and posttest. The presentation will present detailed results as well as implications for practice and further research.

Teachers' direct and indirect promotion of self-regulated learning in secondary school
Presenting Author: Joachim Wirth, Ruhr-University Bochum, Germany; **Co-Author:**Xenia-Lea Weber, Ruhr-University Bochum, Germany; **Co-Author:**Jens Fleischer, Ruhr-University Bochum, Germany; **Co-Author:**Ferdinand Stebner, University of Osnabrück, Germany; **Co-Author:**Corinna Schuster, Ruhr University Bochum, Germany; **Co-Author:**Detlev Leutner, University of Duisburg-Essen, Germany

Various studies have demonstrated positive effects of direct training on metacognitive learning strategies. In direct training, teachers impart metacognitive

learning strategies explicitly, and research shows that students are able to apply those strategies after direct training to deal with learning tasks that are structurally similar to training tasks (near transfer), however, only to a very small extent. Furthermore, students rather fail in applying metacognitive learning strategies for dealing with structurally dissimilar learning tasks (far transfer). Indirect training following direct training could be an option to foster even far transfer of metacognitive learning strategies. In indirect training, teachers enrich a learning environment that is structurally dissimilar to the direct training environment with triggers that prompt students to transfer the acquired metacognitive learning strategies. This may promote far transfer. In a cluster-randomized controlled study with a total of 459 fifth and sixth-grade students, two interventions—direct and indirect training combined (EG1) and direct training only (EG2)—were compared with an untreated control group (CG). Repeated measure analyses of variance show that compared to CG, EG1 and EG2 showed stronger effects in terms of metacognitive learning strategies application in near transfer tasks. The descriptive superiority of EG1 over EG2 was not statistically significant. The preliminary results of the study cannot be considered as clear evidence for the positive effect of combining direct and indirect training to promote the transfer of metacognitive learning strategies in self-regulated learning.

Teachers' motivation for self-regulated learning: Relations to students' motivation
Presenting Author: Johannes Jud, University of Zurich, Switzerland; **Co-Author:**Yves Karlen, University of Zurich, Switzerland; **Co-Author:**Carmen Nadja Hirt, University of Zurich, Switzerland

The use of learning strategies is crucial for successful self-regulated learning (SRL). As the application of learning strategies can be effortful and frustrating, students' motivation for using learning strategies is important. Research highlights the relations between students' motivation and their use of learning strategies. Theoretical frameworks of teachers' professional competences for SRL and Expectancy-Value Theory (EVT) assume that students' motivation can be influenced by teachers' motivation and their promotion of SRL. However, empirical evidence in how far teachers' motivation for SRL and their promotion relate to students' motivation to use learning strategies is absent. Using a multilevel approach, this study investigates the relations between teachers' self-efficacy and attainment value in promoting SRL, their reported promotion of SRL (1) and the effect thereof on various students' motivational constructs (e.g. self-efficacy, utility value, costs) for SRL. Based on a sample of $N_{teachers}$ = 167 and their students (N = 2757) from 17 Swiss lower secondary schools, a multilevel analysis revealed positive and significant relations between teachers' motivation and their promotion. Further, the promotion was positively and significantly related to students' values for applying SRL strategies. No effect could be found for the cost facet. The results confirm theoretical assumptions and therefore highlight the importance of teachers' motivation and the promotion in the development of students' competencies in SRL.

How to optimize metacognitive monitoring and judgment accuracy

Keywords: Comprehension of Text and Graphics, Emotion and Affect, Example-based Learning, Instructional Design, Metacognition, Motivation, Pre-service Teachers, Quantitative Methods, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Rebecca Krebs, Ruhr-University Bochum, Germany
Chairperson: Linda Froese, Ruhr University Bochum, Germany
Organiser: Rebecca Krebs, Ruhr-University Bochum, Germany
Organiser: Linda Froese, Ruhr University Bochum, Germany
Discussant: Lucia Mason, University of Padova, Italy

Monitoring one's thoughts, actions and emotions as well as the quality of one' products during learning is essential for effective self-regulation. How learners can be effectively supported in these metacognitive monitoring processes, however, is in large parts still an open question. The present symposium is designed to address this question. Contribution 1 investigates the effects of a self-talk monitoring tool on preservice teachers' study performance as well as motivation and emotions towards learning. Contribution 2 deals with optimizing monitoring through the diagram completion task. The authors analyze whether prompting learners to self-assess diagrams that they completed after reading expository texts has added value to only completing diagrams regarding the accuracy of learners' judgments of learning. In Contribution 3, metacognitive monitoring in example generation tasks is supported through the provision of external standards. The authors investigate whether providing expert example standards in combination with focused processing prompts fosters judgment accuracy in evaluating the quality of self-generated examples for previously encountered new principles and concepts. Finally, Contribution 4 delves into supporting metacognitive monitoring and regulation through the provision of rubrics. With the help of think-aloud data, the authors aim to understand how rubrics beneficially affect judgment accuracy and regulation decisions in academic writing. In view of the experimental design and the different perspectives of the four contributions, the symposium will likely fruitfully extend our understanding of how learners can be effectively supported in metacognitive monitoring.

Can students monitor motivational and emotional strategies through self-talk? An intervention study.
Presenting Author: Alazne Fernández Ortube, University of Deusto, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Charlotte Dignath, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Lucía Barrenetxea-Mínguez, University of Deusto, Spain; **Co-Author:**Jesús Marauri, Universidad de Deusto, Spain

Zimmerman's (2000) definition of Self-regulated learning (SRL) states that for learners to be good self-regulators of their learning process they must monitor their thoughts, actions and emotions, reflect about them and adjust them to the context. Especially when talking about emotions, this intentional self-awareness is a difficult process, as it answers to environmental and personal factors that may not be controlled easily (Usher & Schunk, 2018). However, the capability of reacting to these factors can be trained. Our research presents an intervention study, which aims to explore whether the control of self-talk helps pre-service teachers improve their motivation and emotions towards learning. For this exploration, we have developed a quasi-experimental longitudinal study, with repeated measure design. We measure SRL skills, emotion, motivation and SRL knowledge. The convenience sample of this study consists of 61 first year pre-service teachers. At this point we have results from the pre-test and the first self-talk monitoring tasks. This data reflects that many participants report to have negative emotions towards learning. Self-efficacy beliefs for learning are rated the lowest, similar to beliefs about social learning. This relates with the data we have about SRL knowledge, where none of the participants mentioned emotions and social interaction as being part of SRL. We hypothesize that SRL skills, emotion, motivation and SRL knowledge will improve during the academic year, as for the moment we can observe a rise in self-monitoring tasks results.

Self-assessment of diagrams to increase monitoring accuracy in reading comprehension
Presenting Author:Héctor J. Pijeira-Díaz, Maastricht University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:**Faisal Rehman Channa, University of Jyväskylä, Finland; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

The accuracy of students' monitoring of reading comprehension is often low. This has been explained by students' utilization of cues that are not diagnostic or predictive of their actual comprehension when making the judgments. Generative interventions such as completing diagrams about texts that students read have been effective in providing students with more diagnostic cues and fostering monitoring accuracy, but there is margin for improvement. We test whether asking students to self-assess their own diagrams increases the utilization of diagnostic cues, thereby improving monitoring accuracy of their text comprehension. Participants (N = 427 secondary school students) were randomly assigned to one of three conditions after reading, namely 1) only diagram completion, 2) diagram completion plus diagram self-assessment, or a 3) picture-matching filler task (control). In both diagramming conditions, monitoring accuracy was significantly higher than in the control condition (i.e., replication of the diagramming effect), but self-assessing the diagrams did not significantly increase either monitoring accuracy or cue utilization. Future attempts at improving monitoring accuracy with diagrams could look, for example, at the effect of providing students with real-time automated feedback on their diagram answers.

How to enhance learners' accuracy in evaluating self-generated examples?
Presenting Author: Linda Froese, Ruhr University Bochum, Germany; **Co-Author:**Julian Roelle, Ruhr University Bochum, Germany

In acquiring declarative knowledge, generating own examples can serve as a beneficial learning activity. As external feedback is rarely provided, learners frequently have to evaluate the quality of their self-generated examples on their own in order to make appropriate decisions concerning the further learning process. Unfortunately, previous research indicates that learners' ability to accurately judge the quality of their examples is poor. The provision of expert example standards has shown to foster learners' judgment accuracy in evaluating self-generated examples, however, learners were still largely inaccurate, which could be explained by the fact that learners did not engage in deep processing of the provided standards. One means to foster the processing of expert example standards could be prompting learners to highlight where in the expert examples the idea units of the respective content are illustrated as well to highlight these idea units in their self-generated examples as well. To test this assumption, in an experiment that followed a 2×2 factorial between-subjects design we varied whether university students were provided with expert example standards (with vs. without) and highlighting prompts (with vs. without) in evaluating the quality of self-generated examples. Preliminary results with $N = 77$ university students indicate that both expert examples and highlighting prompts can increase learners' judgment accuracy. Final results will be presented at the conference.

How to foster self-assessment accuracy and regulation through rubrics
Presenting Author: Rebecca Krebs, Ruhr-University Bochum, Germany; **Co-Author:**Julia Waldeyer, Ruhr-University Bochum, Germany; **Co-Author:**Björn Rothstein, Ruhr University Bochum, Germany; **Co-Author:**Julian Roelle, Ruhr University Bochum, Germany

Rubrics, which inform learners about assessment criteria for a task assignment and illustrate different levels of task performance, foster task performance. These beneficial effects are often attributed to effects of rubrics on self-assessment accuracy, which, in turn, would pave the way for effective regulation. However, research that explicitly tests this theoretically assumed mechanism is scarce. Against this background, in the present study we analyzed the effects of rubrics on (a) self-assessment and (b) regulation. $N = 243$ students received a brief introduction into the writing of abstracts for scientific articles, read a scientific article and wrote an abstract themselves. They then were asked to evaluate their abstract. Using a 2×2 factorial design, we varied whether the participants were guided by a rubric during the self-assessment (with or without) and during the revision phase (with or without). We assessed think-aloud protocols to determine which cues the participants used to assess themselves and make their regulation decisions. The data collection is not yet finished but full results will be available at the conference.

Learning and Social Interaction

Stereotypes and Stereotype Threat in the Classroom: Effects and Interventions

Keywords: Achievement, Anxiety and Stress, Cultural Diversity in School, Gender Issues, Migrant / Refugee and Minority students, Self-efficacy, Social Aspects of Learning and Teaching, Social Interaction
Interest group: SIG 10 - Social Interaction in Learning and Instruction
Chairperson: Cristina Stringher, Istituto Nazionale per la Valutazione del Sistema Educativo di Istruzione e di Formazione (INVALSI), Italy
Chairperson: Justine Stang-Rabrig, TU Dortmund University, Germany
Chairperson: Nele McElvany, TU Dortmund University, Germany
Organiser: Justine Stang-Rabrig, TU Dortmund University, Germany
Discussant: Justine Stang-Rabrig, TU Dortmund University, Germany

Today's students grow up in heterogeneous classrooms. Heterogeneity-generating factors are, for example, gender, culture, and language. Although school contexts are characterized by diversity, stereotypes and stereotype threat (S/ST) are still existent and effects can be manifold. Besides effects on achievement, S/ST can impact motivation, learning, stress response, and social relationships. Thus, among other factors, S/ST contribute to the explanation of educational inequalities. Therefore, this symposium combines current cutting-edge research on central effects of S/ST and the effectiveness of interventions to reduce them. The first presentation investigates effects of stereotype awareness and beliefs on fifth-grade girls and boys math test anxiety and self-efficacy. The second focuses on ST effects on vocabulary learning and stress response in ninth-grade language-minority students and important moderators. The third presentation analyzes how social identity threat contributes to ninth-grade ethnic-minority students' reduced motivation to establish and maintain peer relationships. The last one focuses on immigrant-minority youth students and presents two studies on ST effects on performance and one intervention study to reduce threat. The symposium presents central lines of current S/ST research from different countries and disciplines. Findings approve existing results and go beyond by revealing vital new insights. Against the background of heterogeneous classrooms, it is more important than ever to further investigate S/ST effects on students' educational success and intervention possibilities to reduce educational inequalities. Based on results, relevant implications for research and educational practice can be deduced. The concluding overall discussion allows for an overarching, critical synopsis with appreciation of the individual results.

How stereotype awareness and stereotype belief impact test anxiety and self-efficacy in math
Presenting Author: Nadia Leroy, Université Grenoble Alpes, France; **Co-Author:**Sylvain Max, Burgundy School of Business, France; **Co-Author:**Pascal Pansu, Université Grenoble Alpes, France

The idea that people do not need to believe in a stereotype for them to be victims of it appeared in the early literature about stereotype threat. Since then, many stereotype threat studies have focused on the distinction between stereotype awareness and stereotype belief. This study examines the role of stereotype awareness and stereotype belief in test anxiety and self-efficacy in mathematics. 600 students in 5th grade participated in the study. At the beginning of the school year, they were asked to give their opinion about 2 stereotype awareness items concerning gender performance in math (people think that girls/boys are good/bad at math), and 2 stereotype belief items concerning gender performance in math (I believe that girls/boys are good/bad at math). In the middle of the school year, we measured the participants' test anxiety and self-efficacy. The data were analyzed using a polynomial regression and response surface analysis. The results showed that when girls are strongly aware of the negative stereotype concerning them, and they believe in it, they experience greater test anxiety. For boys, when they are strongly aware of the negative stereotype concerning girls, and they believe in it, they demonstrate greater self-efficacy. By showing the non-linear relationship between awareness/belief and test anxiety/self-efficacy, our results provide a useful insight into how the gender stereotype affects math performance at junior high school. In conclusion, both awareness and belief appear to influence the effects of stereotype threat in that the emotional response and cognitive response are heightened by them.

Stereotype Threat Effects on Vocabulary Learning and Stress Response
Presenting Author: Justine Stang-Rabrig, TU Dortmund University, Germany; **Co-Author:**Sabrina König, TU Dortmund University, Germany; **Co-Author:**Oliver Wolf, Ruhr University Bochum, Bochum, Germany; **Co-Author:**Nele McElvany, TU Dortmund University, Germany

Classrooms in Germany are culturally and linguistically diverse. Large-scale assessments showed on average achievement disparities between language minority and majority students in different domains. One possible explanation for achievement-related differences are stereotype threat (ST) effects. Whether ST impacts minority students' vocabulary learning in the language of instruction, which is key to academic success, as well as their stress response is unclear. Moreover, the role of central personal and contextual mediators and moderators in learning situations is not yet resolved. Based on 200 ninth grade language minority students ($M_{age} = 14.99$, $SD = 0.87$; 49.0% female, 2.0% diverse), we analyzed whether ST affects vocabulary learning and change in two important physiological stress markers (salivary alpha-amylase, cortisol). Furthermore, stress was investigated as mediator, school type (comprehensive/grammar school) and identification with school as moderators of ST effects. Students participated in a pre-post vocabulary learning design within their classrooms with salivary

sampling. They were randomly assigned to one of four experimental conditions (implicit, explicit without and with threat removal before vocabulary posttest, control group). Repeated measures analyses of (co)variance revealed no statistically significant ST effects on vocabulary learning and change in cortisol, but a statistically significant increase in alpha-amylase values from t1 to t2 as well as an interaction between experimental condition and change in alpha-amylase. Neither school type nor identification with school severed as moderators. Results are discussed in terms of content and methodological issues. Implications for further research are derived.

Social Identity Threat is Related to Ethnic Minority Adolescents' Social Approach Motivation
Presenting Author: Laura Froehlich, FernUniversität in Hagen, Germany; **Co-Author:**Nathalie Bick, FernUniversität in Hagen, Germany; **Co-Author:**Jana Nikitin, University of Vienna, Austria; **Co-Author:**Sarah E. Martiny, UiT The Arctic University of Norway, Norway

The current research investigated the relation of social identity threat and social approach motivation for ethnic minority adolescents. In a sample of 426 ethnic minority students from 36 9th-grade classes in Germany, we found a negative indirect effect of social identity threat on social approach motivation via reduced sense of belonging to the classroom. The interplay of students' ethnic and national identity moderated the relationship of social identity threat and sense of belonging. The relationship was particularly negative for students who only endorsed either ethnic or national identity strongly. However, it was less pronounced for students with integrated multiple social identities (i.e., high endorsement of ethnic and national identity) and non-significant for students who identified neither with the ethnic nor the national group. Results generalized for social approach motivation towards ethnic majority students and ethnic minority students in the classroom. Moreover, these patterns were only found for social approach motivation in face-to-face contact situations, but not in online situations. Findings are discussed in light of the literature on social identity threat and multiple social identities, address limitations, and point to future research directions.

CANCELLED: How does stereotype threat work and how to buffer its effects on minority achievement?
Presenting Author: Karen PHALET, KU LEUVEN, Belgium; **Co-Author:**Gülseli Baysu, Queen's University Belfast, United Kingdom

Taking a social identity approach to stereotype threat in the classroom, we conducted 2 field experiments. Firstly, we established stereotype threat processes in the classroom, so that immigrant minority youth in Flanders underperformed on an inductive reasoning task in the experimental threat condition (when their minority identity was made salient immediately preceding the performance task) through disengagement with learning (relative to a control condition (when questions about their minority identity were asked after completing the performance test). Moreover, we found evidence for protective effects of shared non-discrimination norms in the school environment, so that effects of stereotype threat were not significant in non-discriminatory school contexts. Secondly, we piloted a novel field intervention to reduce identity threat in the classroom (through affirming the dual identities of minority students). Our findings partially confirmed our hypothesis, so that Black students were performing better in the dual identity (vs individual) affirmation condition through reduced threat, yet individual self-affirmation worked better for Asian students. We will discuss future directions and applied implications for creating inclusive learning environments.

Symposium
Learning and Social Interaction, Learning and Special Education

Family-based Interventions: Increasing Developmental and Educational Chances of Children At-risk?

Keywords: At-risk Students, Early Childhood Education, Learning and Developmental Difficulties, Parental Involvement in Learning, Parents' Beliefs and Affect, Quantitative Methods, Social Aspects of Learning and Teaching, Social Sciences and Humanities, Special Education
Interest group: SIG 05 - Learning and Development in Early Childhood, SIG 15 - Special Educational Needs
Chairperson: Isabelle Kalkusch, Switzerland
Organiser: Isabelle Kalkusch, Switzerland
Discussant: Minna Törmänen, Switzerland

In the early years the home environment and family–child interactions are the main engine for a child's development (Bronfenbrenner & Morris, 2006), with transition to formal education additional contexts become relevant. For children growing up in families affected by psychosocial risk factors (e.g., social isolation, poverty, or mental illness) as well as children with special needs it might be crucial for their positive development to support their early learning environment. This symposium explores different ways in which children at-risk for developmental problems can be supported in the longer term and in a sustainable way by family-based interventions.
One pathway is using family-based interventions, which aim amongst others at promoting parental sensitivity and positive parenting practice as early as possible in preventive manner. Such interventions are indicated as having a positive short-term effect for several developmental child characteristics (Jeong et al., 2021). However, so far there is few empirical evidence regarding long-term effects. The first and second contribution both investigate the effects of early family-based interventions in the primary school-age using RCTs with a longitudinal design. The third and fourth contribution examine different intervention approaches which take place at a later stage and focus on both the family and the formal education. The symposium provides important indications on how children who are disadvantaged in their developmental chances due to various reasons can be supported throughout their early years by strengthening the family as a resource.

Effects of two staffing models in the home visiting program Pro Kind at age 7
Presenting Author: Marie Lisanne Schepan, Leibniz-Institute for Prevention Research and Epidemiology - BIPS, Germany; **Co-Author:**Malte Sandner, Technical University Nuernberg, Germany; **Co-Author:**Sören Kliem, Department of Social Work, University of Applied Sciences Jena, Germany; **Co-Author:**Tilman Brand, Leibniz Institute for Prevention Research and Epidemiology – BIPS, Germany

Exposures and experiences during pregnancy and the first years can have long-lasting effects on developmental trajectories over the life-course. In this study we analyzed the long-term effects of the home visiting program Pro Kind comparing two staffing models. In this program, low-income first-time mothers were visited either by a midwife (midwife-only model) or a midwife-social worker team (tandem model). The home visits started during pregnancy and lasted to the child's second birthday. The results of a randomized trial at child age 7 showed beneficial effects on children's behavioral problems in both groups. Furthermore, positive effects were found on abusive parenting, parenting stress and maternal mental health in the midwife-only group. In conclusion, this study shows that early interventions can have positive effects on children and parents that can still be detected five years after the end of the intervention.

Early Childhood Family-Based Intervention: Effects on School Relevant Outcomes in Primary School?
Presenting Author: Isabelle Kalkusch, University of Teacher Education of Special Needs, Switzerland; **Co-Author:**Alex Neuhauser, University of Applied Sciences of Special Needs Education, Switzerland; **Co-Author:**Patsawee Rodcharoen, University of Teacher Education in Special Needs Zurich, Switzerland, Switzerland; **Co-Author:**Simone Schaub, University of Teacher Education in Special Needs, Switzerland; **Co-Author:**Minna Törmänen, University of Teacher Education in Special Needs Zurich, Switzerland; University of Helsinki, Finland, Switzerland; **Co-Author:**Erich Ramseier, Bern University of Teacher Education (i. R.), Switzerland; **Co-Author:**Andrea Lanfranchi, University of Applied Sciences of Special Needs Education, Switzerland

Children's early childhood experiences are crucial for their positive development. A high level of familial stress is a risk for children's development – especially children from psychosocially burdened families might experience a high stress level. This study investigates the effectiveness of a family-based early childhood program on school relevant outcomes in primary school-age. The longitudinal RCT study ZEPPELIN examines the effectiveness of the «Parents as Teachers (PAT)» program with families with at least two present risk factors. The final sample were 248 families, who were randomly allocated to an intervention (IG, n = 132 families) and a control group (CG, n = 116 families). Former cross-sectional results showed mainly positive effects on children's language skills, problem behavior and self-regulation. At age 7 an effect was found on children's behavior problems regarding hyperactivity only, preliminary additional analyses showed weak indirect effects on school achievement. For the presentation results on children's school relevant outcomes at age 9 will be included. The investigation of the effectiveness of early intervention programs in school age is a meaningful step to develop sustainable promotion approaches for children with psychosocial

stress.

Reducing behavioral problems: A family and school-based intervention
Presenting Author: Markus Neuenschwander, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Ilona Rösti, University of Applied Sciences and Arts Northwestern Switzerland FHNW, Switzerland; **Co-Author:**Vanessa Prieth, University of Applied Sciences and Arts Northwestern Switzerland FHNW, Switzerland; **Co-Author:**Alafia Zavery, University of Applied Sciences and Arts Northwestern Switzerland FHNW, Switzerland

Behavioral problems in elementary school are a risk factor in children's' school career, that challenges parents and teachers and is related to adolescents' drug abuse. Strategies to reduce problem behavior include improving parents' empathy to appropriately react to the child's needs, supporting child's socio-emotional learning and enriching teachers' practices to handle disruptive behavior in the classroom. A combined intervention with a family program and a teacher program was developed to reduce reactive and proactive aggression of children at risk in kindergarten and elementary school. The effectiveness of the intervention was tested using a randomized pretest-posttest design. A total of 158 children from kindergarten and elementary school participated in this study, 117 children were in the experimental group and 41 children in the control group. In sum, 232 Teachers and 124 parents filled out standardized questionnaires. A test was applied to measure children's emotion recognition. The results show that the intervention increased the parents' empathy toward their child and increased the child's emotion recognition. It increased the extent that the teachers structure their classroom and that teachers react to disruptive behavior in classroom. An in-depth analysis with teachers who applied 7 out of 8 core elements of the intervention showed that the intervention significantly reduced children's reactive and proactive aggression. The family program allowed to support parents at risk who are reluctant to participate in school programs. An innovative combined intervention presents an approach to coordinate interventions in family and school to reduce behavior problems of children at risk.

Parental involvement interventions for children with special educational needs: A systematic review
Presenting Author: Hannah Hamid, UCL- Institute of Education, United Kingdom; **Co-Author:**Zachary Walker, UCL- Institute of Education, United Kingdom; **Co-Author:**Jo Van Herwegen, UCL Institute of Education, United Kingdom

Research literature continues to support the idea that parental involvement and engagement in their children's education and meaningful school partnerships are an important contributor to a child's educational outcomes (Epstein, 1991; Goodall & Montgomery, 2014). This study systematically reviewed research that has examined the impact of parental involvement interventions for parents of children with special educational needs (SEN) and highlights the quality and potential gaps in research.
The population for this review focused on parental involvement interventions for parents of children with SEN aged 4-18. All interventions for parental involvement for parents of children with SEN were included. This included both individual and group-based interventions based in any setting and delivered in any manner. The review also included studies with qualitative, quantitative, and mixed research designs and those that may or may not have included a control group. Studies that conducted interventions that impacted academic, behavioural and wellbeing outcomes for children with SEN were also included. Both published literature and grey literature were searched. We found *n=14* studies that conducted parental involvement interventions for parents of children with special educational needs. Training interventions (*n=12*) were the primary intervention type utilized, with behavioral and academic outcomes being the focus of most interventions (*n=12*). Findings highlighted that the parental involvement interventions had a positive impact on child related outcomes. Future research needs to consider wellbeing outcome measures, follow up assessments, and sample size. Findings from this review will inform a future intervention for parental involvement for parents of children with SEN.

Cognitive and Attentive Measures of Intra-individual Variability in Video-based Learning
Keywords: Cognitive Skills and Processes, E-learning/ Online Learning, Eye Tracking, Higher Education
Presenting Author: Kshitij Sharma, Norwegian University of Science and Technology (NTNU), Norway

Eye-tracking provides unprecedented access to students' attention and cognitive workload. Situated within video-based learning, there are moments when students face attention lapse and variations in cognitive load. The main reasons are prior knowledge, or lack thereof, and variation in the difficulty of the content. In this contribution, I present an analysis of two different constructs: cognitive workload (measured by pupil-diameter) and with-me-ness (students' attentional response to the deictic gestures and dialogue of the teacher) to show the intra-student variance during a video-lecture. I will also compare these variances with the student performance to show how these intra-student variances are related to their post-lecture performance. I will use a context-dependent unit of time, that is, the concept that the teacher presents. I will use a programming lecture, where the teacher presents both the theoretical and practical aspects of a programming concept (i.e., tail-recursion). These two aspects of the lecture will function as the two different time units for the analysis. The results show that students with high performance are "with the teacher" during both theoretical and practical parts of the video-lecture, while students with low performance are "with the teacher" during the theoretical aspects of the lecture but not during the practical aspects. The cognitive load is similar for high-performing students in the two parts. Whereas students with low performance have a higher cognitive load during practical parts of the lecture than the theoretical parts. I will discuss how these results can inform the design of student scaffolding tools.

Social Cues in Educational Videos – The Importance of Moderating Variables
Keywords: E-learning/ Online Learning, Instructional Design, Social Aspects of Learning and Teaching, Video-based Learning
Presenting Author: Maik Beege, University of Education Freiburg, Germany

Educational videos offer various possibilities to include multimodal social cues. Nevertheless, it is still unclear if social cues in videos are beneficial or detrimental for learning and if so, which processes are responsible for the effect. Within this contribution, general theoretical assumptions are presented and implications for educational video design are derived. Relying on this theoretical basis, two experiments are presented that deal with the influence of social cues on different learning processes. In the first experiment the use of gestures performed by a video instructor was investigated. Results revealed that the use of gestures did not foster learning in general. In line with the signaling principle, only the use of deictic gestures was found to be beneficial for learning. In the second experiment, model-observer similarity and emotional design of pedagogical agents regarding gender were investigated. Results revealed that that gender similarity between the agent and the learner was not generally beneficial for learning. Moreover, model-observer similarity was only beneficial when additional enthusiastic cues were performed. Results show that the effects of social cues on learning seem to depend on moderating variables. Consequently, the role of social cues in dynamic learning material should be further discussed and investigated.

Do learners' benefit when taking notes from instructional videos and if how?
Keywords: E-learning/ Online Learning, Higher Education, Instructional Design, Pre-service Teachers
Presenting Author: Anke Wischgoll, TU Dortmund University, Germany; **Co-Author:**Monika Post, TU Dortmund University, Germany

Note-taking is a learning activity practiced condensing information from lectures, texts, and videos. Instructional videos have become more and more common for learning purposes in pre-service teacher education in recent years. However, learners' notes are often incomplete and lack focus on relevant information.

