Learning and Instruction in the Digital Age: Challenges and Hopes for Education and Democracy

Keywords: Citizenship Education, Economics of Education, Educational Policy, School Leadership
Interest group:
Chairperson: Eleni Kyza, Cyprus University of Technology, Cyprus
Organiser: Eleftheria Gonida, Aristotle University of Thessaloniki, Greece
Organiser: Eleni Kyza, Cyprus University of Technology, Cyprus

This year's conference theme, "Education as a Hope in Uncertain Times", has been particularly chosen to signify the importance of education in helping societies across Europe, and the world, be resilient and resistant to significant existing or future challenges. In times of constant changes, the future is a moving target - difficult to predict and prepare for. Yet, education is doing just that. In order to think tomorrow's education and educational research, it is crucial to relate new findings to what we already know and elaborate how these will help foster sustainable learning processes and navigating what is yet to come.
EARLI recognizes the importance of dialogue between different societal stakeholders, with the scientific community and policy makers being two such important stakeholders. This panel seeks to bring to focus the importance of promoting productive exchanges between these stakeholders, and, along the way, understanding the unique contribution that each party can offer for the pursuit of common goals of societal and social importance.
- Andreas Demetriou, Cyprus Academy of Sciences, Letters, and Arts, Cyprus- Anantha Duraiappah, UNESCO Mahatma Gandhi Institute of Education for Peace and Sustainable development (MGIEP), India- Sanna Järvelä, University of Oulu, Finland - Roger Säljö, University of Gothenberg, Sweden- Andreas Schleicher, Director for Education and Skills, OECD

Invited Symposium
Cognitive Science

Attention please! Real-world neuroscience investigations into attention with increasing naturalism.

Keywords: At-risk Students, Cognitive Development, Cognitive Skills and Processes, E-learning/ Online Learning, Educational Neuroscience, Educational Technologies, Mindsets, Mixed-method Research, Quantitative Methods, Synergies between Learning / Teaching and Research
Interest group: SIG 22 - Neuroscience and Education
Chairperson: Tieme Janssen, Vrije Universiteit Amsterdam, Netherlands
Organiser: Jennie Grammer, UCLA, United States
Organiser: Adi Korisky, Bar-Ilan University, Israel
Organiser: Pawel Matusz, Switzerland
Organiser: Tieme Janssen, Vrije Universiteit Amsterdam, Netherlands
Discussant: Nienke van Atteveldt, Vrije Universiteit Amsterdam, Netherlands

As the field of educational neuroscience has grown, questions have emerged regarding the ecological validity and applicability of lab-based research to educational practice. To address this issue, various approaches have been suggested to increase the ecological validity of neuroimaging experiments. One promising approach brings the real-world to the lab (representative design), while another approach brings the lab to the real-world using mobile neuroimaging technology. These approaches to real-world neuroscience are part of the three-stage cyclical model, covering a wide range of lab, semi-naturalistic and fully naturalistic studies, varying on ecological validity and experimental control. By iterating across stages and methods, it is possible to generate complementary and converging evidence that can address complex educational questions. In this symposium, four speakers will share their EEG research on attention, and each of the presentations will be situated on a different part of the cycle. We will begin with a carefully designed lab experiment into attentional control, which takes into account the complex multisensory reality and contextual factors that are important in everyday situations (representative design). This will be followed by increasingly more naturalistic studies into attention in online, in-person and classroom learning environments (mobile EEG). This unique symposium will be closed by our discussant, who will bring these studies together in the cyclical framework.

The context-dependence of neurocognitive attentional control functions
Presenting Author: Pawel Matusz, University of Applied Sciences Western Switzerland (HES-SO Valais-Wallis), Switzerland

We have learnt a lot about how we pay attention from studies using unisensory (e.g., visual) stimuli and manipulating observers' behavioral goals. However, everyday environments, including the classroom, are multisensory and contain regularities. Yet there is little systematic research on how attention is deployed in such complex settings, even in adults, with even less knowledge on development of attention therein. I will first discuss our study which revealed how children across primary education develop their abilities to pay attention to, traditionally studied, visual, and more naturalistic, multisensory (audiovisual, AV) objects - from the age at which those processes and their brain bases reach adult-like state to their role in shaping early scholastic skills. Next, I will discuss a study showing how in complex, naturalistic environments, adult's attention is jointly controlled by processes rarely studied altogether: AV salience-, goal- and context-based processes. Ability of visual distractors to capture attention depended on whether they were equipped with semantic relationships. In EEG, we found that, in such rich contexts, attentional selection is not implemented by the lateralized brain mechanisms traditionally linked to attention, but rather by nonlateralized ones. Crucially, contextual processes affected distractor processing already < 30ms post-stimulus. These findings indicate that, even if sensitivity to contextual processes undergoes development, attention in the classroom is controlled differently than in traditional lab contexts; classrooms are rich in multisensory, meaningful objects and event regularities. Thus, the contexts for studying cognitive processes key to learning, like attention, should at least emulate the contexts where learning naturally transpires.

Examining elementary school children's attention while learning online
Presenting Author: Jennie Grammer, UCLA, United States

Young children's attentional skills are important for their success in school. For children with Attention deficit/hyperactivity disorder (ADHD), the impact of inattention on educational outcomes is particularly pronounced. While the classroom environment presents an opportunity to support the development of children's attentional skills, little systematic research exists on which to base recommendations for practice. In addition, children's attention while learning online – which has become increasingly common since the Covid-19 pandemic – has yet to be thoroughly explored. Here we describe two studies in which we use real-world neuroscience methods, specifically portable electroencephalography (EEG) recordings, to examine elementary schooler's attention and distraction as they are learning online. We will demonstrate the impact of instruction on EEG and ERPs associated with attention and distraction for children with and without ADHD. We will also describe links between behavioral indicators of attention and neural correlates and discuss the implications of children's behavior for their interactions with teachers.

Are you listening to me? Attention in real-life classrooms
Presenting Author: Elana Zion Golumbic, Bar Ilan University, Israel; **Co-Author:**Adi Korisky, Bar-Ilan University, Israel

Paying attention to a classroom lesson is hard. Students are required to maintain a constantly high level of attention towards the teachers' lessons in order to process and internalize its content. All the while, students need to avoid becoming distracted, either by external stimuli (e.g., sounds from outside, other students talking) or by their own internal thoughts (e.g. boredom, mind-wandering). In this talk, we describe a unique research–practice partnership between cognitive neuroscientists and educators aimed at understanding the cognitive and neural underpinnings paying attention in real-life school. Using mobile EEG technology, we study how students respond to different types of distracting events, both in both well-validated cognitive tasks and in real-life classroom experiments. Working together with teachers, this unique research approach allows us to gain a more ecologically-relevant perspective on students' attention, as it pertains to their real-life experiences and how it affects learning outcomes.

Mobile EEG neurofeedback to convince high school students of the controllable nature of their brain
Presenting Author: Tieme Janssen, Vrije Universiteit Amsterdam, Netherlands

Although past research demonstrated growth mindset interventions to improve school outcomes, effects were small. This may be due to the theoretical nature of psychosocial techniques (e.g., reading about brain plasticity), which may not be optimally convincing for students. To address this issue and improve effectiveness, we developed a growth mindset intervention, which combined psychosocial (3 lessons) and psychophysiological (1 lesson) components. The latter adds a convincing experience of influencing one's own brain activity related to attention, using mobile electroencephalography (EEG) theta/beta neurofeedback (NFB), emphasizing the controllable and malleable nature of one's brain. In this randomized controlled trial (RCT), twenty high school classes (N=439) were randomized to either the active control or our newly developed growth mindset intervention condition (4x50 minute lessons). First, the NFB results showed that students were able to control their brain activity, and that objective and subjective control were differently related to motivational beliefs at baseline. Second, the overall RCT results showed that students in the growth mindset intervention reported increased growth mindset directly after the intervention (post, d = 0.38) and at 1-year follow-up (d = 0.25), and demonstrated a protective effect against deterioration of math grades at 1-year follow-up (d = 0.36), compared to controls. Compared to previous studies, we found relatively large effects of our intervention on growth mindset and math grades, which may be attributable to synergetic effects of psychosocial and psychophysiological (neurofeedback) components.

Invited Symposium

'Hope' for disadvantaged students: Extended Education in a Global Perspective

Keywords: At-risk Students, Cultural Diversity in School, Informal Learning, Migrant / Refugee and Minority students, Qualitative Methods
Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Nanine Lilla, Freie Universität Berlin, Germany
Organiser: Nanine Lilla, Freie Universität Berlin, Germany
Organiser: Marianne Schuepbach, Freie Universität Berlin, Germany
Organiser: Ingrid Gogolin, University of Hamburg, Germany
Organiser: Liesel Ebersöhn, Unit for Education Research in AIDS, South Africa
Discussant: David Thore Gravesen, Denmark
Discussant: Ioulia Televantou, European University Cyprus, Cyprus

The proposed symposium focuses on the role of extended education in addressing the challenges of societal changes including family changes and increased complexity of educational processes at times of global change and uncertainty. Forms of extended education are being explored in numerous nations around the world. Examples are extended education offerings as "All-day schools" in Germany, "Outside school hours care" in Australia or "Out-of-school time" in UK. These approaches have been designed to promote the development of school-age children and youth supplementing formal education. They aim in particular to offer a means to support students who are educationally disadvantaged, e.g. because of their socio-economic background or due to cultural or linguistic characteristics. Meta-analyses of US studies show that non-formal education can be successful in promoting disadvantaged students in their academic achievement or social skills. However, other studies show that it is precisely the target group of the particularly disadvantaged pupils that does not benefit from the offerings as desired. The symposium presents empirical papers that will give insights into the ambiguous state of evidence from the perspective of studies from different education systems around the globe.

Educational quality of extended education in Germany with a focus on disadvantaged students
Presenting Author: Jule Schmidt, Freie Universität Berlin, Germany; **Co-Author:**Haiqin Ning, Freie Universität Berlin, Germany; **Co-Author:**Nanine Lilla, Freie Universität Berlin, Germany; **Co-Author:**Marianne Schuepbach, Freie Universität Berlin, Germany

The nationwide expansion of all-day primary schools in Germany is associated with the expectation of strengthening educational success and social participation, especially for socially and educationally disadvantaged students with migration backgrounds (Abbrev. TG) (KMK, 2015). However, these expectations for all-day schools have not been adequately fulfilled in Germany (StEG-Konsortium, 2016). In other countries, however, there are comparable high-quality offerings of extended education that are effective (Durlak et al., 2010; Lauer et al., 2006). Furthermore, international research identifies educational

quality (Tietze et al., 2005) as an important condition for effective offerings (Stecher et al., 2007; Durlak et al., 2010). Based on this, this article deals with two questions: 1) What are characteristics of educational quality in extended education effective for the TG? 2) How is the conception of the current offerings at German all-day primary schools to be assessed in this respect? Fifteen problem-centered interviews according to Witzel (2000) were conducted online with international extended education researchers from all over the world. The data analysis follows the process model of structuring qualitative content analysis according to Mayring (2014) and Kuckartz (2018), supported by MAXQDA (Kuckartz, 2018).Initial explorations of the interview material reveal relevant characteristics of educational quality at structural, process, and orientation quality levels. Regarding the development of the TG, the current qualification of the staff as well as the decreasing cooperation between schools and external partners are predominantly critically discussed, while the orientation towards an inclusive learning environment is evaluated as purposeful.

The role of background characteristics for participation in all-day schooling in Germany
Presenting Author: Luise Krejcik, Universität Hamburg, Germany; **Co-Author:**Ingrid Gogolin, University of Hamburg, Germany

In many education systems around the world, students from socially disadvantaged migrant families or autochthonous minorities have particularly poor educational opportunities. One measure to compensate for educational disadvantages and raise achievement as hope in uncertain times is to provide additional education and care services. In Germany, these are provided especially in newly introduced all-day schools. Internationally, they are discussed under "extended education". Research shows that in some countries these offers provide the expected compensation for disadvantages, but in others - e.g. Germany - they do not. This article presents interim results of an investigation into the possible reasons for this. The focus is on the question of correlations between students' characteristics of origin and their participation in extended education.

The Conundrum of OSHC services in Australia
Presenting Author: Jennifer Cartmel, Griffith University, Australia; **Co-Author:**Bruce Hurst, University of Melbourne, Australia

Outside school hours care (OSHC) is a significant site of care, play and learning for children aged five to twelve years in Australia. The growth of services mirrors international trends. The growth of services also has the potential to support the development and wellbeing of children when its value as a site of play and learning is recognised. expectations of children, families and the wider community. Using a review of academic and grey literature evidence was gathered that suggests that quality OSHC provision for children in an interplay between the following elements: 1. The benefits of OSHC to stakeholders 2. The image of OSHC 3. The partnership between OSHC and schools 4. The workforce delivering OSHC service. This review of Australian literature also highlights the conundrum of equitable and inclusive access for Australian children. Recommendations highlight the need for more research about the OSHC as a site for children’s development and the partnerships between OSHC, schools and families. In particular children from vulnerable circumstances such as those at risk of abuse or neglect, of working sole parents and families requiring additional support to help raise their children appeared to have limited access. The review advocates for a deeper understanding about the value of OSHC to enhance community perceptions and commitment to the utilisation of services to contribute to children’s wellbeing and development.

Why young people in high-poverty contexts choose not to participate in Out-of-School Time provision
Presenting Author: Kirstin Kerr, University of Manchester, United Kingdom; **Co-Author:**Claire Forbes, University of Manchester, United Kingdom

Out-of-School Time (OST) provision offers young people opportunities to participate in a variety professionally-supervised sports, leisure, cultural and academic activities, which aim to promote affective and academic outcomes. While young people from high poverty contexts are widely seen as having most to gain from OST, their participation is typically low, even when activities are easily accessible at little or no cost. Little is known from young people’s perspectives about why this is. Addressing this gap, this paper will report findings from a qualitative study with young people (aged 11-15) living in Hollyburgh, a high-poverty neighbourhood in the UK, with wide-ranging but under-used OST provision. Findings suggest that young people were unwilling to participate in Hollyburgh’s current OST provision, primarily seeing this as a form of professional surveillance to control their behaviour after school. This belief stemmed from young people’s generally negative perceptions of Hollyburgh as a place characterised by crime and anti-social behaviours. We argue that if participation is to be encouraged in places like Hollyburgh, OST provision must been seen as having the potential to interrupt negative discourses about high poverty neighbourhoods and the young people who live in them. Unless it can do so, these discourses may continue to play out in OST provision, leading to young people’s non-participation. We argue that to address this OST provision must first be understood as a contextual and relational activity, and second, OST providers and young people must have opportunities to work together to co-design and -lead activities.

Session A 3

22 August 2023 12:15 - 13:45

Symposium
Learning and Special Education

New procedure to assess Executive Function and predict learning outcome in Special Educational Needs

Keywords: Assessment Methods, Cognitive Development, Cognitive Skills and Processes, Learning and Developmental Difficulties, Social Development, Special Education
Interest group: SIG 15 - Special Educational Needs
Chairperson: Chiara Pecini, University of Florence, Italy
Discussant: Pirjo Aunio, University of Helsinki, Finland

Executive Functions (EF), defined as multiple cognitive control processes for learning and adaptation (Diamond, 2013), are frequently impaired in children with Special Educational Needs (SEN), thus contributing to develop poor learning skills (Crisci et al., 2021). Nowadays, different tools and procedures can be used to test EF in infancy and childhood, that are known to be the most sensible periods for EF development. Nevertheless, the characteristics of the models and tools used (e.g. direct vs indirect; paper and pencil vs digital; in presence vs remote) may affect the EF profile that is found and its relationship with the learning outcome across different types of SEN.The symposium consists of four papers tapping different ages and needs. The first contribution shows that EF precursors can be assessed by an infant and toddler development scale including early term infants. The second study refers to a tablet-based EF assessment of blind and deaf children. In the third study, EF is investigated in children with attentional problems and/or learning disability in different contexts of quiet and noise. The fourth contribution shows the use of EF tele-assessment in low and high comprehenders/writers from primary school. All contributions relate the findings on the EF profiles with the learning skills and cognitive development of a specific SEN population. Strengths and weakness of the different procedures will be discussed to promote a better understanding of the role of EF difficulties in learning and adaptation across different SEN.