Focusing attention to relevant information by providing prompts for note-taking might be a suitable means to foster learners' engagement with relevant information. The aim of the study was to find out how learners might benefit from instructional videos by note-taking, more specifically, whether they benefit from prompted note-taking to increase their learning gains. Therefore, we conducted an intervention study with 183 pre-service math teachers that included three conditions: All groups observed two instructional videos: one on the concept of conditional probability (i.e., part-whole relationship) and one on how to explain it to students (i.e., meaning related-language). In addition, the note-taking group was asked to take notes on important information, whereas the prompted note-taking group was asked to take notes on part-whole relationship and meaning-related language. The control group did not receive an additional treatment. All participants were asked to apply the information provided in the instructional videos in two practicing tasks. Prior knowledge and learning outcome such as use of meaning-related language were measured by specifically developed items. Our results showed that the prompted note-taking group outperformed the note-taking group significantly. However, no statistically significant differences could be found between the control group which did not take notes and the prompted note-taking group.

Prompts and Engagement during an Online Video Lecture: An Experimental Field Study
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Higher Education, Video-based Learning
Presenting Author: Markus H. Hefter, Bielefeld University, Germany; **Co-Author:**Veit Kubik, University of Würzburg, Germany; **Co-Author:**Kirsten Berthold, University of Bielefeld, Germany

During the recent COVID-19 lockdown measures, many university lecturers sought an effective and viable way to transform their lecture material into asynchronous online video lectures. Researchers have recommended implementing prompts to ensure that students process such video lectures adequately. However, as there are still open questions regarding the types of prompts and the role of students' engagement, we conducted an online field experiment with 124 teacher students (73 female, 49 male) in which we presented an online video lecture (on the topic "Cognitive Apprenticeship") supplemented by different kinds of prompts. We compared the following randomly assigned experimental conditions: (A) note prompts ($n = 31$), (B) principle-based self-explanation prompts ($n = 36$), (C) elaboration-based self-explanation prompts ($n = 29$), and (D) both principle- and elaboration-based prompts ($n = 28$). Our results revealed that the video lecture fostered declarative knowledge regardless of the type of prompt. The different prompt types in fact resulted in different types of self-explanations, but they had no statistically significant effect on learning outcomes. However, the students' self-explanation quality and their persistence (i.e., actual participation in a delayed posttest) were beneficial, whereas the number of interruptions was detrimental to the learning outcomes. Overall, our findings provide ecologically valid empirical support for how fruitful it is that students engage themselves in self-explaining and avoid interruptions when learning from asynchronous online video lectures.

The relative influence of epistemic aims and epistemic perspectives on reasoning processes
Keywords: Argumentation, Critical Thinking, Knowledge Construction, Reasoning
Presenting Author: Michael Weinstock, Ben-Gurion University of the Negev, Israel; **Co-Author:**Netta Le Guennec, Ben Gurion University of Negev, Israel

Chinn's AIR model of epistemic cognition specifies three components involved in thinking about aspects of knowledge: epistemic aims, epistemic ideals, and reliable processes. Epistemic aims concern the goals one sets in considering epistemic matters. Epistemic ideals are the criteria one uses to evaluate if epistemic aims have been met. Reliable processes are the strategies, procedures, and cognitive processes people use to successfully achieve their epistemic aims.The current research is to test the interaction between the components by seeing if reliable processes do vary depending on a given epistemic aim. The research also tested the relative contribution of epistemic aims on a reasoning task when compared with aspects of the epistemic perspectives model of epistemic thinking. This model posits three basic epistemic perspectives of absolutism, multiplism, and evaluativism. Evaluativism includes understanding that evidence and theory need to be separated and coordinated to construct and justify knowledge. This has been found to underlie sound reasoning processes. 55 Israeli adults heard a summary of a jury trial, including the judge's instructions. In one condition the judge explicitly emphasized the aim of comparing verdicts, and in the second condition, the judge emphasized the aim of evaluating testimony credibility. Participants explained their verdict choice, and different reasoning types were identified. The instructed aim had little effect on reasoning, but the aim used by the participants did have some effect. Notably, the participant's own aim was related to epistemic perspective. This, both models of epistemic cognition has some confirmation of their role in reasoning process.

Resolving Disagreements Between Experts through Identifying Questionable Research Practices
Keywords: Critical Thinking, Digital Literacy and Learning, Reasoning, Science and STEM
Presenting Author: Clark Chinn, Rutgers University, United States; **Co-Author:**Toshio Mochizuki, Senshu University, Japan; **Co-Author:**Hiroki Oura, Tokyo University of Science, Japan; **Co-Author:**Etsuji Yamaguchi, Kobe University, Japan

In the modern, digital world, citizens often face situations in which experts disagree. It is difficult, however, for laypeople to determine which experts to trust when the experts disagree. We considered two strategies laypeople might use to try to resolve such disagreements—(1) discovering that one expert has engaged in questionable research practices and discounting their work accordingly, and (2) considering the past track record of having engaged in such practices. Specifically, we asked: (1) Do undergraduates (as laypeople) take questionable research practices (specifically, misrepresenting others' findings) into account when they appraise the trustworthiness of experts and their claims? (2) If so, do they use information about an expert's negative track record (specifically, past misrepresentations) to downgrade the credibility of this expert when the expert makes claims about different topics in the future? We addressed these questions in a 2 x 2 factorial experiment with Japanese undergraduates in which participants read claims by two disagreeing educational experts. Expert A misrepresented the findings of Expert B's research, and in some conditions, Expert B called attention to the misrepresentation. In the results, when students saw Expert A's misrepresentations contradicted, they were less likely to trust Expert A's claims about this topic, and they were also less likely to trust this expert's claims on a second, unrelated topic. These findings suggest that one way to combat the rampant misrepresentations that occur online is to explicitly contradict them and to call out the perpetrators for their misrepresentations.

Epistemic Understanding as Basis for Evaluating Change in Scientific Conclusions Regarding COVID-19
Keywords: Critical Thinking, Knowledge Construction, Pandemic, Reasoning
Presenting Author: Michael Weinstock, Ben-Gurion University of the Negev, Israel; **Co-Author:**Sarit Barzilai, University of Haifa, Israel; **Co-Author:**Eva Thomm, University of Erfurt, Germany; **Co-Author:**Nadav Davidovitch, Ben-Gurion University of the Negev, Israel

During the COVID-19 pandemic, many scientific conclusions changed. The unusual public display of science in progress and concern for scientific conclusions makes the COVID pandemic a good context in which to examine whether epistemic understandings are related to how people reason with and about information in everyday contexts. This study, with 398 German and Israeli adults, examined whether epistemic understandings of scientific knowledge predicted evaluations of a change in conclusions about how COVID is transmitted when taking into consideration knowledge about COVID, familiarity with the topic of COVID transmission, and trust in COVID scientists. The epistemic understandings consisted of epistemic perspectives (absolutist, multiplist, and evaluativist), beliefs about the development and changeability of scientific knowledge, and sense of scientific knowledge as variable. Participants' evaluations of change in of the

COVID conclusion consisted of agreement with the new claim, correctness of the new claim, trustworthiness of the scientists who changed their minds, and whether the change represented a positive development in science. Epistemic perspectives, but not belief in development of scientific knowledge nor sense of science as variable, predicted evaluations of change in the COVID conclusion. Notably, evaluativism predicted trustworthiness of scientists who changed their minds and positivity of change. Trust in information provided by COVID scientists was also a major predictor, but epistemic perspectives predicted evaluations of change even when controlling for this. The findings suggest the importance of fostering epistemic growth and an understanding of how uncertainty and openness to change might represent strengths rather than weaknesses of science.

Factorial validity revised: The structure of epistemic beliefs and perspectives across instruments
Keywords: Assessment Methods, Attitudes and Beliefs, Critical Thinking, Knowledge Construction
Presenting Author: Martin Greisel, University of Augsburg, Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany

There is a long-lasting discussion about the structure and interrelations of epistemic beliefs/dimensions and perspectives (absolutism, multiplism, and evaluativism), accompanied by a struggle with factorial validity of corresponding questionnaires. Therefore, this study examines different measurement instruments at different levels of specificity to investigate which facets emerge and whether they can be combined to broader dimensions and perspectives or not. In two studies, N=285 and N=254 pre-service teachers answered the Questionnaire for the Measurement of Epistemic Beliefs (FEE), the Topic-Specific Epistemic Beliefs Questionnaire (TSEBQ), and, in a topic- and situation-specific version, the Epistemic Thinking Assessment (ETA). We found that the expected factor structure could not be replicated, but more fine-grained facets emerged from different factor analyses. Especially certainty and justification seem to be further divisible into distinct dimensions. However, these facets were hardly interrelated as expected and did not always combine to broad dimensions or perspectives. Consequently, we propose that new instruments should be developed that assess the facets separately in a systematic manner. Cluster- or profile-based approaches might then try to identify common patterns of combinations (if they exist across populations and topics) to establish new conceptualizations of coherent epistemic stances beyond absolutism, multiplism, and evaluativism.

Relationships between motivation and anxiety in adult EFL learners
Keywords: Anxiety and Stress, Emotion and Affect, Foreign and Second Language Acquisition, Motivation
Presenting Author: Merih Welay, University of Szeged, Hungary; **Co-Author:**Marianne Nikolov, University of Pécs, Hungary

The motivation and anxiety that comes with learning a new language have been linked in several studies conducted in a variety of educational contexts. Considering the importance and complexity of motivation and anxiety, this study seeks to investigate their connections in a setting where no similar investigation has before, taken place in this context. To accomplish this, we had to first validate the L2 motivational self-system (L2MSS) (Dornyei, 2005, 2009) and a new FL anxiety scale. This was done based on hypothesized relationships between the L2MSS (i.e., the ideal L2 self, ought to L2 self, and L2 learning experience), and FL anxiety (facilitative and debilitative). A total of 65 university students participated in the study. A questionnaire was used to collect the data. Descriptive statistics, correlation analysis, and t-tests in SPSS version 25 were used to analyze the data. The L2MSS and FL anxiety instruments had total scale reliability values that were greater than 0.6 (0.90 and 0.70, respectively), indicating that both constructs had adequate consistency. To evaluate the validity of the constructs, we employed several model fit indices, and they all showed that the models were valid. Student L2MSS and FL anxiety were rated as moderate. The ideal L2 self of students and their L2 learning experiences were shown to have the greatest significant association, whilst the latter was found to have a weak but significant relationship with debilitating anxiety. The report delves into these findings and their ramifications for the classroom and future study.

Primary school EFL teachers implementing an ambitious 21st century skills curriculum
Keywords: Curriculum Development, Educational Policy, Teacher Effectiveness, Teacher Professional Development
Presenting Author: Tony Burner, University of South-Eastern Norway, Norway

A new curriculum was introduced in Norway in 2020. The present study reports from an ongoing longitudinal evaluation project looking into how primary school teachers in different subjects are implementing the new curriculum. This presentation will focus on English as a foreign language teachers (EFL). Data at the first stage are collected through interviews and observations at four case schools. In the second stage questionnaires to a larger sample will be used. The findings indicate that the teachers are more focused on their subject, neglecting the general parts of the curriculum. A more student active role is present. Important elements of the curriculum are worked with, for example democracy and citizenship and health and life skills. However, some teachers feel alone, they miss spaces for collaboration due to the pandemic, they lack updated learning resources, and they lack sufficient time to work with the implementation of the new curriculum. There is also a need for a leadership that is "hands on".

Using educational technology in adult ESOL provision: a case study
Keywords: Digital Literacy and Learning, Educational Technologies, Foreign and Second Language Acquisition, Lifelong Learning
Presenting Author: Pirjo Mottus, University of Tartu, Estonia

The case study explored tutors' readiness to continue using educational technology once they return from the virtual to the face-to-face classroom. Specifically, the action research study examined tutors' attitudes towards incorporating technology into their practice and the enablers and barriers to that. The data collected through focus group interviews showed that tutors are motivated to continue integrating educational technology into their practice, following the Scottish adult learning strategy guidelines for using technology to enhance learning. Although tutors have acquired the necessary educational technology skills during the two years of online teaching, they need further structured training to adopt a more organised and purposeful approach to technology use. Also, learners' low digital skills hamper integrating technology into classroom practice.

Entrepreneurship Education in Higher Education: Preliminary insights from the GUESSS survey
Keywords: Competencies, Educational Policy, Gender Issues, Higher Education
Presenting Author: Athanasia Loukidou, University of Macedonia, Greece; **Co-Author:**Stavroula Laspita, University of Western Macedonia, Greece; **Co-Author:**KATERINA SARRI, UNIVERSITY OF MACEDONIA, Greece

Several scholars support that entrepreneurship education (EE) is positively related with entrepreneurial intentions (EI); however, there are also studies indicating a negative or neutral relation between EI and EE. In this context, the Global University Entrepreneurial Students Spirit Survey (GUESS), a large research project taking place every two or three years since 2003, aims at exploring university students' views about entrepreneurship. Universities, comprising of both formal and informal learning contexts, can have differential effects on students' EI. On the one hand, the formal learning shapes the cognitive structures of potential entrepreneurs, while the informal context cultivates the entrepreneurial values and norms necessary for shaping a sustainable entrepreneurial climate. The aim of the current study is to enquire whether entrepreneurship education and the university climate enhance students' attitudes towards starting a new business. Additionally, the study focuses on gender differentiations, since previous research indicates that men seem to have greater EI than women, whereas the impact of EE on EI may not be as effective for men as for women. The data derive from the two latest GUESSS survey reports for the Greek Universities, carried in 2018 and 2021, which contain close-ended and open-ended questions. The findings reflect that both EE and the university climate have a positive impact on students' EI in the Greek University. Additionally, the gender gap is also evident.

The work of language. Explorations of institutional responses to diversity in Swedish universities.
Keywords: Educational Policy, Gender Issues, Higher Education, Inclusive Education
Presenting Author: Asia Della Rosa, Jönköping University, Sweden; **Co-Author:**Sangeeta Bagga-Gupta, Jönköping University, Sweden

This paper presents initial analysis of a study that aims to highlight the dynamics of power and (in)equality within Swedish academic spaces. Its point of departure is the growing "diversity" within Swedish academia in the 21st century, as evidenced through its increasing "internationalization". The policing of words like "race" (and other identity categories like functional disabilities) in both scholarly endeavors and in the popular imagination in the nation-state of Sweden are explored to highlight the work of language in equity related efforts that Higher Education, HE, is committed to. Aligning with a Second Wave of Southern Perspectives, SWaSP, this study draws attention to the continuing hegemonic *colonial*-order-of-things as the *naturalized*-order-of-things and builds on the entanglements of *two*broad strands of theorizing: sociocultural/adharanikaran/ubuntu perspectives and decolonial/southern thinking.Using a post-methodological gaze, we critically analyze HE web-pages and official documents related to increasing diversity and internationalization-oriented strategies, the promotion of equal opportunities and guidelines governing discrimination, that are published by the five largest universities in the nation-state of Sweden. Our preliminary findings draw attention to the work of language (and other semiotic resources) for understanding issues related to diversity, (inter)culturality and equal opportunities, but also the absence of words like race [*ras*] and racism in HE documents. These findings raise questions regarding the effectiveness of contemporary anti-discrimination policies. We argue that such tendencies need to be understood in light of a peculiar Swedish hegemonic "ISM's of oppression" based on whiteness and a continuing marginalization of the other.

Sexism in Higher Education: An experimental study to assess gender stereotypes using vignettes
Keywords: Attitudes and Beliefs, Gender Issues, Higher Education, Quantitative Methods
Presenting Author: Ana María Espinoza Catalán, Universidad de O'Higgins, Chile; **Co-Author:**Natalia Albornoz, Universidad de O'Higgins, Chile

Moving towards education with equity is an objective of education systems worldwide. However, in Chile, as in other countries, there are multiple manifestations of sexism in education, which undermine the learning and development of all students. Gender stereotypes is one of the most relevant psychosocial factors that explains gender gaps in education. Current study aims to assess gender stereotypes in education among undergraduate students. A 2x2x2 between-subjects experimental design with randomised vignettes was implemented. A sample of 297 students from different background degrees at a Chilean public university participated. Participants were randomly assigned to questionnaires that presented vignettes of fictional characters, in which they varied by: (1) character's sex (male/female); (2) the career which he/she studies (masculinised/feminised); and (3) their level of academic achievement (high/low). Results shows some effects of character's sex on attributions of academic performance. In addition, participants attribute higher expectations of future work and academic performance to women than to men. These findings show the presence of gender stereotypes in higher education and their influence on biases towards men and women. The importance of designing and implementing policies to reduce sexism in education, especially in critical groups such as women and men in counter-stereotypical careers, is discussed.

Lifelong learning and late working life: Risks and Inequalities across four European countries
Keywords: Educational Policy, Gender Issues, Lifelong Learning, Qualitative Methods
Presenting Author: Nehle Penning, TU Dortmund University, Germany; **Co-Author:**Rachel Crossdale, The University of Sheffield, United Kingdom; **Co-Author:**Monika Reichert, TU Dortmund University, Germany

This paper examines the role of lifelong learning from an international comparative and life course perspective. Raising levels of lifelong learning is viewed as central to promoting employability among older workers (Walker, 1997; Hyde and Phillipson, 2015). The extended working lives agenda requires integral support of lifelong learning throughout the life course, however opportunities and take up are often unequally distributed.This paper takes a person-centred perspective to findings from 100 interviews with older workers in Germany, Poland, Sweden, and the UK, providing original insight into how inequalities in lifelong learning are assessed in late working life. This is taken further to assess how lifelong learning influences the prevention and/or management of exclusion risk – e.g. through improving one's chances on the labour market in late working life. The link between lifelong learning and the biosocial, macro, and operational life/work courses is explored to evaluate how lifelong learning influences the potential to extend working lives both equally and inclusively. An overview of the European perspective of lifelong learning, supplemented by findings from a comparative report of macro social and political-economic change within Germany, Poland, Sweden, and the UK, informs case studies of these four countries. This contextualises the primary findings within the national policies and political-economic background of each nation to demonstrate both good and poor practice and opportunities for shared learning. Finally, these two perspectives are brought together to evaluate the potential of lifelong learning for the broader extended working lives agenda in the near- and longer-term future.

Learners engagement in shared regulation between the learner and the technology
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Rianne Kooi, Radboud University Nijmegen, Netherlands; **Co-Author:**Carolien Knoop-van Campen, Radboud University, Netherlands; **Co-Author:**Eliane Segers, Radboud University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University, Netherlands

Many learners face difficulties with adequate Self-Regulated Learning (SRL) (Greene & Azevedo, 2010). Therefore, external support to engage in successful SRL seems needed. Learning analytics, present in adaptive learning technologies (ALTs), hold potential to provide such external SRL support (Winne, 2017). Here, we studied a design for shared regulation between an ALT and the learner. The default for the ALT in our study is to select tasks with a probability of 75% correct answers. In the current study, learners could manipulate this probability to 65, 75 or 85% probability for success after each set of tasks (i.e., *control enactment*). We examined how students engage in*control enactment* and whether *control enactment* mediated between prior knowledge and post-test in a sample of 98 5th grade students. Results showed relations between metacognitive knowledge and skills and measures for *control enactment*. An effect of prior-knowledge on *control enactment* in the mediation model indicates that students with higher prior-knowledge more often challenge themselves with a lower probability to answer the selected questions correct. However, *control enactment* did not relate to posttest after controlling for prior knowledge, and also was not found to mediate the effect between prior knowledge and post-test scores. This indicates that while students with higher knowledge -on average- do tend to challenge themselves more, this does not directly lead to higher learning outcomes. This shows need for further investigations of variation in engagement in *control enactment* between learners to help both teachers and technology to adapt SRL support to learners' needs.

Fostering Self-Regulated Learning through a Digital Tool - A Mixed Methods Study
Keywords: Digital Literacy and Learning, Higher Education, Mixed-method Research, Self-regulated Learning and Behaviour
Presenting Author: Mathias Mejeh, University of Bern, Switzerland; **Co-Author:**Livia Sarbach, University of Bern, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland

AbstractSelf-regulated learning is essential for students in higher education to be successful learners. The relevance of feedback for successful SRL is undisputed. However, opportunities to provide learners with personalized, real-time feedback are often lacking, especially in tertiary education. Through learning analytics, continuous monitoring of learning processes can be conducted, thereby triggering specific, individualized feedback. Little research has been conducted on how far learners succeed in developing appropriate SRL on the basis of LA feedback. The present study examines the effect of a digital tool on the development of students' SRL, and how learners perceive and deal with the feedback provided by the tool. It turns out that (a) certain aspects of SRL develop positively over time (we will illustrate this in our paper using the example of "goal orientation"), (b) both intra-individual and inter-individual differences can be shown, and (c) students perceive the digital tool positively, however, the use and benefit strongly depends on their individual situation during the semester.

Supporting regulated learning in collaboration in higher education
Keywords: Computer-supported Collaborative Learning, Higher Education, Mixed-method Research, Self-regulated Learning and Behaviour
Presenting Author: Suijing Yang, The University of Queensland, Australia; **Co-Author:**Jason Lodge, The University of Queensland, Australia; **Co-Author:**Cam Brooks, The University of Queensland, Australia; **Co-Author:**Jingyang Ai, University of the West of Scotland, United Kingdom

The aim of this study was to develop and examine metacognitive prompts to support content monitoring in collaborative learning in higher education. A digital scaffolding tool was developed to deliver the prompts to collaborative groups. This study employed two process-oriented case studies to explore how prompts influence the dynamic interplay of self-, co-, and socially shared regulatory processes with different foci in collaboration. Meanwhile, the dynamic changes in students' perceived challenges and perceived helpfulness of prompts were investigated. Video and video-stimulated recall interview data were collected from first-year undergraduate students in a scaffolded collaborative task. Process mining and qualitative methods were used to capture temporal and sequential patterns of regulatory processes, students' interpretations, and perceptions over time. Results showed that the prompts facilitated students to review task understanding and assess their content development against the task criteria at the individual- and social levels. Externalisation of perceived challenges was evidenced when students engaged in prompted content monitoring activities. Moreover, the prompts were found to promote additional regulatory processes besides the prompted activities.

Understanding social emotions and their regulation in online CSCL
Keywords: Computer-supported Collaborative Learning, Emotion and Affect, Higher Education, Social Interaction
Presenting Author: Sabrine Hassane, Open University of the Netherlands, Netherlands; **Co-Author:**Jorrick Beckers, Open University of the Netherlands, Netherlands; **Co-Author:**Karel Kreijns, Open University of the Netherlands, Netherlands

Online computer supported collaborative learning (CSCL) could be challenging for students attending distance higher education. These challenges become troublesome when negative emotions emerge thereby strongly influencing the learning process. Therefore, students need to regulate their emotions to collaborate successfully. Yet, little is known about emotion regulation, especially among students in online distance education. In the current study, we investigated the socio-emotional challenges, social emotions and their regulation in online CSCL. We used the Adaptive Instrument of Emotion Regulation (AIRE) corroborated with interviews to gain insight in the quantitative data. The results revealed that about 89% of the students experienced more than one socio-emotional challenge during the online collaboration. These challenges involved differences in personal life, differences in understanding of the task, group members who were not fully committed to the task and differences in interaction styles. These challenges gave rise to negative social emotions: such as disappointment, dislike, shame, anger and guilt. Finally, regulation of emotion seemed to be focused more on the self- and socially shared level, but less on the co-regulation level. Interviews revealed that socio-emotional challenges coincided with negative social emotion and that the students did not always feel safe to discuss their emotions among their group members. On the other hand, during successful collaboration students felt safer, had open conversations, and experienced more positive social emotions, including respect, sympathy, and trust. In conclusion, this study paints a rich picture of emotion regulation during both successful and unsuccessful online collaborations.

Teachers' assessments of their collaboration practices
Keywords: Cooperative/Collaborative Learning, In-service Teachers, Qualitative Methods, Social Interaction
Presenting Author: Katrin Saks, University of Tartu, Estonia; **Co-Author:**Pihel Hunt, University of Tartu, Estonia; **Co-Author:**Äli Leijen, University of Tartu, Estonia; **Co-Author:**Liina Lepp, University of Tartu, Estonia

Contemporary models of teacher professionalism assume continued professional learning and collaboration with colleagues. The TALIS survey showed that deep levels of teacher collaboration are rather rare. This paper investigates the teachers' collaborative practices in the frame of teacher-teacher interaction continuum. The qualitative study with semi-structured interviews with 18 Estonian teachers revealed more frequent collaborative activities on the lower levels - creating positive working atmosphere, supportive relationships and mutual trust on the level of *storytelling and scanning*; and asking for help with classroom management and teaching methods, and providing help only when it was asked for, on the level of *aid and assistance*. Assisting and *sharing* became more important during the Covid-period when teaching was done online and personal contacts were rare. *Joint work* revealed the focus on students predominantly in the context of problem-solving or classroom discipline, much less in the context of enforcing their learning process or wellbeing at school.
Teamwork as the highest form of collaboration with strong interactions and interdependence was found to be launched by the will to create something new and

meaningful without jeopardizing teachers' sense of personal autonomy, sense of freedom and decision-making. In addition, this study proposes an additional unit to the interaction continuum - *no interaction*. This level stays deeply individualistic in the generally collaborative environment.

Evaluating the impact of a pedagogical training program offered to awarded university teachers
Keywords: Cooperative/Collaborative Learning, Higher Education, Mixed-method Research, Teacher Professional Development
Presenting Author: Radu Balan, West University of Timisoara, Romania; **Co-Author:**Purtan Nadia, West University of Timisoara, Romania; **Co-Author:**Velibor Mladenovici, West University of Timisoara, Romania; **Co-Author:**Marian Ilie, West University of Timisoara, Romania

This study presents the impact analysis of a pedagogical training program offered to 20 beneficiaries of a university teaching grant. The impact evaluation had a quantitative quasi-experimental design with two measurement points (pretest and posttest), both at the faculty level and at the students' level. We measured the faculty's conceptions about teaching, their teaching approaches, and their psychological resources. At the student's level, we measured their approaches to learning and their evaluation of the faculty's behavior during class. Two-way mixed ANOVA, Quade's ANCOVA, and Mann-Whitney U were conducted to analyze the collected data, depending on the compliance with the assumptions related to hypothesis testing. On the one hand, the results showed that after the program there were significant differences between faculty from the experimental group (EG) and control group (CG) in their perceptions of active learning appreciation and psychological resilience, with CG faculty reporting higher scores at the end of the program. On the other hand, the training program had significant positive effects on the faculty's behaviors of fostering active learning and the method of assessment in a student-centered manner, with EG students reporting a higher frequency of these behaviors from their teachers compared to CG students. Regarding the students' approaches to learning, the results were insignificant. Generally, we identified significant differences between the two groups only on variables that did not have high values at the initial measurement. Implications for planning the impact evaluation process of similar programs are discussed.

Exploring faculty members' diverse perspectives on interdisciplinary higher education
Keywords: Cooperative/Collaborative Learning, Engineering Education, Higher Education, Teaching Approaches
Presenting Author: Xiaoqi Feng, Aalto University, Finland

Interdisciplinary initiatives have been encouraged in higher education curricula, especially in engineeringeducation as a result of global calls for future graduates with interdisciplinary competencies to co-create solutions for tackling complex real-world problems. While many studies found benefits of interdisciplinary education to students' learning, teachers still reported a number of pedagogical challenges in teaching, such as navigating the disciplinary differences when collaborating across disciplines, as well as balancing the trade-off between depth versus breadth of disciplinary knowledge in teaching. Since teachers' effective teaching practices are closely related to their beliefs, the present study investigated teachers' perspectives and experiences in interdisciplinary education. Semi-structured interviews were conducted with 13 faculty members from engineering, business, art and design with varied teaching, course design, and management experiences. The analysis showed that while faculty members converged on the importance of collaboration, they tended to adopt different pedagogical approaches in interdisciplinary education, due to their different disciplinary epistemologies. By uncovering faculty members' perspectives and experiences, this study can help faculty members derive an in-depth understanding of their own and others' conceptions of interdisciplinary education to facilitate effective teaching collaborations.

Peer Assisted Study Scheme (PASS) and its potential benefits for participants and facilitators
Keywords: Cooperative/Collaborative Learning, Knowledge Construction, Qualitative Methods, Quantitative Methods
Presenting Author: William Carey, Lund University / Loughborough University, Sweden; **Co-Author:**Joakim Malm, Lund University, Sweden; **Co-Author:**Lise-Lotte Mörner, Lund University, Sweden

PASS is a 50-year-old proven peer-learning model that addresses student engagement, learning, performance and retention as well as the transition to Higher Education (HE). PASS combines 'how to learn' with 'what to learn', using collaborative activities under the guidance of a 'senior' student – the PASS Leader. The PASS leaders are trained in the concept of PASS, collaborative techniques, group dynamics, etc., before starting their work, and are supervised continuously during their service. PASS is internationally well-established and is found in some 30 countries at 1000+ higher education institutes. The present study addresses the potential benefits of PASS for student participants and PASS leaders based on attendance and performance data as well as information from surveys taken from a European University. Results show that student attendees perform better on exams, which is consistent with other studies. Furthermore, they improve upon skills like teamwork, problem solving, critical thinking and improve their confidence that will help them in future studies. The PASS leaders also improve upon various transferable skills like communication, leadership and group management that gives them an advantage later in working life. This development of "soft" skills for PASS participants and leaders have received little attention before and are of value as it contributes to some of the graduate attributes HE Institutes (HEIs) want to achieve.

Friendships in inclusive classrooms – network analysis from teachers' and students' perspectives
Keywords: Inclusive Education, Peer Interaction, Social Development, Social Interaction
Presenting Author: Katharina-Theresa Lindner, University of Vienna, Austria

Empirical findings show that building friendships as well as having friends influences students' academic, socio-emotional as well as health development. In this context, recent studies indicate lower social participation in school of students with special educational needs (SEN) and that they lack friendships (Avramidis et al., 2018; Bossaert et al. 2013; Hassani et al. 2020; Koster et al. 2009; Schwab 2018). In light of these findings, friendship analysis in inclusive school settings seems particularly interesting for tracing the social connectedness of students with and without SEN and for explaining any differences that may exist. Within a sequential explanatory design, two study phases have been implemented in the present study. In phase 1, a sociometric network analysis of 449 students from 25 inclusive primary school classes were examined. Results showed that the agreement of students' and teachers' rating varies strongly across classes ($r = .18 – .71$). In phase 2, interview data from a subsample (a sub-sample selected from phase 1) comprising teachers ($n = 2$) and students ($n = 15$) was qualitatively analyzed. The evaluation of teachers' interviews identified three explanations for missing accuracy in the sociometric networks. From students' interviews, six subcategories describing friendship were found.

Students' friendships - The role of gender & self-perceived social inclusion in inclusive classrooms
Keywords: Gender Issues, Inclusive Education, Peer Interaction, Social Interaction
Presenting Author: Ariana Garrote, University of Applied Sciences and Arts Northwestern Switzerland, School of Education, Switzerland; **Co-Author:**Carmen Zurbriggen, University of Fribourg, Switzerland; **Co-Author:**Susanne Schwab, University of Vienna, Austria

Friendships with classmates play a significant role for every student's social and academic development. However, only some friendships are maintained longer than a school year, and their formation depends on social processes. At the dyadic level, the social process of gender homophily is consistently found in friendship networks: girls are more likely to befriend girls and boys are more likely to befriend boys. There are also social processes at a classroom level,

namely network effects, that influence the formation of friendships, such as density, transitivity, and reciprocity. For the social inclusion of students, it is not only important to have friends but also to feel socially included. Few studies investigate social inclusion along different dimensions, such as friendships and self-perceived social inclusion. Thus, there is little knowledge about the relationship between students' friendships and their perception of inclusion. To contribute to this research gap, friendship networks of 280 students aged 9 to 11 years (49% girls) in 15 classes of grade 4 were examined longitudinally during a school year. Changes in friendship networks from the beginning to the end of the school year were analyzed with social network analyses. Gender and self-perception of inclusion were added as covariates. Network effects (e.g., reciprocity, transitivity) were included in the model. The results confirmed gender homophily and showed that students who perceived themselves as included were more likely chosen as friends by classmates, whereas feeling included did not predict naming friends. This suggests that peers substantially contribute to students' perception of their inclusion.

Improving students' attitudes towards peers with special needs: Results from an intervention study
Keywords: Attitudes and Beliefs, Inclusive Education, Peer Interaction, Social Interaction
Presenting Author: Marwin Felix Loeper, Paderborn University, Germany; **Co-Author:**Gamze Görel, Paderborn University, Germany; **Co-Author:**Frank Hellmich, Paderborn University, Germany

In our study, we evaluated the effects of a newly developed intervention approach to foster primary school students' social participation in the inclusive classroom on their attitudes towards peers with learning difficulties and their attitudes towards peers with difficulties in their social-emotional development. *N*=503 students from the third and the fourth grade participated in our study. Half of the students (*n*=259) took part in the six-week intervention program to foster their social participation. Meanwhile, the other half of the students (*n*=244) attended their regular school lessons and therefore acted as an inactive control group. Before and after the intervention, we investigated students' attitudes towards their peers with learning difficulties and towards their peers with social-emotional difficulties by means of a questionnaire.The results of an ANOVA with repeated measures revealed a significant effect of the intervention on students' attitudes towards their peers with learning difficulties and their attitudes towards peers with social-emotional difficulties. Thus, the attitudes of the students in the intervention group significantly increased from the pre to the post measurement, whereas the attitudes of the students in the control group remained stable or even decreased. Overall, our findings confirm the effectiveness of a school-based intervention to foster students' social participation in the inclusive classroom for the development of their positive attitudes towards peers with special educational needs.

University students' behavioural intentions towards social exclusion
Keywords: Bullying, Higher Education, Motivation, Peer Interaction
Presenting Author: Mareike Brehmer, University of Agder, Norway; **Co-Author:**Jennifer Meyer, Leibniz-Institute for Science and Mathematics Education, Germany

Social exclusion from group activities is a prevalent issue among students in higher education and poses challenges to a safe and inclusive learning environment. We conceptually replicated and extended a study by Hayashi and Tahmasbi (2021) to investigate to what extent the Theory of Planned Behaviour may predict university students' behavioural intentions towards in-person peer social exclusion. The Theory of Planned Behaviour assumes that a person's attitudes towards a behaviour, their subjective norms deriving from significant others, and their perceived behavioural control predict their intention to execute the behaviour in question. In the above-mentioned study, empathy and anticipated regret were found to be significant predictors of intention, over and above the standard variables. We analysed data collected online from *N*=420 undergraduate students to examine to what extent attitudes, subjective norms, perceived behavioural control, empathic concern and anticipated regret predicted various prosocial and antisocial behavioural intentions towards peer social exclusion in university students. Preliminary findings suggest that among the standard variables proposed by the Theory of Planned Behaviour, perceived behavioural control and cognitive attitudes were those with the most significant effects on the outcome variables. Furthermore, empathic concern and anticipated regret significantly contributed to the prediction of both prosocial and antisocial behavioural intentions.

Authentic tasks and Scaffolding in Higher Education: a Meta-Analysis on Effects of Simulations
Keywords: Higher Education, Meta-analysis, Simulation-based Learning, Teaching/Instructional Strategies
Presenting Author: Olga Chernikova, Ludwig Maximilian University, Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM) & ZIB (Centre for International Student Assessment), Germany; **Co-Author:**Nicole Heitzmann, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Matthias Stadler, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Tina Seidel, Technische Universität München, Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

This meta-analysis is based on 152 empirical studies and investigates the relationship between task authenticity and scaffolding in simulation-based learning environments and their role in facilitating complex cognitive skills in higher education. We explored different types of scaffolding and their additional value for simulations with high and low levels of task authenticity. The analysis revealed that additional scaffolding in form of providing reflection phases is beneficial for highly authentic tasks in simulations but providing examples or prompts as the only support measure in simulation is rather counter-productive. For simulations with low task authenticity, different types of scaffolding contribute to effectivity similarly well. We conclude that providing different types of scaffolding can support simulations, but also lower the effects on learning outcomes if not properly matched with tasks.

Can simulation-based training shape professional identity in addition to competencies?
Keywords: Competencies, Health-care Education, Qualitative Methods, Simulation-based Learning
Presenting Author: Pauliina Rikala, University of Jyväskylä, Finland; **Co-Author:**Minna Ruoranen, University of Jyväskylä, Finland; **Co-Author:**Kaisa Silvennoinen, University of Jyväskylä, Finland; **Co-Author:**Aaron Peltoniemi, University of Jyväskylä, Finland; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland

There has been a great deal of theoretical and empirical research focused on the construction of professional identity in healthcare. However, discourse on the relationship between simulation-based training and the construction of professional identity remains meagre. The purpose of this preliminary study is to provide insight into the competences that are fundamental in professional identity and are constructed in high-fidelity healthcare simulation-based training situations involving multi-professional interaction and hands-on activities. In our study, we focus on the contents of video-recorded scaffolding between the trainer and trainees during healthcare simulation-based training and debriefing. We aim to answer the question of what competences are present in the scaffolding and how they reflect projected learning goals. Based on available literature and content analysis of the video-recordings, we discuss the potential of simulation-based training as an important constructor of professional identity for training professionals in healthcare. Our preliminary results reveal that, overall, the competences relevant for professional identity construction include practical skills, communication and collaboration, which were also well reflected in the projected learning goals. In addition, during the debriefing, it was noticed that individual learning experiences were not explicitly communicated among colleagues. This raises the question of whether some themes, such as motives, motivation or emotions, that may be significant to professional identity construction were left unaddressed. We hope to provide some suggestions for simulation designers and trainers to better design and implement healthcare training that supports the construction of

professional identity for trainees. Final results will be presented at the conference.

Social embedding in virtual learning simulations and its relation to the quality of task solution
Keywords: Higher Education, Simulation-based Learning, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Anke Braunstein, University of Mannheim, Germany; **Co-Author:**Viola Deutscher, University of Mannheim, Germany

Virtual learning simulations (VLS) are on the rise as they reflect realities more authentically in learning processes and thus help learners to solve authentic tasks in an action-oriented approach. Since real-life learning largely occurs through social interactions between learners, the question arises to what degree these social interactions can be represented in VLS and how social embedding effects task-solving, perceived authenticity, enjoyment and social immersion. For this purpose, the commercial work task of a supplier selection is implemented in the VLS *LUCA Office Simulation*. Here, the task was adapted to four different degrees of social interaction ('no social embedding', 'social placement', 'social interaction' and 'collaborative interaction'). Learners are assigned randomly to the different levels of social embedding. We analyze the effects of the degree of social embedding on task-solving, perceived authenticity, enjoyment, and social immersion via a one-way MANOVA on 120 economic and business education students. The preliminary results so far indicate an improvement in task solving with an increase in the degree of social embedding. Furthermore, it becomes clear that with the increase of social embedding learners' perceived authenticity of a task, enjoyment as well as immersion increase.

Task perception, task performance, and learning outcomes in simulation-based inquiry learning
Keywords: Interest, Knowledge Construction, Science Education, Simulation-based Learning
Presenting Author: Tomi Jaakkola, Tampere University, Finland; **Co-Author:**Koen Veermans, University of Turku, Department of Teacher Education, Finland

The positive effects of computer-simulations on learning outcomes are clearly demonstrated in the literature. However, it is less well understood how situational factors during learning with simulations are connected to each other and how they might mediate the learning outcomes. To this end, the present study investigates how students' task perception (interest in the task and perceived task difficulty) and task performance (quality and fluency of learning) in a simulation are connected to learning outcomes and prior knowledge and interest, and how these factors interact with each other while students carry out experiments in the simulation. Participants of the study were 115 upper elementary school students. Preliminary results showed an interesting interaction between different process variables measured during learning, but learning outcomes were only explained by prior knowledge. The results of the study can provide more detailed information on how different situational variables relate to the learning outcomes obtained from simulations and they help us to better understand the learning processes that take place in a simulation environment.

Students Value Alignments and Tensions with Learning Analytics
Keywords: Attitudes and Beliefs, Educational Technologies, Ethics, Learning Analytics
Presenting Author: Egle Gedrimiene, University of Oulu, Finland; **Co-Author:**Hanni Muukkonen, University of Oulu, Finland

Learning analytics (LA) tools are getting increasingly popular in higher education (HE). This process has been especially facilitated by recent Covid-19 pandemic and increase in distance education. However, ethical concerns and low acceptance from users reported in previous literature stimulates the search for constructs that could serve to better understand users' experiences with LA tools and thus positively impact the LA field development. We investigate students' (N = 12) value alignment and tension experiences in connection to LA tool use in HE institution, Finland. Preliminary results from qualitative content analysis of student interviews indicate that significant value tensions as well as alignment experiences emerged in connection to LA tool use. Moreover, the value tensions distributed differently between users with educational sciences and computer science backgrounds. We conclude that values of students from educational sciences are not sufficiently accounted for in LA tool design, thus causing contradictory experiences.

The use and misuse of learning analytics dashboards: the case of UK primary schools teachers
Keywords: Computer-assisted Learning, Educational Technologies, In-service Teachers, Learning Analytics
Presenting Author: Manolis Mavrikis, UCL Knowledge Lab, United Kingdom; **Co-Author:**Eirini Geraniou, University College London, Institute of Education, United Kingdom

This paper reports on the use of Adaptive Learning Technologies (ALTs) that include learning analytics (LA) in the form of data visualisation (dashboards) and other means of providing information for teachers. Following a qualitative methodology we interviewed teachers and teaching assistants who extensively use such tools in practice and look into their beliefs, competences and data literacy skills and how these, together with the broader educational context and their specific goals, shape their practice. Analyzing their interactions, and common breakdowns and misconceptions, we provide recommendations for dashboard design and teacher training. The results point to the need for further research into the relationship between teachers' data literacy and the actions and nuanced decisions they take based on the dashboards. The paper also highlights the importance of looking into the whole school and broader educational context including how or whether teachers involve parents and learners in making sense of the data.

Automated Short Answer Grading using BERT on German datasets
Keywords: Assessment Methods, E-learning/ Online Learning, Educational Technologies, Learning Analytics
Presenting Author: Sukanya Nath, Swiss Distance University of Applied Sciences (FFHS), Switzerland; **Co-Author:**Behnam Parsaeifard, Swiss Distance University of Applied Sciences (FFHS), Switzerland; **Co-Author:**Egon Werlen, Swiss Distance University of Applied Sciences (FFHS), Switzerland

Owing to a growth in online learning, the interest in automated grading has intensified, especially due to scoring time reduction. The aim of automated grading is to approximate human level scoring. Automated Short Answer Grading (ASAG) is a subfield under automated grading, where the length of the answers ranges from a few words to a few sentences. Recently, transformer-based models have improved the state-of-the-art performance in several Natural Language Processing tasks, including ASAG. While a lot of work has focused on English language datasets, not enough attention has been paid to other languages such as German. In this study, we experiment with fine-tuned Bidirectional Encoder Representations from transformers (BERT;Devlin et al. 2018), on German ASAG datasets. We show that the BERT approach beats the bag-of-words (BOW) similarity-based approach by a substantial margin.

Primary school teachers' skills to perceive, interpret and make decisions based on dashboards
Keywords: Digital Literacy and Learning, Educational Technologies, In-service Teachers, Learning Analytics
Presenting Author: Rani Van Schoors, KU LEUVEN, Belgium; **Co-Author:**Stefanie Vanbecelaere, KU Leuven, Belgium; **Co-Author:**Line Deprez, KU LEUVEN, Belgium; **Co-Author:**Antje Demulder, KU LEUVEN, Belgium; **Co-Author:**Fien Depaepe, KU Leuven, Belgium

Digital tools are increasingly used in primary education for learning purposes. These digital learning tools often contain a dashboard which shows the teacher aggregated data of the interactions between the learner and the digital tool. Teachers need to transform the data presented on dashboards into information which they can use to inform their teaching. Whether these dashboards improve teaching quality and lead to more personalization in the classroom depends to

a large extent on the teacher's competence. According to the competence model of Blömeke and colleagues (2015), competence is viewed as a continuum consisting of dispositions, situation-specific skills and performance. So far, limited empirical evidence is available about teachers' competence to use dashboards. In this study, we focus on teachers' situation-specific skills (i.e. how teachers perceive, interpret and make decisions based on the data presented on dashboards). In total 45 primary school teachers participated. Each participant participated in an interview measuring their situation-specific skills. The interviews were coded and scored based on a rubric developed using available literature. Results regarding teachers' situation-specific skills showed high variability across teachers. On average, for most subdimensions of perception, teachers address several aspects of the dashboards in detail and concretely. However, the subdimensions of interpretation and decision-making were fairly limitedly addressed. Moderate to high correlations were observed between perception, interpretation and decision-making skills. It can be concluded that teachers' situation-specific skills are currently limited, especially when it comes to interpreting and making decisions based on data.

Developing plurilingual writing competence in collaborative and cooperative settings
Keywords: Bilingual Education, Cooperative/Collaborative Learning, Learning Approaches, Writing/Literacy
Presenting Author: Olivia Rütti-Joy, St.Gallen University of Teacher Education, Switzerland; **Presenting Author:**Valentin Unger, St.Gallen University of Teacher Education, Switzerland

Societies are becoming more dynamic, heterogeneous, diverse and increasingly more plurilingual in the 21st century. To be able to successfully thrive within and navigate these increasingly complex societal structures requires numerous sophisticated competences that schools need to account for in the reconceptualisation of their curricula. One of these competences constitutes plurilingual writing – a highly important and strategic skill that shapes the way knowledge is constructed and shared, not least because knowledge is primarily communicated through writing. Despite this high relevance, many students fail to write appropriately, effectively and communicatively. These difficulties can, among others, be attributed to the highly complex nature of writing. Students therefore need targeted support in developing their (plurilingual) writing competence. One way of supporting learners is to integrate pluralistic i.e. plurilingual and cooperative and/or collaborative approaches in a unified educational context, as such a combination to writing instruction may contribute effectively to sustainable plurilingual writing competence development. This theoretical paper presents an attempt to promote change in language education and seek to better equip language learners with the learning strategies, resources and language competences needed for global citizenship in the 21st century by proposing a didactic model for plurilingual writing competence development in collaborative and cooperative didactic settings in the lower-secondary level language classroom. The proposed model was developed in an interative multi-stage process with the involvement of leading experts in the field. Aside from the methodology employed, affordances and limitations of the model as well as future research trajectories will be outlined.

Developing revision skills: Studying real-time writing processes to inform instruction practices
Keywords: Cognitive Development, L1/Standard Language Acquisition, Lifelong Learning, Writing/Literacy
Presenting Author: Victoria Johansson, Kristianstad University, Sweden; **Co-Author:**Åsa Wengelin, University of Gothenburg, Sweden

This contribution aims to give an overview of how revision during writing is used by writers across the school curriculum until adulthood. In doing so it wants to identify revision patterns typical for specific age groups, and explore some qualitative differences in revision practices, with the purpose to inform e.g. writing instruction practices. We ask qualitative and quantitative research questions: Does the amount of revision (in proportion of time on task, and in number of revised characters) differ across the school age? In which contexts do participants revise, and does this differ between the ages? Are there any qualitative differences between the revision strategies of children, adolescents and adults? The cross-sectional comparisons are made through empirical data consisting of experimentally collected texts, using keystroke logging, which allows for the in-depth study of what has been deleted and when, and for analyzing revisions and planning patterns (through pauses) at the same time. In total, 170 narrative and expository texts by writers age 9–18, and adults are analyzed. The results show no linear connection between increase in age and amount of deleted text. The analyses of revision strategies reveal that students until 15 years of age are linear in both text generation and revision. In the later part of adolescence more students rearrange the texts more, both through text deletion, reworking what is written, and adding information. The adult controls adapt a more global revision perspective, and often rework a greater part, if not all of their texts.

A study on the impact of explicit instruction and collaborative writing on argumentative writing
Keywords: Argumentation, Instructional Design, Secondary Education, Writing/Literacy
Presenting Author: Yana Landrieu, Ghent University, Belgium; **Co-Author:**Fien De Smedt, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium; **Co-Author:**Bram De Wever, Ghent University, Belgium

Despite the key relevance of argumentative writing in contemporary society, it is agreed upon that education fails in successfully promoting students' argumentative writing skills. Recent research showed that argumentative texts are often weak and are not factual accurate, have a weak level of persuasiveness, include bad writing mechanics and often do not include counterarguments nor rebuttals. This study investigated the effect of explicit instruction and collaborative writing on secondary school students' (a) argumentative writing skills and (b) self-efficacy for argumentative writing (n=400). Moreover, this study additionally evaluated the effectiveness of alternating between individual and collaborative writing throughout the writing process. Multilevel analyses showed that explicit strategy instruction had a positive impact on students' argumentative writing skills and their self-efficacy for writing. There were no significant difference between students alternating between individual and collaborative writing and students exclusively collaborating during all phases of the writing process.

Approaches to thesis writing and writer profiles
Keywords: Higher Education, Learning Approaches, Self-efficacy, Writing/Literacy
Presenting Author: Laura Mendoza, University of Helsinki, Finland; **Co-Author:**Sari Lindblom, University of Helsinki, Finland; **Co-Author:**Tuula Lehtonen, University of Helsinki, Finland; **Co-Author:**Heidi Hyytinen, University of Helsinki, Finland

Master's thesis is a complex task for most students, requiring students to conduct research and write about it while they are still in the process of learning such a skill. Through a person-oriented approach, this study investigates the interrelations between students' approaches to master's thesis writing, the perceptions of the thesis as a teaching-learning environment, self-efficacy for thesis writing, and thesis grade in a Finnish university. Master's thesis writers from engineering fields (N=283) participated in this study by answering a survey. In addition, their thesis grade was obtained separately from the study register. Three profiles of thesis writers were identified based on the individual variation in approaches to thesis writing: 1) Students applying a dissonant approach; 2) Students applying a deep and organized approach; 3) Students applying an unorganized approach. Students applying a deep and organized approach to thesis writing differed from the other two groups at significant levels with a higher thesis grade and higher levels of self-efficacy for thesis writing. They also reported more positive experiences of the thesis as teaching and learning environment, with higher levels of interest and relevance as well as feedback and supervision.

Digital natives = digital experts? Designing a novel instrument to measure digital competence
Keywords: Assessment Methods, Competencies, Digital Literacy and Learning, Secondary Education
Presenting Author:Sümeyra Tural, Leibniz Institute for Educational Trajectories, Germany; **Co-Author:**Mariann Schwaß, Leibniz Institute for Educational Trajectories, Germany

With the digitization of modern day society, the competence of handling information and communication technologies (ICT) has become increasingly significant. Newer generations are often labelled as ‘digital natives’ (Prensky, 2001), which implies a certain level of competence. Scientific evidence, however, indicate the ongoing challenge that the internet can pose for adolescents and emphasize the importance of teaching children a critical and reflected approach (Vlacke et al., 2010).In order to capture the aspect of critical reflection, a new test to measure ‘digital competence’ has been developed for Starting Cohort 8 of the NEPS. The test aims to reflect the knowledge that is needed to responsibly approach the possibilities and the risks of digital media and also to reflect not only on its content, but also to identify its modes of action. In a synthesis and extension of former research (e.g. Calvani, Fini & Ranieri, 2009; Carreto, Vuorikari & Punie, 2017; Dannelse, 2009; Fraillon et al., 2019), four main facets with multiple subfacets were defined: (1) *Information competence,* (2) *Detection of intentions and strategies*, (3) *Communication and interaction competence,* and lastly, (4) *Data handling competence.* The computer based test to measure digital competence will first be applied in a pilot study for the NEPS-SC8 starting in 2022. Data will be gathered in regular schools and schools for children with learning difficulties, in grade 6 and 8, respectively. This presentation aims to introduce the conceptual framework for this novel test domain and to show analyses on the test quality and its dimensionality.

Fostering text integration in primary education: What type of instruction should teachers provide?
Keywords: Assessment Methods, Cognitive Skills and Processes, Comprehension of Text and Graphics, Digital Literacy and Learning
Presenting Author: Raquel Cerdan, University of Valencia, Spain; **Co-Author:**Fátima Rahim, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Ignacio Máñez, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Jason L.G. Braasch, Georgia State University, United States

We explored how receiving different types of reading instructions affects primary school students' integration of conflicting pieces of information and the identification of source features. Primary school children read four short texts and were asked to write an essay on the controversy about becoming vegetarian. Half of the participants received an *academic task instruction*, demanding to read and summarize the information from the texts to justify the convenience to become vegetarian, based on the information in the texts. The rest of the participants received a *personalized task instruction*, with an instruction to write to give some advice to a relative. Students performed the reading and essay writing on the computer. In a second session, they completed a post-learning essay on paper, with a general recall prompt and a memory for ideas and sources task. Contrary to our expectations, no significant effects were found for the experimental essay. For the post-learning essay measures, students reading for an academic purpose included more inferences and a higher number of against vegetarianism ideas, showing that those students focused on different sides of the controversy. Further studies that compare other types of task instructions and consider the influence of students’ reading skills and background knowledge, should help us to better understand this effect.

Digital multimodal message quality and features that affect it: an exploratory study
Keywords: Communication Skills, Digital Literacy and Learning, Pre-service Teachers, Writing/Literacy
Presenting Author: Ilias Karasavvidis, University of Thessaly, Greece

Communication through multiple modes has become standard in modern textual landscapes. Yet, neither the quality of digital multimodal messages has been mapped out nor is it known how it varies as a function of specific message features. The present study aims to (a) assess multimodal message quality using an ensemble of psychometrically valid instruments and (b) identify how specific message features influence this quality. This study examined 208 digital multimodal messages created by student teachers in the context of an undergraduate course on digital media. The main course deliverable was a digital multimodal message in the form of a short digital video. Two graduate students coded the messages using four widely used scales from the areas of communication and entertainment. Message features such as duration, number and type of semiotic resources, number of video effects were used as independent variables. The composite variables that were computed for each scale served as dependent measures. A series of single factor MANOVA indicated that the perceived quality of the digital multimodal messages depended neither on the message duration nor on the number or type of semiotic resources used. Yet, both the number of video effects and captions affected the perceived message quality. Higher levels of video effects and captions led to increased perceived quality for four of the dependent variables. The paper is concluded with a discussion of the findings and their implications for future work in assessing multimodal message quality.

Student groups evaluating their group work behaviour and learning of critical online reading
Keywords: Cognitive Skills and Processes, Cooperative/Collaborative Learning, Digital Literacy and Learning, Secondary Education
Presenting Author: Miika Marttunen, University of Jyväskylä, Finland; **Presenting Author:**Minna Lakkala, University of Helsinki, Finland; **Co-Author:**Timo Salminen, University of Jyvaskyla, Finland; **Co-Author:**Liisa Ilomäki, University of Helsinki, Finland

The study examined upper secondary school student groups' (n = 72) self-evaluations of their group work behaviour and learning of critical online reading during an online inquiry task. The analyses focused on aspects of critical online reading (author, venue, intentions, evidence, corroboration, perspectives, information search, sources), describing group practices (coordination, division of work, shared responsibility, co-construction, joint discussions, helping others and asking for help) and evaluation of group work (members’ contribution, coordination, inquiry task success, collaboration, general success). For learning of critical online reading the most often mentioned aspects were sources (86.1% of the groups), perspectives (43.1%), and author (37.5%). The total number of aspects mentioned suggests that the extent of perceived learning was low among 51.4% of the groups (moderate 34.7%; high 13.9%). The most often mentioned aspect in describing group practices was division of work (79.2% of the groups). In the evaluation of group work, member contribution was evaluated most often (77.8%). A majority of the groups (52.8%) mentioned four or five aspects of group work practices or evaluation which implies moderate ability to conduct or reflect on group work. The results suggest that the students’ learning of critical online reading and reflecting on group work jointly was not very extensive. The results also suggest that, in some schools, students have good opportunities to practice group work and develop their competencies in reflecting collaboration. Further, some interdependence seems to exist between content learning and group work skills.