The development of Executive Functions with early term toddlers from families with social burdens
Presenting Author: Minna Törmänen, University of Teacher Education in Special Needs Zurich, Switzerland; University of Helsinki, Finland, Switzerland; **Co-Author:**Simone Schaub, University of Teacher Education in Special Needs, Switzerland; **Co-Author:**Erich Ramseier, PH Bern, University of Teacher Education, Berne, Switzerland; **Co-Author:**Christina Koch, University of Teacher Education in Special Needs, Zurich, Switzerland; **Co-Author:**Alex Neuhauser, University of Applied Sciences of Special Needs Education, Switzerland; **Co-Author:**Isabelle Kalkusch, University of Teacher Education in Special Needs, Zurich, Switzerland; **Co-Author:**Patsawee Rodcharoen, University of Teacher Education in Special Needs, Zurich, Switzerland & University of Bern, Switzerland; **Co-Author:**Andrea Lanfranchi, University of Applied Sciences of Special Needs Education, Switzerland

The development of Executive Functions (EF) in infants and toddlers has received increased interest. Children born prematurely are biologically immature and are at-risk of developmental difficulties and executive deficits. Early term births have increased rapidly, and they predispose to developmental delays and disabilities. EF is an umbrella term for heterogeneous, higher-order cognitive processes that are important for active regulation of thought, emotion, and adaptive behavior. EF are very sensitive to environmental factors including negative ones, such as poverty, and positive ones, such as sensitive parenting.ZEPPELIN (Zurich Equity Prevention Project with Parents’ Participation and Integration) is a longitudinal intervention study (RCT) conducted with

families (N=248) having social burdens, like social, financial and/or psychological risk factors. It aims to study weather early support has positive impacts on children's development, educational opportunities and later on their academic achievements, and parents show improved parenting practices.The aim of this study is to describe EF development in children with early term (N=69) and on term births (N=163) between 0 and 3 years. Main method is Bayley Scales of Infant and Toddler Development (BSID-III, 2006). There is lack of EF measurements for toddlers and situation is more complicated with children having early term birth. We hypothesized that BSID-III contains items with EF components.According to our results it was possible to extrapolate EF components from BSID-III in longitudinal manner. However, concerning the development of different EF components results were contradictory.

Executive functions in blind and deaf children: a Tablet-based assessment
Presenting Author: Camila Martinez, Pontificia Universidad Católica de Chile, CIE 160007, Chile; **Co-Author:**María Victoria Espinoza,, Centre for Educational Justice at the Pontifical Catholic University of Chile., Chile; **Co-Author:**Catalina Santa Cruz, Centre for Educational Justice at the Pontifical Catholic University of Chile., Chile; **Co-Author:**Ricardo Rosas Diaz, CEDEti-UC, Chile

Executive functions are of the highest interest because of their relationship with learning, in general, and specifically with reading and math. We hereby present the development of the YellowRed App, a Tablet-based test to assess Executive Functions (EF) in deaf and blind children. YellowRed was developed to assess the three main EF components (inhibition, working memory and cognitive flexibility) in typically developing children, as well as children with special educational needs, from 6 to 12 years of age. Additionally, as EF impairments could be associated with learning problems in deaf or blind children, two YellowRed versions adapted to these populations were developed. We present the results of a pilot study performed in blind and deaf children by using the adapted YellowRed App. The results support the usefulness of assessing EF in deaf and blind children by a tool that resembles that one for typically developing children, thus allowing for a direct comparison between different developmental circumstances.

Assessing inattentive children's executive functioning in quiet and noise
Presenting Author: Barbara Arfé, University of Padova, Italy; **Co-Author:**Gaia Spiacciarelli, Human Inspired Technology Centre, University of Padova, Italy; **Co-Author:**Chiara Montuori, Human Inspired Technology Centre, University of Padova, Italy; **Co-Author:**Flavia gheller, School of Psychology, University of Padova, Italy, Italy

Children with attentional problems associated with a learning disability (LD) or attention deficit hyperactivity disorder (ADHD) have greater difficulties in self-regulating and sustaining their attention during academic tasks. In educational and clinical settings, their executive function (e.g., sustained attention and verbal working memory) are typically assessed in individual testing sessions under optimal environmental conditions, i.e., in quiet. In real life, however, children are often asked to perform attentional and memory tasks in noisy classrooms. The study explored how inattentive and attentive children's sustained attention and working memory performance are influenced by babble noise, a type of noise frequently associated with classroom activities. Fifty-eight typically developing children and 13, 8 to 12 years-old, children with either attentional problems associated to LD or ADHD (n= 10) or performance 2 SD below the mean on standardized attention tasks (n= 3) completed two visual attention tasks and a verbal WM task (digit span) on tablet, under two acoustic conditions: quiet and 65dB multitalker-babble noise. Significant differences between the groups were found on both visual attention tasks and the verbal WM (digit forward and backward) task in quiet, but not in noise. In the group with attentional problems, sustained attention abilities improved significantly in noise. These findings will be discussed in the light of the stochastic resonance hypothesis, according to which background noise could ameliorate inattentive children's performance, increasing their arousal on task.

Paper and digital learnings in low and high performers: the involvement of Executive Functions
Presenting Author: Costanza Ruffini, University of Florence, Italy; **Co-Author:**Christian Tarchi, University of Florence, Italy; **Co-Author:**Chiara Pecini, University of Florence, Italy

Literature supports a disadvantage of students' performances when learning tasks are conducted in the digital modality in comparison to the paper one. The present research aims to investigate the difference between digital and paper text comprehension (TC) and text writing (TW), placing a specific focus on Executive Functions (EF) role as mediator factors of the performances. 175 typically developing children (mean age=9.75, sd=.89) performed TC and TW tasks on computer and on paper and were assessed with digital EF tasks. The results showed no differences between digital and paper TC in the whole sample; however, Low Comprehenders (LC) children obtained higher TC scores in the digital than in the paper modality, an opposite trend to High Comprehenders (HC) with differences that tended to decrease with school grade. EF, especially working memory, supported digital and paper TC. For what concerns TW, productions were longer and less complex in the digital modality than in the paper one. Low Writers (LW), in opposition to High Writers (HW) showed an advantage of digital over paper in the level of narrative complexity and in the number of words, although the latter interacted with school grade. EF, especially processes of updating and switching of interference control, supported both paper and digital writing skills. The results support the utility of the technological devices for children with low learning skills, but they also highlighted the need to consider the child's individual functional profile, both in terms of cognitive control processes and learning performance level.

Symposium
Motivational, Social and Affective Processes

Theoretical or methodological perspective on process-oriented research of motivation and emotion

Keywords: Assessment Methods, Cooperative/Collaborative Learning, Emotion and Affect, Health-care Education, Mixed-method Research, Motivation, Quantitative Methods, Self-regulated Learning and Behaviour, Social Interaction
Interest group: SIG 27 - Online Measures of Learning Processes
Chairperson: Tiina Susanna Törmänen, University of Oulu, Finland
Organiser: Hanna Jarvenoja, University of Oulu, Finland
Discussant: Roger Azevedo, University of Central Florida, United States

An increasing number of learning researchers are collecting and analyzing data implementing various on-line process methods. This trend to implement more various methods align well with interest to understand motivation and emotions as varying across contexts, situations and learning processes. However, the endeavor for more versatile approaches in research on motivation and emotions leads to reconsidering some basic premises. On one hand, when implementing on-line measures to study motivation and/or emotions as a part of a learning process, it is essential that the methodological and analytical choices are considered from their underlying theoretical perspectives. This strong theoretical basis provides premises for considering the novel methodological and analytical choices. On the other hand, new methods and approaches provide means for challenging the current theories and approaches. For example, the continuous and fine-grained data enable new types of temporal and sequential analyses as well as person- or group-centered approaches, which can broaden the current understanding of motivation and emotions and their role in a learning process.
The aim of this symposium is to have an overview on a set of researches that approach the motivation and/or emotion research primarily on one perspective but regardless implement different on-line measures (e.g., ESM, video recordings or biophysiological data) and engage in considering the relation between the implemented theory and methodology. Through four presentations, each having their own theoretical and methodological premises the underlying questions, the different conceptual issues and their consequences for the empirical decisions are addressed and discussed.

Theoretical Challenges for Motivational Regulation revisited: Data Granularity and Time Frame
Presenting Author: Thomas Martens, Medical School Hamburg, Germany; **Co-Author:**Moritz Niemann, MSH Medical School Hamburg, Germany; **Co-Author:**Diana Pistoll, Medical School Hamburg, Germany

Motivational processes and regulation, especially in the framework of self-regulated learning were primarily investigated by questionnaires. New data sources

with different data granularities representing different time frames can be triangulated to understand motivational processes in a specific learning situation: e.g. observation data, trace data, physiological data or even self-report data like thinking aloud or experience sampling can be used. We argue that interpretation of these data should be guided by strong theoretical models.For this purpose, three different time frames are defined: A micro-level time frame that describes direct learning processes that are associated with solving problems and resolution of confusion. These processes may last for seconds or minutes. A meso-level time frame that reflects processes that are described by most theories of self-regulated learning. These processes may last for minutes, hours, even days or weeks. The macro-level time frame comprises processes that develop over months or years usually covered by personality theories. All three time frames are covered by multiple theories, but the theoretical gap remains: how can these three different time frames be connected? It can be theorized that two major processes may connect these time frames:(a) An internalization process from micro- to meso- to macro-level.(b) A motivation regulation mechanism from macro- to meso- to micro-level.Different data sources with different granularities can roughly be associated to the three defined time frames. Empirical examples from different studies will illustrate how to connect data from different time frames to better understand motivational regulation.

Paradigmatic shifts in theory and methods regarding short-term motivational & emotional processes
Presenting Author: Julia Moeller, Universität Leipzig, Germany; **Co-Author:**Julia Dietrich, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Jessica Baars, Leipzig University, Germany; **Co-Author:**Miriam Jähne, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Lennart Nörenberg, Universität Leipzig, Germany

In-the-moment measures of emotions and motivation in learning and achievement settings become increasingly ubiquitous, cheap and easy to obtain and analyze. The increasing availability of such data is expected to drive paradigmatic changes to both the theory and empirical research of emotions and motivation. Regarding theory development, we face the interesting situation in which methodological advancement seems to be driving theoretical change, rather than usually expected theories determining the research methods. To make the most of the innovations in intensive longitudinal methods and describe short-term developmental processes, theories need to become more specific than before about expectations regarding moment-to-moment stability and change, inter-individual differences in within-person trajectories, person-specific stability and change across many measurement time points, ergodicity or the lack thereof, and concurrent and lagged relationships among motivational and emotional constructs in time series data. With regard to the research methods, we expect the process character of emotional and motivational experiences to become more of a research focus particularly in research on learning, which is by definition a process of change. We see a steady increase of intensive longitudinal studies and much innovation in analytic approaches, including studies of moment-to-moment stability and change, within-person idiographic patterns and their subsequent generalization to nomothetic models based on machine learning procedures used to identify the paths and trajectories that generalize across individuals (e.g., Beltz et al., 2016). We will discuss how these and further paradigmatic shifts are expected to shape the theory and methods of emotional and motivational processes in the near future.

Multilayered perspective on Motivation and Emotion Regulation in Collaborative Learning
Presenting Author: Hanna Jarvenoja, University of Oulu, Finland; **Co-Author:**Tiina Susanna Törmänen, University of Oulu, Finland; **Co-Author:**Tatiana Shubina, University of Oulu, Finland, Finland; **Co-Author:**Kristiina Mänty, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

In this presentation, we frame the theoretical underpinnings of the process-oriented research of motivation and emotion regulation in collaborative learning contexts. Self-regulated learning theories provide the theoretical grounding for considering the motivation and emotions related to learning in groups. We define the types of regulation present in collaborative learning contexts—namely, self-, co-, and socially shared regulation—and the role of motivation and emotion regulation in them. Then, we elaborate on the function of motivation and emotions in social forms of regulation. We focus on (1) motivational and emotional conditions, (2) situational and contextual variations, and (3) the temporal manifestation of regulation in interaction. Prior studies have indicated that although the occurrence of co- and socially shared regulation of motivation and emotions is relatively rare, they are meaningful to group collaboration. Groups can activate socially shared regulation throughout the collaborative learning process to establish a stage for high-level cognitive processes. Our claim is that motivation and emotions are integral parts of social and cognitive functioning and should be studied in relation to the situation, context and other group processes.

Examining Medical Residents' Physiological Synchrony During Crisis Simulation Training
Presenting Author: Jason Harley, McGill University, Canada; **Co-Author:**Lucia Patino, McGill University, Canada; **Co-Author:**Matthew Moreno, McGill University, Canada; **Co-Author:**Keerat Grewal, McGill University, Canada; **Co-Author:**Sayed Azher, McGill University, Canada; **Co-Author:**Negar Matin, McGill University, Canada

Medical training is emotionally demanding yet, trainees' emotions are rarely addressed in curriculums. Emotions can facilitate or hinder learning, thus Crisis Resource Management (CRM) simulated training has been incorporated into medical curriculums to facilitate the development of medical residents' intrapersonal and interpersonal skills necessary to function within collaborative medical teams during crisis situations, when emotional demands increase. Electrodermal activity (EDA) is a signal used as index of emotion measuring autonomic physiological arousal as a response to emotional stimuli. Physiological synchrony (PS), the spontaneous similarities over time in individuals' physiological responses such as EDA, has been linked to collaboration, learning quality, and performance. However, there is a paucity of research in medical education examining PS as a predictor of cohesion, and performance, despite the importance of these emotional qualities in medical teams. We therefore aim to examine the presence of PS in medical residents as they undergo CRM simulation training. We observed thirty-seven second year medical residents in ten groups ranging from 3 to 6 participants each, during CRM scenarios. Participants' EDA was captured using Empatica E4 wristbands, and simulation sessions were videotaped. EDA signals are being pre-processed, standardized, and synchronized with the video. A Multidimensional Recurrence Quantification Analysis will be conducted to determine the presence of PS and its characteristics.Our research will explore the presence of PS during collaborative learning tasks in medical residents and provide novel scientific insights into group emotional dynamics, particularly in the context of simulation-based medical education.

Symposium
Motivational, Social and Affective Processes

Goals, Reasons, and Complexes: Current Advances in Achievement Goal Research

Keywords: Goal Orientations, Motivation, Self-determination, Self-regulated Learning and Behaviour
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Martin Daumiller, University of Augsburg, Germany
Chairperson: Marc Philipp Janson, University of Mannheim, Germany
Discussant: Ruth Butler, Hebrew University of Jerusalem, Israel

The achievement goal approach is a particularly prominent and productive approach to the study of achievement motivation. Rooted in the works by Dweck, Nicholls, Ames et al. in the 1980s, much has been learned about characteristics, antecedents, and consequences of goal pursuit. Achievement goal research is still ongoing, with multiple recent theoretical developments and accompanying empirical realizations, including reasons behind goals, goal complexes, equifinality and multifinality, and joint goal pursuit. Addressing these current trends, this symposium consists of four papers that complement each other by combining different theoretical perspectives, methodological approaches, and data from multiple international samples. Paper 1 provides a novel perspective on achievement goals and regulatory foci, extending their fundamental linkage beyond goal valence (approach-avoidance dimension) towards underlying self-guides of ideals and oughts. Paper 2 investigates how achievement goals are linked with multiple underlying reasons, and examines consequences and personal predictors of these linkages. Paper 3 addresses underlying reasons of achievement goals by testing their relation to challenge-seeking and procrastination in a longitudinal design. Finally, Paper 4 presents results of an experiment on the interplay of goal complexes and feedback on learning processes and outcomes. All contributions are characterized by the aspiration to dive deeper into what drives achievement goal pursuit, and in doing so

contribute to both theory and practice. This provides better understanding of how different perspectives on and developments within goal research align, and how exactly goals motivate human behavior. A leading achievement goal scholar will critically discuss the presentations and directions for future research.

Beyond Approach-Avoidance: Achievement Goals, Regulatory Foci, and Self-Guides
Presenting Author: Sophie Bossert, University of Mannheim, Germany; **Co-Author:**Marc Philipp Janson, University of Mannheim, Germany

Achievement goal theory and regulatory focus theory are two prominent approaches explaining individual goal striving. Achievement goal theory states that individuals prefer different qualities of goals in achievement situations such as developing competence (mastery goals) versus demonstrating competence (performance goals). Both achievement goals can be subdivided into approach and avoidance. Regulatory focus theory proposes two motivational systems. A promotion focus emphasizes striving for reaching positive outcomes like hopes, wishes, and aspirations (ideals), while a prevention focus emphasizes striving for not failing on negative outcomes, duties, responsibilities, and obligations (oughts). Recent research has connected both constructs mainly based on the approach-avoidance distinction which is central to both theories. We see this as a theoretical as well as a methodological shortcoming and propose a different theoretically meaningful association of those constructs. Based on theoretical considerations of the underlying processes and existing studies on correlates, we propose that performance goals (approach and avoidance) are associated with a prevention focus, and mastery goals are associated with a promotion focus. We provide cross-sectional data from N = 192 German university students as first empirical support and designed an experiment manipulating regulatory focus and measuring achievement goals for this registered report. We expand research on the nomological network of both constructs with our perspective and contribute to a deeper understanding of human strategic orientations. We also provide opportunities for the development of improved goal fostering interventions in achievement situations.

Do Perfectionistic Tendencies Moderate the Effect of Goals and Goal Reasons on Academic Well-being?
Presenting Author: Markku Niemivirta, University of Eastern Finland, Finland; **Co-Author:**Antti Pulkka, National Defence University, Finland; **Co-Author:**Anna Tapola, University of Helsinki, Finland; **Co-Author:**Heta Tuominen, University of Eastern Finland, Finland

In this study, we looked at the role of goals in student motivation and well-being in combination of various perspectives. More specifically, we investigated how achievement goals and reasons for those goals (utility, indication of competence, gaining respect, personal importance, promotion of self-worth) link with each other, how they jointly predict study-related engagement and exhaustion, and whether these connections vary depending on what the students expect from themselves and how concerned they are about their accomplishments (i.e., perfectionistic tendencies). Through latent profile analysis, we identified three groups of Finnish university students (N = 305) with different perfectionistic profiles, perfectionists (high strivings and concerns; 31.8 %), ambitious (high strivings, low concerns; 40.7 %), and non-perfectionists (low strivings and concerns; 27.5 %), which also differed systematically in terms of the achievement goals and goal reasons they emphasised. Interestingly, reasons for goals predicted academic well-being above and beyond the effects of goals, and the predictions were for the most part rather similar across the perfectionistic profiles. The differential effects between the groups observed, however, revealed that the experiences of strain in studies might be more dictated by how the students approach their goals and attainments. Our complex set of results provide new insights into the dynamics of achievement goals and the linkage between motivation and well-being.

Autonomous Reasons Underlying Achievement Goals and Challenge-seeking, Procrastination, and Grades
Presenting Author: Athanasios Mouratidis, National and Kapodistrian University of Athens, Greece; **Co-Author:**Aikaterini Michou, University of Ioannina, Greece; **Co-Author:**Aysenur Alp, University of Zurich, Switzerland; **Co-Author:**Aylin Kocak, Izmir University of Economics, Turkiye; **Co-Author:**Şule Selçuk, University of Kastamonu, Turkiye

More and more empirical research has started testing the theoretically attractive proposition of examining the reasons for which students endorse specific achievement goals. Yet, most of these studies rely on cross-sectional data. In this two-wave study, we build on the accumulated evidence by investigating to what extent autonomous and controlling reasons underlying the pursuit of mastery and performance-approach goals predict changes in challenge-seeking, procrastination, and grades among adolescent students. Participants were 1,336 Turkish adolescent students (M_{age} = 15.52, SD = 0.39 years; 63.5% females).

They filled out a survey in the Fall semester (T1) where they reported autonomous and controlling reasons underlying mastery and performance-approach goals for either mathematics or Turkish language, their preference to seek challenges, and their tendency to procrastinate their homework in that subject. Six months later (T2), they reported their challenge-seeking and procrastination again, and at the end of the school year their grades in that subject. Path model analyses showed that, after controlling for autoregressive effects, autonomous reasons unergirding mastery-approach and performance-approach goals predicted T2 challenge-seeking, which positively predicted end-year subject-matter grades. Also, autonomous reasons underlying mastery-approach goals negatively predicted T2 procrastination, which negatively predicted end-year subject-matter grades. The latter was also directly predicted positively by autonomous reasons and negatively by controlling reasons underlying mastery-approach goals. These findings provide further empirical evidence for the adaptive role that autonomous reasons could play in achievement striving. The limitations of the study and suggestions for future research are discussed accordingly.

You did well! Does Feedback Independently of or Interactively with Goal Complexes Affect Outcomes?
Presenting Author: Aikaterini Michou, University of Ioannina, Greece; **Co-Author:**Servet Altan, MEF University, Turkiye; **Co-Author:**Athanasios Mouratidis, National and Kapodistrian University of Athens, Greece; **Co-Author:**Maarten Vansteenkiste, Ghent University, Belgium; **Co-Author:**Caroline Pulfrey, Swiss Federal Institute of Technology, Switzerland

Experimental studies have shown that mastery and performance goals communicated in an autonomy-supportive style facilitate goal endorsement for autonomous reasons leading to positive outcomes. In the present experimental study, we extended this line of research by investigating whether positive or negative feedback after task completion could attenuate the effect of autonomy-supportive style or achievement goals or their interaction on task takers' interest, task value, pressure, and perceived competence. Following the Goal Complex perspective, we conducted a two (mastery vs. performance goals) by two (autonomy-supportive vs. controlling style) by two (positive vs. negative feedback) experimental study in which conditions were induced through language (i.e., semantically) and voice tone. The sample consisted of 175 middle school Turkish students (51.4% males; M_{age} = 12.67, SD = 1.4), who performed two emotion recognition tasks (ERTs) participating randomly in one of the eight conditions. Factorial ANOVA showed that feedback interacted neither with the autonomy-supportive style of achievement goal promotion nor with the achievement goal in the prediction of task outcomes. Participants in the autonomy-supportive conditions reported higher interest and task value than those in the controlling conditions. Performance (against mastery) goal conditions increased task value only after feedback was introduced, but they also increased pressure. Lower task value was observed in the mastery-controlling condition than in all the others. Finally, positive feedback predicted only perceived competence. The findings speak for the importance of autonomy-supportive style in achievement goal promotion to facilitate their endorsement for autonomous reasons and enhance positive outcomes.

Session A 6

Symposium
Culture, Morality, Religion and Education

Determinants of school success for immigrant children

Keywords: Cultural Diversity in School, Developmental Processes, Educational Attainment, Foreign and Second Language Acquisition, Migrant / Refugee and Minority students, Multicultural Education, Primary Education, Quantitative Methods, Reading
Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Sebastian Nicolas Thomas Vogel, TU Dortmund University, Germany
Organiser: Justine Stang-Rabrig, TU Dortmund University, Germany
Organiser: Nele McElvany, TU Dortmund University, Germany
Discussant: FROSSO MOTTI, National and Kapodistrian University of Athens, Greece

Immigrant students often face challenges in school that can hinder school success. Global patterns of migration and refuge led to rising numbers of increasingly heterogeneous immigrant students in educational systems worldwide, further increasing the importance to identify how these students are negatively affected at various stages of education and what protective factors can help them succeed. Therefore, this symposium with contributions from Germany, Sweden and Ireland aims to give an overview over the challenges these students are facing and what factors can be beneficial for overcoming them. The first contribution focuses on refugee students entering the school system and the role that language proficiency and other factors play for successfully starting school. Next, educational participation and language development of second generation immigrant students before and during elementary school are investigated with regard to family background. The third contribution compares recently immigrated students at the upcoming transition to secondary school with peers regarding school track recommendation, competences and life satisfaction, considering also potential protective factors like students' vocabulary. Finally, potential measures to facilitate immigrant students' success are presented based on recent developments in Swedish primary and secondary education, discussing both the reasoning behind, and challenges for successfully implementing them. The symposiums brings together central lines of current research from different countries and disciplines. The findings are vital to concluding what forms of support are most beneficial for immigrant students, providing a basis for developing programs aimed at the specific needs of immigrant students to help them meet the challenges they face.

Primary school enrollment of refugee children in Germany
Presenting Author: Melanie Olczyk, Martin-Luther Universiät Halle-Wittenberg, Germany; **Co-Author:**Julian Seuring, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Gisela Will, Leibniz Institute for Educational Trajectories (LIfBi), Germany

In the context of the refugee movements between 2010 and 2020, many refugees also came to Germany – among them many children. For children who fled their country of origin before starting school, enrollment in primary school in the host country is one of the first important steps in their educational biography. We examine the conditions under which the start of primary education is delayed among school-age refugee children. In addition, we investigate whether refugee children attend regular classrooms or so-called 'newcomer' classrooms (i.e., separate classes for refugees and immigrants with special education, such as language instruction) upon entering primary school. We used data from the study ReGES, which was conducted in five German federal states. For the analysis, we used a subsample of N=677 children who were of school age in wave 2 (2019) and who would normally have started primary school in the 2018/19 school year. The results showed that the majority of refugee children are enrolled in school according to their age and attend a regular class. Although the quota of delayed refugee children was low (7.5%), it was higher than the quota among native children. In particular, children from educationally disadvantaged backgrounds seemed to be affected. Furthermore, there was also a small group of refugee children who attended separate immigrant classes. In addition to state-specific regulations, the lack of German skills played a particularly important role here.

English language and reading development of migrant children in Ireland
Presenting Author: Merike Darmody, The Economic and Social Research Institute, Ireland; **Co-Author:**Helen Russell, The Economic and Social Research Institute, Ireland; **Co-Author:**Frances McGinnity, The Economic and Social Research Institute, Ireland

Ireland provides a useful case study into the experiences of second-generation migrants in a 'new immigration country'. To date relatively little is known about how the Irish-born children of these migrants are faring in English language development compared to their Irish peers. This paper draws on a large representative cohort study of children born in 2008, *Growing up in Ireland*, one third of whom are of migrant origin (14% with one parent born abroad and 19% with both parents (or lone parent) born abroad). This paper use OLS modelling and Gelbach decomposition analysis to examine how country of birth, linguistic and ethnic background of parents influence children's English vocabulary and reading scores from age three to age nine, and the role of socio-economic status, child characteristics and school characteristics in explaining these relationships, and a lagged dependent variable model to explore progression over time. Results suggest considerable convergence in English language scores over time: at age three, 60% of migrant-origin children are in the bottom quartile in the English vocabulary test, but by age 9, only 26% were in the bottom quintile for reading. Parents' linguistic background is more important than country of birth or ethnic background in predicting reading scores at 9 years. Important factors also include lower income and attending disadvantaged schools and coming from 'mixed' family – one Irish and one foreign-born parent.

What helps immigrant and refugee children succeed at the end of German primary school?
Presenting Author: Sebastian Nicolas Thomas Vogel, TU Dortmund University, Germany; **Co-Author:**Justine Stang-Rabrig, TU Dortmund University, Germany; **Co-Author:**Philipp Jugert, Institute for Psychology of Duisburg-Essen University, Germany; **Co-Author:**Birgit Leyendecker, Faculty of Psychology, Child and Family Research, Ruhr-University Bochum, Germany; **Co-Author:**Nele McElvany, TU Dortmund University, Germany

Students' school success at the end of primary school comprises various aspects like competences but also well-being and teacher's track recommendation, as the chosen secondary track is strongly influential for the following educational pathway in the German education system. An immigrant background is often negatively related to school success but how these relations appear for recently immigrated and refugee children specifically remains largely unclear. Their share in German schools has strongly risen over the last decade, making it vital to investigate potential negative effects for this especially vulnerable group. Additionally, considering mediators of the relation of their family background and school success (e.g., vocabulary) can reveal potentially protective factors. A sample of 278 German fourth grade students (53.2% female; M_{age} = 10.45, SD = 0.55; 36.4% recent immigrants or refugees), performed standardized tests and answered questions on variables of interests while teachers provided information on grades and track recommendation. Controlling for cognitive abilities and socioeconomic background, logistic regression revealed a significantly lower probability of receiving an academic school track recommendation for recent immigrant or refugee students compared to other groups. Structural equation models considering additional family background variables revealed that refugee/immigration experience related to lower reading competence, worse grades and lower probability of academic track recommendation, but not life satisfaction. Vocabulary partially mediated the relation of refugee/immigration experience and the aforementioned outcomes. Findings underline the relevance of immigrant students' vocabulary as a protective factor against negative background effects. Further implications are discussed in the presentation.

Determinants of school success for immigrant children - the case of newly arrived students in Sweden
Presenting Author: Nihad Bunar, Department of Special Education, Stockholm University, Sweden

Based on a thorough review of mainly recent Swedish literature, and conclusions from three research projects, the aim is to present and explore organizational models for reception, schooling of and provision of support measures to newly arrived migrant students (NAMSs) in Sweden. Main organizational models for elementary schools (separate classes and direct immersion) and for upper-secondary schools (Language Introduction Program) are presented and explored. An overall conclusion is that the organizational models deployed in elementary schools affect conditions for inclusion of NAMSs only to a certain degree. The Language Introduction Program does not facilitate inclusion by removing obstacles, focusing on individual needs and strengths and by providing shared physical spaces. As evident from research accounts, precisely the opposite seems to be taking place. Additionally, two major support measures are presented and explored: a) the initial assessment of students' background and experiences of learning and schooling; b) multilingual classroom assistance. The overall conclusion is that high ambitions of both are being considerably distorted in the enactment process, undermining their capacity to promote social and pedagogical inclusion of NAMSs. Finally, the policy has to pay more attention to how ambitious support measures are negotiated in the process of their enactment and that a critical gaze ought to be redirected from only focusing models, without underestimating their impact, to individual circumstances and educational needs and strengths of every student.

Symposium
Assessment and Evaluation

The Development of Feedback Literacy: From Intervention Programs to Programme Interventions

Keywords: Curriculum Development, Feedback, Higher Education, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Teacher Professional Development
Interest group: SIG 01 - Assessment and Evaluation
Chairperson: Martijn Leenknecht, HZ University of Applied Sciences, Netherlands
Organiser: Martijn Leenknecht, HZ University of Applied Sciences, Netherlands
Discussant: Rachelle Esterhazy, University of Oslo, Norway

With the introduction of the concept of 'feedback literacy' by Carless and Boud (2018), research focus has shifted from feedback as external input to the role of the individual in feedback processes (Nieminen & Carless, 2022). The notion has grown that feedback processes can only be successful when participants have sufficient feedback literacy. This raises the question: how do persons become feedback literate? In this symposium we take the conceptualisation by Carless and Boud (2018) as starting point to discover the development of feedback literacy in students and teachers in higher education. The four studies in this symposium capture the broad perspective of feedback literacy, from developing skills and abilities, socialisation, to building identity through discourse (Nieminen & Carless, 2022). In a scoping review (Presentation 1), the nature and scope of intervention studies is reviewed to explore key aspects of developing feedback literacy through intervention programs. The social context and process of socialisation is mapped in relation to identity building (Presentation 2) and feedback seeking behaviour (Presentation 3), to shed light on feedback literacy as social construct and the impact of the context on the development of it. In the last presentation the impact of programme design on students' and teachers' feedback literacy is explored. The combination of observational and intervention studies provides a powerful basis for scientific discussion on intervening aspects from the social context on participants' feedback literacy. Moreover, the symposium provides a wide palette from interventions programs to programme interventions to support feedback literacy.

Can Students' Feedback Literacy be Improved? A Scoping Review of Interventions
Presenting Author: David Boud, Deakin University/University of Technology Sydney, Australia; **Presenting Author:**Joanna Tai, Deakin University, Australia; **Co-Author:**Tegan Miller, Deakin University, Australia; **Co-Author:**Phillip Dawson, Deakin University, Australia

Empirical research into feedback literacy has rapidly developed, as studies look for ways to increase positive feedback behaviours in students. As interventions are established, questions remain surrounding which elements of feedback literacy can be successfully improved in practice. This paper seeks to explore the key aspects concerning the development and implementation of feedback literacy interventions. A scoping review was conducted to address two research questions, including the foci, nature, and success of interventions. A total of 16 papers met the criteria for review. The review found evidence of enhanced feedback literacy in students, such as managing perceptions and attitudes, improving understanding of the student role, and having more confidence and agency in the feedback process. Implications and recommendations for future feedback literacy studies are discussed.

The Development of Feedback Literacies and Identities of First Year Education Students
Presenting Author: Juuso Henrik Nieminen, The University of Hong Kong, Finland

The idea of feedback literacy has gained widespread attention in higher education literature, yet not much is known about the longitudinal development of students' feedback literacies over time. This study takes an in-depth narrative approach to understand the development of feedback literacy in its socio-cultural context. The dataset consists of four narrative interviews as conducted for five first-year students in the specific context of an early education programme in a university in Hong Kong. Through in-depth narrative inquiry, the analysis shows how the students' feedback literacies develop in tandem with their evolving identities as future 'assessors'. The student narratives take place in the test- and competition-driven context of Hong Kong; the study sheds light on the critical aspects of feedback literacy by discussing how the students wish to use their feedback literacies to build more sustainable futures of assessment and feedback in this context.

Feedback Seeking of Undergraduate Nursing Students: From Whom and Why?
Presenting Author: Martijn Leenknecht, HZ University of Applied Sciences, Netherlands; **Co-Author:**Hanneke Wiltjer, HZ University of Applied Sciences, Netherlands

Understanding (the development of) feedback literacy requires a perspective that looks beyond the individual student. The social learning context of the student determines their feedback literacy and active involvement in feedback processes. In the current study, social network analysis is used to map students' proactive feedback behaviour in medical education. Students were asked to indicate from whom and why they will seek feedback. These nodes were connected to each other and graphically plotted in a network to obtain new insights. Findings showed that students asked for feedback within their learning 'bubble' first, from others who are at a non or low-hierarchical distance from themselves. These persons were asked for feedback because of their overview over the learning process of the student and their perspective and closeness. Those findings show that teachers could support students more in crossing the boundaries and asking for feedback from others than the usual subjects.