Epistemic development during the three first undergraduate years in five academic professions
Keywords: Attitudes and Beliefs, Higher Education, Learning Approaches, Metacognition
Presenting Author: Kirsti Lonka, University of Helsinki, Finland; **Co-Author:**Elina E. Ketonen, University of Helsinki, Finland

We looked at how epistemic beliefs changed in five disciplines that prepared for various academic professions. The participants of this 3-year longitudinal study were Finnish university students (N=502; 60% female) from five different disciplines (BA+MA programs): law, theology, science, engineering, and educational sciences (i.e., teacher students). Of these participants, there were 215 students, who participated across all three waves. We investigated the joint trajectories of university students' epistemic beliefs across the three years of study and examined, how these trajectories related to gender, discipline and academic achievement. Particularly, we explored the simultaneous development of different epistemic beliefs over time, enabling us to explore the potential synergy in epistemic change. We found statistically significant signs of reflective and practical beliefs increasing, and dualist believes decreasing over the three undergraduate years. Male students were less likely to give up dualist beliefs. Teacher students' beliefs were the most integrative to start with, but science students demonstrated highest level of epistemic change and law students became increasingly pragmatic during studying. To our knowledge, there are no other longitudinal studies on epistemic change covering several disciplines and archive measures of academic achievement. Our results were in line with Muis et al. (2006).

The Retest-Stability of Epistemic Beliefs about the Certainty of Knowledge in Science

Presenting Author: Peter Edelsbrunner, ETH Zurich, Switzerland

Epistemic beliefs have been criticized to exhibit low reliability, as indicated by low estimates of internal consistency (e.g., Cronbach's Alpha). In the present study, we argue that high internal consistency is not necessary for questionnaires assessing beliefs to be reliable or valid. Beliefs represent a formative construct that should not be internally consistent; otherwise, different items would be redundant. In such cases, retest-reliability is a better index of a questionnaire's true reliability. To examine whether the retest reliability is comparable or higher than internal consistency, we posed the same four questions assessing beliefs about the certainty of knowledge in Science three times on university students with delays of one month. Our findings show that the retest-reliability of these questions was very similar to their internal consistency, and both were moderate. Based on this finding, we discuss whether we should expect consistency across different items meant to assess beliefs and if so, how we can best estimate their reliability.

Modeling learners' epistemic emotions and engagement in a university live-streaming classroom
Keywords: E-learning/ Online Learning, Emotion and Affect, Engagement, Science and STEM
Presenting Author: Tonny Menglun Kuo, Center for Teaching and Learning Development, National Tsing Hua University, Taiwan, Taiwan; **Co-Author:**Tzung-Jin Lin, School of Learning Informatics, Program of Learning Sciences, National Taiwan Normal University, Taiwan

This preliminary study explores the role of epistemic emotions in learning engagement in a university live-streaming classroom. Two waves of data (*N*=997) were collected from a research-oriented university in northern Taiwan. Through multivariate regression analysis and bootstrapping method, our data found that "boredom" and "excitement" are two critical epistemic emotions to the students when learning in the live-streaming classroom. Both of them not only directly lead to different aspects of learning engagement but also serve as mediators that connect other positive and negative epistemic emotions to learning engagement. In addition, "frustration" played an influential role in the learners' interpersonal forms of engagement (i.e., social and agentic engagement) but it did not contribute to intrapersonal forms of learning engagements (i.e., behavioral, cognitive, and emotional engagement), even controlling all the other emotions. Moreover, "curiosity" was found to be the most frequently appeared epistemic emotion in this live-streaming classroom setting. To our best knowledge, this study is the first attempt to explore the relationships between epistemic emotions and learning engagement in a live-streaming classroom.

Feeling confident about your wrong answer: The role of feedback in the arousal of epistemic emotions
Keywords: Emotion and Affect, Metacognition, Problem Solving, Reasoning
Presenting Author: Katerina Nerantzaki, Aristotle University of Thessaloniki, Greece; **Co-Author:**Paraskevi Stergiadou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Panayiota Metallidou, Aristotle University of Thessaloniki, Greece

How do we feel when we are confident that we answered correctly in a task but are informed that the answer is wrong? This study aims to provide empirical evidence for affective reactions following different types of feedback received after providing a biased heuristic solution, in an attempt to better understand our affective reactions when processing external feedback that conflicts with our cognitive schemas and biased judgments. Decision-making tasks that tend to activate biased heuristic solutions were used as epistemic emotion-elicited situations after receiving feedback for the correct answer. Self-reported epistemic emotions of surprise, confusion and curiosity were used as an affective reaction measurement. The sample consisted of 595 undergraduate and postgraduate university students. Performance in each task was followed by two types of feedback: a "*low informative*", namely if the answer is correct or not, and a "*high informative*", in which a detailed justification of the correct answer was provided by presenting the logical principle underlying the correct answer. Epistemic emotions were reported immediately after each type of feedback. The main effects of feedback type and performance were found to be significant in all cases. There was a significant decrease in epistemic emotions after receiving highly informative feedback, especially in the case of confusion for those who gave biased heuristic answers. The results extended previous evidence by showing the value of informative feedback for diminishing emotions caused by unexpected information that is incongruent with previous knowledge or cognitive schemas. Direction for future research and educational implications will be discussed.

The East Asia-Pacific Early Child Development Scales: A Longitudinal Validation Study in China
Keywords: Assessment Methods, Early Childhood Education, Multicultural Education, Tool Development
Presenting Author: Stephanie Wing Yan Chan, The University of Hong Kong, Hong Kong; **Co-Author:**Yufen Su, The University of Hong Kong, Hong Kong; **Co-Author:**Nirmala Rao, The University of Hong Kong, Hong Kong

The significance of early childhood development is reflected in United Nations Sustainable Development Goal (SDG) Target 4.2, which states that all children should have access to quality early education services to be ready for primary education. SDG Target Indicator 4.2.1 concerns the proportion of children aged 24 to 59 months who are developmentally on track in health, learning, and psychosocial well-being. It is critical to have psychometrically robust tools to track progress towards Target Indicator 4.2.1 in low- and middle-income countries, wherein a large proportion of young children are not reaching their developmental potential. This study examined the test-retest reliability and predictive validity of the East Asia-Pacific Early Child Development Scales Short Form, EAP-

ECDS(SF). A total of 709 children in Kindergarten Level 2 (K2: M_{age} = 57.85 months, *SD* = 4.77) were randomly selected from 29 kindergartens in Shanghai municipality and Guizhou province of China. Children were assessed using the EAP-ECDS(SF) in K2 and K3. School readiness was assessed in K3 (*n* = 538), and literacy and mathematics were assessed in Grade 2 (*n* = 316). Pearson's correlation coefficient and intraclass correlation coefficient (ICC = 0.73) indicated that the tool had good test-retest reliability across K2 and K3. Regarding predictive validity, K2 EAP-ECDS predicted K3 school readiness (β = 0.26), Grade 2 language and literacy (β = 0.18) and mathematics (β = 0.22) after adjusting for age, gender, socioeconomic status, and region. Findings support using the tool to measure holistic development of preschool-aged children in China and the region.

Cross-cultural measurement invariance of the early childhood development assessment tool FREDI 0-3
Keywords: Assessment Methods, Early Childhood Education, Multicultural Education, Tool Development
Presenting Author: Nadine Doennecke, University of Hildesheim, Institute of Educational Science, Germany; **Co-Author:**Janin Brandenburg, TU Dortmund University, Germany; **Co-Author:**Claudia Maehler, University of Hildesheim, Germany

Development tests are widely used in the scope of cross-cultural and comparative research to support intervention studies and health care projects concerning early childhood development. Therefore, it is crucial to use culturally sensitive and fair assessment tools. A culturally adapted version of the German development test FREDI 0-3 was used to assess a German (*n* = 405) and an Indian (*n* = 2075) sample of children between ten and thirty-two months. Measurement invariance indicates psychometric equivalence of a construct across groups and is a prerequisite for test applications in a cross-cultural setting. Confirmatory factor analyses for single cohorts per age group and multi-group measurement invariance analyses were used to examine the data equivalence of the test across groups. Weak measurement invariance could be established across both groups in all four age groups (10-14; 15-21; 22-26; 27-32 months) suggesting that the development factor was measured in the same way in both groups and accounted similarly for performance differences in the developmental subdomains for the German and the Indian sample. However, scalar and strict measurement invariance were violated in almost all group comparisons suggesting differences in scale difficulty and reliability across the German and the Indian sample. This suggests that a culture-sensitive adaptation process is necessary in order to create a culturally fair development test. It is recommended to always carry out measurement invariance testing to determine the psychometric equivalence of the test. If in doubt of the equivalence of data a locally developed assessment tool should be used.

Test-fairness assessing executive functions in preschoolers from Germany and Hongkong
Keywords: Assessment Methods, Early Childhood Education, Multicultural Education, Tool Development
Presenting Author: Claudia Maehler, University of Hildesheim, Germany; **Co-Author:**Katharina Schirmbeck, University of Hildesheim, Germany; **Co-Author:**Stephanie Wing Yan Chan, The University of Hong Kong, Hong Kong; **Co-Author:**Nirmala Rao, The University of Hong Kong, Hong Kong

While an emerging body of research has documented cross-cultural differences in executive functions (EF) development in the early years, few studies have provided evidence that the tasks used to assess EF show measurement equivalence across cultures. The current study is one of the first to explicitly test for measurement invariance of EF tasks across different cultural contexts at preschool age. Three EF tasks, each designed to assess a specific domain of EF, namely working memory (Object Span task), inhibitory control (child-friendly Stroop task), and cognitive flexibility (Dimension Change Card Sort), were administered to *N* = 193 3- to 6-year-olds from Hong Kong and Germany. We compared the goodness-of-fit of three theory-driven EF factor structure models (one-factor-model, two-factor-model, and three-factor-model) individually for each of the two contexts as well as for the full sample. The three-factor model, comprising of separate but correlated latent factors, across the full sample yielded the best fit. We then tested for measurement invariance of this best fitting model across the full sample. The results of multigroup confirmatory factor analyses show that the identified factor model reaches strong measurement invariance. These findings suggest that EF assessment at preschool age is likely equivalent across the subsamples from Hong Kong and Germany. The importance of test-fairness in cross-cultural research is discussed.

Digital Competence in Kindergarten: Adopting the DigCompEduSAT for Kindergarten Teachers
Keywords: Early Childhood Education, Educational Technologies, Teacher Professional Development, Tool Development
Presenting Author: Attila Rausch, ELTE Eötvös Loránd University, Budapest, Hungary

Technological development in education affects kindergarten and brings several new opportunities and challenges to early childhood education (Magen-Nagar & Firstater, 2019). The use of digital technology is more frequent in early childhood education as well, and there is growing attention on the successful and effective integration of these tools in everyday practice. While research suggests that kindergarten teachers are the most important actors in applying digital technology in kindergartens, we know little about their digital competence.We aimed to adapt the DigCompEdu self-assessment tool (Ghomi & Redecker, 2019) and inspected its psychometric properties to explore its usability in kindergarten. Our instrument contained 21 questions of the original DigCompEduSAT modified for early childhood education, regarding 6 areas of digital competence of educators. Overall, 242 kindergarten teachers participated from Hungarian kindergartens selected by systematic random sampling. Reliability (Cronbach's alpha=.894) and construct validity (CFI=.956) of the instrument proved to be good. Kindergarten teachers' average score was 31.2 %p (SD=14.3 %p), they reached higher scores on the professional engagement subscale (M=48.1 %p, SD=20.3 %p), but they have room to improve on facilitating children's technology use (M=18.7 %p, SD=19.1 %p). Considering the limitations of self-assessments, this can be a helpful instrument to survey and develop teachers' digital competence in kindergarten. Our research also showed that parallel to equipping kindergartens with digital technology, improving early childhood educators' digital competence needs more attention in the future.

Practices of technology-enhanced informal workplace learning in knowledge work
Keywords: Computer-assisted Learning, Informal Learning, Lifelong Learning, Qualitative Methods
Presenting Author: Anne Karhapää, University of Jyväskylä, Finland; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland; **Co-Author:**Johanna Pöysä-Tarhonen, University of Jyväskylä, Finland

Informal learning is an essential part of workplace learning. Digital technology can play a significant role in enabling informal learning at work with various tools and resources. However, there is still little empirical research on informal learning in this context and therefore knowledge about technology-mediated learning processes is needed. This study uses digital ethnography to investigate informal learning in authentic work settings. The data was collected from one public-sector workplace during the years 2020-2022, including observations, interviews, and diaries, and was analysed using qualitative content analysis. The current paper applies practice theories to investigate how the practices of technology-mediated work support informal learning and how these practices are formed in people's daily activities and speech, in social and material environment of digital technology and work. The results demonstrate how inseparable part of work and learning digital technology is and how technology-mediated work practices foster informal learning. The detailed accounts of these practices provide new understanding of how technology is used for informal learning in authentic work settings.

Pop Bands' Practice: Goal Setting, Monitoring and Feedback Seeking
Keywords: Feedback, Informal Learning, Metacognition, Qualitative Methods

Presenting Author: Simon Schmidt, Universität Regensburg, Germany; **Co-Author:**Helen Jossberger, University of Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany

The level of music performance is a result of demanding practice processes, especially deliberate practice. Within pop bands several musicians join forces and perform together. Thus, individual practice processes as well as collective practice processes play an essential role in advancing accomplishments. Important aspects in both individual and collective practice processes are setting appropriate goals, monitoring one's own performance, and seeking feedback from others. It is not yet clear, however, how these aspects of practice are shaped and implemented in pop bands of different professional levels. To gain a detailed understanding about practice within pop bands, a qualitative interview study with six professional and six semi-professional music bands was conducted. Demographic data was used to divide participating bands into both groups. Data on aspects of individual practice and collective practice were collected through semi-structured interviews. First results indicate that professionals aimed to establish themselves in the field, while semi-professionals strived to expand their popularity. Moreover, professionals reported more conscious monitoring strategies and sought feedback from more external sources than semi-professionals. At the conference, further results should draw a detailed picture of the similarities and differences between professional and semi-professional pop bands.

The Relationships between Job Insecurity and Informal Learning in Finance – A survey study
Keywords: Feedback, Informal Learning, Lifelong Learning, Quantitative Methods
Presenting Author: Patrick Beer, University of Regensburg, Germany; **Co-Author:**Sandra Bauhofer, University of Regensburg, Germany; **Co-Author:**Regina Mulder, University of Regensburg, Germany

Advancing digitalisation as well as economic crises induce a feeling of job insecurity among employees in the form of concerns about one's own work-related future. To handle these concerns in an agentic and effective manner, engaging in informal learning is important. There is however little evidence on how job insecurity might affect informal learning. Therefore, the research question is: *What are the effects of perceived job insecurity on informal learning?*Based on the Conservation of Resources Theory, the hypothesis is that an increase in job insecurity is related to a decrease in informal learning.To answer the research question, a cross sectional survey study with employees from full-service banks in Germany was conducted (N=195). The questionnaire contained measures for various forms of job insecurity (i.e. quantitative job insecurity, qualitative job insecurity, techno-uncertainty) as well as various informal learning activities (i.e. feedback-seeking, help-seeking, information-seeking, reflection). Stepwise regression analyses were conducted.Preliminary results indicate that quantitative job insecurity (i.e. the fear of losing one's job) is not a predictor for informal learning, while qualitative job insecurity (i.e. the fear of a change in central features of one's job) has a significant negative relationship with informal learning. Additional analyses on the relationships between the different forms of job insecurity and the different informal learning activities will be highlighted and discussed before theoretical and domain-specific practical implications will be derived.

Factors related to Teachers' innovative behavior: a multilevel meta-analysis
Keywords: In-service Teachers, Informal Learning, Meta-analysis, Teacher Professional Development
Presenting Author: Stefan Robbers, Open University Netherlands, Netherlands; **Co-Author:**Arnoud Evers, Open Universiteit Nederland, Netherlands; **Co-Author:**Marjan Vermeulen, Heerlen Open Universiteit, Netherlands

In today's society, teachers are increasingly expected to respond to various new developments. This requires a high degree of innovative behavior (IB) of teachers, which is described as generating, promoting and realizing new ideas on one's own initiative. The antecedents of IB are increasingly discussed in scientific literature, however, these antecedents seem to be randomly selected without an underlying research agenda or model. The current meta-analysis aims to cluster these studies and their underlying variables and establish an aggregated effect size in relation to IB. To include as many measurements as possible, multilevel meta-analysis was applied at three hierarchical levels. The results showed that individual factors were moderately associated with IB, and organizational factors were weakly associated. Within organizational factors, the strongest relationships were found for the cluster of social capital theory. However, social capital theory has not been explicitly addressed in any of the publications analyzed in the present meta-analysis. The applicability of this theory in relation to IB confirms our research agenda, namely that IB should be further examined in relation to larger overarching theories.

Intent and relationality in middle leading practices of facilitation, mentoring and coaching
Keywords: Conceptual Change, School Leadership, Teacher Efficacy, Teacher Professional Development
Presenting Author: Christine Edwards-Groves, Griffith University, Australia; **Co-Author:**Catherine Attard, University of Western Sydney, Australia; **Co-Author:**Sharon TIndall-Ford, University of Wollongong, Australia; **Co-Author:**Peter Grootenboer, Griffith University, Australia

Amidst increasing acknowledgement across the world that the work of middle leaders is critical for improving teaching practices in schools, less empirical evidence exists about their specific leading practices compared to, for example, principal leadership (Grootenboer, Edwards-Groves & Rönnerman, 2020; Harris, 2014). Coupled with the complexity of the dual responsibilities of teaching and leading instructional development that middle leaders undertake in schools, evidence delineating and describing the specific dimensions of their leading practice is scant. Studies to date have established that more focused research is required to investigate the distinctiveness of middle leaders' practices (Harris et al., 2019; Lipscombe et al., 2019). Drawing on practice theory, this paper presents preliminary results from the first phase of a three-year project examining the 'flow of influence' of middle leading practices on teacher development and student learning. Thematic analysis of interviews with 32 middle leaders reveals that the practices of facilitating, mentoring and coaching are nuanced and distinctive in their intent and relationality in school-based education development. A critical exploration of the multidimensionality of middle leading as elicited by participants in detailed descriptions of their day-to-day leading practices is presented. It is argued that the common and interchangeable usage of these terms in policy obscures and threatens to erase, or blur at best, the important distinctions between these facets of middle leading work. Results have important implications that cannot be ignored by school leaders and policy makers seeking to improve broader systemic support for building and refining middle-leading practices in schools.

Implementing conceptual change principles for mathematics instruction: the case of fraction division
Keywords: Conceptual Change, Instructional Design, Mathematics/Numeracy, Teaching Approaches
Presenting Author: Ioanna Koptsi, University of Ioannina, Greece, Greece; **Co-Author:**Konstantinos Christou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Xenia Vamvakoussi, University of Ioannina, Greece

A major source of difficulty in rational number learning is that students over-rely on their prior knowledge of natural numbers to make meaning of rational numbers and their operations. The dominant meaning of division in natural number contexts (i.e., equi-partitioning) does not generalize for fraction division. In addition, an efficient algorithm for fraction division aka "invert and multiply" is obscure for students. Thus, students face conceptual as well as procedural difficulties with fraction division. We present the rationale and insights from the first enactment of an ongoing topic-specific design research study aiming at supporting students to make sense of fraction division and the "invert and multiply" algorithm. We drew on conceptual change principles for instruction,

specifically a) search and enhance prior knowledge that can be employed productively, and b) use appropriate analogies to facilitate knowledge transfer from a more to a less familiar domain. We invested on the measurement meaning of division that is transferable to rational numbers; and designed an instructional sequence building on systematic cross-domain mapping between length measurement and division. This allowed for explaining the “invert and multiply” algorithm as analogous to the “compensation principle” in measurement. We enacted this sequence with four 6th graders who were pre-and post-tested regarding their understandings of fraction division. We found that the intervention promoted substantially their competences in interpreting division as measurement, and in applying and explaining the “invert and multiply” algorithm. We discuss key insights from the first enactment that will inform the re-design of the instructional sequence.

An intervention with erroneous examples to address misconceptions on equations and inequalities
Keywords: Cognitive Development, Conceptual Change, Mathematics/Numeracy, Misconceptions
Presenting Author: Eleni Karagiannidou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Courtney Pollack, Harvard University, United States; **Co-Author:**Konstantinos Christou, Aristotle University of Thessaloniki, Greece

Equations and inequalities, core concepts in algebra, are difficult for students to understand. Students may make mistakes and hold misconceptions because of their prior knowledge about arithmetic and about algebraic notation. This study investigated the hypothesis that errors in equations and inequalities may be due to students’ tendency to consider variables as symbols that represent only natural numbers and to misinterpret the phenomenal sign of the algebraic expressions that appear in the equations/inequalities as the real sign of the values they can represent (i.e., phenomenal sign misconception- PSM). Also, this study tested whether a teaching intervention with erroneous examples could help students resolve mistakes and misconceptions better than an intervention with correctly solved examples. The participants were 119 9th grade students. Students completed Pre-, Post- and Retention tests, which asked whether there are solutions for nine equations and nine inequalities in each test, and to present the possible solutions. The equations and inequalities were designed so that a PSM would produce specific mistakes. The Experimental Group (44 students) saw 4 erroneous examples and the Control Group (65 students) saw correctly solved examples that included inequality tasks. The results showed that PSM and students´ tendency to associate variables only with natural numbers negatively affected their performance in the tests. Both the teaching intervention with erroneous examples and with solved examples were equally effective in helping students address part of their misconceptions. This finding raises theoretical issues about the effectiveness of erroneous examples which will be discussed.

Motivational, Social and Affective Processes

Effort Tracking: Using Teacher and Student Ratings of Students’ Effort in Goal-Setting Conversations

Keywords: Digital Literacy and Learning, Learning Analytics, Motivation, Secondary Education
Interest group: SIG 27 - Online Measures of Learning Processes

Please bring your own device if you are attending this ICT demonstration.Recent research has identified students’ effort as a potent and malleable focus for improving academic and other outcomes, in students of all abilities. However, measuring students’ academic effort is often conducted using ad hoc approaches in schools (typically allocating single grades rated by teachers) that are subject to reference (as well as other forms of) bias. Studies employing both teacher- and student-ratings of students’ effort have shown there to be generally low correlations between these two perspectives, however student-perceptions and teacher-perceptions provide unique and complementary insights into students’ effort. This presentation demonstrates a tool (Effort Tracking) used for measuring tripartite effort (with operative, cognitive, and social-emotional dimensions) from both student and teacher perspectives, used in Australian Independent schools over the past five years and now being trialled in the United States. Demonstrations will show how data is collected via a novel user interface and how it is displayed longitudinally on dynamic student dashboards to improve intrinsic motivation for learning. Participants will take part in a hands-on activity, exploring real (anonymised) effort data, to discover how it can be used to distinguish student profiles and to better ‘know all students,’ informing formative goal-setting conversations in students of all abilities.

More than just noise? New insights on heterogeneity in students' perceptions of instruction

Keywords: Achievement, Classroom Assessment, Classroom Management, Instructional Design, Large-scale Assessment, Social Aspects of Learning and Teaching, Teacher Effectiveness, Teaching Approaches, Teaching/Instructional Strategies
Interest group:
Chairperson: Lisa Bardach, University of Tübingen, Germany
Organiser: Lisa Bardach, University of Tübingen, Germany
Organiser: Sebastian Röhl, University of Tübingen, Germany
Discussant: Jonathan Schweig, United States

Even though students in the same class are exposed to the same teacher, they can differ considerably in their perception of their teacher's instruction. This heterogeneity has been largely ignored by prior research and in practical applications as they typically use class-level aggregates (i.e., the mean of the ratings of all students in a class) and treat heterogeneity in students' perceptions as "noise". Our EARLI Emerging Fieldgroup and the present symposium aim to advance current understandings of heterogeneity by focusing on its sources, implications, and new integrative perspectives. Röhl and Bardach demonstrate that heterogeneity in students' perceptions of instruction arises for substantial reasons as it indicates whether teachers manage to adapt instruction to the needs of individual students within classes. Prast et al. add to this by shedding light on differentiated instruction from students' perspective. Neuendorf et al. contribute to the knowledge of potential sources of heterogeneity by testing whether teachers' diagnostic competences predict heterogeneity in students' ratings of instruction. Lastly, Davison et al. adopt an intraindividual approach to explore the issue of within-group heterogeneity and present findings from multi-level analyses focusing on teacher involvement. Jonathan Schweig, our discussant, will integrate the four studies, and outline promising directions for future research and potential implications for practice.

Heterogeneity in students' perception of instruction is a marker of non-adaptive teaching
Presenting Author: Sebastian Röhl, University of Tubingen, Germany; **Co-Author:**Lisa Bardach, University of Tübingen, Germany

Students in the same class can vary greatly in their perceptions of the same teacher; however, the current understanding of heterogeneity in students' perceptions of instruction, and its sources and implications remains limited. Here, we propose that heterogeneity in students' ratings of instruction may serve as a marker of non-adaptive teaching: If students in the same class feel equally supported and experience that the teacher adapts instruction to their needs and learning prerequisites, then heterogeneity should be low. By contrast, if the teacher fails to provide tailored instruction to individual students, heterogeneity in students' perceptions of instruction within classes should increase. Using latent change score modelling, we analyzed data from the TALIS GTI survey (N = 19659 students and their N = 679 mathematics teachers). It was tested whether an increase in adaptive teaching predicts changes in heterogeneity in students' perceptions of teaching quality (clarity of instruction, cognitive engagement, support for autonomy, and teacher's classroom management) within classrooms. Results showed that for most teaching quality dimensions, students in classrooms with higher levels of adaptive teaching (as rated by students) had less heterogenous perceptions of teaching quality. No significant effects were found for teacher-rated adaptive teaching. Overall, this study notably adds to the body of knowledge on heterogeneity in students' perceptions of instruction and holds important implications for educational practice.

Differentiated instruction from students' perspective in mathematics lessons
Presenting Author: Emilie Prast, Leiden University, Netherlands; **Co-Author:**Marieke van Geel, University of Twente, Netherlands; **Co-Author:**Trynke Keuning, Hogeschool KPZ, Netherlands; **Co-Author:**Hans Luyten, University of Twente, Netherlands

Differentiated instruction concerns adapting education to students' needs. However, relatively little is known about how students experience the degree to which their teachers fulfill their individual educational needs. In the current study, the Differentiated Instruction from Students' Perspective (DISP) questionnaire was developed and administered among 458 students of grade 4 to 6 of 22 primary school teachers in the Netherlands. The internal consistency of the DISP instrument was considered good. Students in general were moderately positive about the level of differentiation they experienced and few differences between DISP-ratings of students with varying mathematics achievement levels were identified. It is concluded that the DISP questionnaire is a suitable instrument to study students' perspectives and can be used by researchers as well as by teachers who would like to gain insights in and improve their differentiation practice.

Heterogeneity in instructional quality perceptions as indicator of teachers' diagnostic competence?
Presenting Author: Marko Lüftenegger, University of Vienna, Austria; **Co-Author:**Claudia Neuendorf, Hector Institute for Education Research and Psychology, Tübingen University, Germany; **Co-Author:**Joy Muth, University of Vienna, Austria; **Co-Author:**Kou Murayama, University of Tübingen, Germany

Students' perceptions of teachers' instructional practices are an important source for understanding why classroom environments are effective. Students in the same classroom, however, can differ considerably in their perceptions of instructional quality, but our knowledge about factors that shape this heterogeneity is rather limited. Especially teacher-related factors such as teachers' diagnostic competence have remained largely unexplored. Using a longitudinal design with two waves, the present study seeks to improve our understanding of what drives heterogeneity in students' perceptions of instructional quality by investigating the role of teachers' diagnostic competence. We used data from 1678 eleventh grade students (60% female, mean age = 17.02, SD = .79) from 97 English language classrooms. We measured instructional quality using the three generic basic dimensions classroom management, student support and cognitive activation. Using latent multilevel models, we found that the more students perceived that their teachers knew about their achievement and learning behavior, the more they shared perceptions of their teachers' classroom management. Unexpectedly, no such effects were found for cognitive activation and student support. The level of teachers' diagnostic competence was also not predictive of at least short-term changes in heterogeneity in students' perception of instructional quality. Our study provides further evidence for our limited understanding of the factors involved in driving students' variability in classroom perceptions of instructional quality.

Teacher involvement and help seeking: An intraindividual approach to within-group heterogeneity
Presenting Author: Kyle Davison, University of Oxford, United Kingdom; **Co-Author:**Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:**Kathy Sylva, University of Oxford, United Kingdom

Using the example of teacher involvement and academic help-seeking behaviour, we discuss how investigating within-group heterogeneity may help researchers to understand within-learner processes that can be stable or variable over time. Help seeking is an important learning strategy involving an interaction between two-or-more individuals. These interactions occur within the context of interpersonal relationships, and research suggests that the decision to seek or avoid necessary help is particularly susceptible to social factors, including the type of personal involvement learners have with their teachers. In our presentation, we go beyond the literature by examining the heterogeneity of student perceptions of teacher involvement and the extent to which these perceptions are associated with students' help-seeking behaviour from one lesson to the next. Our study is situated in N = 12 English primary school classrooms across three schools. Data consists of 6,592 task-specific reports. N = 290 students in Years 4-6 (aged 8.22 to 11.48) reported on their need for help and help-

seeking behaviour at the end of each lesson, across 13 school subjects, for two weeks. Teacher involvement was measured using both student and teacher reports at a single time-point at the beginning of the study. We will present findings from the ongoing multilevel analyses and reflect on the strengths and limitations of adopting an intraindividual approach to the issue of within-group heterogeneity.

Motivational, Social and Affective Processes

Multimodal approaches with measures of physiological arousal in education

Keywords: Cooperative/Collaborative Learning, Educational Technologies, Emotion and Affect, Feedback, Health-care Education, Peer Interaction, Primary Education, Problem Solving, Secondary Education, Self-regulated Learning and Behaviour, Simulation-based Learning, Social Interaction
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Inge Molenaar, Radboud University Nijmegen, Netherlands
Organiser: Anne Horvers, Radboud University Nijmegen, Netherlands
Discussant: Lars-Erik Malmberg, University of Oxford, United Kingdom

The measurement of physiological arousal in education has become easier over the last year due to the rise of higher-quality wearable devices that measure electrodermal activity (EDA) or skin conductance (Posada-Quintero & Chon, 2020). These novel opportunities to measure unconscious bodily variations have the potential to add to important constructs, such as emotions, collaborative learning, and self-regulated learning (Azevedo et al., 2018; Fang et al., 2018; Malmberg et al., 2019). So far, most previous research has used unimodal approaches. However, multimodal approaches combining physiological arousal with self-reports and observations seem promising (Harley et al., 2015; Horvers et al., 2021). This symposium combines four contributions that have multimodal approaches with measures of physiological arousal. These papers describe novel ways to address physiological arousal by applying new analysis methods to triangulate multimodal data streams that measure important constructs during learning. The first paper combined physiological arousal with behavioural, SRL and group-regulated learning codes in a collaborative learning setting. The second paper investigated which socio-emotional interaction profiles can be identified in students in a collaborative learning setting. They combined physiological arousal with video observations and self-reports. The third paper focused on the connection between physiological synchrony in a collaborative setting by combining physiological arousal with coding of interpersonal behaviour. The fourth paper investigated emotional responses to immediate feedback by combining physiological arousal with self-reports and observations of facial expressions. This symposium makes a significant contribution to the rising field of addressing essential constructs in learning with physiological arousal combined with multimodal data streams.

Analyzing Multimodal Data to Understand Trainees' Regulation Strategies in Simulation Scenarios
Presenting Author: Matthew Moreno, McGill University, Canada; **Co-Author:**Lucia Patino, McGill University, Canada; **Co-Author:**Keerat Grewal, McGill University, Canada; **Co-Author:**Sayed Azher, McGill University, Canada; **Co-Author:**Jason Harley, McGill University, Canada

Self-regulated learning (SRL) skills are needed to help ensure that learners can be autonomous masters of their own learning and have the skills needed to reach their potential (Hadwin & Järvelä, 2011; Jarvela & Hadwin, 2013). Group regulated learning (GRL) is the ability of groups to collectively regulate their own learning which is required for teams to learn, make decisions, and regulate their behaviors (Hadwin & Oshige, 2011). Medical simulations allow trainees to work as teams to develop their SRL and GRL skills (Bransen et al., 2022) to better prepare medical trainees for the challenges faced in clinical practice. Questions remain about how medical trainees' behaviors, group regulation strategies, and physiological responses vary while they participate in a medical simulation and what indicators multimodal data channels provide concerning the success of groups' regulation strategies. Using a mixed methods convergence design incorporating multi-modal data (Azevedo & Gašević, 2019) including behavioural, SRL and GRL codes, and electrodermal activity, researchers studied fourteen (N= 14), 1st to 3rd-year medical residents as they engaged in high-fidelity simulation scenarios. Results suggest that psychophysiological responses increase as simulations progress, in conjunction with an increase in group-regulated learning strategies to manage the effective delivery of patient care from initial contact through to delivering critical procedures. These results provide steps to advance the use of a group-regulation based framework with multi-modal data, to understanding of how medical trainees develop group-based approaches to performance in simulation scenarios.

How students' socio-emotional interaction profiles emerge in collaborative learning
Presenting Author: Tiina Susanna Törmänen, University of Oulu, Finland; **Co-Author:**Mohammed Saqr, University of Eastern Finland, Finland; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Jonna Malmberg, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

Research has shown individual differences in how students experience emotions in learning situations. Prior studies have, for example, focused on situational emotional expressions in different learning settings, including socio-emotional interactions in collaborative learning. What is yet to be studied is what are the emotional and social aspects in collaborative learning that influence these situational emotional expressions, and furthermore, how these aspects relate to the formation of the students' socio-emotional interaction profile in the long run. To this end, this study aims to investigate why a student adopts a certain socio-emotional interaction profile during a four-lesson collaborative science learning period. Multimodal data (video observations, physiological arousal, self-reported appraisals of social and emotional aspects of collaboration) together with mixture hidden Markov models (MHMM) are used to identify secondary school students (n = 54, 18 groups) socio-emotional interaction profiles. Furthermore, relevant covariates are examined to search explanations for students' profile memberships. The results revealed three socio-emotional interaction profiles (negative, diverse, neutral). Strikingly, students' individual appraisals of social and emotional aspects of collaboration were not significant predictors of the profile membership. Instead, the interaction of the students' group members during the learning process seemed to make a difference: the valence of their socio-emotional interaction was a significant predictor of the profile membership. The findings demonstrate how emotions are constructed together in groups' socio-emotional interactions highlighting the social dimension of situational emotional reactions. The findings support the implementation of multimodal process data in unpacking students' emotional experiences in collaborative learning.

Physiological Synchrony in Interpersonal Agency: A Case Study on Collaborative Problem Solving
Presenting Author: Reito Visajaani Salonen, Helsinki Institute for Social Sciences and Humanities, University of Helsinki, Finland; **Co-Author:**Eeva Haataja, University of Helsinki, Finland; **Co-Author:**Esther Chan, University of Melbourne, Australia; **Co-Author:**Chase Sherwell, University of Queensland, Australia; **Co-Author:**Ross Cunnington, University of Queensland, Australia

Educational sciences are adapting different technologies to classroom research and collaborative work situations. Rapidly developing gadgets designed to measure physiological activity such as Heart rate or skin conductivity have eased access to human body reactions in real-life situations. Studies no more contain only technical results but also have a wider perspective to understand relations between results and theory. In our research, we used two novel approaches to understand connections between physical arousal and interpersonal behavior. Skin conductivity is a way to obtain physiological changes both reactive to situation (phasic), but also level of intensity and duration (tonic) during the situation. Skin conductivity is measured by Empatica E4 bracelet and combined with joystick analysis of video to estimate person IP, especially interpersonal agency during collaborative group work. This is a case study of 4 students working collaboratively during one lesson. Results indicate that students have reactive physiological arousal and students' agency has a connection to physiological reactions. In collaborative group work situation students have high physical synchrony and moments of distraction is able to detect. Interpersonal agency is maximal correlated to students' phasic and tonic EDA in window of physiological lag of 30 seconds. This maximum correlation weakens for situations of low collaboration and topic of discussion. Benefits of both EDA and IP CAID analysis leads to new analyzing methods to establish more information about the total process. Further studies with larger samples are required, but it is evident to say EDA and interpersonal agency have connections with each other.

Multimodal data streams to explore emotional responses to immediate feedback in young learners

Presenting Author: Anne Horvers, Radboud University Nijmegen, Netherlands; **Co-Author:**Ard Lazonder, Radboud University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Tibor Bosse, Radboud University Nijmegen, Behavioural Science Institute, Netherlands

As technology is making its way into primary classrooms, young learners nowadays get feedback from both their teacher and the learning system. This feedback can elicit various emotional responses in students, depending on the correctness of their previous actions. Feedback on failure (FOF) often leads to negative emotions, although it can elicit positive emotions as well. The same mixed findings have been found for feedback on success (FOS). As emotions have a direct influence on student learning, it is important to gain more insight into the relationships between immediate feedback and emotional responses. Therefore, this study investigated fifth graders' emotional responses to immediate feedback provided by adaptive learning technologies (ALTs). A multimodal approach was used that combined physiological, experiential and behavioural responses to FOF and FOS. Physiological arousal was measured by electrodermal activity (EDA), experiential responses by self-reported valence and behavioural responses by observations of facial expressions. Preliminary results indicate that FOS elicits more above-threshold peaks in EDA than FOF, but first indicators of FOF eliciting higher EDA peaks are found. FOF elicited mostly negative emotions and FOS elicited mostly positive emotions This study provides opportunities for understanding the relations between multimodal data streams to measure emotional responses in a three-dimensional way, which in turn can be used to determine which of these are critical to measure emotions.

Symposium
Teaching and Teacher Education

Educating for democracy. Teaching and learning domain-specific reasoning to discuss social issues

Keywords: Reasoning, Secondary Education, Social Sciences and Humanities, Teaching/Instructional Strategies
Interest group: SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Carla Van Boxtel, University of Amsterdam, Netherlands
Organiser: Geerte Savenije, University of Amsterdam, Netherlands
Discussant: Gerhard Stoel, Radboud University, Nijmegen, Netherlands

Developing skills to examine, analyse and reason about social issues is considered important to support and develop a more robust, deliberative democracy. Scholars in the field of specific subjects, e.g. history, philosophy, geography and social sciences, often argue that fostering subject-specific skills is also relevant for democratic citizenship. However, it remains unclear whether and how teachers and students are able to apply subject-specific skills to reason about social issues. A recent report on civic reasoning (Lee et al., 2021) – i.e. to examine and discuss complex civic, political, and social issues – recommends further in-depth research on subject-specific elaborations for this type of reasoning. This is also in line with previous research on the relevance of subject-specific components of reasoning. This symposium brings together research in various subjects in the humanities and social sciences focusing on the teaching and learning of reasoning about social issues in subject-specific ways. The four contributions provide insight in the difficulties secondary school students encounter when using subject-specific skills to reason about social issues. Furthermore, it presents elaborated and evaluated design principles, teaching approaches and materials that teachers can use when aiming to stimulate students' reasoning about social issues. In line with the EARLI theme of 2023, the plenary discussion will reflect on how the presented educational materials and interventions contribute to students' ability to take their position in current social issues and help shape our future democracies. Lee, C. D., White, G., & Dong, D. (2021). *Educating for Civic Reasoning and Discourse* National Academy of Education.

Design principles and educative materials that can promote students' social scientific reasoning
Presenting Author: Thomas Klijnstra, University of Amsterdam, Netherlands

Social scientific reasoning is essential in social science education and for a democratic society as a whole. Students are challenged to analyze and reason about social issues such as social inequality, crime, and poverty. However, students experience difficulties in their social scientific reasoning. This study aims to develop and evaluate design principles and curriculum materials and activities that promote students' social scientific reasoning and that can help social science teachers to develop effective instruction. In this design-based research, teachers, informed by a conceptualization of social scientific reasoning and the identification of students' naïve ways of reasoning, and guided by researchers, developed materials and activities piloted in two classes and evaluated by three focus groups of teachers and students and student questionnaires. The participants were four social science teachers in The Netherlands and their students in eight 9^{th} and 10^{th} grades of senior secondary education classes in the two highest tracks preparing for college and university. This study resulted in (1) refined design principles for teaching students social scientific reasoning and; (2) authentic learning tasks to promote students' social scientific reasoning through explicit instruction, the use of video clips with explicit instruction on subskills and group activities with graphical organizers that can promote social scientific reasoning.

Teaching strategies for value-loaded critical reasoning in philosophical dialogues
Presenting Author: Geerte Savenije, University of Amsterdam, Netherlands; **Co-Author:**Floor Rombout, Utrecht University, Netherlands

In order to form a reasoned judgment about social issues, students need critical and moral reasoning skills. The concept *value-loaded critical reasoning* combines critical thinking, moral reasoning, and critical self-reflection. Researchers have emphasized the potential of classroom dialogue for teaching critical and moral reasoning skills (Bleazby, 2020) and previously, we have developed design principles for promoting value-loaded critical reasoning in classroom dialogues. The five design principles are: address, apply and reason critically about moral values, create intercontextuality, and promote meta-level reflection. The aim of the present study is to describe how secondary school philosophy teachers implement the design principles for promoting value-loaded critical reasoning in whole-class, teacher-led dialogues. We discuss the findings of two phases in an educational design study (Plomp & Nieveen, 2013). In the first phase, five secondary school philosophy teachers participated in five professional development meetings over the course of one school year. During this prototyping phase, the teachers learned about design principles, collaboratively developed teaching strategies and evaluated the implementation thereof. We qualitatively analyzed recordings of the classroom dialogues, which resulted in a practical list of teaching strategies for each design principle. However, we observed very few teaching strategies for the design principle about promoting meta-level reflection. Therefore, we consequently analyzed classroom dialogues that were recorded in the evaluation phase of our educational design study (N=6 teachers). Similar qualitative analyses resulted in a framework of teaching strategies for promoting metalevel reflection during value-loaded critical classroom dialogues.

Advancing students' reasoning about democracy: A project on social and political trust
Presenting Author: Maria Jansson, Örebro University, Sweden; **Presenting Author:**Johan Sandahl, Stockholm University, Sweden; **Co-Author:**Patrik Johansson, Departement of Teaching and Learning, Stockholm university, Sweden

Schools in general, and social science education in particular, prepare youths for life in democracies. Teaching, especially in the social sciences, is expected to advance students' knowledge and to socialise them into becoming active and critical citizens with democratic behaviours and attitudes. However, there are challenges for teachers in realising these aims such as dealing with: tensions between thinking critically while being socialised, the trend of diminishing support for democracy among youths, and fading social and political trust in many countries. This paper reports from a research project that departed from the important role of social and political trust in democracies. The project was carried out as participatory action research with social science teachers. The paper addresses three areas with contributions to social science education. Firstly, we suggest educational gains from displacing democracy from traditional content areas, i.e., how students' reasoning about democracy benefit from engaging with democracy in other contexts than that of the structures of the political system. Secondly, we reflect on how teaching designs can provide new experiences and specific reasoning skills to students, particularly the significance of introducing social science theory in teaching. And thirdly, we address the value and potential gains of collaborations between teachers and researchers in performing educational design research, and how it can contribute with theoretical and practical knowledge that is relevant for academia, as well as for teachers' practice.

The relationship between students' reasoning about historical and social issues in inquiry tasks
Presenting Author: Fien Depaepe, KU Leuven, Belgium; **Presenting Author:**Karel Van Nieuwenhuyse, KU Leuven, Belgium; **Co-Author:**Marjolein Wilke, KU Leuven, Belgium

Several history education scholars argue that historical thinking not only increases students' familiarity with the practice of historians, but may also contribute to skills that are relevant for democratic citizenship. In particular, fostering students' historical inquiry skills is expected to improve their ability to critically evaluate contemporary sources, weigh evidence and substantiate a position towards social issues. These scholars assume that students will spontaneously transfer skills and procedural strategies acquired via historical inquiries to contemporary contexts. However, such a "far transfer" from one context to another is difficult to obtain, as educational research shows. There is currently little research examining whether such a spontaneous transfer is possible. This study builds on data stemming from an intervention study examining the effects of a lesson series specifically aimed at fostering students' historical inquiry competences on (a) students' historical inquiry skills and (b) democratic skills, using historical and topical essays based on multiple documents tasks. It explores in a qualitative way students' historical and topical essay tasks to explore differences between students' engagement with both tasks and to explore whether and on which particular aspects these tasks potentially showed signs of a transfer. To this end, a purposeful sample of students is selected who had progressed substantially on both tasks. The study reveals remarkable differences between students' historical and topical pretest essays and offers limited evidence for a spontaneous transfer from historical to democratic skills, among others in students' use of sources and attention for their reliability.

Symposium
Higher Education

Internal and External Influences that Promote Interest Development During Higher Education

Keywords: Achievement, Attitudes and Beliefs, Cultural Diversity in School, Curriculum Development, Higher Education, Interest, Mindsets, Motivation, Science and STEM, Self-regulated Learning and Behaviour
Interest group: SIG 08 - Motivation and Emotion, SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Paul O'Keefe, Singapore
Chairperson: Kathleen M Quinlan, University of Kent, United Kingdom
Discussant: K. Ann Renninger, Swarthmore College, United States

Interest research emphasises the malleability of interest, with potential for it to develop from situational interest to well-developed interest through interactions with people, content, and activities (see O'Keefe & Harackiewicz, 2017; Renninger & Hidi, 2022). Higher education (HE) students rely on appraisals of their interests to make important educational and career decisions. Thus, the ways in which interest develops, particularly during HE, not only has instructional and curricular design implications, but could have far-reaching impact on workforce preparedness and productivity, and graduates' contributions to the wider world. Yet we still know little about how to best support students' interest development during HE. Practice-relevant research designed to support students' interest during HE needs to consider both the external influences educators create for students as well as the way students' beliefs and individual characteristics drive them to interact with those resources. Thus, this symposium investigates this balance between supporting structures, such as curricular design and educational interventions, and students' own beliefs and values. In doing so, this symposium considers a variety of contexts from different countries and different subject areas. Presenters draw on findings from longitudinal, intervention, and cross-sectional studies. They also consider how their findings advance our understanding of interest development in HE and its implications for theory, research, and practice.

Boosting STEM Interest Among Liberal Arts Undergraduates with a Brief Growth-Mindset Intervention
Presenting Author: Paul O'Keefe, Yale-NUS College, Singapore; **Co-Author:**E. J. Horberg, Yale-NUS College, Singapore; **Co-Author:**Carol Dweck, Stanford University, United States; **Co-Author:**Gregory Walton, Stanford University, United States

College presents unique opportunities for students to explore diverse disciplines and develop a breadth of interests—but if students view interests as relatively fixed, they may not explore new disciplines that can broaden and enrich their education. Could a brief intervention that portrays interests as developable boost interest, and even grades, in mandatory math and science coursework in an enduring way among students who begin college not identifying as a "math or science person"? In a randomized controlled field-experiment, first-year undergraduates (*N*=580) in the school of arts and social sciences of a large university completed a brief growth-theory-of-interest (vs. study-skills control) module before matriculating. Among those who entered college less identified with math and science, the intervention increased interest and final grades in two mandatory first-year math/science courses. Our results suggest that a growth theory promotes the development of new interests, which is crucial for successfully navigating a diverse college curriculum. By representing interests as having the potential to grow, colleges can encourage the development of interdisciplinary scholars. Such messages would be most usefully relayed to students at critical junctures in their educational trajectory, before they make important decisions about their future.

Interventions to Promote Interest in Introductory Chemistry and Longer-Term Persistence in STEM
Presenting Author:judith harackiewicz, University of Wisconsin-Madison, United States; **Co-Author:**Michael Asher, University of Wisconsin-Madison, United States; **Co-Author:**Cameron Hecht, The University of Texas at Austin, United States; **Co-Author:**Patrick Beymer, University of Wisconsin - Madison, United States

To increase diversity in STEM fields, we must address attrition in the STEM pipeline. We developed and tested a novel prosocial utility-value intervention (UVI) in an introductory college chemistry class, in a U.S. university, comparing it with a "standard" UVI and control condition, on interest, instructor perceptions and performance in the short term. We also followed students through graduation to examine persistence in STEM. We found that the prosocial UVI was particularly effective in promoting interest, deeper involvement in STEM courses, course performance, and perceptions that instructors valued prosocial applications of chemistry for first-generation students (students for whom neither parent has a college degree). Both the standard and prosocial UVI improved persistence, for all students.

Promoting Student Interest Via Culturally Sensitive Curricula in Higher and Professional Education
Presenting Author: Kathleen M Quinlan, University of Kent, United Kingdom; **Co-Author:**Dave Thomas, University of Kent, United Kingdom; **Co-Author:**Annette Hayton, University of Bath, United Kingdom; **Co-Author:**Jo Astley, University of Derby, United Kingdom; **Co-Author:**Leda Blackwood, University of Bath, United Kingdom; **Co-Author:**Fatmata Daramy, The University of Law, United Kingdom; **Co-Author:**Morag Duffin, The University of Law, United Kingdom; **Co-Author:**Muhammad Arslan Haider, University of Kent, United Kingdom; **Co-Author:**Deborah Husbands, University of Westminster, United Kingdom; **Co-Author:**Helen Kay, Sheffield Hallam University, United Kingdom; **Co-Author:**Mary Mosoeunyane, Buckinghamshire New University, United Kingdom; **Co-Author:**Ian Turner, University of Derby, United Kingdom; **Co-Author:**Clare Walsh, Sheffield Hallam University, United Kingdom; **Co-Author:**Dan West, University of Derby, United Kingdom

We examined whether English higher education (HE) students' perceptions of the cultural sensitivity of their curriculum supported their interest in their program of study. 286 (228 F) second-year undergraduates rated the cultural sensitivity of their curriculum on six scales and rated their interest and their relationships with teachers. Most students (69%) were enrolled in professional education programs, including nursing, law, and education. Racially minoritized students (*n*=99) perceived their curriculum as less culturally sensitive than White students (*n*=182). There were no significant differences between minoritized students and White students on interest or the perceived quality of relationships with teachers. Five dimensions of cultural sensitivity (Diversity Represented, Positive Depictions, Challenge Power, Inclusive Classroom Interactions, Culturally Sensitive Assessments) each predicted interest. Curricula and assessments that represent diversity positively, challenge unearned privilege, and promote inclusivity may support HE students' interest, particularly those studying professional education programs. Through its practical, situated description of curricular features, this study extends existing research on external (curricular/instructional)

factors that promote interest among HE students, with important implications for curricular design.

The Role of Implicit Theories about Interest when Regulating Motivation
Presenting Author: Carol Sansone, University of Utah, United States; **Co-Author:**Yun Tang, University of Utah, United States; **Co-Author:**Jasmine Norman, University of North Carolina, Wilmington, United States; **Co-Author:**Dustin Thoman, San Diego State University, United States

Maintaining motivation is often a challenge for college students. The Self-Regulation of Motivation (SRM) model embeds the interest experience within the self-regulation process (Sansone & Thoman, 2005), proposing that students may choose to engage in strategies that will help to create interest under certain circumstances. Thoman et al. (2020) further proposed that individuals might differ in beliefs that interest can be regulated, which may help to understand when interest regulation likely occurs. We used data collected as part of the Online Evaluation Project 2020 to examine whether students' implicit beliefs about interest regulation predicted use of interest development strategies when they found it difficult to sustain motivation, and the effects on motivation and performance outcomes. The more that students believed interest was malleable, the more likely they were to report using interest development strategies during the first third of the course when they found sustaining motivation to be difficult. Greater strategy use predicted greater interest at the end of the semester. Tests of moderated mediation showed that implicit beliefs indirectly affected final interest via strategy use especially when sustaining motivation was difficult. This process leading to greater final interest was associated with higher final grades. However, strategy use was also negatively associated with grades once the path through final interest was controlled, suggesting potential trade-offs. These results suggest that students can strategically work to develop interest as a response to motivational challenges, but this response depends on their beliefs about the nature of interest.

Effects of a comparative assessment method on how students use peer feedback for revision
Keywords: Assessment Methods, Feedback, Peer Interaction, Writing/Literacy
Presenting Author: Janneke stuulen, University Utrecht, Netherlands; **Co-Author:**Renske Bouwer, Utrecht University, Netherlands; **Co-Author:**Huub van den Bergh, Utrecht University, Netherlands

Peer feedback is often used in secondary education as an important learning tool. But implementing it effectively can be quite complicated. The aim of this study is to investigate if revising based on peer feedback is more effective than without peer feedback, and whether a comparative or a non-comparative assessment method affects how students provide and use peer feedback for revision. Participants were 65 high school students from three classes who each wrote and rewrote a persuasive text. The classes were randomly assigned to three different conditions: a comparative feedback condition, a non-comparative feedback condition and a control condition without peer feedback. Revision based on peer feedback resulted in higher text quality scores than revision without peer feedback. The feedback comments in the comparative condition directed students more towards revising higher order aspects in the text than in the non-comparative condition. However, a relation between text comments and revision quality could not be defined. It is remarkable that students in the comparative condition did receive relatively more feedback on higher order aspects, but didn't succeed to use this feedback effectively into a better second draft. Probably, they need more guidance or instruction on revision and peer feedback. Further research is needed to understand what additional support students need to effectively revise based on peer feedback.

Joint knowledge construction during feedback interaction in Reciprocal Peer Observation
Keywords: Feedback, In-service Teachers, Knowledge Construction, Teacher Professional Development
Presenting Author: Ester Miquel, Universitat Autonoma de Barcelona, Spain; **Co-Author:**Marta Flores, UAB Universitat Autònoma de Barcelona, Spain; **Co-Author:**Andy Morodo, Universitat Autònoma de Barcelona, Spain; **Co-Author:**David Duran Gisbert, Universitat Autònoma de Barcelona, Spain

Peer learning is a good mechanism for teachers' professional development, but there is little evidence of how it works. Reciprocal Peer Observation (RPO) involves a pair of teachers (both act as observer and observee) with similar degrees of experience and status who mutually agree to observe each other's practice. Using a category system based on Popp and Goldman (2016), this study analyses the discourse moves of 15 pairs of teachers during the interactive feedback session in RPO practice (30 recordings) to ascertain if, and how, the discourse between observer and observee plays a role in supporting the joint construction of knowledge. First, the interactive feedback sessions (80.4%) were separated from the monologic (19,6%), which indicates that most participants understood the feedback session as a space for dialogue. Considering 30 feedback sessions with interactive talk, nearly 66% of discourse moves are associated with joint knowledge construction. Explaining Thinking is the most frequent category, both for observers and observee. Self-reflecting on Practice is the most frequent for observer, especially in the subcode Acknowledging a good practice rather than recognizing an improvement in practice. Results show that feedback sessions are a good opportunity to joint knowledge construction between observer and observe, but providing supporting tools to the teachers who participate in RPO is necessary to improve the feedback interaction.

Providing Agency to Students in Peer Feedback Settings: The Free-Selection Approach
Keywords: Cooperative/Collaborative Learning, Instructional Design, Learning Approaches, Peer Interaction
Presenting Author: Pantelis Papadopoulos, University of Twente, Netherlands; **Co-Author:**Alieke van Dijk, University of Twente, Netherlands; **Co-Author:**Natasha Dmoshinskaia, University of Twente, Netherlands; **Co-Author:**Hannie Gijlers, University of Twente, Netherlands

This study explored the benefits of increasing students' agency in an online, double-blinded peer feedback process. A total of 63 Bachelor's students of Psychology volunteered to participate in the study. This included (a) a pre-test questionnaire on their experiences and preferences toward peer feedback, (b) a course activity in which they had to write a draft essay analyzing the potential of a learning tool, provide feedback to other students' drafts, and submitting the finished essay integrating peer feedback and own insights, and (c) a post-test questionnaire recording students' opinions on the process. In a free-selection setting, students are offered several peer works and they are free to apply their own criteria to read and review the one(s) they want. In the study, a hybrid approach was implemented by having the teacher assigning one reviewer to each draft and allowing the students to select and review *at least* one more draft from a random pool of four. The analysis showed that 16 out of the 63 students (25.39%) submitted more than the minimum two reviews (i.e., one assigned and one selected), while 20 out of the 30 students that answered a related question said that they read more than two peer drafts. Students acknowledged that providing feedback helped them identify their own strengths and weaknesses and reach own insights. Post-hoc analysis showed that students that reviewed more than the minimum number of draft essays were also significantly more appreciative towards the benefits of the peer feedback process.