Student and Teacher Feedback Literacy in the Context of Programmatic Assessment
Presenting Author: Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Natalie Liebrechts, Utrecht University, Netherlands

Feedback literacy is viewed as a process in which students actively make sense of information from different sources to enhance their work. This fits programmatic assessment, in which students are viewed as active participants in the feedback process. Programmatic assessment involves the longitudinal collection of "data-points" about student learning. In programmatic assessment, feedback has a dual purpose: [1] students collect feedback from different perspectives (e.g., teachers, peers, workplace) on their data-points, with the aim to foster learning; and [2] data-points and feedback are used for later (summative) decision-making. This may leads to confusion, reluctance in giving critical feedback and the need to document written feedback. Therefore, taking the perspective of feedback literacy might help illuminate some problems experienced with the dual purpose of feedback in programmatic assessment. Research questions therefore focused on students' and teachers' feedback literacy features in the context of programmatic assessment and this dual purpose of feedback. Students (N=18) and teachers (N=11) of a ba-course in the paramedic domain were interviewed individually or in focus groups. This ba-course implemented programmatic assessment and students and teachers thus experienced the dual purpose of feedback. Results show some specific assessment literacy features in the context of programmatic assessment. Teachers need to connect feedback on single data-points to long term learning. Both teachers and students sometimes struggled with dual roles of feedback giver and decision-maker. Students reported increased evaluative judgment capabilities.

Symposium
Instructional Design

Emotional design and the necessary but not sufficient influence of triggering motivation

Keywords: Comprehension of Text and Graphics, Game-based Learning, Instructional Design, Interest, Metacognition, Motivation, Multimedia Learning, Video-based Learning
Interest group: SIG 06 - Instructional Design
Chairperson: Tino Endres, University of Freiburg, Germany
Organiser: Tino Endres, University of Freiburg, Germany
Discussant: K. Ann Renninger, Swarthmore College, United States

In many types of learning materials that are popular in the internet, such as instructional videos or games-based learning, aesthetics play an essential role. Research on emotional design investigates the impact of aesthetical design features on learning. Recent findings in this field point towards possible positive effects on learning that can be attributed to increased motivation and engagement as well as to cognitive aspects such as reduced unproductive cognitive load.

In this symposium, we examine four aspects (partly within or between contributions) that might moderate the effectiveness of emotional design and should be considered when developing theoretical models on emotional design and its use in instructional design. The four aspects are the learning setting in which the emotional design is implemented (game-based or instructional learning), the age of the learners, the duration of the learning situation, and the surrounding learning situation such as narrative framing or attractive alternative behavior. All four contributions consider motivational as well as cognitive variables when explaining potential learning gains. The presented studies suggest that triggering motivation is a necessary but not sufficient condition for positive effects of emotional design. The development of the motivation, especially situational interest will play an essential role in the discussion of those four studies.

Contextual animation in multimedia learning materials for children: saga of null results continues
Presenting Author: Cyril Brom, Charles University, Czech Republic; **Co-Author:**Karolína Schubertová, Czech Television, Faculty of Arts, Czech Republic; **Co-Author:**Anna Drobná, Faculty of Education, Faculty of Mathematics and Physics, Czech Republic; **Co-Author:**Kristina Volná, Czech Television, Czech Republic

Empirical evidence on effectiveness of 'emotional design' approaches for primary school children is limited. This study examines effects of one specific emotional design approach, contextual animation, on learning outcomes and situational interest in the case children 9–10 years of age. Contextual animation refers to the non-expository animation of context-providing representational pictures. Unlike decorative animation, contextual one does not add extraneous elements. In the present study, children studied about exponential growth and public opinion polls from two 3-min-long narrated videos either with or without contextual animation (N = 50; within-subject design; the order of video topics and the type of animation were counterbalanced). Null results were found both as regards learning outcomes and situational interest. This study increases a body of literature pointing at limited effects of emotional design approaches in the case of preadolescents.

How emotionally designed scaffolds affect learning and motivational outcomes in game-based learning?
Presenting Author: Antti Koskinen, University of Tampere, Finland, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland; **Co-Author:**Manuel Ninaus, University of Graz, Austria; **Co-Author:**Kristian Kiili, Tampere University, Finland

In recent years, the importance of emotions in learning has been increasingly recognised. Applying emotional design to induce positive emotions has been considered a means to enhance the instructional effectiveness of digital learning environments. However, only a few studies have examined the specific effects of emotional design in game-based learning. This quasi-experimental study utilised a value-added research approach to investigate whether emotional design applied to scaffolding in a game-based learning environment improves learning and motivational outcomes more than emotionally neutral scaffolding. A total of 138 participants, mean age of 11.5 (SD = 0.73) participated in the study. Sixty-eight participants played the base version of a fraction learning game (Number Trace), where scaffolding was provided with emotionally neutral mathematical notations, and 70 participants played the value-added version of the game using emotionally designed animated scaffolding agents. Pre-and post-tests were used to measure conceptual fraction knowledge and self-reported measures of situational interest and situational self-efficacy to evaluate motivational outcomes. Our results indicate that the emotional design applied to scaffolds can improve the educational value of a game-based learning environment by enhancing players' situational interest and situational self-efficacy. However, although the intervention improved the participants' conceptual fraction knowledge, there was no significant difference between the scaffolding conditions in participants' learning outcomes. These results suggest that emotional design can increase the educational impact of game-based learning by promoting the development of interest, as well as improving self-efficacy.

Narratives as feature of emotional designed whiteboard animations – learning effects and moderators
Presenting Author: Sascha Schneider, University of Zurich, Switzerland

Whiteboard animations can be used to acquire knowledge on various topics in a narratively presented form. However, understanding narratives as a feature of emotional design has not yet been examined. In a series of three between-subject experiments, various attempts to create a narrative context in whiteboard animations are shown and examined for their contribution to learning enhancement. In addition, the research will help to clarify the extent to which possible moderators affect the effect of narrative support on learning. Thus, in Experiments 1 and 2 the influence of procedural character on the effect of narration was investigated, whereas in Experiment 3 a personal address of the learner was analyzed. In all experiments, data on cognitive and affective processes perceived during learning is used to explain found effects. Results show that narratives can have a major impact on learning outcomes. In addition, the effect of narratives is higher when a procedural character and a personal addressing is used.

Can emotional design be an aid to overcome the hurdle of high opportunity-costs in learning?
Presenting Author: Charlotte Vössing, University of Freiburg, Germany; **Co-Author:**Tino Endres, University of Freiburg, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany

More and more learning happens on digital devices such as laptops. Those devices increase the flexibility of learners, especially in challenging times such as the pandemic, and can support productive home schooling or similar concepts. However, they also come with the challenge that they provide many attractive alternative behaviors, causing high opportunity-costs. The emotional design of the learning material might help students coping with those high opportunity-costs by its potential to trigger situational interest and reduce cognitive load. In this study a 2x2x2 mixed design is implemented varying video-design (emotional vs. neutral), opportunity-costs (without vs. with possibilities for alternative behavior) and repeated measurement (beginning vs. ending of the learning phase). Situational interest was assessed after learning to investigate the development of motivation. The participants (*N*=144) learned from 15-minute whiteboard-animation videos with a neutral design or with an emotional design, either shown with or without attractive alternative behavior options. The found results suggest that emotional design fosters learning outcomes in the end of prolonged learning sessions. This effect was mediated by situational interest and cognitive load. When integrating the opportunity costs, it showed that the impact of emotional design increased with the possibility of alternative behaviors. Overall, emotional design helped students to learn better in longer learning sessions and to cope with high opportunity-costs.

Session A 9

22 August 2023 12:15 - 13:45

Symposium

Implications of different responses to errors. Perspectives from several educational contexts

Keywords: Attitudes and Beliefs, Classroom Management, E-learning/ Online Learning, Early Childhood Education, Emotion and Affect, Feedback, Motivation, Parental Involvement in Learning, Parents' Beliefs and Affect, Primary Education, Secondary Education, Teacher Effectiveness, Teacher Professional Development
Interest group:
Chairperson: Annalisa Soncini, University of Bologna, Italy
Discussant: Eleftheria Gonida, Aristotle University of Thessaloniki, Greece

Errors, mistakes and setbacks are an integral part of life. However, many educators and parents avoid talking about errors and failure reducing the opportunity to learn from them. Supportive feedback after mistakes, error-handling strategies and error friendly environments can is argued to promote students' and children's positive reactions towards errors as well as their self-regulation processes and learning. However, more empirical evidence on the role and benefit of dealing with errors within different contexts and in constructive ways is needed. This symposium brings together empirical research (longitudinal, experimental, and qualitative) from different educational settings (i.e., home, school, and professional training) and with different populations (i.e., mother-child dyads, primary and middle-school students, and teachers) to further explore the positive role of errors in learning and how to promote such environments. The four papers included in the symposium present innovative findings that add new insight on differences in individual perceptions of and responses to errors and failure in different contexts. Educational relevance and practical implications of the symposium lie in the possibility of applying evidence-based finding to promote error friendly learning environments, support more adaptive responses to errors and failure and to promote innovative teacher training. Keywords: Errors, Failure, Parents, Online learning, Teachers education

Error climate and alienation from teachers: A longitudinal analysis in primary school
Presenting Author: Gabriele Steuer, University of Bielefeld, Germany; **Co-Author:**Alyssa Laureen Grecu, Center for Research on Education and School Development, Germany; **Co-Author:**Julia Morinaj, University of Bern, Switzerland

How errors are handled in the classrooms is a crucial aspect of instruction quality and has multiple consequences for students' own dealing with errors, their learning, and achievement (Steuer et al., 2013). Teachers' unsupportive behaviours such as negative reactions to errors may increase students' alienation from teachers. Alienation from teachers comprises a decreasing sense of belonging to teachers (Hascher & Hadjar, 2018). Teacher-student interactions have a strong impact on students' academic as well as social learning experiences (Pianta et al., 2003). So far, little is known about the association between the error culture and students' alienation from teachers in primary school, and how this relationship develops over time. In our study, we used a sample of $N = 406$ students in 29 primary school classrooms in Switzerland. They were on average T1 10.3 years old ($SD = 1.0$), T2 10.9 years old ($SD = 0.5$), and 221 students were female (54.4 %). At two measuring points, they reported error climate and alienation from teachers. Multilevel analysis revealed that error climate at T1 negatively predicted alienation from teachers at T2. That means that a positive error climate is related to less alienation from teachers. Our findings close the gap to examine interrelations of error climate and alienation from teachers in the primary school setting. We found that error climate predicted alienation from teachers, which implies that improvements of dealing with errors may be beneficial for teacher-student interaction and attenuate alienation from teachers.Keywords: Primary education; Social aspects of learning and teaching; Error culture; Alienation from teachers; Longitudinal study

Supportive error feedback fosters students' positive emotions and motivation
Presenting Author: Annalisa Soncini, University of Bologna, Italy; **Presenting Author:**Maria Cristina Matteucci, University of Bologna, Italy

The learning from errors model proposes that positive feedback after an error may support students' adaptive affective-motivational and cognitive-metacognitive self-regulation processes useful to correct the error. Even with positive feedback, these adaptive responses to mistakes may be hindered if pupils are tested and evaluated. The purpose of the current study was to test experimentally the effect of giving supportive feedback after an error on students' adaptive reactions towards errors comparing an evaluative situation (e.g., receiving a grade for a final exam) and a not evaluative situation. We implemented an experimental manipulation base on four different conditions: positive feedback - grades, positive feedback - no grades, negative feedback - grades, and negative feedback - no grades. A total of 222 Italian middle school students took part in an online learning unit with experimental manipulation. During the manipulation, students were informed of the possibility of being graded or not for an end-lesson test (i.e., grading conditions) and were provided with positive vs negative feedback (i.e., feedback conditions) after the errors. The main finding showed a main effect of feedback condition, whereby students who received positive feedback reported more adaptive reactions towards errors than those who received negative feedback. No other significant effects were found. This study adds to other research findings on the importance of supportive and positive error feedback in promoting adaptive self-regulation processes helpful to learn from errors.Keywords: Feedback; Grading; Adaptive reactions towards errors; Online learning environment; Secondary education

How you talk to your kids about setbacks and failures matters
Presenting Author: Elizabeth Peterson, University of Auckland, New Zealand; **Co-Author:**Sharma Tanvi, The University of Auckland, New Zealand; **Co-Author:**Amy Bird, The University of Auckland, New Zealand; **Co-Author:**Elaine Reese, The University of Auckland, New Zealand; **Co-Author:**Annette Henderson, The University of Auckland, New Zealand; **Co-Author:**Varun Ramgopal, Madras Institute of Development Studies, India; **Co-Author:**Susan M B Morton, The University of Auckland, New Zealand

How parents talk to their children about recent setbacks and failures matters. In a longitudinal study of 250 mother-child dyads from diverse backgrounds analysis has found that the way mothers talk to their 8-year-old children about a recent setback is associated with their children's self-reported adaptability, bounce back and response to failures four years later. Findings suggest that the combination of conversational features modelled and discussed is important. We found that parental recognition of their child's emotion alongside a discussion of the range of resources available to the child was associated with higher levels of confidence in the children's ability to adapt to change and an increased chance of the child reporting they take time to learn from their mistakes at aged 12. Similarly, when mothers discussed with their child a clear plan to manage the disappointment *and* discussed a range of resources that were available to support the child in the future should the event occur again, this this was associated with increased child reporting of bounce back at age 12. As parents continue to look for ways to build their children's resilience to manage increasingly uncertain times, our findings suggest that parent-child conversation can offer an early guide to children and help build their confidence that they can navigate and learn future challenging events. Keywords: Parents, Errors Adaptability, Resilience

The value of (learning from) mistakes in teacher education in Finland and Germany
Presenting Author: Annika Breternitz, Technische Hochschule Ostwestfalen-Lippe, Germany; **Co-Author:**Maria Tulis, University of Salzburg, Austria

Teachers' everyday error management in the classroom is one important aspect of their professional competence. This comprises (a) the ability to deal constructively with students' errors – and, thus, the knowledge of possible types of errors – and (b) adaptive error beliefs inclusive of error tolerance and openness to learning from mistakes. The purpose of this study was to explore how teacher education programs prepare teachers to meet these expectations or build these competencies. In order to identify indicators of learning from mistakes during teacher education and everyday teaching practice, we analyzed comprehensive interviews with 27 teachers of different subjects and different school forms in Germany (NRW) and Finland (southern Finland and middle Finland). The data were coded into different categories: expressions of dealing with errors in the classroom, recollections of acquiring of theoretical knowledge about errors during teacher education, retrospective accounts of experience learning from mistakes and mentors' feedback during initial teaching practice, and indicators of teachers' current error-related belief system and their suggestions for dealing with mistakes. Based on these dimensions, we identified different values of failure and errors as an opportunity for learning and improvement as being present in the teachers' narratives. Respondents expressed different attitudes towards mistakes, as well as constraints of constructive error-related learning opportunities. Interestingly, our findings suggest that teacher education may have little impact on adaptive activities and beliefs about dealing with errors. The Role of Attitudes, Peer and Lecturer Norms in Predicting How Students Use Lecture Recordings.
Keywords: Attitudes and Beliefs, Educational Technologies, Higher Education, Quantitative Methods
Presenting Author: Kasia Banas, University of Edinburgh, United Kingdom; **Co-Author:**Thomas Thejll-Madsen, University of Glasgow, United Kingdom; **Co-Author:**Anita Tobar-Henríquez, University of Edinburgh, United Kingdom; **Co-Author:**Eva Murzyn, University of Edinburgh, United Kingdom

Given the widespread availability and use of recorded lectures in higher education, the key research question is not *if* students use lecture recordings, but rather *how* they use the recordings, and how educators can support them to use recordings most effectively. Indeed, a distinction is made in the literature between using lecture recordings as a substitute to attending live lectures (watching *instead of* attending; usually undesirable) and using them as a supplement to

attending live lectures (watching *in addition to* attending; usually desirable). This study examined the demographic and psychological variables associated with the use of lecture recordings as a substitute or as a supplement. We measured the students' own opinions about attending live lectures and using lecture recordings (attitude), students' beliefs about what their classmates thought about these behaviours (peer norm), and students' beliefs about what their lecturers thought about these behaviours (lecturer norm). Using data gathered in a large introductory psychology course (n=212), we found that students had a positive attitude and perceived a positive peer norm towards all three behaviours. Their perception of lecturer norm was more nuanced, with substitution perceived to be the least accepted by lecturers. Generally, the more positive the students' own attitude and the perceived peer norm towards the focal behaviour, the more likely students were to engage with lectures in that way. These findings suggest that attitudes and social norms may be useful targets for educational interventions promoting the use of lecture recordings as a supplement rather than substitute.

Measurement and Promotion of Critical Online Reasoning Skills among Young Professionals
Keywords: Digital Literacy and Learning, Educational Technologies, Higher Education, Quantitative Methods
Presenting Author: Lisa Martin de los Santos, Johannes Gutenberg University of Mainz, Germany; **Co-Author:**Olga Zlatkin-Troitschanskaia, Johannes Gutenberg University of Mainz, Germany; **Co-Author:**Marie-Theres Nagel, Johannes Gutenberg University Mainz, Germany; **Co-Author:**Denis Federiakin, Johannes Gutenberg University of Mainz, Germany

Although young professionals across different domains are increasingly using digital media as information and learning tools, little research has been conducted on the actual use of online information and the promotion of corresponding Critical Online Reasoning (COR) skills in post-university education. With our newly developed digital assessment and training tool, we investigate how the COR skills of young professionals can be measured and promoted at the beginning of their professional training. We determine how the COR facets are measured in young professionals and to what extent they can be improved through online COR training. Using a longitudinal panel design, we analyze the COR skills of young professionals using both performance (COR responses) and process data (log files). Participants were asked to conduct an open-ended web search, rate online information or sources, and write an open-ended response to a short COR task. Following the pre-survey, an online training session was conducted in which participants were trained in the critical use of online information by learning strategies for Internet use. An analysis of the data from the pre-post-measurement was then conducted to evaluate the effectiveness of the digital training. The results indicate significant differences between the young professionals from different fields. A comparison of the results of the 1^{st} and 2^{nd} measurement shows initial evidence of changes in COR skills, suggesting that these skills can be developed in post-university training and that young professionals with previously weak COR skills in particular could benefit from such online training.

Keep Some Distance: Seductive Details Are Only Harmful When Closely Related to the Learning Content
Keywords: Comprehension of Text and Graphics, E-learning/ Online Learning, Higher Education, Multimedia Learning
Presenting Author: Lisa Bender, University of Freiburg, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany; **Co-Author:**Kim Brosemer, University of Education Freiburg, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany

We investigated whether the negative effects of seductive details (i.e., interesting but irrelevant adjuncts in learning materials) are only apparent when the details' content is closely related to the learning topic (i.e., in the same domain) and they, therefore, are mistakenly deemed as relevant part of learning content. For this purpose, we conducted a study in which participants (N = 77) learned two expository texts either (a) without seductive details, or (b) with seductive details that were closely related to the learning content or (c) with seductive details only loosely related to the learning content. Our results revealed no effects on recall performance, but - as expected - we found that only the closely related seductive details harmed students' transfer performance. Self-reported perceived relevance of seductive details and extraneous cognitive load were, however, not affected by experimental condition. In summary, our results suggest that the negative seductive details effect is contingent upon the strength of relation between the details and the learning content.

How Social Cues Influence Students' Non-Cognitive Experiences In Online Feedback Processes
Keywords: Feedback, Higher Education, Pre-service Teachers, Social Aspects of Learning and Teaching
Presenting Author: Theresa Ruwe, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Elisabeth Mayweg, Humboldt University of Berlin, Germany

A variety of factors can influence feedback effectiveness and social (e.g., feedback provider or language) as well as non-cognitive aspects become increasingly important in learning research. Building on this, this study examines how varying feedback providers and personalisation influence self-efficacy, motivation, and emotions as well as the effectiveness of feedback, determined by students' perceptions and performance. N = 98 teacher students participated in the 3 (provider: peer, educator, AI) x 2 (language: neutral vs personalised) between-subject study. Regression analyses show that an AI as feedback provider is perceived more trustworthy than humans (F(2, 95) = 3.43, p < .05, R^2 = 0.07, η^2p = 0.07) and elicits more positive emotions (F(2, 94) = 2.66, p < .1, R^2= 0.05, η^2p = 0.05). Furthermore, motivation is positively (F(3, 93) = 2.71, p < .05, R^2= 0.01, η^2p = 0.05) and self-efficacy for ideation negatively influenced by neutral language (F(7, 89) = 2.01, p < .1, R^2= 0.14, η^2p = 0.02). Further analyses show that neutral feedback from educators is perceived the fairest (F(7, 89) = 1.91, p < .01, R^2= 0.13, η^2p = 0.09). Additionally, self-efficacy for ideation increases from neutral AI feedback F(7, 89) = 2.01, p < .1, R^2= 0.14 2.261; η^2p = 0.04). This confirms the impact of social cues in online feedback processes. Conclusively, social presence, elicited by feedback provider and personalisation, plays a crucial role. Results will be discussed in relation to their theoretical and practical implications for the implementation of online feedback processes.

Motivation and self-regulated learning during the COVID-19 pandemic - a systematic review
Keywords: Motivation, Pandemic, Self-regulated Learning and Behaviour, Well-being
Presenting Author: Tamara Van Gog, Utrecht University, Netherlands; **Co-Author:**Ewa Miedzobrodzka, Utrecht University, Netherlands; **Co-Author:**Willeke Kitselaar, Leiden University, Netherlands; **Co-Author:**George Burchell, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Julia Henrich, Leiden University, Netherlands; **Co-Author:**Chris Hoeboer, Amsterdam University Medical Centers Location AMC, Netherlands; **Co-Author:**Lydia Krabbendam, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Milene Bonte, Maastricht University, Netherlands; **Co-Author:**Wouter van den Bos, University of Amsterdam, Netherlands; **Co-Author:**Peter Verkoeijen, Erasmus University Rotterdam, Netherlands

The COVID-19 pandemic has unprecedented consequences for education. This systematic review aimed to determine the effects of online education during the pandemic on motivation and self-regulation, which are both vital for learning and academic achievement. We investigated factors that might support or impede motivation and self-regulated learning (SRL). We reviewed longitudinal, (quasi)experimental and cross-sectional studies that tested participants aged between 5-25 who were enrolled in online educational programmes during the COVID-19 pandemic, measured motivation or/and SRL, and explored their possible relationships with academic achievements, engagement, well-being, and basic psychological needs. Moreover, we examined individual differences in age, gender, socio-economic status, country, and learning disability as possible moderators of the outcomes of interest. Search of four databases yielded over 8k records, which were subsequently screened with Rayyan and ASReview. Based on 73 papers included in the review, it became apparent that both motivation

and SRL decreased during the pandemic period. (Quasi)experiments, which tested various forms of online education that aimed to support motivation and self-regulated learning, such as gamification or flipped classrooms, yielded mixed evidence. Such effects may depend on various underlying mechanisms, such as engagement, autonomy, or social support, and on individual differences, mainly in age and gender. Studies with a correlational design mostly indicated strong relationships between motivation, various aspects of self-regulated learning, and well-being. These findings provide a better understanding of how online education during the COVID-19 pandemic has affected students' motivation and self-regulated learning and offers insights that may be informative both for educational theory and practice.

Perception of academic success among face-to-face and distance students during the covid period
Keywords: E-learning/ Online Learning, Higher Education, Motivation, Pandemic
Presenting Author: Jean-Marc Meunier, Université Paris 8, France; **Co-Author:**Elisabetta Zibetti, Université Paris 8, France

The successive confinements in France during the Covid-19 pandemic have disrupted the work modalities of all face-to-face students. In this paper, we also question the impact on distance students. With a survey of 108 students from the University of Paris 8, we show that anxiety and motivation profiles differ between these two populations and that, paradoxically, the perception of academic performance decreases for the most anxious or least motivated distance students. We propose to relate these results to the absence of specific support and the deterioration of study conditions at home to explain these results and to resituate them within the framework of self-determination theory (Ryan & Deci, 2000) and distance learning (Hartnett et al., 2011).

Perceptions of elementary school students regarding remote learning due to COVID-19
Keywords: Achievement, Attitudes and Beliefs, Pandemic, Primary Education
Presenting Author: Edit Tóth, SZTE Institute of Education, Hungary; **Co-Author:**Benö Csapó, University of Szeged, Hungary

From spring 2020 on, due to the COVID-19 pandemic in many countries, the schools were closed and students were engaged in learning from home. In the last two years, several studies have shown the negative and diverse effects of remote learning on student performance and highlighted teachers', parents', and secondary and tertiary students' perceptions, but we have scarce information about elementary school students' perceptions. This study focuses on students' perspectives at ISCED 2, the support and activities students receive from their families and schools, access to digital tools for supporting learning, and the relationship between student experiences, beliefs, and learning outcomes in mathematics and reading. Data were collected in the frame of the Hungarian Educational Longitudinal Program in May and October 2021 (N = 1590). Students filled out a questionnaire consisting of adapted items from the PISA Global Crises Questionnaire Module (OECD, 2020), and completed a mathematics and reading test. Our results indicate that most of the students have tools for learning during the school closure. The most frequent form of parental and school activity and support was the control and monitoring of learning. The students whose results were lower in math and reading comprehension tests received more family and school support for learning at home, and those whose results were higher on average received support rarely or never.

Understanding E-resilience in Education: Reviewing Public Policy Education during and after COVID-19
Keywords: Higher Education, Inclusive Education, Learning and Developmental Difficulties, Resilience
Presenting Author: Mindel van de Laar, Maastricht University, Netherlands; **Co-Author:**Julieta Marotta, UNU-MERIT / Maastricht University, Netherlands

The right to education, a basic right included in Sustainable Development Goal 4, needs to be ensured even when shocks occur. Hence, educational systems need to be prepared to overcome shocks as quickly and effectively as possible. Clearly, during the global health pandemic COVID-19, most educational systems experienced a shock that they needed to overcome. At the time, digital technologies were the main elements that enabled educational systems to continue instructing the population. In this context, the concept of e-resilience became relevant because the capacity of educational systems to overcome such shocks was linked not only to the resilience of the actors but also to the system's capacity to use digital technologies. This paper sheds light on the drivers and challenges that various actors in the educational system experienced in dealing with the COVID-19 shock. Using a comparative case study design, with cases from The Netherlands, Nigeria, Argentina and The United States, we mapped e-resilience in public policy schools based on 36 (group)-interview data from 42 students staff, administration and programme directors. The findings highlight that challenges within the technological system result in system underperformance. Yet, challenges at the human level tend to be disruptive for learning and harder to overcome by the system. However, in each context there were numerous drivers – both at technological and human level as well as in the interaction. These can be used to structure stronger educational systems.

What and how to learn with Virtual Reality Learning Environments?
Keywords: Achievement, Immersive Technologies for Learning, Motivation, Vocational Education and Apprenticeship Training
Presenting Author: Felix Kapp, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Presenting Author:**Pia Spangenberger, Universität Potsdam, Germany

Virtual Reality environments provide huge opportunities for learning experiences going beyond classroom settings. The immersive character and the corresponding experience of presence is associated with motivational and cognitive effects. Various frameworks linking the unique experience of immersive Virtual Reality (iVR) to learning have been developed in recent years (e.g. Makransky, 2021). There is, nevertheless, still need for empirical research on the effects of VR learning environments and the necessity of determining factors influencing the effects in educational settings such as schools. The present contribution introduces two empirical studies ($n_1 = 45$, $n_2 = 41$) investigating the effects of an immersive Virtual Reality Environment compared to studying text and picture material and to a classroom presentation. In both studies participants used either an iVR environment about offshore windenergy or studied material about the topic in a more traditional way. Results of the studies suggest motivational benefits of iVR while at the same time showing that participants of the text/picture and the classroom presentation group had advantages with regard to declarative knowledge compared to the iVR groups. Based on the findings existing models of Virtual Reality Learning are reflected. A special focus of the study lies on the implementation of iVR in schools, in particular in vocational education schools.

Desktop virtual reality learning environments: Can cues reduce search time and support learning?
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Educational Technologies, Instructional Design
Presenting Author: Daniela Decker, Deutsches Institut für Erwachsenenbildung, Germany; **Co-Author:**Martin Merkt, Deutsches Institut für Erwachsenenbildung, Germany

In two pre-registered experiments, we investigated the effects of light and movement cues in a desktop virtual reality learning environment on search time and learning outcomes. Participants were asked to find 16 (Experiment 1) / 12 (Experiment 2) craft objects in a virtual workshop, while information about the respective object was narrated by a male off-screen voice. In Experiment 1 (within-subject design, 60 participants), we found that search time for small objects could be decreased by movement cues, but not by light cues. There were no significant effects on learning or the learners' mental representation of the virtual

environment. However, since the average search time regardless of the cueing method (M = 10.28, SD = 5.67) was substantially shorter than the narrated contents about the objects (average length: 44.13 seconds), participants may have had sufficient time to devote exclusively to the narrated information. Therefore, we shortened the narration of the narrated content in Experiment 2 to an average of 12.90 seconds. Results of Experiment 2 (between-subject design, 159 participants) revealed significantly faster search times for both cueing methods and better learning outcomes with the light cues, whereas movement cues did not affect learning. This result could be explained by the slightly reduced presence in the movement cue condition.

Primary teachers didactical design for students' learning in VR environments
Keywords: Computer-supported Collaborative Learning, Educational Technologies, Immersive Technologies for Learning, Primary Education
Presenting Author: Emma Edstrand, Halmstad University, Sweden; **Co-Author:**Sylvana Sofkova Hashemi, University of Gothenburg, Sweden; **Co-Author:**Jeanette Sjöberg, Halmstad university, Sweden

AbstractVirtual reality (VR) is an example of a technology that invites new ways of how to design learning activities. The aim of this study is to explore how teachers organize onsite and distance learning environments for multilingual study guidance to promote students' subject-specific learning. Multilingual study guidance is a support in Swedish schools to enhance the development of students' subject-specific learning in native language. There are limitations in the ways in which multilingual study guidance is designed. It is often the case that learning activities are not grounded in students' individual needs. VR constitutes a resource that can support individualized learning activities. The study is part of a Design-Based research project involving 3 researchers, 1 VR-designer, 2 teachers, 3 students from 2 schools in a cyclic process of systematic, iterative and reflective development of concrete educational activities. The results of the designs for learning demonstrate a planning for student-active practice where the student is encouraged to engage with the knowledge content in the virtual space moving around, showing knowledge by pointing/selecting, getting familiar with objects by holding them, watching a process, etc. The students are expected to show and demonstrate their knowledge, while discussing using acquired concepts in the knowledge domain. The study has pivotal implications for both research and practice regarding developing theoretical and practical outcomes in the context of developing students' subject-specific learning in multilingual study guidance.

The use of virtual reality scenarios in science: Results of a design-based research experiment
Keywords: Engagement, Immersive Technologies for Learning, Motivation, Science and STEM
Presenting Author: Bruno Poellhuber, University of Montreal, Canada; **Presenting Author:**Sebastien Wall-Lacelle, University of Montreal, Canada; **Co-Author:**Christine Marquis, Cégep de Saint-Jérôme, Canada; **Co-Author:**Normand Roy, University of Montreal, Canada

We are witnessing a decline in student interest in science and technology, which is often attributed to the abstraction of science concepts, the scope of the content and teacher-centred approaches. The use of VR simulations appeared promising in the COVID-19 period, when access to laboratories was scarce. For VR simulations, the pedagogical scenarios seem very important. This design-based research aims to explore the pedagogical and didactic potential of computer-based VR scenarios for postsecondary science courses. A mixed methodology relying on individual questionnaires and group interviews was deployed on seven sites with 39 teachers and 5,759 students, grounded in Pintrich's expectancy-value model of motivation and engagement, the TAM3 technology acceptance model, the theory of interest, and Mahlke's (2008) model of user experience. After using the simulations, both teachers and students reported advantages, but these varied quite a bit depending on who was responding. While teachers focus on the pedagogical advantages, such as diversifying teaching methods, students focus first on the affective aspects of the experience (fun, perceived enjoyment, etc.) and also on some advantages for learning (e.g., visualization). Multilevel regression models show that the scenario scores, associated with quality and complexity, are an important and significant variable at the teacher level.