Teachers' peer feedback in basic education
Keywords: Feedback, In-service Teachers, Peer Interaction, Teacher Professional Development
Presenting Author: Dolors Forteza Forteza, Universitat de les Illes Balears, Spain; **Co-Author:**Francisca Moreno Tallón, Universitat de les Illes Balears, Spain; **Co-Author:**Joana Llabrés Ferrer, Universitat de les Illes Balears, Spain; **Co-Author:**Begoña De la Iglesia Mayol, Universitat de les Illes Balears, Spain

In the framework of the research on Peer Observation and Feedback for Professional Development (PeerObserv), to analyse the effectiveness of peer observation practice for the improvement of teacher professional development, we present a systematic review on feedback that focuses on a dialogical model,

among primary and secondary school teachers. The main aim of this paper is to analyse previous research and report on the empirical evidence found, in order to specifically answer the following questions: a) What kind of research has been done on feedback among primary and secondary school teachers during the last decade, and which findings are reported., and b) What type of feedback is defined as effective in relation to improving teaching practice and teacher professional development? Following the PRISMA protocol, 30 peer-reviewed articles were selected based on inclusion criteria: peer-reviewed articles; focused on dialogic feedback; between teachers with the same rank and role in the school; not developed in higher education. The analysis evidences that the quality feedback is defined as a feedback that is not focused on the person but on the goal, is pro-active, cyclical, helps to improve classroom practices and enriches the school climate. It is relevant that the studies come to an agreement on the benefits of peer feedback, but find difficulties in ensuring that it takes place between equal partners and that the conversation follows the characteristics that define quality dialogic feedback. Based on the findings, numerous recommendations for developing research and practice of teacher feedback in schools are suggested.

Effect of Interest Fit on Academic Success in Higher Education: Meta-Analysis and Systematic Review
Keywords: Achievement, Higher Education, Interest, Meta-analysis
Presenting Author: Nicky de Vries, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Martijn Meeter, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Mariette Huizinga, Vrije Universiteit Amsterdam, Netherlands

A satisfying fit between student and study program is critical to academic success (i.e., academic achievement, satisfaction with their program, and retention). Previous studies examining the effect of interest fit in higher education on academic success reported mixed results. This might be attributed to (1) different operationalizations of interest fit, (2) the type of interest measure used, (3) the outcome under examination, or (4) the educational system that is the context of the study. In order to evaluate the effect of interest fit on academic success, a meta-analysis is needed. We performed a systematic review and meta-analysis. We included empirical, peer-reviewed articles published between 2000 and 2021, involving a measure of fit between student and study-program (i.e., interest congruence) as predictor and used a measure of academic success as outcome variable. Preliminary meta-analytic results showed that interest congruence was positively related to measures of academic success. The operationalization of fit was a significant moderator of the relation between fit and satisfaction. The majority of the studies included in the systematic review was carried out in the United States, which has a different educational system than most European countries with regard to choosing a study program in higher education. Thus, the interpretation of the results warrants firm conclusions on the European educational system. Further research should confirm the positive effect of interest fit between a student and study program on academic success in European countries.

Does the situation matter for learning? Effect of mind wandering and interest in multimedia learning
Keywords: Cognitive Skills and Processes, Interest, Motivation, Multimedia Learning
Presenting Author: Perche Louise, Paris Nanterre University, France; **Co-Author:**Yennek Nora, Paris Nanterre University, France; **Co-Author:**Leger Laure, Paris Nanterre University, France

Abstract
In this research, we explored the interaction between the individual and situational dimensions of interest and mind wandering and their impact on learning. Mind wandering is deleterious to performance, particularly during a sustained attention task (Cheyne et al., 2009), during reading tasks for text comprehension (Mooneyham & Schooler, 2013), or in a learning context (Szpunar et al., 2013). 165 undergraduate students filled up questionnaires about their topic interest, prior knowledge, and tendency to mind wander. They then viewed a 16.5-minutes sound PowerPoint on introductory statistics during which there were 4 probes caught measures. After the viewing, they completed questionnaires about their situational interest, their mind wandering during the task, and a learning questionnaire. Our results showed that mind wandering appeared to be a central variable explaining learning scores, which replicates the results found by Kane et al. (2017). Mind wandering mediated the impact of situational interest on learning. These results have important relevance to the educational field, as they highlight the importance of situational characteristics in learning.

Watching the paint dry in the classroom. Evolution and predictors of boredom in bachelor students
Keywords: Emotion and Affect, Higher Education, Personality, Well-being
Presenting Author: Velibor Mladenovici, West University of Timisoara, Romania; **Co-Author:**Laurentiu P. Maricutoiu, West University of Timisoara, Romania; **Co-Author:**Daniela - Georgiana Valache (Voinescu), West University of Timisoara, Romania; **Co-Author:**Zselyke Pap, West University of Timisoara, Romania; **Co-Author:**Eusebiu Stefancu, West University of Timisoara, Romania; **Co-Author:**Bianca Popescu, West University of Timisoara, Romania; **Co-Author:**Marian Ilie, West University of Timisoara, Romania; **Co-Author:**Delia Virga, West University of Timisoara, Romania

In higher education, boredom is one of students' most frequent emotions, but the empirical evidence regarding its evolution is scarce. In the current study, we investigated the evolution of student boredom during a semester. We also considered the role of self-esteem and personality traits in this process. We utilized a longitudinal approach to analyze 605 answers from 135 undergraduate psychology students (mean age = 22.27, 84.45% female) from a Romanian university. In the beginning of the semester, students completed the IPIP-50 personality questionnaire. During the semester, every 3 weeks, students completed self-reported inventories that assessed student boredom and self-esteem. We analyzed our data using a multilevel structural equation modeling approach. Results suggested that students declared themselves more bored as the semester progresses. Also, we found that students' self-esteem plays a significant role in decreasing boredom (i.e., as student self-esteem increased during the semester, their boredom decreased). The relationship between measurement moments and student boredom was moderated by extraversion (i.e., extraverted students had a larger increase in boredom as the semester unfolded, as compared with introverted students) and by emotional stability (i.e., emotionally stable students had smaller increases in boredom). Even more, as students advanced in the semester, their self-esteem increased. This relationship was moderated by the students' emotional stability and openness. Finally, inter-personal levels of boredom were negatively associated with students' conscientiousness. The current investigation results bring valuable input for academic instructional developers and student counselors, bringing insight for better managing student boredom throughout academic semesters.

Students' situational boredom: Typology and relations to the requirement-skill fit
Keywords: Emotion and Affect, Higher Education, Instructional Design, Quantitative Methods
Presenting Author: Lina Wirth, Leuphana University Lueneburg, Germany; **Co-Author:**Poldi Kuhl, Leuphana Universität Lüneburg, Germany; **Co-Author:**Timo Ehmke, Leuphana Universität Lüneburg, Germany; **Co-Author:**Jan Retelsdorf, University of Hamburg, Germany; **Co-Author:**Burak Aydin, Leuphana University Lueneburg, Germany

Boredom is a commonly experienced emotion of students in learning and achievement contexts. It can be assumed to be essentially determined by the task-related requirements, such as language requirements, of a learning situation and to result from a mismatch between learners' skills and those requirements. To analyze boredom as a function of the mismatch between task requirements and students' skills, in this study we first examined the development of boredom over the course of a learning situation and second, whether groups with different developmental trajectories of boredom could be identified. Third, we

investigated whether boredom develops differently as a function of language requirements. To do this, we varied the language features of an instructional video on a statistical topic linguistically (easy vs. moderate vs. difficult). *N*=123 students were randomly assigned to one of these three language conditions and rated their boredom before, during and after viewing the video. Finally, we exmined whether the fit between language requirements and language skills is related to the development of boredom. While we did not find any significant changes in boredom over the course of the learning situation across all students, two groups of students could be identified that showed significantly different trajectories of boredom (decreasing vs. increasing). The trajectories did not differ as a function of the language requirements. However, students assigned to the linguistically difficult instructional video showed different trajectories of boredom depending on their language skills; hinting at the importance of a requirement-skill fit for emotional well-being in learning contexts.

Effects of an Adaptive Math Learning Program on Students' Performance, Self-Concept and Anxiety
Keywords: Achievement, Game-based Learning, Mathematics/Numeracy, Motivation
Presenting Author: Anna Hilz, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Karen Aldrup, IPN - Leibniz Institute for Science and Mathematics Education, Germany

Using digital math learning programs in schools was expected to have a revolutionary impact on students' learning. However, effects regarding such programs are mostly small and heterogeneous, and hence disappointing. Following the ongoing debate in the literature about *why* to continue research on math learning programs, we aim to reframe this question into *how* to continue research on math learning programs. Studies on such programs are lacking that consider a wide set of outcome variables, such as differentiating performance measures+ and affective-motivational variables. Moreover, as students can only benefit from a program if they indeed use it, researchers need to take practice behavior into account. Therefore, we investigated whether the adaptive arithmetic learning program Math Garden fosters students' math performance (addition and subtraction), math self-concept, and a reduction of math anxiety, and how practice behavior (practiced tasks and practiced weeks) affect the investigated variables. We used a pre-post control group design with a total of 357 German fifth-grade students. Randomization took place on the class level. Students in the experimental condition practiced with the program for 22 weeks. Math self-concept only improved in the experimental condition. Students' subtraction performance improved as a function of practiced tasks, and addition performance improved as a function of practiced weeks. We found no effects on math anxiety.

The Strength and Direction of the Adaptation Affect Situational Interest in Game-Based Math Learning
Keywords: Educational Technologies, Game-based Learning, Interest, Mathematics/Numeracy
Presenting Author: Antti Koskinen, University of Tampere, Finland, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Manuel Ninaus, University of Graz, Austria; **Co-Author:**Kristian Kiili, Tampere University, Finland

Research has shown that difficulty adaptation is a promising instructional technique in digital game-based learning. Nevertheless, although the strength and direction of difficulty adaptation can affect motivational outcomes, these effects remain insufficiently examined in game-based learning. This within-subject study examined how the strength and direction of difficulty adaptation affected motivational outcomes in digital game-based math learning. The participants were 167 Finnish fifth-graders who studied fractions with the Number Trace game. The game included 144 number line estimation tasks, half were adapted according to participants' playing performance. Situational interest and perceived difficulty were measured several times with in-game self-report items during the intervention. The manipulation check confirmed that difficulty adaptation was implemented successfully as task correctness and perceived difficulty changed according to the strength and direction of adaptation. Regarding motivational outcomes, two-way repeated-measures ANOVAs showed that the difficulty adaptation increased situational interest, but only when the task difficulty was substantially adapted downwards. Contrary to our expectations, a substantial upwards adaptation of the task difficulty significantly decreased situational interest. Minor adaptation of difficulty did not affect situational interest. The current study contributes to the field of adaptive digital learning environments by highlighting the effects of the strength and direction of difficulty adaptation on motivational outcomes.

The Effectiveness of an Adaptive Digital Educational Game to Enhance Fraction Understanding
Keywords: Educational Technologies, Game-based Learning, Instructional Design, Mathematics/Numeracy
Presenting Author: Febe Demedts, University of Leuven - Campus KULAK, Belgium; **Co-Author:**Bert Reynvoet, KU LEUVEN, Belgium; **Co-Author:**Delphine Sasanguie, Hogeschool Gent, Belgium; **Co-Author:**Manuel Ninaus, University of Graz, Austria; **Co-Author:**Kristian Kiili, Tampere University, Finland; **Co-Author:**Fien Depaepe, KU Leuven, Belgium

It is of major concern that cognitive and noncognitive difficulties interfere with developing a thorough fraction understanding. Regarding cognitive difficulties, learners possess several misconceptions that underlie the difficulties of mastering the complex domain of fractions. Regarding noncognitive difficulties, feelings of math anxiety also play a role in the learning of fractions. Given these cognitive and noncognitive difficulties, it is critical to provide adequate instruction on fractions. A promising method is the use of adaptive educational games to foster students' learning. However, evidence on the effectiveness of adaptive educational games is rather mixed because previous research has not yet rigorously examined the benefits of different game features. This study aims to (1) unravel the difficulties learners encounter when performing a number line estimation (NLE) task and (2) examine the effectiveness of an adaptive digital educational game. Regarding the first research aim, we observed moderate proficiency in NLE-tasks and identified two misconceptions (i.e., natural number bias and unit of reference bias). For the second aim of this study, we investigate the effectiveness of an adaptive educational game to tackle these difficulties by comparing a condition based on corrective feedback with a condition based on adaptive, exploratory feedback tackling students' misconceptions. Participants are randomly assigned to one of the two experimental conditions of the Number Trace Fraction Game (with or without adaptive feedback) or the control condition (playing a non-fraction game).

Serious Games in Economics Education: The influence of game mechanics and reflection prompts
Keywords: Game-based Learning, Instructional Design, Interest, Secondary Education
Presenting Author: Liane Platz, University of Konstanz, Germany; **Co-Author:**Michael Jüttler, University of Konstanz, Germany

The implementation of serious games in economics education offers advantages over more traditional learning approaches when it comes to fostering subject-specific competencies, especially regarding knowledge development. However, it is still unclear how such game-based learning environments have to be designed in order to result in positive learning outcomes when it comes to promoting other sub-facets, such as motivation and interest. In a design comparison (n = 292), a quasi-experimental approach based on a 2x2 control group design with four points of measurement is applied to study different game mechanics and reflection prompts in order to observe effects on the development of financial interest of upper secondary school students in economics. In this regard, structural equation models are used to a) observe the effect of the level of game complexity and the mediating role of basic needs experience and b) the effect of direct and generic reflection prompts on the development of domain-specific interest in financial topics. First results show, that games which offer a higher degree of strategic decision options and direct reflection prompts positively influence students' situational interest with moderate effect size. Long-term effects on students' domain-specific competency are part of current data curation and analyses. Thus, we expect that serious games can promote subject-specific

interest if they are challenging for the game players and at the same time accompanied by direct reflection prompts.

Motivation and attainment: a systematic review of recent studies
Keywords: Achievement, Educational Attainment, Motivation, School Effectiveness
Presenting Author: Daniel Muijs, Queen's University Belfast, United Kingdom

The importance of motivation has long been a contentious topic in education. While the existence of a correlation between the two is established, there is discussion, not least among practitioners, of the causal direction of the relationship and therefore whether schools need to focus primarily on approaches to improve motivation or on approaches to improve attainment. In this study we used a systematic literature review approach to look at recent evidence on this relationship. Findings suggest that the relationship is clearly reciprocal, and while in primary the impact of attainment on motivation tends to be stronger than vice versa, this is no longer true in secondary. This suggests that schools need to take a dual-track approach, focusing on both attainment and motivation, in order to develop a positive cyclical effect.

Adolescents' expectancies and values in phenomenon-based learning and various school subjects
Keywords: Achievement, Interest, Motivation, Primary Education
Presenting Author: Inka Ronkainen, University of Helsinki, Finland; **Co-Author:**Janica Vinni-Laakso, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland; **Co-Author:**Veli-Matti Vesterinen, The University of Helsinki, Finland

According to the expectancy-value theory, student motivation consists of gender roles, the self-concept of ability, success expectations and subjective values. Phenomenon-based learning was elevated in the newest Finnish national core curriculum since teachers are obligated to teach multidisciplinary modules. The aim of the study was to examine Finnish middle school students' motivation towards different subjects and phenomenon-based learning. 1013 Finnish 7^{th} grade students (mean age 13.8, 54 % girls) answered an electronic questionnaire in 2019, which had questions related to school motivation and well-being. With a person-oriented approach, five different motivation profile groups were identified among 7^{th} graders' success expectations and subjective values towards phenomenon-based learning, Finnish language, mathematics and physics. Identified groups were named as follows*: phenomenon-oriented* (23%), *motivated and well-being* (24%), *weakly motivated* (15%), *motivated but loaded* (16%) and *science-oriented* (26%). Phenomenon-oriented students were more interested in phenomenon-based learning and science-oriented students hold higher interest value in mathematics and physics compared with other subjects. Motivated and well-being were interested in all subjects and were not burdened by studies, whereas motivated but loaded students hold high attainment value across subject domains, but they also showed high cost value. Weakly motivated did not value any of the subjects and the study was perceived as burdensome and challenging. According to the cross-tabulation, girls were more evenly distributed in all profile groups, while the percentage of boys was lower in phenomenon-oriented group compared with girls. School performance was lower in weakly motivated and higher in motivated and well-being compared with other groups.

Changes in students' interest, competence and choice towards science learning on a long-term setting
Keywords: Interest, Motivation, Science Education, Self-determination
Presenting Author: Moonika Teppo, University of Tartu, Estonia; **Co-Author:**Miia Rannikmäe, University of Tartu, Estonia; **Co-Author:**Regina Soobard, University of Tartu, Estonia

The purpose of the current study was to examine on a long term-setting the change in and associations between students' interest, competence and choice towards science learning being components of intrinsic motivation based on self-determination theory. Data were collected twice – at first when students were in grade 6 and secondly after three years when the same students were in grade 9. A sample of 171 lower secondary school students completed the self-reported questionnaire. Descriptive statistics and correlation analysis was used identify the possible changes and relationships between interest, competence and choice. The results indicated a significant decrease in students' competence, although not in interest, nor perceived choice change towards science learning on comparing outcomes from grades 6 and 9. Correlation analysis showed strong positive relationship between competence and interest among students answers in both grades. Results and implications for science learning at lower secondary level will be discussed during the presentation.

Teaching to the test - killing students' motivation for the sake of good grades?
Keywords: Achievement, Motivation, Secondary Education, Teaching/Instructional Strategies
Presenting Author: Joy Muth, University of Vienna, Austria; **Co-Author:**Marko Lüftenegger, University of Vienna, Austria

Standardized tests have become a gold standard for assessing students' competencies, but also the quality of teachers and schools. To help their students score high, many teachers apply a test-centered instruction style, also known as "teaching to the test" (TTT). Although TTT is claimed to help raise test scores, no knowledge exists about how this teaching style affects students' daily academic lives and experiences. This study investigated whether TTT is associated with secondary students' intrinsic motivation, perceived importance, utility, and cost of engaging with the subject, their subject-specific self-efficacy, and test performance. The sample consisted of 1625 11^{th}-grade students, from 30 Austrian high schools, who were surveyed about their experiences in English class. Perceived teaching to the test practices were measured with 4 scales from a newly developed measurement instrument. Four multiple regression models with gender as a covariate were conducted. Results showed statistically significant positive associations between the TTT scales repetitive exercising, test-taking strategies, and reference to the test with intrinsic motivation, importance, and utility, but not with cost. Repetitive exercising further showed significant positive associations with self-efficacy and a small positive effect on test-performance. An authoritarian teaching style showed statistically significant negative associations with intrinsic motivation, importance, utility, self-efficacy and test performance while having significant positive associations with cost. Our results suggest that, contrary to current beliefs, TTT, except for authoritarian teaching, might rather enhance than reduce students' motivation, while not impacting test performance to a significant degree.

Participatory Research with youth as a Panacea for Educational Inequalities? A Meta-ethnography
Keywords: Communities of Learners and/or Practice, Inclusive Education, Qualitative Methods, Synergies between Learning / Teaching and Research
Presenting Author: Aline Muff, The Hebrew University of Jerusalem, Israel; **Co-Author:**Aviv Cohen, The Hebrew University of Jerusalem, Israel

A growing amount of research employs participatory methods in which the participants take an active role in gathering and analyzing empirical data in collaboration with the investigators. Such approaches have the potential to make education and educational research more meaningful for both participants and researchers – especially in times of global uncertainty and increased complexity. Considering the diverse use of the label “participatory,” we saw a need to examine participatory action research (PAR) studies to understand better how researchers justify its use and conceptualize its purposes and goals. Focusing on PAR research with young people, we conducted an interpretive meta-ethnography of 122 studies. Our review identified four distinct types of PAR studies, reflecting different ontological and epistemological approaches: technical, capacity building, justice oriented, and transformative. We conclude that while the use of PAR is not necessarily a panacea to address educational inequalities, academic studies should better align with the transformative approach that has the potential to support participants in becoming agents of change by engaging them in self-directed civic learning and activism.

Social disadvantage, classroom talk and educational attainment: RCT of a dialogic teaching programme
Keywords: Dialogic Pedagogy, Educational Attainment, Primary Education, Teacher Professional Development
Presenting Author: Jan Hardman, University of York, United Kingdom

Research shows that socio-economically disadvantaged students underperform in UK primary schools; therefore, there is a need to close the attainment gap between these students and their peers. Informed by social-cultural learning theories and Alexander’s dialogic teaching framework, a dialogic teaching programme was developed to close the gap. This paper reports on findings of the randomised controlled trial of the programme addressing two questions: 1) Does dialogic teaching improve the quality of classroom talk in primary English, mathematics and science? and 2) Does dialogic teaching improve students’ attainment? The study involved 76 schools in disadvantaged areas of England (randomly assigned to the intervention and control groups), 152 teachers and 5,000 aged 9-10 students. The intervention teachers received the dialogic teaching training lasting 20 weeks, and the control teachers did business as usual. 156 lessons were video-recorded and analysed quantitatively using a coding scheme for classroom talk alongside the discourse analysis of lesson transcripts. In addition, student test scores in English, mathematics and science were collected. The analysis of lesson recordings and transcripts showed that the quality of classroom talk improved significantly in the intervention schools. The test scores showed that students in the intervention schools made two additional months’ progress in English, mathematics and science compared to students in control schools, on average. The study empirically verifies the positive impact of dialogic teaching on classroom processes and students’ learning outcomes. Further research is needed to determine the sustainability of the effects of the intervention over time.

Visualizing Effect Sizes for SciComm: Which Plot Types and Enrichment Options Support Sense-Making?
Keywords: In-service Teachers, Pre-service Teachers, Teacher Effectiveness, Teacher Professional Development
Presenting Author:Jürgen Schneider, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Kirstin Schmidt, University of Education Karlsruhe, Germany; **Co-Author:**Kristina Bohrer, University of Education Karlsruhe, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany; **Co-Author:**Samuel Merk, PH Karlsruhe, Germany

Effect sizes are a key piece of information in scientific evidence. Science communication aims to provide this information in a way that is easy to understand. In three studies, we are exploring ways to visualize effect sizes to support teachers' sense-making from effect sizes. In a Delphi study, four data visualization experts collected and ranked 44 visualization types suitable for the target audience of teachers. The four most promising visualization types are examined in Study 1 for their ability to promote understanding (sensitivity, accuracy), information processing (cognitive load) in a resource-sensitive way (efficieny), as well as assessing practical implications (value for practice, informativity) in teachers. In a 4x6 within-design, N = 40 teachers evaluated all four visualization types displaying six different effect sizes. Results indicate half-eye plots to be most efficient and most helpful for promoting information processing and deriving practical implications, whereby gardner-altman plots and raincloud plots are comparably sensitive and accurately perceived. Study 2 will explore the additional enrichment options of 'benchmarking' and 'cues' for visualization and their effect on understanding, information processing, resource-sensitivity and derivation of practical implications. The findings have direct implications for science communication for evidence-informed instruction, such as information representation in clearinghouses.

Dialogic Problematization of Academic Integrity Education
Keywords: Cultural Diversity in School, Dialogic Pedagogy, Engagement, Morality and Moral Development
Presenting Author: Mark Smith, Kean University, United States

Many university educators have argued for a need for academic integrity education as an alternative to a focus on students’ and scholars’ compliance with academic rules and conventions (Brimble, 2016; Christensen Hughes & Bertram-Gallant, 2016; Hutton, 2006). I argue that the universal ethical-moral discourse of academic integrity disciplines subjects to comply with frequently alienating academic practices. This ethical discourse focuses on individual responsibility, in turn rendering invisible the authority of sometimes dysfunctional and oppressive instructional and summative assessment practices. Taking a Bakhtinian dialogic authorial perspective, the paper calls on students, scholars, instructors, and academic advisors to engage in critical ontological dialogue on diverse responses and motivations in regard to academic demands and deeds. Dialogue on situated instead of universal ethics in academic settings contextualizes and problematizes not just individual actions but also the ethics of the summative assessment regime, the instruction, the curriculum, authority dynamics, and the educational system as a whole. This discussion on academic integrity violations calls on educators to consider the ethical value of separating summative assessment from instruction.

Investigating productive social interaction and the development of a group atmosphere in CSCL
Keywords: Computer-supported Collaborative Learning, Peer Interaction, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching
Presenting Author: Azusa Nakata, University of Oulu, Finland; **Co-Author:**Karel Kreijns, Open University of the Netherlands, Netherlands; **Co-Author:**Armin Weinberger, Saarland University, Germany; **Co-Author:**Marija Milosevic, Saarland University, Germany; **Co-Author:**Hanna Jarvenoja, University of Oulu, Finland

Productive social interactions are keys to successful collaborative learning, but cannot be taken for granted. Interacting in an online space is especially challenging with limited social affordance and context cues. In this study, we investigated students' social interactions and the development of their group atmosphere through an online Computer Supported Collaborative Learning (CSCL) course. Participants were higher education students (n=38) from four European universities. They worked on a collaborative task in an online CSCL environment within a small group for six weeks. The data scope includes questionnaires on their perceptions towards the collaboration process and environmental support, self- and group evaluation in a Group Awareness Tool, and video recordings of their meetings. Two groups, namely a high- and a low-performing group were determined by the questionnaire results and final grades of the course and moved onto a qualitative content analysis. The results show that the high-performing group developed their group atmosphere as the course progressed and trust among the members was particularly high (=92.4). Conversely, the low-performing group's indicators of group atmosphere dropped in the middle of the course, especially in the trust category. In both groups, higher levels of argumentative knowledge construction, such as integrating and modifying peers' opinions, rarely occurred. However, there were some notable differences in group-level regulation and emotional valence in the two groups, which influenced their group atmosphere development.

Making invisible visible– Exploring social processes of remote collaborative problem solving
Keywords: Computer-supported Collaborative Learning, Eye Tracking, Mixed-method Research, Social Interaction
Presenting Author: Johanna Pöysä-Tarhonen, University of Jyväskylä, Finland; **Co-Author:**Shupin Li, University of Jyväskylä, Finland; **Co-Author:**Jarkko Hautala, Niilo Mäki Institute, Finland; **Co-Author:**Nafisa Awwal, University of Melbourne, Australia; **Co-Author:**Päivi Häkkinen, University of Jyväskylä, Finland

To better understand remote CPS and the related social processes, the current study relies on the concept of joint attention (JA) behaviour and applies eye-tracking data and methods for time series analysis to search for quantitative indicators of JA to be further verified by theory-driven, qualitative examinations. The study involved the following: (1) dual eye-tracking data of 12 dyads was analysed for the strength of the coupling of their eye gazing during CPS (as cross-recurrence quantification analysis, CRQA). The measures of CRQA served as a proxy of joint visual attention (JVA) and a possible indicator of higher attentional levels of JA (mutual and shared attention) in dyadic interaction during CPS. The results of CRQA were able to identify prominent values of coupling between individuals regarding JA. The qualitative interaction analysis on multimodal observational data (logfiles, scan path videos) of the dyads, selected on the basis of the highest recurrence rates, made visible behaviour related to the higher attentional levels of JA, indicating mutual attention level between the partners.

Group Learning or Learning Group? A Social Network Analysis on Group Regulated Learning
Keywords: Cooperative/Collaborative Learning, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Mathias Mejeh, University of Bern, Switzerland

After four decades of research and theory development, it can be stated that Self-Regulated Learning (SRL) and Socially-Shared Regulated Learning (SSRL) are central educational principles for the successful learning of students. This is especially the case in higher education as learners are expected to be more autonomous in their learning and increasingly required to collaborate in small groups over a longer period. In this study, longitudinal questionnaire data from 80 university students over a course of 6 weeks were analyzed by stochastic-actor-oriented-models (SAOM). The question of how metacognitive regulation develops over time and which social factors are responsible for this change was investigated. Findings suggest that both individual and group structural factors are relevant for successful metacognitive regulation.