Civic education and social interactions at school as drivers of intended electoral participation
Keywords: Citizenship Education, Quantitative Methods, Secondary Education, Social Aspects of Learning and Teaching
Presenting Author: Daniel Deimel, University of Duisburg-Essen, Germany; **Co-Author:**Katrin Hahn-Laudenberg, University of Leipzig, Germany; **Co-Author:**Johanna Fee Ziemes, University of Duisburg-Essen, Germany; **Co-Author:**Hermann J. Abs, University of Duisburg-Essen, Germany

Through civic education and social interactions at school, students are able to develop more or less political knowledge and trust in political institutions. Both precede intended electoral participation. However, it is disputed whether the relationship between political knowledge, trust, and intended participation is consistent across countries. We analyse data from the International Civic and Citizenship Education Study 2016 that consist of representative subsamples for 14-year-old students (N = 14,567) in Bulgaria, Croatia, Denmark, and Germany (North Rhine-Westphalia). A structural equation model approach reveals that both political knowledge and trust in political institutions contribute to explaining variation in adolescents' intended electoral participation. The effect of political knowledge is partly mediated by trust, which in turn is negatively associated with political knowledge in Bulgaria and Croatia and positively in Denmark and Germany (NRW). These results are discussed in the light of country-specific differences in the political context of civic education.

Online political engagement of upper secondary students: Does media education have an impact?
Keywords: Citizenship Education, Quantitative Methods, Secondary Education, Social Media
Presenting Author: Tessa Consoli, University of Zurich, Institute of Education, Switzerland

Many studies from Switzerland, Germany and other countries showthat young people's political engagement in institutionalized politics is currently stagnating or even declining. Several scholars see growing possibilities for online participatory politics (e.g., online campaigns, mobilizations, fundraisings, discussions and petitions) as a new opportunity for greater political engagement among young people. However, only a small proportion of young people seem to be politically engaged online. Furthermore, it has been argued that the unequal distribution of skills and competencies necessary to safely participate in politics through digital media and navigate the dangers of the internet (e.g. misinformation, echo chambers, hate speech) require a pedagogical intervention. This study investigates the extent to which upper secondary school students in Switzerland are politically engaged online and whether school-based media education practices are related to students' online political engagement. Results show that 13-24% of the students are politically engaged online, that Swiss upper secondary schools put little emphasis on digital citizenship education and that production-oriented practices (e.g. the development of online content) seem relevant in promoting online political engagement.

Evaluating Education for Sustainability: Survey creation based on a Systematic Literature Review
Keywords: Citizenship Education, Secondary Education, Sustainable Development, Tool Development
Presenting Author: Alessio Surian, Università degli Studi di Padova, Italy; **Co-Author:**Diego Posada, University of Padova, Italy; **Co-Author:**Diego Di Masi, University of Turin, Italy

Education for sustainability (EfS) responds to complex matters such as environmental crises including climate change and biodiversity loss. There is robust available literature of case studies focused on EfS in formal education at the primary school level. However, how EfS is conducted in secondary schools, to what

end and the effects on students is less frequently explored (Taylor et al. 2019). Secondary school students are particularly relevant in this matter since they are approaching adulthood, which means they can vote, take active part in civil matters and make choices as consumers (Ferkany & Whyte, 2013).We conducted a systematic literature review regarding EfS assessment methods in secondary schools. The study explores the following three inter-related research questions: What evaluation or assessment mechanisms are available in the literature? What are the characteristics and focus of the evaluation or assessment mechanisms available? In which contexts are they used? and how?What are the limitations and opportunities of such evaluation and assessment mechanisms? Based on the review, we created a 53-item survey aimed at understanding students' values, attitudes, and behaviours that are relevant and worth discussing within the key competencies in sustainability frameworks (Bianchi, 2020; Brundiers et al. 2020; Glasser & Hirsh, 2016; UNESCO 2019) and in relation to ways to operationalize them (Sterling et al., 2017). The questionnaire has been administered to over 400 students in Northern Italy and data have been benchmarked in relation to both other sustainability surveys and to key educational topics.

Sustainable citizenship in South America
Keywords: Citizenship Education, Engagement, Environmental Education, Morality and Moral Development
Presenting Author: Antonia Larrain, Universidad Alberto Hurtado, Chile; **Co-Author:**Paulina Freire, Pontifiica Universidad Ctaólica de Chile, Chile; **Co-Author:**Ana Andaur, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Maria Teresa Rojas, Universidad Alberto Hurtado, Chile; **Co-Author:**Hernán Cofré, Pontificia Universidad Católica de Valparaíso, Chile; **Co-Author:**Claudia Vergara, Universidad Alberto Hurtado, Chile; **Co-Author:**Joaquin Grez Mansilla, Pontificia Universidad Católica de Chile, Chile

The question of sustainability in general is central to a contemporaneous notion of democracy (Kyle, 2020), that is, whether present generations are able to deal with these kinds of global crisis without risking the living conditions of future generations. This involve what we call sustainable citizenship (Kurian et al., 2014), or the active participation and engagement with the exercising of rights in a field of plural interests, often contradictory and in conflict, in a way that allows needs to be addressed. However, to date this idea of citizenship has not been empirically tested. The aim of this paper is to report a study that explored the relation between climate change and citizenship variables. We adapted two questionnaires: one to assess knowledge and attitudes toward climate change and other to assess political and civic knowledge and skills. 237 students (97 female) answered climate change and 218 students (84 female) answered the citizenship questionnaire. Confirmatory factor analyses were conducted to test the scales and fixed effects hierarchical regressions (controlling by school variables and perceived socioeconomical status) were conducted to explore the relations between scales. Results show that knowledge of climate change negatively predicted authoritarianism justification; political self-efficacy, knowledge of climate change, and attitude towards climate science positively predicted attitude towards future political participation; and attitude towards climate science and environmental interest positively predicted, and authoritarianism justification negatively predicted, attitudes toward mitigation.

Chairperson: David Purpura, Purdue University, United States

Research-based teacher education: preparing students to be research active teachers.
Keywords: Competencies, Lifelong Learning, Pre-service Teachers, Researcher Education
Presenting Author: Aimie Brennan, Marino Institute of Education, Ireland

In countries where student outcomes are high, teacher education is required to be research driven and 'graduate teachers [apply] research to their work in a reflective way' (Sahlberg, 2012. p. 15). Significant policy reform in teacher education in Ireland has advocated for an enquiry-oriented, evidence-informed vision of the profession. Teachers are expected to become reflective practitioners who actively engage in and with research to regularly develop their practice. Research on student teacher preparedness to conduct research in their future careers is scarce (van der Liden et al., 2015). Interpretations of research-based education, and practitioner engagement with and in research varies widely (Leat et al., 2015). This paper reviews accreditation standards for initial teacher education in Ireland, UK and Norway to identify variations in research-based teacher education (TC, 2020; DfE, 2019). Subsequently, this paper draws on scholarly literature on research competency and research preparation in higher education (Griffiths, 2004; Healy and Jenkins, 2009; Mateo et al., 2012) to identify specific models of research competency development in undergraduate students. Finally, this paper also presents a framework outlines levels of competency from; research literacy, research engagement, applied research, and research dissemination and their association with the knowledge, skill and attitude of the student teacher. The success of students' engagement in research is based, not only on their ability to engage with published research but to conduct their own research, to exercise scholarly judgement and to contribute to new knowledge, ensuring that they are prepared to be research active, rather than simply research literate.

Legitimising undergraduate educational research methodology courses
Keywords: Qualitative Methods, Quantitative Methods, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Athanasios Verdis, National and Kapodistrian University of Athens, Greece; **Co-Author:**Liza Dorli, National & Kapodestrian University of Athens, Greece

Twenty two years after Lagemann's characterization of educational research as "elusive science", faculty members at departments of education around the world seek to agree on the term with questions like "what should be the content of a course on educational research methodology" and "who among faculty members should teach it". To answer these questions we have utilized a sociolinguistic theory known as "Legitimation Code Theory" that combines Bernstein's system of language codes and Bourdieu's concepts of fields of struggle and cultural reproduction. This theory has been used to explore knowledge and knower structures in a number of social practices. In our study, we have explored epistemic relations to the objects of educational research and social relations among those involved in teaching and learning educational research at undergraduate level. Through a mixed methods research design we have analysed life history interviews with pioneer teachers of educational research methods in Greece in 1970's and 1980s. We have also conducted two surveys concerning one thousand undergraduate students and seventy faculty members across Greece. We have concluded that realist language codes and the mathematical symbols are the main "knowledge codes" in educational research methods courses in Greece. Discourses emphasizing "who you are" in education are the "knower codes". The "right type of knowledge" and the "right type of knower" are being synchronized in the "legitimation" of educational research methodology as an undergraduate object.

Pre-service teachers' beliefs shape their views of the value of scientific evidence for teaching
Keywords: Attitudes and Beliefs, Pre-service Teachers, Quantitative Methods, Reasoning
Presenting Author: Timo Reuter, Rheinland-Pfälzische Technische Universität Kaiserslautern - Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany

Teachers are increasingly expected to implement research-informed teaching practice (RITP) in their classroom. However, they lack knowledge and skills in information-seeking and research methods. We therefore developed a 13-weeks university course addressing these skills and knowledge, and examined whether pre-service teachers' beliefs regarding the utility of science for teaching practice moderate their learning. We conducted a quasi-experimental pre-posttest design with an experimental group (EG) and a control group (CG). We measured information-seeking skills, research methods knowledge, beliefs

regarding the utility of science for teaching practice, and performance in evaluating scientific evidence. Multilevel models revealed differential learning effects depending on participants' perceived utility of science for teaching practice. The higher the perceived utility, the greater was the learning gain in the EG. In the CG, the pattern was reversed. Moreover, a latent profiles transition analysis revealed four different profiles with regard to pre-service teachers' perceived usefulness of strong scientific, limited scientific, and anecdotal evidence for decision making in school contexts. The higher participants' perceived utility of science for teaching practice, the higher was the probability for transitioning from an "intermediate" to a "scientific" profile. Moreover, the probability of transitioning from the "intermediate" to the "scientific" profile was higher in the EG than in the CG. Our findings suggest that pre-service teachers can acquire information-seeking skills and research methods knowledge. However, participants' beliefs affected their learning and evaluation of evidence. Thus, university courses should not only address knowledge, but also reflect on (false) beliefs to prepare future teachers for RITP.

Student teachers' research competences after writing a Master thesis in the Master of Teaching
Keywords: Competencies, Curriculum Development, Pre-service Teachers, Teacher Professional Development
Presenting Author: Stefanie De Jonge, Ghent University, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium; **Co-Author:**Evelien Opdecam, Ghent University, Belgium; **Co-Author:**Leen Haerens, Ghent University, Belgium

Worldwide, there is an increasing attention to educate (future) teachers with an inquiring habit of mind and research competences. Teachers who have developed the competence to use and conduct research will be able to continually evaluate, innovate and improve their teaching. In this regard, an increased need is expressed to integrate research in teacher education programs. Recently, in Flanders, research was also integrated in academic teacher education programs, resulting in a master's degree in teacher education. To date, however, little is known about the implications of integrating research in teacher education in terms of how this improves student teachers' research competences. Following Astin's (1993) Input-Environment-Output model, this study examined the relations between student teachers' demographic and pre-program educational characteristics (input), the academic environment in which they are learning (context), and the development of their research competences and their satisfaction with writing an educational thesis (outcomes). By means of a survey, based on the Postgraduate Experience Questionnaire and Course Experience Questionnaire, 197 university student teachers from academic year 2019-2020 and 2020-2021 were asked about their actual experiences when writing the master thesis. The univariate hierarchical regression analyses showed that infrastructural support and students' intellectual motivation related positively to students' development of their educational research competences, while students' perceived workload negatively and the supervision students received with the thesis positively impacted their satisfaction. These findings imply that teacher educators and teacher training programs should pay attention to good infrastructural support, students' workload and respond to students' intellectual motivation.

A multi-country comparison of lower secondary students' critical thinking under different curricula
Keywords: Assessment Methods, Critical Thinking, Quantitative Methods, Secondary Education
Presenting Author: Samantha-Kaye Johnston, The University of Oxford, United Kingdom; **Co-Author:**Joshua McGrane, The University of Melbourne, Australia; **Co-Author:**Therese N. Hopfenbeck, The University of Melbourne, Australia; **Co-Author:**Mireia Vendrell Morancho, Universidad Complutense de Madrid, Spain

Critical thinking is an essential skill for life-long learning, and, given its increasing importance as a graduate attribute, it is vital to robustly evaluate how educational systems can best improve students' critical thinking through their curricula and classroom practices. This study evaluates the differences in the critical thinking skills of students in the International Baccalaureate (IB) Middle Years Programme (MYP), which explicitly emphasises critical thinking development in its curriculum and has been shown to facilitate classroom strategies to develop critical thinking, versus students enrolled in the national curricula in Australia, England, and Norway. The study comprised of 870 MYP (n = 386) and non-MYP (n = 484) students in Grades 9 and 10 across 21 schools. Data were remotely collected on their critical thinking skills, and several other relevant cognitive, non-cognitive and background characteristics. A propensity score matching approach was used to match the MYP and non-MYP groups on these characteristics and their critical thinking skills were compared using weighted regression. Findings showed that, overall, IB MYP students possessed significantly higher levels of critical thinking skills than their non-IB MYP peers with a moderate effect size. This advantage also held at both grade levels and across Australian and English students, with no significant difference for Norwegian students. Thus, the MYP appears to be a promising exemplar for enhancing critical thinking among secondary-aged students, although context needs to be considered. Based on these findings, recommendations of specific instructional strategies are offered, as well as future research to inform critical-thinking pedagogy.

The effects of reading and writing instruction on writing about historical significance
Keywords: Argumentation, Critical Thinking, Instructional Design, Writing/Literacy
Presenting Author: Johan van Driel, University of Amsterdam, Netherlands; **Co-Author:**J.P. van Drie, University of Amsterdam, Netherlands; **Co-Author:**Carla Van Boxtel, University of Amsterdam, Netherlands

The literacy demands set in the domain of history are high. In order to achieve historical understanding, students need for example to read historical accounts and write historical arguments. More knowledge is needed on effective instructional approaches for reading and writing in history. In an earlier study we found positive effects of a domain-specific reading instruction on the quality of students' writing in history. In this study we investigated the additional effects of a writing instruction to this reading instruction. In a randomized pre- post design, we compared the effects of a reading instruction followed by a writing instruction to a repeated reading instruction on text quality. Participants were 142 10^{th} grade students. To gain additional insight into the processes conducted, we asked 8 students from the combined reading and writing instruction to think aloud during the posttest. Text quality was analyzed with a previous developed coding scheme focusing on text structure, general writing quality, and reasoning about historical significance. Think aloud protocols were analyzed on reading processes, reasoning processes, and writing processes.Results showed that students in both conditions improved, but students who received reading and writing instruction improved more than students who received only reading instruction. Based on the think-aloud protocols, students who applicate elements of the instruction showed deeper understanding of historical perspectives and argumentation. This study shows that a combined reading and writing instruction improves students' writing in history and elicits processes such as understanding historians' perspectives and historical argumentation.

The filter bubble app: how can secondary school students become aware of algorithmic filtering?
Keywords: Critical Thinking, Digital Literacy and Learning, Secondary Education, Social Media
Presenting Author: Tjitske de Groot, Utrecht University, Netherlands; **Presenting Author:**Maria De Haan, Utrecht University, Netherlands

This research paper describes young people's ideas and understandings of technology related to their own social media use, with a particular focus on their knowledge and imaginations of the working of algorithms, as well as how they evaluate these workings for themselves. This study is part of a design based research in which an educational app is being designed that promotes algorithmic awareness, knowledge, agency and ethical reflection on the effects of algorithms for students in secondary education in the Netherlands. Drawing upon the concepts of algorithmic consciousness, imagination, and power, we

analyze how secondary education students make sense of the algorithmic workings of their social media apps. We discuss to what extent such sense making and 'making the algorithm work for them' can be seen as forms of agency as well as how technology that sorts, selects, secludes and judges in invisible ways can become 'educative' again.

Critical Thinking in Primary School – a Large Scale Design-Based Research Project
Keywords: Critical Thinking, Primary Education, Qualitative Methods, Teaching Approaches
Presenting Author: Emilia Andersson-Bakken, Oslo Metropolitan University, Norway; **Co-Author:**Kirsti Marie Jegstad, Oslo Metropolitan University, Norway; **Co-Author:**Tuva Bjørkvold, Oslo Metropolitan University, Norway

The project Critical Thinking in Primary School is an innovation project using design-based research to investigate how teachers and students in grades 1-7 can work with critical thinking using picture books and news. Critical thinking is a 21st century skill, and in Norway central in the competence definition laying ground for all teaching and learning from the 1st through 13th grade. In the project, we have collected data throughout three cycles in a timespan over 2 years. We have interviewed teachers, observed, and videotaped lessons and collected student products. Between each cycle, we have analyzed the data, both regarding the overall tendencies and more in detail focusing on one or two aspects of critical thinking. Preliminary findings show that students' critical thinking is affected by the teachers' understanding of critical thinking, notably when aspects broader than formal *Buildung* are included. Further, the teaching design and the teachers' facilitation of the classroom conversation are crucial in order to enhance critical thinking. This relates in particular for the teacher to make relevant and engaging startup activities, and to allow sufficient time for the students to think actively in a dialogic classroom where students build on each other's utterances. Finally, picture books and news are suited to inspire critical thinking, especially when thematizing ethical dilemmas or issues close to the students' sphere of interests. However, the teacher must plan actively for critical thinking directly linked to the content.

Justice and metacognitive awareness as predictors of master students' wellbeing in supervision
Keywords: Ethics, Higher Education, Metacognition, Well-being
Presenting Author: Anne Haarala-Muhonen, University of Helsinki, Finland; **Co-Author:**Liisa Myyry, University of Helsinki, Finland

University students' wellbeing or lack of it has alerted higher education institutions in recent years. Especially, writing a master's thesis can be a stressful phase of studies, because it demands cognitive involvement, agency and metacognitive skills from students. Justice experiences has been found essential for human being in organisational context but research integrating supervision and justice experiences in higher education is scarce. The present study investigates students' experiences of master's thesis supervision and analyses the links between study-related burnout, metacognitive awareness and justice experiences in supervision. To conduct the study survey responses were collected by 441 master students from the Faculty of Law. The results of the survey revealed that metacognitive awareness and justice experiences in supervision were significant predictors of students' wellbeing in master's thesis project. The results confirmed earlier findings about the importance of justice experiences for human beings and open new avenues for future research in higher education.

How Does Supervision Influence Doctoral Supervisor's Occupational Wellbeing?
Keywords: Burnout, Competencies, Doctoral Education, Well-being
Presenting Author: Lotta Tikkanen, University of Helsinki, Finland; **Co-Author:**Henrika Anttila, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland

PhD candidates' wellbeing has gained much attention in the field of doctoral education. For example, research has identified that high quality supervision plays a central role in PhD candidates' study-related wellbeing. However, research on the association between supervisory responsibilities, competencies and interaction and supervisors' occupational wellbeing has been surprisingly scarce. It can be assumed that supervisory interaction influences supervisors' occupational wellbeing, which further is likely to reflect back on supervisory interaction. In this study, we aimed to understand the interrelationships between doctoral supervisor's occupational wellbeing and quality of supervision better. Altogether 561 doctoral supervisors from research-intensive, multidisciplinary university participated in the study. Results showed that supervisors' occupational wellbeing in terms of work engagement, stress and burnout symptoms were related to their perceptions of the supervisory interaction, supervisory competencies and the support they received from the professional community. Also differences in occupational wellbeing were detected between supervisors in various positions, and those supervising mainly fulltime cf. part-time candidates and those supervising candidates working alone cf. candidates working in a group. The findings imply that supervisors' occupational wellbeing is highly embedded in supervisory practices and that individual and factors related to supervisee contribute to supervisors' wellbeing.

PhD holder transitions outside academia: The role of social support in (dis)engaging experiences
Keywords: Doctoral Education, Engagement, Qualitative Methods, Well-being
Presenting Author: Sara Rönkkönen, University of Helsinki, Finland; **Co-Author:**Viivi Virtanen, Häme University of Applied Sciences, Finland; **Co-Author:**Lynn McAlpine, University of Oxford / McGill University, Canada; **Co-Author:**Montserrat Castelló, Ramon Llull University, Spain; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland; **Co-Author:**Marina García-Morante, Blanquerna, Universitat Ramon Llull, Spain

Globally, the number of PhD graduates is constantly increasing. The share of the PhD holders working outside the academia is growing accordingly (Germain-Alamartine et al., 2021) and not necessarily without challenges (Skakni et al., 2022). The present study aims to increase the awareness of the role of social support in engaging and disengaging experiences, reported by PhD holders who have made a career transition outside the academia. Our data comprise 30 semi-structural interviews from PhD holders in the UK, Spain, and Finland. The preliminary findings propose that various forms and sources of social support, or the lack of it, played a pivotal role in engaging and disengaging experiences. The practical implications of the study are related to PhD research and education development. Additionally, on a societal level, the findings of this study support the understanding of constantly changing labor markets that the PhD holders enter.

Precarious careers: postdoctoral researchers and wellbeing at work
Keywords: Anxiety and Stress, Higher Education, Researcher Education, Well-being
Presenting Author: Inge Van der weijden, Leiden University, Netherlands; **Co-Author:**Christine Teelken, VU University Amsterdam, Netherlands

The purpose of this paper is to understand how, in the context of labour market instability, postdoctoral researchers in The Netherlands experience their working conditions and their prospects and opportunities, in relation to their mental health and wellbeing. 676 postdocs of nine universities in the Netherlands completed an online questionnaire. Results show that 70% if the respondents indicated experiencing serious thoughts, feelings or conditions related to their mental health. Most commonly reported experiences are feelings under constant strain, concentration problems and sleeping problems. 39% of the postdocs are at risk of developing serious mental health problems, which can lead to anxiety and depression. Main stress factors are dissatisfaction with supervisor, colleagues and negative academic career perceptions. In addition, more mental health problems develop in case of conflicting demands. Half of the respondents provided an

explanation for their answers concerning their mental health. Based on a round of in-depth explorative investigations, we have diagnosed three categories of responses: positive, ambivalent and negative. The results of our study are a call for action: universities need to take initiatives to prevent mental health problems and should offer adequate support to postdocs who are already experiencing problems.

Variation theory as teaching theory. In hope for a sustainable classroom concerning assessment
Keywords: Art Education, Classroom Assessment, Feedback, Qualitative Methods
Presenting Author: Pernilla Ahlstrand, Department of Pedagogical, Curricular and Professional Studies,, Sweden

We will present and discuss preliminary analyses of the research project “On BOUNCE! Practice-based feedback – A study of Theatre, Teaching and Dance Situations”. The title ‘Practice based feedback’ refers to formative assessment that takes place during feedback in teaching situations. Filmed material from teaching situations is the starting point for stimulated recall discussions together with two different teacher teams in dans and theatre. The discussions will include planning of similar teaching situations where variation theory is used as teaching theory. Preliminary analyses and results from material collected autumn-22 and spring -23 will be discussed. The purpose of the project is to develop knowledge about knowing that is expressed in a physical form and to develop methods on a scientific basis that can strengthen teaching practices in the school subjects of dance and theatre, at upper secondary school level. This is proposed as one way to create a sustainable classroom in relation to assessment.

Performative arts training for Nursery teachers. Shared learning and impacts
Keywords: Art Education, Early Childhood Education, Qualitative Methods, Teacher Professional Development
Presenting Author: Anna Ciraso, Universitat Autònoma de Barcelona, Spain; **Co-Author:**Silvia Blanch, Universitat Autònoma de Barcelona, Spain; **Co-Author:**Gemma París, Universitat Autonoma de Barcelona, Spain

With the goal of introducing aesthetic experiences and artistic thinking in early childhood education, a training project for three nurseries was implemented with the involvement of international artists and cultural agents of the territory (within Erasmus+ project INTERSTICE: Encounters between artists, children and educators, 2020-1-ES01-KA203-082989). Teachers were involved in a performance, different workshops, a video feedback session with two artists and a joint closure activity; these processes allowed them to experience artistic situations, and re-think educational practices, relationships and learning scenarios. In order to identity individual learning of both teachers and artists, as well as eventual changes in the educational practices, this qualitative research was developed. Information was gathered through questionnaires, participant observation and interviews with artists, teachers and trainers. Results show different degrees of learning on the role of art in daily pedagogical practices, and deep reflexions about the function and attitude of the adults, in children’s aesthetic experiences. The core elements of this training proposal will be highlighted and the difficulties that were faced will be discussed, in order to facilitate other similar experiences within educational and cultural settings.

Art and Design teachers’ Personal Rules of Thumb while Designing Design Based Education Studios
Keywords: Art Education, Higher Education, In-service Teachers, Instructional Design
Presenting Author: Migchiel Riemer van Diggelen, NHL University of Applied Sciences, Netherlands; **Co-Author:**Marjanne van Gameren, Open University of the Netherlands, Netherlands; **Co-Author:**Arnoud Evers, Open University of the Netherlands, Netherlands

In Higher Vocational Education, innovations are shifting from teacher-oriented to student-oriented education. Moreover, boundaries between education and the professional field are blurring. This makes designing innovative learning environments a complex activity. This is recognized at NHL Stenden University of Applied Sciences (NHLS) in the Netherlands, where teachers design education in studios in the context of Design-Based Education (DBE). Teachers at NHLS turn out to have a need for support in designing studios. More in general, it is unclear which knowledge and skills teachers actually need to possess in order to adequately design education in studios. Rules of thumb of experienced designers of design education could provide insight into the practical knowledge that teachers need in order to design studios. Rules of thumb, derived from teachers’ practical knowledge, are ideas about characteristics that design education should have to achieve certain learning outcomes in students. Six teachers from the art and design disciplines participated in this multiple-case study. During the interviews, they created a design for a studio for their own teaching practice, thinking aloud. Through within- and cross-case analyses, insight into their rules of thumb and patterns was gained, revealing that learning theories are recognizable in teachers' rules of thumb. Teachers and their rules of thumb could be positioned on a dimension from cognitivism to social constructivism. Typical of social-constructivist rules of thumb is to focus on students' ownership of their learning processes and cooperation between different actors in an authentic context.

Effects of teacher professional development on student academic achievement: A meta-analysis
Keywords: Achievement, In-service Teachers, Meta-analysis, Teacher Professional Development
Presenting Author: Natasha Dmoshinskaia, University of Twente, Netherlands; **Co-Author:**Adrie Visscher, Univ. of Twente, Netherlands; **Co-Author:**Marta Pellegrini, University of Cagliari, Italy

We present results from a meta-analysis of 145 experimental and quasi-experimental studies that used teacher professional development (TPD) programs in grades pre-K–12, examining the effect of TPD interventions on student achievement. We find an average weighted effect size of +0.08 standard deviations on achievement outcomes, with heterogeneity of most effects ranging from -0.16 to 0.31. Guided by the MUTOS framework, we tested separately categories of moderators related to Methods, Units, Treatments, Outcomes, and Settings characteristics. Findings of the meta-regression models showed that several moderators explained heterogeneity in effects across studies. Particularly positive outcomes were found for students in lower primary grades (K–2) compared to secondary or mixed grade levels. On treatment characteristics, programs focusing on a specific subject and delivering professional development using

workshops and coaching had larger impacts compared to respectively cross-curricular interventions and an only workshop delivering mode. In the final meta-regression that combined significant and marginally significant moderators from the previous models, grade level still showed an impact on student achievement.

The role of a data coach in supporting data use in school teams: voices of experts and practitioners
Keywords: In-service Teachers, Qualitative Methods, Teacher Efficacy, Teacher Professional Development
Presenting Author: Iris Decabooter, Hasselt University, Belgium; **Co-Author:**Ariadne Warmoes, Vrije Universiteit Brussel (VUB), Belgium; **Co-Author:**Katrien Struyven, Hasselt University / Vrije Universiteit Brussel, Belgium; **Co-Author:**Els Consuegra, Vrije Universiteit Brussel, Belgium; **Co-Author:**Roos Van Gasse, University of Antwerp, Belgium

A data coach is necessary to support school teams in the use of data to adjust school and classroom practices (Marsh, 2010; 2012). Research shows that depending on the context of the school, the profile of the data coach can take many different forms (Decabooter et al., in press). In this study a multifaceted perspective on the role of a data coach is presented by interviewing international academic experts in the field of data use and conducting focus groups with practitioners such as school leaders, teachers and educational support staff. The focus is on the perceived benefits and pitfalls of the different data coach profiles and how they contribute to supporting data use. The results show that experts highlight the importance of coaching skills of a data coach, whereas practitioners prefer a hands-on and practical approach. There are also some similarities between these two groups regarding the combination of an internal-external position.

Differentiating homework from the perspective of Swiss secondary teachers
Keywords: Qualitative Methods, Secondary Education, Teacher Professional Development, Teaching Approaches
Presenting Author: Christine Feiss, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Gerda Hagenauer, University of Salzburg, Austria; **Co-Author:**Sandra Moroni, Universitiy of teacher education Bern, Switzerland

Homework is a common practice in many schools. It has been shown that a crucial aspect for the effectiveness of homework is its quality (e.g. Rosário et al., 2018). One aspect of quality is fit, which for most students can only be achieved with differentiated homework. However, it has been found that few teachers give differentiated homework (Hascher & Hofmann, 2008, 2011), although they are aware that differentiation is a quality indicator for homework practice. Therefore, further research is needed that explores the question of why teachers give differentiated homework and what are possible hindering factors. Against this backdrop, the present study investigates whether teachers use differentiation measures regarding homework and if so, which ones (RQ1). Furthermore, it is investigated which arguments and challenges the teachers express regarding differentiation of homework (RQ2). Finally, it is explored what conditions for success the teachers express about differentiation of homework (RQ3). Methodologically, a qualitative approach was chosen. 23 semi-structured interviews were conducted with Swiss secondary school teachers who teach German. These interviews were transcribed verbatim and analysed using structuring qualitative content analysis (Mayring, 2017). It was found that of the 23 teachers, six use strategies of differentiation when giving homework. They implement different forms of differentiation. They mention diverse arguments for differentiating in homework as well as arguments against and challenges. In relation to the third research question (RQ 3), the teachers reported on the conditions for success at the individual teacher level and at the structural level.

What competencies do teachers need to use students' perceptions of teaching quality?
Keywords: In-service Teachers, Teacher Effectiveness, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Lucas Silva, University of Groningen, Netherlands; **Co-Author:**Kim Schildkamp, University of Twente, Netherlands; **Co-Author:**Adrie Visscher, Univ. of Twente, Netherlands; **Co-Author:**Roel J. Bosker, Rijksuniversiteit Groningen, Dept of Education and GION, Netherlands

Supporting teachers to improve their practices is key for every educational system. Data coming from students' perceptions of teaching quality (SPTQ) can be used by teachers to improve their teaching quality. However, the use of this type of data requires a complex set of competencies called Data Literacy for Teachers. Researchers have described in general terms what competencies are needed for data use. However, these are still generally described and are not specific to SPTQ data. This article aims to identify what competencies teachers need to be able to use SPTQ data to improve their teaching quality. We first conducted a literature review. Based on this review we developed a data use cycle for SPTQ data as well as an overview of competences needed to implement this cycle. Next, by using the Delphi method, we presented to 20 research experts in data use and SPTQ this data-use cycle and a list of competencies needed for the use of SPTQ data. Our results show that experts agree with our eight-step data-use cycle to use SPTQ data, and also with 67 of the 73 competencies presented to them. During the session we will discuss this further. We will also discuss how the competencies can be distributed between teacher, community and technology, and considerations for teacher professional development. For example, the results of this study can be used to design teacher professional development programs in the use of SPTQ data.

Pre-service teachers practicing the ways of scaffolding self-regulated learning with simulation
Keywords: Pre-service Teachers, Self-regulated Learning and Behaviour, Simulation-based Learning, Social Interaction
Presenting Author: Piia Naykki, University of Jyväskylä, Finland; **Co-Author:**Minna Silvennoinen, Jyvaskyla University of Applied Sciences, Finland; **Co-Author:**Sirpa Laitinen-Väänänen, JAMK University of Applied Sciences, Finland; **Co-Author:**Saara Pyykkönen, University of Jyväskylä, Finland; **Co-Author:**Jenni Latva-aho, University of Jyväskylä, Finland; **Co-Author:**Heini Ikäheimo, JAMK University of Applied Sciences, Finland

The aim of the study is to explore how simulation-based learning can function as a support for learning to scaffold self-regulated learning in a teacher education context. The particular research question is how do pre-service teachers construct understanding of SRL and the ways of scaffolding SRL during small group simulation tasks? The data collection was conducted in the vocational teacher education in Finland. The participants (N = 18) were divided into small groups of 3-5 members. The groups followed structured working phases for planning, performing and reflecting simulation tasks. The video data was analysed with the AtlasTi analysis program by observing when the groups discussed cognitive, motivational, emotional, and environmental regulation (Pintrich, 2000). It was also coded when the groups discussed learners' SRL skills in general and teachers' ways of scaffolding SRL. Findings show that the pre-service teachers constructed their understanding of SRL and the ways of scaffolding SRL during the simulation task by reflecting their prior teaching experience (f = 35), SRL theory (f = 22) and their personal school experiences (f = 18). The most common way to understand SRL while planning, performing and reflecting the simulation tasks was motivational self-regulation (f = 223). The pre-service teachers also expressed cognitive self-regulation (f = 163) and emotional self-regulation (f = 95) during the simulation-based learning. The least mentioned theme was environmental regulation (f = 69). The study explores the relatively infrequently studied topic by highlighting a pedagogical view to SRL development with simulation tasks.