Measuring collaborative problem-solving skills in primary and secondary school students
Keywords: Assessment Methods, Computer-supported Collaborative Learning, Large-scale Assessment, Problem Solving
Presenting Author:matias rojas, Universidad Diego Portales, Chile; **Co-Author:**Miguel Nussbaum, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**César Moreno, Red Educacional los Conquistadores, Chile; **Co-Author:**Camila Rojas, Red Educacional los Conquistadores, Chile

In recent years, Collaborative Problem Solving (CPS) has become essential in almost all areas of life. Consequently, different theoretical frameworks and assessment instruments have emerged for measuring this skill. However, a frequent limitation among CPS studies is that they have only been validated for use at specific ages. Therefore, this research aims to validate a CPS assessment instrument that can be used for primary and secondary school students. A sample of 1024 students was analysed to validate the instrument among different ages. This sample comprised 476 boys and 548 girls aged between 10 and 18 assessed during the period of mandatory quarantine due to the COVID-19 pandemic. The results showed good validity and reliability of the instrument for assessing CPS between the fifth and twelfth grades of k12. Furthermore, it can be seen from the results that there is an association between the grade to which the student belongs and the level of achievement obtained in the assessment.

The context matters: Exploring students' use of the resonance concept in organic chemistry tasks
Keywords: Higher Education, Qualitative Methods, Reasoning, Science and STEM
Presenting Author: Irina Braun, Justus-Liebig-University Giessen, Germany; **Co-Author:**Nicole Graulich, Justus-Liebig-University Giessen, Germany

Resonance is a crucial concept in organic chemistry that enables deriving chemical properties, molecular structures, and predicting reactions. Despite its importance for problem-solving and learning success in organic chemistry, research in chemistry education has shown that learners encounter various difficulties regarding the resonance concept, foremost a fragmented conceptual understanding of the concept, which leads to misconceptions. Although prior research also indicates that students apply this concept inadequately in problem-solving tasks, these studies are often limited to singular contexts. Given that task approaches and reasoning are context-dependent, it remains unclear how students use the resonance concept across different task contexts. However, such insights are essential to identify possible conceptual gaps and, subsequently, to support students adequately regarding the acquisition and application of this concept.
To this end, a qualitative study was conducted with 21 undergraduate chemistry students, all beginners in organic chemistry. The participants solved three organic case comparison tasks in (un-)familiar contexts requiring the application of the resonance concept, followed by a retrospective semi-structured interview focusing on their reasoning and problem-solving process. Through the analytical lens of the Coordination Class Theory, the extent to which students used their representations of resonance structures, and the variety of resource activation and connection in problem-solving across different tasks were examined. Although all students referred to similar structural features, the individual associations differed. As resources concerning the electronic level proved productive across different contexts, these ideas should be strengthened in future instructional interventions.

Disclosing own reasoning while appraising others'. Implications for formative assessment development
Keywords: Assessment Methods, Engineering Education, Reasoning, Science Education
Presenting Author: Mariana Orozco, University of Twente, Netherlands

When tutors assess students' reports to appraise these students' scientific reasoning, they disclose their own concerns, epistemological assumptions, and beliefs about science. The analysis of such assessments (i.e., rubric-centred scores and the corresponding justificatory comments), offer a wealth of insights that

can be re-engaged in the improvement of the assessment tool and procedure, and used for further developments in formative assessment more generally. Such insights include: concerns exceeding the rubrics descriptions (about meaningfulness, exhaustiveness, implicitness, connectivity, vagueness, true inquiry, relevance); and differences among assessors (regarding epistemic values, approaches to scoring, positionings, and sensitivity). This contribution is part of a broader research effort to promote students' conducive ways of scientific thinking and deep-learning, and is embedded in engineering-science education, in the field of Chemical Science Engineering. This study was guided by the question: What does the assessors' reasoning tell about the ways in which formative assessment is conducted, and could ideally be (in consideration of the course intended learning outcomes)? The main implication for developments in formative assessment resides in a call for reconceptualisation of assessment criteria, as the result of a co-design activity where it appears crucial to consider the assessors' reasoning. Our investigation connects to existing knowledge and discussions on formative assessment, focussing on issues of representativeness and granularity. The full paper elaborates on our process of co-design of the assessment tool, the proper assessment procedure, and the analytical steps and pieces of evidence to support our claims. Further implications for educational research and for educational practice are discussed.

Examining all the evidence: Do undergraduates prioritize a review of studies over a single study?
Keywords: Higher Education, Quantitative Methods, Reasoning, Science Education
Presenting Author: Etsuji Yamaguchi, Kobe University, Japan; **Co-Author:**Clark Chinn, Rutgers University, United States; **Co-Author:**Hiroki Oura, Tokyo University of Science, Japan; **Co-Author:**Toshio Mochizuki, Senshu University, Japan

Today's digital world is rampant with information in which different experts make diverse claims which contradict each other. To resolve such contradictions, one strategy is to consider the full body of evidence relevant to the issue. Instead of examining only one or two pieces of evidence, science experts synthesize large bodies of evidence in meta-analyses and other kinds of reviews. However, there is a lack of research on whether non-experts give greater weight to reviews of studies over single studies. Therefore, we conducted an experiment to investigate whether undergraduates prioritize evidence from reviews of studies over evidence from a single study when they read two conflicting documents about medical issues written by different experts. We varied the evidence (a single study presented in detail, a review of studies, and a review of studies with a detailed explanation of one study) in one document, and presented opposing evidence (always one detailed study) in a second document. The documents' order was counterbalanced according to the position taken. We found that undergraduates tend to value the expertise and benevolence of the author who cited only a single study instead of a review of studies. Furthermore, the students preferred the position of the first document, regardless of which position it took. Students did not prefer positions supported by reviews over positions supported by single studies. Thus, educators need to design more effective instruction to prepare people to consider larger bodies of evidence (e.g., reviews) over single studies.

Students' Metacognitive Understanding of Apt Epistemic Performance in Science
Keywords: Cognitive Skills and Processes, Metacognition, Reasoning, Science Education
Presenting Author: Huma Hussain-Abidi, Rutgers University Graduate School of Education, United States; **Co-Author:**Clark Chinn, Rutgers University Graduate School of Education, United States; **Co-Author:**Kyle Hunker, Rutgers Graduate School of Education, United States; **Co-Author:**Susan Yoon, University of Pennsylvania, United States; **Co-Author:**Noora Noushad, University of Pennsylvania, United States; **Co-Author:**Thomas Richman, University of Pennsylvania, United States; **Co-Author:**Amanda Cottone, University of Pennsylvania, United States

To combat the perilous nature of the "post-truth" era, where misinformation is rampant, science education must change. One way to prepare students to evaluate scientific information is to promote apt epistemic performance in the classrooms. In this study, we aim to analyze various students' metacognitive knowledge from focus group interviews to provide a portrait of students' understandings of ideals and reliable processes for developing scientific knowledge. Our findings suggest that not only do students have metacognitive knowledge of a wide range of ideals and reliable processes, but they also can critique other students and themselves for using less reliable processes as they engage in science inquiry.

Measuring the Collaborative Diagnostic Problem Solving Process in Automotive Malfunction Diagnosis
Keywords: Higher Education, Simulation-based Learning, Social Aspects of Learning and Teaching, Vocational Education and Apprenticeship Training
Presenting Author: Dave Rexhäuser, Technische Universität Dresden, Germany; **Presenting Author:**Stephan Abele, Chair of Vocational Education, Institute of Educational Vocation and Vocational Didactics, Germany; **Co-Author:**Anika Radkowitsch, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Constanze Richters, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Louise Kaseler, TU Dresden, Germany; **Co-Author:**Peter Hesse, TU Dresden, Germany; **Co-Author:**Inga Glogger-Frey, University of Erfurt, Germany; **Co-Author:**Julius Meier, University Erfurt, Germany

Collaborative diagnostic problem solving (CDPS) is becoming increasingly important in the practice of technical professions. Despite its high practical relevance, CDPS does not play a significant role in vocational education and training. This may be due to a lack of theoretical conceptualizations and empirically tested measurements. We present a theoretically grounded model of CDPS and a computer-based method for measuring the CDPS process in automotive malfunction diagnosis and report results on the reliability of the measurement, characteristics of the process, and their associations with diagnostic accuracy.A total of 64 dyads of automotive mechatronics trainees solved automotive malfunctions in a computer simulation. The trainees took on two different roles with different functions and information available. During the process, text chat transcripts were recorded, subsequently coded and analyzed.In the transcripts, the following diagnostic activities (κ=.85): "generating hypotheses", "generating evidence", "interpreting evidence", and "others" (e.g., small talk) and collaborative activities (κ=.79) "sharing", "eliciting", "coordinating", "negotiating", and "maintaining communication" were found. We found that the frequencies of collaborative activities strongly varies between the diagnostic activities. Analyses showed no significant associations between frequency of activities and diagnostic accuracy. However, detailed analyses showed significant associations between diagnostic accuracy and the exchange of relevant evidence (ρ=.356; p=

How Role Power & Social Persuasion Relate to Self-Efficacy & Performance in a Role-Play Simulation
Keywords: Higher Education, Simulation-based Learning, Social Aspects of Learning and Teaching, Vocational Education and Apprenticeship Training
Presenting Author: Dorothy Duchatelet, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium

Role-play simulations of political decision-making have grown to be the most commonly used active learning method to teach about complex, dynamic political processes. The way that participants enact their role and the simulation process unfolds most certainly shapes participants' learning. Previous work has shown that the outcome of self-efficacy in negotiating largely relates to the emergence of social persuasion during the simulation conduction. This study builds further on this work. It focuses on the mediating role of social persuasion between role power and the outcomes of self-efficacy in negotiating and negotiation performance. After a two-day United Nations-simulation, 74 students completed a survey. Data were analysed by means of structural equation modelling. Results show a mediating role for social persuasion between role power, and both self-efficacy in negotiating and negotiation performance. Remarkably, the relation between role power and negotiation performance disappears after including social persuasion as mediator. Results are discussed with regard to implications for future research and simulation-based learning practice.

Social Experiences During Verbal and Video-Assisted Debriefings
Keywords: Higher Education, Simulation-based Learning, Social Aspects of Learning and Teaching, Vocational Education and Apprenticeship Training
Presenting Author: Stefan Hanus, University of Regensburg, Germany; **Presenting Author:**Helen Jossberger, University of Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany

Most debriefings after simulations are either conducted verbally or with the help of video playback. While research has concentrated on comparing the learning outcomes, the social experiences during different debriefing modes are not fully explored. However, these experiences are considered important, as they create implications for the successful implementation of debriefings. This study explores the social experiences connected to verbal debriefings (VD) versus video-assisted debriefings (VAD) during simulation training of mountain rescuing. A total of 42 mountain rescuers participated. As part of a within-subject design, participants experienced three debriefing modes: VD, VAD with advanced technical equipment and VAD with simple technical equipment. A qualitative approach was used. Biographical information was collected and focus group interviews with the participants were conducted to gain insights into their perspectives regarding the debriefing modes. Preliminary results indicate that the outside view provided by the VAD helped with the acceptance of feedback from the facilitator. It created positive emotions by being able to find the cause for mistakes that were falsely attributed to oneself before the debriefing. However, VAD also created stress, which led to changes in behaviour during simulation. To benefit from VAD, debriefings have to take place in a safe environment.

Scaffolding in healthcare simulation training
Keywords: Health-care Education, Instructional Design, Qualitative Methods, Simulation-based Learning
Presenting Author: Pauliina Rikala, University of Jyväskylä, Finland; **Co-Author:**Aaron Peltoniemi, University of Jyväskylä, Finland; **Co-Author:**Minna Ruoranen, University of Jyväskylä, Finland; **Co-Author:**Kaisa Silvennoinen, University of Jyväskylä, Finland; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland

Simulation-based training has been shown to be an effective method of training for the demands in clinical healthcare. However, little research has examined scaffolding as an instructional strategy in simulation-based healthcare training. This study focused on scaffolding strategies that involve interaction, discussion, collaboration, and support between trainer and trainees and among trainees. Our aim was to answer the following question: How does scaffolding manifest during healthcare simulation-based training? We examined scaffolding strategies through video-recorded scaffolding episodes (n = 221), in which participants (trainees, n = 27) and instructors (trainers, n = 8) collaborated to make treatment decisions in varying multi-professional, high-fidelity healthcare simulation scenarios. A GoPro camera was used to record interactive and collaborative situations during the simulation training, and we applied theory-based content analysis to assess the data. According to our preliminary results, scaffolding can be understood as tailored interaction and support between the trainer and trainees as well as among trainees, and three categories of scaffolding strategy emerged: i) orientation talk, ii) step forward, and iii) reflection. Our results reinforce the idea that open and cross-border interaction between trainers and trainees during simulation-based training is essential in the learning process. At best, trainee-centred joint reflection during the debriefing highlighted opportunities for improvement. It is challenging, however, to find a balance between trainer-centred and trainee-centred approaches. The structure of the simulation can partly explain trainer-centred discourse; however, the question arises of how to strengthen trainee-centred reflections.

The Implications of Math Self-Concept Decline Among High-Ability and Average-Ability Students
Keywords: Gifted and Talented Students, Quantitative Methods, Secondary Education, Self-concept
Presenting Author: Alicia Ramos, KU Leuven, Belgium; **Co-Author:**Karine Verschueren, KU Leuven, Belgium

This study examined the intra-individual development of math self-concept during the transition to secondary school comparatively among high-ability and average-ability students in a largescale longitudinal sample in Flanders, Belgium (*N*=5,740 students, 49.5% males, Grade 6 to 7). Latent change models revealed that high-ability students, although maintaining higher relative levels of math self-concept, experienced steeper levels of math self-concept decline in the transition to secondary school than their average-ability peers. Cognitive ability predicted steeper math self-concept decline within both ability groups, and in both groups stronger math self-concept decline was associated with higher levels of perceived underachievement, lower standardized math achievement and school well-being, and higher probability of grade repetition by the end of secondary school. These findings establish that not only the level of math self-concept but also the degree in decline in math self-concept can have negative implications for educational outcomes, even when math self-concept level remains high relative to peers.

Mathematics self-concept, self-beliefs, and performance for mid-adolescent New Zealanders
Keywords: Interest, Mathematics/Numeracy, Self-concept, Self-efficacy
Presenting Author: Penelope Watson, University of Auckland, New Zealand; **Co-Author:**Bernhard Ertl, Universität der Bundeswehr, Germany; **Co-Author:**Shengnan Wang, The University of Auckland, New Zealand

Self-beliefs are key to academic performance and career directions. Mathematics self-concept has been positively associated with mathematics self-efficacy, interest, and achievement and the desire to pursue quantitative domains. Large gender differences in mathematics self-beliefs persist, however, with associated differences reflected in underrepresentation of females in mathematics-related careers. How mathematics self-beliefs might be associated with mathematics performance, the role of mathematics self-concept in mediating mathematics self-beliefs and performance, and gendered differences in these associations were explored for mid-adolescents (N = 210) from four New Zealand secondary schools of mid to high socioeconomic level, and comprising a range of ethnicities. Data were collected using the Mathematics Self-Beliefs, and Career Aspirations in Mid-Adolescence Questionnaire. After good model fit was established by confirmatory factor analysis, comparison of latent factor means showed that male students' mathematics interest was significantly higher than female students, and female students' mathematics helplessness (low self-efficacy) was significantly higher male students. A structural equation model revealed that mathematics self-concept fully mediated the positive effect of mathematics interest on mathematics achievement, fully mediated the negative effect of mathematics helplessness on mathematics achievement, partially mediated the positive effect of academic self-concept on mathematics achievement, and that academic self-concept had a direct positive effect on mathematics achievement. Implications are suggested for gendered differences in self-beliefs for mid-adolescent New Zealanders that could impact gendered futures in that country. Overall, the findings hold implications for pedagogy and policy to promote positive mathematics self-beliefs for young New Zealanders, and especially for young New Zealand women.

Becoming a "math-person": Interplay between achievement emotions, motivation and math identity
Keywords: Achievement, Emotion and Affect, Mathematics/Numeracy, Motivation
Presenting Author: Barbara Blažanin, Faculty of Philosophy, University of Belgrade, Serbia; **Presenting Author:**Jelena Radisic, University of Oslo, Norway; **Co-Author:**Ksenija Krstic, University of Belgrade, Serbia; **Co-Author:**Katarina Mićić, University of Belgrade, Faculty of Philosophy, Serbia

An extensive line of research was dedicated to exploring the influence of academic identity on motivation. Still, only a few examined the interplay between

academic identity, motivation, and emotions and their impact on academic achievement, especially among younger students. The present study explores these relationships among eight-, nine- and ten-year-old students. The survey was conducted in the context of the MATHMot project. In the current investigation, we focus on the Serbian subsample, consisting of 437 students. Path analyses were employed to analyse the relationship between motivational beliefs, academic emotions, math identity, and math achievement. The analysis (χ^2/df = 1.544, CFI= .996, TLI=.988, NFI=.990 and RMSEA=.035) confirmed a strong influence of mathematics identity on perceived competence, intrinsic value, extrinsic value and cost and once again established the importance of identity formation for the mathematics domain. Perceived competence and cost influenced anxiety, intrinsic motivation and cost influenced boredom, while enjoyment was affected by intrinsic motivation only.

Peer Spillover and Big-Fish-Little-Pond- Effects with SIMS80: Resolving a Theoretical Paradox?
Keywords: Large-scale Assessment, Peer Interaction, Quantitative Methods, Self-concept
Presenting Author: Ioulia Televantou, European University Cyprus, Cyprus; **Co-Author:**Herbert W. Marsh, Australian Catholic University, Australia; **Co-Author:**Kate Xu, Open University of the Netherlands, Netherlands; **Co-Author:**Jiesi Guo, Australian Catholic University, Australia; **Co-Author:**Theresa Dicke, Australian Catholic University, Australia

Class- or school-level compositional effects are said to be revealed when students' individual outcomes are found to be associated with the composition of their class- or school-mates. The present study estimates the effect of average mathematics achievement at the class-level on students' subsequent mathematics achievement (the *peer spillover effect*) and mathematics self-concept (the *big-fish-little-pond-effect; BFLPE*), controlling for individual differences in prior mathematics achievement and measurement error. Our data, consisting of thirteen-year-old students from Canada, USA, and New Zealand, come from a unique cross-national database with a longitudinal design at the student-level; the Second International Mathematics Study (SIMS80). Using mediational analysis and doubly latent models, we show that when the peer spillover effects are modeled as the sum of a direct and an indirect effect of prior class-average achievement through self-concept, a negative and a statistically significant mediation is shown. This indicates that BFLPEs and peer spill over effects might not operate independently.

Chairperson: Alexandra Gkloumpou, Aristotle University of Thessaloniki, Greece

A gamified approach to examining health literacy and information sharing among ethnic populations
Keywords: E-learning/ Online Learning, Lifelong Learning, Misconceptions, Social Media
Presenting Author: Giovanna Morara, University of South Carolina, Italy; **Presenting Author:**Shea Ferguson, University of South Carolina, United States; **Co-Author:**Melissa Duffy, University of South Carolina, United States; **Co-Author:**Gregory Trevors, University of South Carolina, United States

Health literacy is an important set of skills and knowledge fundamental to effectively navigating online information and has been linked to health outcomes. However, there is increasing concern about health disparities across ethnic and racial groups, which may be linked to gaps in effective communication of health information. Identifying existing health misconceptions is a critical step in reaching more diverse groups to increase health literacy. In this study, we used a digital gamified platform designed to share health information and identify misconceptions about COVID-19. Health misconceptions, knowledge retention, and knowledge share intent and behavior were examined among Black, White and Hispanic/Latino US adult participants (total N=13,479). Results demonstrated differences in baseline knowledge, indicating that within our sample, Black participants reported relatively more misconceptions. However, share intent and behavior was also more frequent among Black participants and there were no differences in retention across groups. The findings provide insights into key areas to address in future educational interventions designed to share health information and combat misconceptions more effectively among diverse communities. Information about sharing behavior can also help by building upon existing assets in health literacy within marginalized communities.

Reasons and consequences for media multitasking during studying – an experience sampling approach
Keywords: Anxiety and Stress, Motivation, Quantitative Methods, Social Media
Presenting Author: Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Erika Maksniemi, University of Helsinki, Finland; **Co-Author:**Jussi Järvinen, University of Helsinki, Finland; **Co-Author:**Elina E. Ketonen, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

Media multitasking (MMT) while studying may be distracting for learning and related to negative study-related outcomes. This one-way conceptualization is, however, limited. Behavioral exploitation-exploration cycle means that students switch back and forth between studying (*exploitation*) and social media (*exploration*) because the two different tasks provide different kinds of rewards. The present study investigates this cycle in a moment-to-moment setting by means of Experience sampling method (ESM). We analyze how study task value (perceived interest, importance and utility) is associated with momentary MMT while studying, and how MMT relates to self-reported concentration and relaxation. Data from (N=119) students (aged 17-18, 69% female) were collected via two-week ESM study, consisting of 1337 momentary measures when students were studying. Linear mixed models showed that task duration and lower interest were related to a higher likelihood of MMT, whereas task importance or utility had no effect. In addition, MMT was related to lower self-reported concentration and lower relaxation at the given moment. The results suggests that when studying was not experienced instantly rewarding students were more likely to seek stimulus from MMT. .Furthermore, MMT was negatively related to reported concentration and relaxation, indicating that either MMT has a detrimental effect on concentration and relaxation, or that MMT occurs more likely when concentration is waning and relaxation is needed. Future studies should examine direction of these effects as well as the longitudinal consequences of MMT for academic achievement. As digital environments continue to expand, students need skills in how to regulate their own digital practices.

Is experience of digital stress more harmful for schooling than social media use before bedtime?
Keywords: Anxiety and Stress, Quantitative Methods, Social Media, Well-being
Presenting Author: Erika Maksniemi, University of Helsinki, Finland; **Co-Author:**Elina E. Ketonen, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland; **Co-Author:**Reito Visajaani Salonen, Helsinki Institute for Social Sciences and Humanities, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

Social media use has been claimed to delay adolescents' bedtimes and influence academic functioning, but longitudinal evidence is still rather scarce. Therefore, this longitudinal and multi-informant study aims to investigate how interactive (i.e. chatting with friends) and passive (i.e., scrolling content) social media use close to bedtime, perceived social demands to stay constantly available online, and socio-digital stress related to these availability demands are associated with objective bedtimes, and tiredness and stress at school. We conducted a two-week ESM study with N=141 students (aged 17-18, 71% female, N=2735 daily measures collected by smartphones five times a day). Objective bedtimes were measured with activity bracelets. Evening interactive and passive social media use were categorized based on open-ended answers from the students. Multilevel models were conducted and showed that earlier bedtimes were measured on those evenings' students reported interactive social media use. However, students who reported more availability demands were measured, on average, with later bedtimes. Students who reported more socio-digital stress were, on average, more tired and stressed during schooldays. Our results pointed out that social media use per se (interactive or passive) was not as harmful as the availability demands or socio-digital stress. Therefore, research should move

forward by investigating the practices of social media that increase daily stress and tiredness, and to find out which adolescents are more susceptible to delayed bedtimes due to social media use. Students need to develop social and emotional skills to handle the social demands that occur due to different social media practices.

Associations of critical thinking with educational and socioeconomic background of Finnish students
Keywords: Critical Thinking, Higher Education, Parents' Beliefs and Affect, Quantitative Methods
Presenting Author: Heidi Hyytinen, University of Helsinki, Finland; **Co-Author:**Kari Nissinen, University of Jyväskylä, Finland; **Co-Author:**Katri Kleemola, University of Helsinki, Finland; **Co-Author:**Jani Ursin, University of Jyväskylä, Finland

The present study aims to explore how final-stage undergraduate students' critical thinking is associated with educational and socioeconomic background. The data were collected in 18 higher education institutions in Finland. Participants were 744 final-stage undergraduate students, of which 631 had a general upper secondary degree and 113 had a vocational qualification as a background degree. An open-ended performance task of CLA+ was used to assess three measures of critical thinking: analysis and problem solving, writing effectiveness, and writing mechanics. Self-report questionnaire was used to collect demographic data, including educational and socioeconomic background. The interrelations of the variables were analyzed with the path analysis. Students' educational and socioeconomic background, especially number of books in the childhood home, had important effect on the level of critical thinking at the final stage of undergraduate degree. The pedagogical implications include considering how higher education could better promote equality in students' educational path.

Promoting university students´ scientific thinking development: a perspective of university teachers
Keywords: Critical Thinking, Higher Education, Metacognition, Researcher Education
Presenting Author: Mari Murtonen, University of Turku, Finland; **Co-Author:**Heidi Salmento, University of Turku, Department of Teacher Education, Finland

Scientific thinking is at the heart of university education in all disciplines. We conducted focus group interviews to explore 1) how university teachers (N = 11) think that the development of students´ scientific thinking should be promoted and 2) how they aim to facilitate students´ epistemic growth, which forms a fundamental part of scientific thinking. A data driven content analysis revealed that from teachers´ viewpoint, students´ scientific thinking should be supported more explicitly, there should be more collaboration between teachers and more attention should be paid to scientific thinking in curriculum work. Additionally, supporting the development of scientific thinking requires pedagogical skills and recourses. Metacognitive monitoring of students´ thinking showed to be the most central way to facilitate their epistemic growth. Our findings highlight that more attention should be paid to explicitly supporting the development of students ´ scientific thinking and teachers´ pedagogical skills to do so.

Cognitive in context: How course-taking breadth supports skill formation in emerging adults
Keywords: Cognitive Skills and Processes, Critical Thinking, Higher Education, Reasoning
Presenting Author: Gabe Orona, University of Tübingen, Germany

Theories of cognitive development among emerging adults posit that environmental and age-related influences are responsible for individual differences in complex reasoning abilities. Exposure to and engagement with a diverse set of ideas and perspectives is stipulated to provide a context for which individuals are positioned to coordinate, integrate, and form new abstractions. This notion is implicit in the general education and elective requirements of university programs. In this study, we draw upon the cognitive psychology literature on emerging adult development to examine how intellectual breadth via course-taking patterns relates to gains in cognitive skills. Using recently collected longitudinal data of undergraduates enrolled at a large public university, we leverage a unique set of cognitive measures that tap a string of related constructs. We find moderate associations between intellectual breadth and reasoning skills, with notable differences across cognitive dimensions. Additionally, intellectual curiosity moderates the association between course breadth and cognition. Implications for theories of intellectual development are discussed in relation to undergraduate experiences.

Characteristics, Context, and Conditions: A Systematic Review of Critical Thinking Interventions
Keywords: Critical Thinking, Higher Education, Reasoning, Synergies between Learning / Teaching and Research
Presenting Author: Eric Schoute, University of Maryland, United States

Within education writ large, critical thinking (CT) is touted as the hallmark of learning, and much research and practitioner effort is directed toward the promotion of this skill. Yet, the mechanisms by which CT can be improved among students remain largely inconclusive, and the majority of studies yield non-significant changes. This systematic review sought to scrutinize extant interventions and unearth the characteristics of the participants and study, the context of the intervention, and the conditionalities under which CT is positively promoted. Some crucial theoretical and methodological issues are identified in included literature. For one, although some foundational CT research has forwarded consensus conceptualizations (e.g., Facione, 1990), CT interventions seldom forward clear conceptualizations of the very thing they set out to bolster, clouding what the targeted construct in the intervention is. For another, researchers conducting experiments do not operationalize CT in accordance with their (implicit) conceptualization, making for poor construct validity that perhaps explains nonsignificant CT yields. Alternatively, researchers do not have a clear rationale for the mechanism by which their intervention should improve CT. Lastly, few studies employ robust (quasi-)experimental designs. Most CT interventions included suffer from at least one of these issues, and recommendations for robust CT interventions are forwarded.

Teachers' and parents' attitudes towards the use of AI technology in school

Keywords: Artificial Intelligence, Educational Technologies, Learning Analytics, Primary Education
Presenting Author: Janne Paula Mesenhöller, University of Potsdam, Germany; **Co-Author:**Katrin Böhme, University of Potsdam, Germany

Students in primary schools differ greatly in their individual learning prerequisites. Hence, classes are characterised by a high degree of heterogeneity (Lazarides & Chevalère, 2021; Warwas et al., 2011). New technologies, such as adaptive learning apps, that are based on artificial intelligence (AI) offer new opportunities to deal with this diversity. However, *acceptance* of those systems is an important precondition for the use of new technologies in education (Nistor, 2020). Thus, in the present study we investigated the social acceptance (SA) of AI-based learning apps for the use in schools by 141 teachers and 223 parents in Germany. We used the newly developed questionnaire *ELEKIS*, which is based on the well validated Technology Acceptance Model (TAM) by Davis et al. (1989). Contrary to previous assumptions SA for both groups was shown to be relatively high on a four-point Likert scale ($\bar{x}$ teachers = 2.96, SD = .53, $\bar{x}$ parents = 2.94, SD = .65). Additionally, two open-ended items probed teachers' and parents' concerns regarding the use of AI in schools, as well as the information they would need to successfully implement AI in schools. Based on these results an information workshop called *More information on the use of AI in schools*will be designed to provide basic information on the topic of AI and to further outline realistic potentials and limits.

Preservice teacher discourse with AI-integrated virtual students: A look at sentence function
Keywords: Artificial Intelligence, Educational Technologies, Immersive Technologies for Learning, Pre-service Teachers
Presenting Author: Alex Barrett, Florida State University, United States; **Co-Author:**Chih-Pu Dai, Florida State University, United States; **Co-Author:**Luke West, Florida State University, United States; **Co-Author:**Saptarshi Bhowmik, Florida State University, United States; **Co-Author:**Nuodi Zhang, Florida State University, United States; **Co-Author:**Fengfeng Ke, Florida State University, United States

Artificial intelligence (AI) and virtual simulations are becoming increasingly powerful tools in education. This paper reports on a case study involving eight preservice teachers who engaged with AI-integrated virtual students in a simulated middle-school science and math classroom. Transcripts of the teacher-student discourse, containing over 12,000 words, were analyzed and coded by sentence function. Results indicated high frequencies of declarative and interrogative sentences and very few imperative and exclamatory sentences. Patterns of declarative and interrogative sentence use emerged which appear to reflect the behaviors of real teacher-student interactions. This likely afforded the preservice teachers with valuable teaching practice in a low-risk and low-cost setting. Comparing participant dialogues showed how certain discourse strategies influence the virtual students to behave in a knowledge-seeking fashion. These findings support the use of AI-integrated virtual students and simulation-based teaching practice in preservice teacher training. The findings can help teacher trainers to better coach preservice teachers in their classroom discourse.

Chatting with the past, developing a chatbot for history education
Keywords: Digital Literacy and Learning, Inquiry Learning, Synergies between Learning / Teaching and Research, Tool Development
Presenting Author: Albert Logtenberg, ICLON-Leiden University Graduate School of Teaching, Netherlands; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Ron Pat-El, Open University, Netherlands

Chatbots are an increasingly popular tool in education and are commonly used as basic teacher assistants or tutors. Even though chatbots have found their way into educational contexts, little is known about how chatbots can facilitate the learning process or how teachers and students can be involved in the implementation of chatbots in learning. In this project we developed and implemented a chatbot in cooperation with the National Museum of Antiquities in which the chatbot simulated a person from antiquity, a Roman girl called *Caetennia*. The aim is to investigate how students and teachers interact with a chatbot. We designed, implemented, and evaluated a learning task in which secondary students provided content for the chatbot by studying provided texts concerning the relevant historical context. In cooperation with university students this content was used to develop a prototype of the chatbot that is tested with students in lower levels in secondary education and with museum visitors. Students formulated mainly descriptive questions. This resulted in a chatbot that simulates a question-and-answer type conversation with someone from the past which can be used inside and outside the museum. The next step will be implementing the chatbot in museum lessons and at schools in a way that support students in formulating more elaborate historical questions.

Using Machine Learning to Understand how the Predictors of Maths Ability Change over Time
Keywords: Achievement, Artificial Intelligence, Developmental Processes, Secondary Education
Presenting Author: Rosa Lavelle-Hill, University of Copenhagen, Denmark; **Co-Author:**Stephanie Lichtenfeld, Universität Hamburg, Germany; **Co-Author:**Reinhard Pekrun, University of Essex, United Kingdom; **Co-Author:**Michiko Sakaki, University of Tübingen, Germany; **Co-Author:**Kou Murayama, University of Tübingen, Germany

A number of panel studies employ psychological concepts measured using large scale surveys to predict students' achievement. However, few studies use such longitudinal data to understand how the relative importance of different predictors change over time. In this study, we employ a machine learning approach to enable the modelling of 104 variables simultaneously, in order to comparatively assess the change in different features' (or groups of features') utility at predicting next years' maths achievement scores for German secondary school students (N=3,425). We found that maths achievement can be predicted one year ahead statistically significantly better than a mean baseline model (always predicts the mean of the training set), with prediction R squared ranging from 0.68 to 0.77. The survey data (motivation, emotion, expectations, maths self-concept, demographics, cognitive strategies, and reports on classroom and home environments), school grades, and cognitive tests (IQ) together added an additional 0.03-0.10 R squared, beyond students' current ability scores, with the contribution getting less over time. The feature importance results confirmed that current maths ability increases in importance as students progress through the schooling years. Conversely, features measured using the survey and cognitive tests, such as IQ, classroom environment, grades, and psychological concepts became less predictive over time. These findings are interpreted and discussed in relation to schools promoting increased specialisation and testing as students get older.

Expertise in interpreting historical images: An eye-tracking study
Keywords: Cognitive Skills and Processes, Eye Tracking, Reasoning, Social Sciences and Humanities
Presenting Author: Marjaana Puurtinen, University of Turku, Finland; **Co-Author:**Johanna Kaakinen, University of Turku, Finland; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Research on visual expertise has a longish tradition in domains such as chess, sports, or medicine, but studies on visual expertise in history have been hitherto overlooked. This study begins to bridge eye-tracking studies on visual expertise with expertise research in history. We ask: during interpretation of historical images, are eye movements affected by (RQ1) history expertise and/or (RQ2) task performance, and if so, how? 38 adults with a university history degree and 36 adults without such a degree inspected series of three historical images on a computer screen. They were tasked with writing down a topic for each series. Each image appeared for four seconds, and participants' eye movements were recorded with a Tobii X3-120 eye tracker. Two-way repeated measures ANOVA tests showed no differences in the average fixation durations or first fixation durations between the viewing of images. However, in terms of the number of

fixations, participants with a history degree tended to inspect the last images of the series with more fixations than those without a degree. In the final modeling that will address RQ1 and 2 in full, the last images might prove a useful starting point for examining potential interactions between eye-movement measures, domain expertise, and task performance (the latter as reflected in participants' written responses). With little prior empirical research on visual expertise in history, the study hopes to contribute to current theoretical discussions on characteristics of expertise both on general and domain-specific level.

Promoting Professional Vision through Minimal Intervention: An Eye-Tracking Study
Keywords: Eye Tracking, Instructional Design, Pre-service Teachers, Teacher Professional Development
Presenting Author: Sylvia Gabel, Universität Augsburg, Germany; **Co-Author:**Andreas Gegenfurtner, University of Augsburg, Germany

Professional vision as a key competency in the teaching profession requires high attention and is often challenging for pre-service teachers. Disturbing situations are one of many challenges teachers are confronted with, where quick and accurate perception is needed. Implementing videos in pre-service teacher programs are effective formats for developing teacher professional vision. Based on previous investigations that tested the effectiveness of minimal interventions to support professional vision and classroom management competencies of pre-service teachers, this study explored whether providing specific task instructions before watching the video or providing prompts during the video makes a difference in terms of noticing classroom management situations. A pilot study analyzed this minimal intervention with a sample of 85 pre-service teachers with respect to the number, accuracy, and velocity of identified classroom management situations. In a mixed method approach, participants were asked to click a button when they perceived a classroom management-relevant situation in the video. Afterwards, they explained in an interview why they considered these situations as relevant. *T*-tests revealed that both interventions tended to produce a similar attention-guiding effect on noticing. In a future study, we aim to replicate these findings using eye tracking methodology to examine the number of fixations, time to first fixation, and perceptual relevance. Results will be presented in the conference. Implications for educational and empirical practice about using videos in university courses and their instructional setting are discussed.

Did I see it all? - Prompting Preservice Teachers' Noticing During Teaching
Keywords: Classroom Management, Eye Tracking, Pre-service Teachers, Simulation-based Learning
Presenting Author: Leonie Telgmann, Leibniz University Hannover, Germany; **Co-Author:**Katharina Mueller, Leibniz University Hannover, Germany

Being able to notice events related to classroom management next to managing a classroom effectively is regarded a crucial and challenging skill of beginning and expert teachers. In a quasi-experimental between-subject design we explore, how a classroom management training together with cognitive prompting might help pre-service teachers' (PST) to activate classroom management knowledge and identify related events while teaching. PSTs (N=24) took part in a standardized classroom simulation, after one group received prompting and one group received no prompting. To assess differences in PSTs' noticing, we differentiate between slight and salient classroom events while controlling for count, time and saliency over participating PSTs. For the assessment of noticing, we use trained observers coding of PSTs' gaze videos, recorded with mobile eye tracking and PSTs' retrospective commentaries. With that, the results allow new insights into perceptual processes during teaching and provide possibilities to investigate and possibly promote noticing skills in teacher education.

Disfluency as Moderator for the Seductive Details Effect: An Eye-Tracking Investigation
Keywords: Eye Tracking, Instructional Design, Metacognition, Multimedia Learning
Presenting Author: Sophia Christin Weissgerber, University of Kassel, Germany; **Co-Author:**Ralf Rummer, University of Kassel, Germany

Non-informative content such as seductive details distract the learner's attention from the essential and relevant learning content (attention-distraction hypothesis). Research on perceptual disfluency suggest that harder-to-read fonts can shield against distraction by focusing attention on the learning material (attention-binding hypothesis). The present experiment is the first to test whether a text written in a disfluent font can reduce the detrimental effect of dynamic seductive details on learning. Moreover, the present experiment is the first to directly test the attention-binding hypothesis of disfluent fonts by adopting eye-tracking as measure of attentional processes. 130 psychology students learned a short expository text, either in Arial or Sans Forgetica, which was either accompanied by short videos or not (2 x 2 between-subjects). The preliminary analysis on a subset of the sample (n = 39) show (descriptively) that participants spend less time looking at the seductive videos in the disfluent condition than in the fluent condition. Moreover, participants spent more time on the text in the disfluent condition that in the fluent condition when seductive details were displayed. The present trend is consistent with the attention-binding hypothesis of disfluent fonts and shows the potential of disfluency as promising moderator for the seductive details effect.

In-game performance and the role of students' socioeconomic status, self-efficacy and interest
Keywords: At-risk Students, Game-based Learning, Immersive Technologies for Learning, Self-efficacy
Presenting Author: Michaela Arztmann, Utrecht University, Netherlands; **Co-Author:**Jessica Lizeth Domínguez Alfaro, KU Leuven - University of Leuven, Belgium; **Co-Author:**Lisette Hornstra, Utrecht University, Netherlands; **Co-Author:**Johan Jeuring, Utrecht University, Netherlands; **Co-Author:**Liesbeth Kester, Utrecht University, Netherlands

Digital games are widely used in education to motivate students for science. Additionally, technological advances in immersive learning environments, such as augmented reality (AR), provide new opportunities in education. However, it is unclear whether these technologies are equally beneficial for students with different background characteristics. Students with different backgrounds may differ in their self-efficacy and interest when playing games, and this may lead to differences in performance. Given the widespread use of games in education, it is important to gain a better understanding of the effectiveness of games for different student groups. Moreover, log-data in games can provide valuable insights into individual behavior and are increasingly used in research to predict learning outcomes. This study focused on the role of students' socioeconomic status (SES) and examined whether SES was associated to in-game performance and whether interest and self-efficacy mediated potential associations between SES and in-game performance. In total, 279 early secondary school students participated in this study. The results indicate that SES has no direct or an indirect effect through self-efficacy and interest on in-game performance. However, lower self-efficacy did increase the likelihood to drop-out of the game. These findings indicate that students from different socioeconomic backgrounds are equally interested and self-efficacious while playing the game and that their performance is not affected by their background. The affordances of AR as an immersive learning environment might be motivating enough to help mitigating possible SES differences in students' performance.

PandHEMOT®: An App for Children and Adolescents to Foster Pandemic-Related Emotional Competence
Keywords: Emotion and Affect, Game-based Learning, Pandemic, Resilience
Presenting Author: Giada Vicentini, University of Verona, Italy; **Co-Author:**Daniela Raccanello, University of Verona, Italy; **Co-Author:**Emmanuela Rocca, University of Verona, Italy; **Co-Author:**Roberto Burro, University of Verona, Italy

Pandemics are biological natural disasters that can have a traumatic impact on children and adolescents' wellbeing. Recent metanalyses have well documented the consequences of the COVID-19 pandemic in terms of psychopathological symptoms. To promote children and adolescents' resilience and foster their

emotional competence concerning the pandemic, we developed the psychoeducational app PandHEMOT® (Pandemics – Helmet for EMOTions), as part of a larger project. In this study, we tested the efficacy of a training using PandHEMOT® aiming at increasing children and adolescents' knowledge and metacognitive awareness about pandemics, emotions, and emotion regulation strategies, also investigating class level differences. Moreover, we explored changes in participants' wellbeing for ethical issues. We involved a sample of 65 third and 82 seventh-graders from Northern Italy, divided into an experimental and a control group. The experimental group participated to a three-unit training using PandHEMOT®; both groups filled in pretest and posttest questionnaires. Our findings indicated that participants belonging to the experimental group increased their knowledge and metacognitive awareness about the training contents, with adolescents performing better than children. In addition, participating to the training did not affect wellbeing. On the whole, we documented the efficacy of PandHEMOT® following the standards of evidence-based research. Notwithstanding some limitations, this study expanded knowledge about the possibility to use digital activities for promoting disaster-related learning with children and adolescents. It is also a valid example for developing other psychoeducational tools to foster emotional competence to cope with both possible future disasters and everyday life tasks.

"Try to contaminate patients and objects": Effects of discovery instructions in VR
Keywords: Computer-assisted Learning, Game-based Learning, Higher Education, Immersive Technologies for Learning
Presenting Author: Juliette Desiron, University of Zürich, Switzerland; **Co-Author:**Aline Wolfensberger, Department of Infectious Diseases and Hospital Epidemiology, University Hospital Zurich, Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland

In this study we investigated the effect of prompts when training to moments to perform hand hygiene, with a focus on learning from your mistakes. In line with previous research in non-immersive training environments, we expected a positive effect of prompting participants to contaminate patients and objects on later performance, but a negative effect on their sense of presence. Further, we investigated predictors of sense of presence (feeling of being there and of realism), including prompts as well as engagement, technology acceptance, and play habits. 178 first-year medical students participated as part of a seminar on infection prevention. Data analyses are ongoing.

Online intervention program for first graders to close pre-reading skills gaps
Keywords: Cognitive Development, Game-based Learning, Primary Education, Reading
Presenting Author: Renáta Kiss, University of Szeged Institute of Education, MTA-SZTE Digital Learning Technologies Research Group, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:**Katalin Szili, Hungarian University of Agriculture and Life Sciences, Institute of Education, Hungary; **Co-Author:**Dora Mokri, Szeged Center for Research on Learning and Instruction!, Hungary; **Co-Author:**Benö Csapó, University of Szeged, Hungary; **Co-Author:**Gyöngyvér Molnár, University of Szeged, MTA-SZTE Digital Learning Technologies Research Group, Hungary

A lack of foundational pre-reading skills may cause reading and learning problems, therefore early diagnosis and development is essential. In recent years, increasing attention has been paid on the need of targeted improvement. The aim of this study is to develop a valid and widely usable online intervention program that does not require the continuous presence of a teacher. In this paper we present the direct results as well as the longitudinal effects of an online training program prepared for developing pupils' pre-reading skills. Participants in the quasi-experimental study were 306 first-grade students. Propensity score matching was used for examining the efficiency of the intervention. As a result, the intervention group developed significantly (Cohen's d=.52). The most noticeable development was found among students in the lower third skill group (Cohen's d=.99). The study provided evidence that a well-designed online intervention program can prevent learning gaps in pre-reading skills even at this early stage, without the presence of the teacher, even in disruptive times as well as directs attention to the continuity of the development of pre-reading skills.

Addressing the Climate Crisis in Higher Education: Game Design for Transformative Learning
Keywords: Attitudes and Beliefs, Game-based Learning, Higher Education, Sustainable Development
Presenting Author: Pia Spangenberger, Universität Potsdam, Germany; **Co-Author:**Linda Kruse, Hochschule Mainz / University of Applied Sciences, Germany; **Co-Author:**Anja Schultze-Krumbholz, Technische Universität Berlin, Department of Educational Psychology, Germany; **Co-Author:**Mandy Singer-Brodowski, Freie Universität Berlin, Germany

Transformative learning describes a methodological approach in the concept of education for sustainable development to equip the upcoming generation with competencies to cope with the climate crisis. In our current study we investigate the question on how designing a serious game as a seminar concept in higher education can foster transformative learning. We conducted a pretest-posttest study-design (n=40) investigating the effects of a game-design seminar on students' understanding of sustainable development, students' critical reflection concerning own values and on pro-environmental behavior. Based on our results, we will discuss the potential of serious game design as didactical approach for transformative learning.

Design, Development and Implementation of VR Serious Games for Science in a Postsecondary Context
Keywords: Game-based Learning, Higher Education, Immersive Technologies for Learning, Science and STEM
Presenting Author: Christine Marquis, Cégep de Saint-Jérôme, Canada; **Presenting Author:**Bruno Poellhuber, University of Montreal, Canada; **Co-Author:**Sébastien Wall-Lacelle, Cégep de Saint-Jérôme, Canada; **Co-Author:**Audrey Groleau, Université du Québec à Trois-Rivières, Canada; **Co-Author:**Normand Roy, University of Montreal, Canada

In order to find active methods that can engage students and counter the declining interest in science, we relied on an educational value research-development framework to develop and test VR serious games for science courses offered in colleges in Quebec. We thoroughly documented each step of the process, as well as the result of each phase. The pre-design phase relied on a questionnaire, a comparative analysis of existing VR science learning applications and a review of the literature about the advantages and pitfalls of VR, as well as the main design and development models in the field. The functional analysis phase made use of comparative analysis through the nominal group process and led to a quality criteria grid for VR serious games for science. This grid was the starting point of the design and development phase, in which disciplinary teams brainstormed and discussed until a specific scenario was chosen for each discipline. In the development phase, a very detailed storyboard was elaborated for each scenario, and a science teacher led a student team that iteratively developed prototypes. In the last phase, the final prototypes were tested and evaluated by students in biology and chemistry classes in fall 2022.

From Awareness to Adjustment: A Teacher's Local Adaptation of a Game-based Learning Environment
Keywords: Educational Technologies, Game-based Learning, Problem-based Learning, Science Education
Presenting Author: Tianshu Wang, Indiana University, United States; **Co-Author:**Krista D. Glazewski, Indiana University, United States; **Co-Author:**Haesol Bae, Indiana University, United States; **Co-Author:**Chen Feng, Indiana University, United States; **Co-Author:**Daeun Hong, Indiana University, United States; **Co-Author:**Cindy E. Hmelo-Silver, Indiana University, United States; **Co-Author:**Seung Lee, North Carolina State University, United States; **Co-Author:**Bradford W. Mott, North Carolina State University, United States; **Co-Author:**James C. Lester, North Carolina State University, United States

With the involvement of mutually connected variables and dynamic situations, complex problem-solving practices can represent one way for teachers to meet priorities in authentic and disciplinary learning. Problem-based learning (PBL) is an ideal pedagogical model and context to embed content knowledge within the problem-solving of ill-structured tasks. Game-based learning environments can provide a rich, interactive context for students to engage in the PBL process. However, embedding a game-based learning environment in the classroom can add additional variables to the interaction among teachers, students, and the game. In this case study, we explore a middle school science teacher's adaptation of a game-based learning environment into a local classroom during an implementation. The study focuses on the reason, steps, and types of adaptation.Keywords: Teacher Adaptation, Game-based Learning, K-12, Science and STEM, Classroom Implementation, Problem-based Learning

Global crisis and increase in domestic violence. Education as a force for change
Keywords: Citizenship Education, Gender Issues, Pandemic, Resilience
Presenting Author: Rossella Marzullo, University of Reggio Calabria Mediterranea, Italy

Time of crisis we are going through - aggravated by the effects of the pandemic and by the after-effects it has caused - is the plastic testimony of human relations and civil coexistence deterioration: prosocial behaviors have drastically decreased and thoughts, words and actions of hate have grown in a directly proportional manner. Within this scenario, women and minors continue to be the first victims of violence, so it seems urgent to rekindle a light on those pains that too often end up being submerged, relegated to "private affairs", considered minor compared to major emergencies, but which, conversely, have found in COVID-19 the breeding ground to proliferate and manifest themselves in all their dangers. This leads us to consider it essential to strengthen the life skills training system, coping strategies, resilience, which have the ability to provide individuals with the necessary tools to manage the transitions in progress, the tumultuous changes of our time and disorientation, that does not help to build functional relationships with the other, causing social discomfort and all sorts of prevarication.

Researching youth voices on Comprehensive Sex Education: a systematic review of qualitative studies
Keywords: Critical Thinking, Dialogic Pedagogy, Gender Issues, Meta-analysis
Presenting Author: Carolina Trivelli, University of Verona, Italy

The past decades have seen an increase in the design and implementation of sexuality education programs deemed ‘comprehensive’ within formal schooling. Such programs adopt a rights-based approach and are grounded in critical pedagogy, offering insights on positive sexualities, young people’s rights, participation and agency, and gender equality among others. Qualitative research is gaining relevance in the field; however, few studies focus on teenagers’ perspectives. This study analyzes qualitative research through a systematic review on the implementation of Comprehensive Sexuality Education (CSE) programs from the perspective of youth. A systematic review of qualitative studies with a subsequent meta summary were conducted to outline a ‘state-of-the-art’ of qualitative research on youth perceptions of CSE. Using specifically defined search terms, a database search was carried out of peer reviewed journals in five databases, arriving to a total of forty studies. Ten studies were included using supplementary searching. A total of fifty studies are included in the review.

The period of time ranges from January 1st, 2017, until July 31st, 2022 (post #metoo). Results point to two main areas of concern for young people: contents and pedagogical strategies. There remains a general dissatisfaction over depth and breadth of the CSE curriculum; most studies describe CSE as leaving them feeling unprepared for positive relationships and good sexual health. In terms of pedagogy, there is still a debt towards the adoption of experiential learning based on critical thinking.

Exploring gender differences in Coding at the beginning of Primary school
Keywords: Cognitive Skills and Processes, Computational Thinking, Gender Issues, Primary Education
Presenting Author: Costanza Padova, University of Padova, Italy, Italy; **Co-Author:**Chiara Montuori, Universita di Padova, Italy; **Co-Author:**Lucia Ronconi, Universita di Padova, Italy; **Co-Author:**Tullio Vardanega, Universita di Padova, Italy; **Co-Author:**Barbara Arfé, University of Padova, Italy

Coding, seen as a component of STEM and a tool for learning computing, has entered the curriculum of primary school education in several countries. Among the studies conducted to assess children’s coding skills and the effectiveness of instructional interventions focused on coding, few have examined gender-related differences in coding, especially in the early years (4-7) where gender-related stereotypes are not yet likely fully endorsed by children. Some of these studies report an advantage for boys in coding from their first experience with it. Previous research also found evidence of (1) association between the development of coding skills and children’s executive functions (EF); and of (2) gender differences in EF. In this work we explored the gender gap issue further, looking at whether gender differences emerged in the coding abilities of 1st graders, at their first experience with coding, and whether they were mediated by gender differences in EF, i.e., response inhibition and planning skills. We assessed the coding, response inhibition, and planning skills of 109 Italian first graders, before a coding course (*pretest*), when the children had no prior experience of coding. We repeated the assessment after the coding course (*posttest*). No statistically significant difference between girls and boys emerged at the pretest. Yet, an advantage in coding appeared for boys at the *posttest*. Mediation analyses show that the gender differences in coding were *not* mediated by children’s EF (response inhibition or planning).These results are part of a study in which we tested the effectiveness of coding.

Self-efficacy and utility value as predictors of adolescents’ intentions to study science subjects
Keywords: Gender Issues, Motivation, Science Education, Self-efficacy
Presenting Author: Erin Mackenzie, Western Sydney University, Australia; **Co-Author:**Kathryn Holmes, Western Sydney University, Australia; **Co-Author:**Nathan Berger, Western Sydney University, Australia

Expectancy value theory implies that adolescents’ subject selections will be motivated by their expectations for success in that subject, and the extent to which they value the subject. However, it is unknown whether these attitudes have distinctive roles in adolescents’ decisions to study different science subjects (biology, chemistry, and physics). In this study, we examined the relative contribution of gender, self-efficacy, intrinsic value, and utility value to adolescents’ intentions to study biology, chemistry, and physics in the senior years of high school. Participants were 475 adolescents (332 female, 141 male, 2 other) from five independent schools in Sydney, Australia. Data were collected using a survey that measured adolescents’ self-efficacy in biology, chemistry, and physics, intrinsic value of science, and utility value of science, along with their intentions to study biology, chemistry, and physics in the final two years of high school. Findings suggest that self-efficacy and utility value are the strongest predictors of adolescents’ intentions to study all sciences, and that gender is also influential in the cases of biology (favouring girls) and physics (favouring boys). On the other hand, intrinsic value did not predict adolescents’ intentions to study any of the sciences. These findings suggest that interventions to increase senior science enrolments should focus on building self-efficacy and increasing utility value of science.

Empowering e-learning relationships: refugee women explore civics during the lock-down in Greece
Keywords: Citizenship Education, E-learning/ Online Learning, Gender Issues, Migrant / Refugee and Minority students
Presenting Author: Agapi Chouzouraki, UNIVERSITY OF MACEDONIA, Greece; **Co-Author:**Ioanna Papavassiliou-Alexiou, University of Macedonia, Greece

Within a persistent and chronical gap of citizenship or social orientation state-run classes, refugees and asylum seekers in Greece face insurmountable difficulties towards their integration in general and in the labor market in particular. Especially for refugee and asylum seeking women, labor-market integration is more than often the only way towards emancipation, autonomy and self-esteem restoration. Therefore, innovative experiential learning program was designed for a group of refugee and asylum seeking women residing in Greece, aiming to explore the learners’ views on the role of democratic citizenship (EDC) and human rights education (HRE) in their career development, focusing on empowerment and career resilience. The training lasted an academic semester, was part of a PhD thesis and was at the premises of the University of Macedonia in Thessaloniki and then remotely, due to the measures taken in October 2020 to prevent the spread of corona virus. The latter condition of learning, greatly revealed opportunities for learning in a new environment which also created the space to cultivate and acquire other career-related skills such as flexibility, cooperativeness and tech-related ones. According to these vulnerable learners, the relationships shaped within this semester boosted their personal and professional empowerment and led to the enhancement of their resilience in the workplace.

Interest group:

Please bring your own device if you are attending this ICT demonstration.
Students often struggle to engage meaningfully in science practices, and to write scientific explanations using evidence. Our ICT demo features a Digital Notebook created to support students' science learning and inquiry practices. The environment consists of multiple integrated tools to scaffold interactions such as, running a simulation; data generation, export, and analysis; and automatic assessment of students' written explanations using PyrEval (Gao et al., 2018), an NLP technology. The digital notebook also has a teacher dashboard which provides information about students' progress so teachers can make informed instructional decisions to better facilitate students' science learning and writing. The notebook has three views: student view, teacher view, and researcher view. We will discuss the backend architecture and various features of the tool and attendees will be able to try all three aspects of the notebook, while working to solve a design-based challenge and get automatic feedback on their essays, as students would. They will also learn how to create content and download data for analysis, from teacher and researcher perspectives.

Learning and Instructional Technology

nStudy: A software system for tracing learning

Keywords: Educational Technologies, Metacognition, Motivation, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning

Please bring your own device if you are attending this ICT demonstration.
Modern software technologies offer new opportunities to help researchers and learners examine learning. With learners' consent, software can track in fine-grained and extensive detail the information on which they operate; traces of cognitive, metacognitive and motivational operations they apply to information as they learn, and timing. This ICT demonstration displays how nStudy can help researchers overcome limitations of the conventional research paradigm to advance learning science. nStudy collects extensive trace data describing learning events in terms of information on which learners operate and the cognitive, metacognition, motivation and self-regulated learning operations they apply. Features of the software are demonstrated and data logged are displayed.

nStudy: A software system for tracing learning