The differential effect of simulations on SEL among preservice, beginner, and experienced educators
Keywords: In-service Teachers, Simulation-based Learning, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Ronen Kasperski, Gordon College of Education, Israel; **Co-Author:**Merav Hemi, Gordon Academic College, Israel

Accumulating research points to the effectiveness of clinical simulations as a means for improving educators' socio-emotional learning (SEL) competencies. The present study attempts to add to the research literature by exploring the differential effect of clinical simulations on SEL development in three professional phases: pre-service (n=134), beginners (n=43), and experienced educators (n=44). To this end, a sample of 221 educators took part in clinical simulation workshops. SEL questionnaires were administered pre- and post-simulation. Overall, results showed a time effect of the simulations on SEL, suggesting an improvement in the total SEL score of the entire sample. In addition, a time×group interaction emerged, suggesting that pre-service educators benefited from the simulations more than beginners and experienced educators in terms of the emotional sub-scale. Pre-service and beginner educators also benefited more than experienced educators in terms of the social sub-scale. One exception was the cognitive sub-scale, where all groups reported the largest improvement. The contribution of clinical simulations to the development of SEL competencies is discussed with regard to each professional development stage, its potentials and challenges.

Professional inquiry in teacher education: Positioning student teachers as co-developers
Keywords: Inquiry Learning, Pre-service Teachers, Simulation-based Learning, Teacher Professional Development
Presenting Author: Birgitte Lund Nielsen, VIA University College, Denmark; **Co-Author:**Anja Madsen Kvols, VIA University College, Denmark

Research is presented from the Danish LULAB-initiative where student teachers and teacher educators are involved in professional inquiry projects. The aim is to examine in what ways the participation contributes to teacher educators' experience of professional agency and what kinds of practices of participation and cooperation the initiative enables for the student teachers. Multiple qualitative data is analyzed in a process of reflexive thematic analysis. Findings show that teacher educators experience elements of agency in LULAB. Furthermore, they refer to being positioned as competent professionals and they emphasise that the professional inquiry approach is giving them a possibility to contribute with practitioner research close to their teaching. Their professional identity as teacher educators is in flux. The experimental approach is also positively acknowledged by the student teachers. Data indicates a complex pattern across projects in the roles given and taken by the student teachers. In general, they value being positioned as co-developers, and they emphasize relations with the teacher educators, being listened to and taken seriously as (future) professionals. Hence, the possibilities teacher educators are given through the approach to organizational development appears to be mirrored in the way they position the student teachers and, furthermore, student teachers to a higher degree position themselves as students instead of pupils, indicating development of professional teacher identity.

Analyzing the potential of interdisciplinary collaborative diagnosing in a school context
Keywords: Computer-supported Collaborative Learning, Higher Education, Pre-service Teachers, Simulation-based Learning
Presenting Author: Amadeus J. Pickal, University of Hildesheim, Germany; **Co-Author:**Katharina Engelmann, Universität Hildesheim, Germany; **Co-Author:**Birgit J. Neuhaus, LMU Munich, Germany; **Co-Author:**Raimund Girwidz, LMU Munich, Germany; **Co-Author:**Christof Wecker, Universität Hildesheim, Germany

The potential of collaborative diagnoses – i.e. diagnoses of students' skills that are generated by teachers in collaboration – is still largely unexplored. These might be particularly helpful when diagnosing cross-domain skills such as scientific reasoning. However, individuals often need support for successful collaboration, but this need may vary depending on the degree to which information is shared or distributed among collaborators. Hence, the present study investigated to what extent *collaboration* (individual vs. collaborative diagnosis), a *collaboration script* (without vs. with collaboration script) and the level of *distribution of information* (fully shared vs. distributed information) affect pre-service teachers' *diagnostic accuracy* when diagnosing scientific reasoning. In a video-based simulation setting, 194 pre-service teachers composed diagnoses of a student's scientific reasoning skills – first individually and subsequently in dyadic collaboration. A 2x2x2 mixed design with *collaboration* as a within-subjects factor and *collaboration script* and *distribution of information* as between-subjects factors was implemented. Collaboration had not statistically significant main effect on diagnostic accuracy, but collaboration was beneficial when supported by means of a collaboration script. Further analyses will elucidate how collaboration scripts can improve pre-service teachers' interactions during their collaborative diagnostic activities and whether or not they can create a lasting positive effect.

Socioemotional interaction and co-construction of knowledge in online synchronous teacher education
Keywords: Computer-supported Collaborative Learning, Knowledge Construction, Pre-service Teachers, Social Interaction
Presenting Author: Auli Lehtinen, Department of Teacher Education, University of Jyväskylä, Finland; **Co-Author:**Piia Naykki, University of Jyväskylä, Finland; **Co-Author:**Emma Kostiainen, Department of Teacher Education, University of Jyväskylä, Finland

The pandemic has accelerated societal and educational changes related to digital technologies and online interaction. More research is needed on understanding and developing pedagogical support for socioemotional interaction and knowledge construction in online synchronous higher education and in teacher education (TE). This case study analyzed how pre-service subject teachers engaged in socioemotional interaction and socially constructed knowledge in an online synchronous TE course. Additionally, the study investigated pre-service teachers' conceptions about the quality of interaction in online TE. Two small groups (n=4 and n=5 and a teacher educator) were analyzed. Data consisted of screen recorded Zoom breakout rooms (166 min) and questionnaire and interview responses from the same pre-service teachers. The study builds on a socio-constructivist theory and previous work on collaborative learning and interaction analysis examining social construction of knowledge online. The latter views collaborative interaction as progressing from lower to higher levels of thinking. Data were analyzed by content and interaction analysis. Results indicate that most discourse was at the level of sharing information or opinions and at the level of negotiating meaning and co-construction. Only a small percentage of talk reached the highest levels of synthesis, application, or metacognitive statements. Results are largely similar to those from asynchronous text-based online interaction. One group reached higher levels only after the visit by the teacher educator. Groups differed in their ways of showing active listening and humor and discussing about experiences outside the shared context. Implications, e.g., favorable scaffolding strategies, will help design for quality blended learning.

Signs of self-organization in technology-mediated knowledge co-creation
Keywords: Artificial Intelligence, Computer-supported Collaborative Learning, Educational Technologies, Knowledge Construction
Presenting Author: Niina Halonen, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland

When adapted creatively, socio-digital technologies offer new collaborative affordances which promote the strands of modern learning theories (Wise & Schwarz, 2017). Similarities can be found when modern learning theories and system theories are compared and analyzed next to each other (Ståhle et al., 2020). Group of students and technology-enhanced learning context can be seen to represent one unit, a system. Like modern view of learning is recognized as collaborative and iterative processes, in the theory of self-organizing systems iteration is seen as a power center of the whole system. In this study, we used the systems theories approach when we analyzed technology-mediated knowledge co-construction. The participants were eight student teachers in mathematics and natural sciences. Pedagogical design of knowledge co-construction followed Engaging Learning Model (Lonka, 2018) in three phases 1) Activation 2) Learning 3) Evaluation. Technology used in co-construction was novel, voice-driven software, which produced visual artifacts from oral discussions. Data included videos and audio recordings. In this qualitative study, a thematic and content analysis were used with descriptive analysis. Results showed that voice-

driven technology triggered signs of system's self-organization in groups' co-construction. Exchange of information, "entropy levels", were increased. Also "chaos zone" were reached. New knowledge was classified and evaluated, and the process resulted as a "new order". Technology can be seen as an interactor which scaffolded the self-organization and transformation towards group's collaborative identity.

Fostering computer-supported collaboration knowledge and interaction through scripting and awareness
Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Educational Technologies, Problem Solving
Presenting Author: Isis Tunnigkeit, Ruhr University Bochum, Germany; **Co-Author:**Sebastian Strauß, Ruhr-University Bochum, Germany; **Co-Author:**Julia Eberle, Ruhr-Universität Bochum, Germany; **Co-Author:**Arlind Avdullahu, Ruhr-University Bochum, Germany; **Co-Author:**Nikol Rummel, Ruhr University Bochum, Germany

Collaboration scripts and group awareness tools are two promising approaches to improve students' knowledge about collaboration and their collaborative processes. While scripts offer learners guidance by prompting specific interactions, awareness tools guide learners tacitly by increasing their awareness of information relevant to the collaboration. In this study, we compare which approach is more effective in fostering knowledge about successful collaborative problem-solving processes and the quality of students' interactions. In a laboratory study with 156 learners, we provided groups with either an external collaboration script during collaborative problem-solving, a group awareness tool with guided reflection on their collaborative performance, or no support. We assessed individual knowledge about collaboration and the groups' quality of interaction. Results show that the group awareness tool with reflection as well as the external script positively influenced participants' knowledge but not the quality of their interaction in a post-intervention collaboration phase. The effect of the group awareness tool on students' knowledge is higher than that of the collaboration script.

Supporting student teachers' reflection through assessment: the case of reflective podcasts
Keywords: Assessment Methods, Cooperative/Collaborative Learning, Higher Education, Pre-service Teachers
Presenting Author: Laura Ketonen, University of Jyväskylä, Finland; **Co-Author:**Juuso Henrik Nieminen, The University of Hong Kong, Finland

Research on teacher education has noted how tricky it is to support student teachers' reflection through assessment. In this case study, we examine how a novel assessment task, podcasts, can promote reflection. Students (N = 14) produced podcasts in groups based on their course literature. Using qualitative content analysis and reflexive thematic analysis, we analyzed podcasts, group discussions on the podcast process, and individual student interviews. The podcast task was noticed to engender reflection. Three theory-driven themes were analyzed to both promote and hinder reflection: experientiality, digitally mediated authenticity, and communality. We propose that these elements of assessment foster reflection, calling for greater attention to how assessment and grading support and hinder student teachers' reflection.

Severson-Irby, School of Education, Virginia Commonwealth University, United States; **Co-Author:**Jose Reinaldo Martinez-Fernandez, Universitat Autònoma de Barcelona, Spain

Graduates of doctoral (Ph.D.) programs are expected to be competent at designing and conducting research independently. Given the level of research competence needed to successfully conduct research, it is important that assessors of doctoral programs (e.g., faculty and staff) have a reliable and validated tool for measuring and tracking perceived research competence among their students and graduates. A high level of research competence is expected for all Ph.D. graduates worldwide, in addition to in all disciplines/fields. Moreover, graduates of Ph.D. programs may complete their studies in one country but then obtain a research position in another country, emphasizing the need to ensure that all doctoral programs are fostering similar levels of research competence. Thus, the purpose of this study was to gather additional evidence for validity and reliability of the Research Competence (R-Comp) scale (Böttcher & Thiel, 2018). Specifically, we sought to extend the findings of Böttcher and Thiel (2018) by adapting the scale, translating it to other languages, and applying the tool with a sample of early stage researchers. Our findings provide initial evidence that the adapted PR-Comp is appropriate for use in three languages (Catalan, English and Spanish) and across a variety of disciplines/programs of study.

Development and Evaluation of a Science Communication Training for Master Students in STEM
Keywords: Communication Skills, Competencies, Instructional Design, Researcher Education
Presenting Author: Julian Fick, TU Braunschweig, Germany; **Co-Author:**Noemi Kumpmann, University of Muenster, Germany; **Co-Author:**Friederike Hendriks, TU Braunschweig, Germany

Communication skills are essential outcomes of higher education (Ritchie, 2022). However, the necessary science communication competencies are rarely covered in professional training programs (Ritchie et al., 2022) and existing training programmes often are insufficiently or not at all evaluated (Baram-Tsabari & Lewenstein, 2017). Therefore we developed and evaluated an evidence-based training program based on a constructive alignment approach. The training's effectiveness was assessed using a pre-post summative evaluation design and a comprehensive definition of communication competencies.
After participating in our manual-based training, the 16 German STEM master students showed increased knowledge and self-efficacy, more positive attitudes towards science communication as well as high satisfaction with the training. Coding video recordings of short presentations to compare their actual behavior before and after the training revealed an increase in involvement strategy, but not credibility strategy usage. The comprehensibility which was assessed using a syntax-based algorithm, did not increase either.
One of the major limitations of our study refers to the behavioral assessment which was done rather coarse. Additionally, the relationship between single strategy usage and overall communication success is discussed.

Baram-Tsabari, A., & Lewenstein, B. V. (2017). Science communication training: What are we trying to teach? International Journal of Science Education, 7(3), 285–300.Ritchie, T. S., Rossiter, D. L., Opris, H. B., Akpan, I. E., Oliphant, S., & McCartney, M. (2022). How do STEM graduate students perceive science communication? Understanding science communication perceptions of future scientists. PLOS ONE, 17(10).

PhD supervisors' and supervisees' perceptions on supervisory support
Keywords: Doctoral Education, Higher Education, Mixed-method Research, Researcher Education
Presenting Author: Henrika Anttila, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland; **Co-Author:**Lotta Tikkanen, University of Helsinki, Finland

Supervisory relationship is a highly significant driver of doctoral experience. However, empirical studies exploring the alignment between supervisors' and supervisees' perceptions of good doctoral supervision is lacking. A total of 768 doctoral candidates and 561 doctoral supervisors from a multi-field research-intensive university participated in the study. Data were collected with the doctoral experience survey and the supervisory experience survey, and qualitatively and quantitatively analysed using a mixed methods approach. The results showed that both doctoral candidates and the supervisors described *informational support, emotional support, instrumental support, and co-constructional support* as the primary characteristics of high-quality supervision. However, some differences also existed. Furthermore, their perceptions regarding frequency of supervision are well aligned, although supervisors report supervising slightly more than candidates report receiving it. The results highlight the importance of promoting the alignment between doctoral candidates' and supervisors' perceptions of quality and quantity of supervision, as it fosters study progress, reduces the risk of candidates dropping out and increases satisfaction.

From findings to impact: Implications of current research for researcher-practitioner communication
Keywords: Communities of Learners and/or Practice, Primary Education, Synergies between Learning / Teaching and Research, Teacher Professional Development
Presenting Author: Paul Howard-Jones, University of Bristol, United Kingdom; **Co-Author:**Bethany Woollacott, Loughborough University, United Kingdom; **Co-Author:**Samuel Sims, University College London, United Kingdom; **Co-Author:**Korbian Moeller, Loughborough University, United Kingdom; **Co-Author:**Hugo Lortie-Forgues, Loughborough University, United Kingdom; **Co-Author:**Matthew Inglis, Loughborough University, United Kingdom; **Co-Author:**Tim Jay, Loughborough University, United Kingdom; **Co-Author:**Camilla Gilmore, Loughborough University, United Kingdom; **Co-Author:**Colin Foster, Loughborough University, United Kingdom

Experience tells us that the development of high-quality, research informed, rigorously evaluated resources for teachers does not guarantee the successful translation of educational research into practice. The journey from findings and resources to student learning is influenced by, amongst other factors, how these are communicated to teachers. Such communication may benefit from current understanding of the 'mechanisms' underlying effective professional development, but also depend on the emotional responses of practitioners to concepts and forms of messaging, the impact of findings on teachers' existing views and beliefs, the processes by which teachers communicate between themselves and adapt new ideas in their practice, and a range of sociocultural factors arising from the complex situation of classroom teaching within a given sociocultural environment. Here, we draw together diverse empirical findings to identify key insights from the research literature that may have general implications for researcher-practitioner communication, with a particular focus on barriers and enablers for mathematics education in the Early Years.

How does interdisciplinary doctoral experience matter?
Keywords: Cooperative/Collaborative Learning, Doctoral Education, Quantitative Methods, Researcher Education
Presenting Author: Auli Toom, University of Helsinki, Finland; **Co-Author:**Lotta Tikkanen, University of Helsinki, Finland; **Co-Author:**Henrika Anttila, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Helsinki, Finland

Interdisciplinarity has been a buzz-word in research policy and research funding calls for a while. Engagement in interdisciplinary research is expected to result solutions to tricky challenges, promote scientific breakthroughs and enhance researcher career opportunities. It has also suggested to provide a measure for researcher quality and impact. Yet, empirical evidence on the influences of engaging in interdisciplinary research, particularly on early career researcher experience, is still limited. We aim to contribute to bridging the gap in the literature by exploring PhD candidates' involvement in conducting interdisciplinary research and whether having such experience is related to having experience in national and international research collaboration, and time-to-candidacy. Altogether 768 PhD candidates from a multidisciplinary research-intensive university participated in the study. Results showed that 39% of the participants had experience in interdisciplinary research. Having such experience was less common in health sciences than in other disciplinary fields. The PhD candidates with interdisciplinary research experience reported having more diverse experience in international collaboration compared to those candidates without interdisciplinary research experience. The candidates with inter-disciplinary experience estimated to take considerably longer time to complete their doctoral studies than those without such experience. Results imply that engagement in cross-disciplinary research has pros and cons from both PhD candidate and doctoral education system perspective.

Teaching writing in primary schools: the impact of curricula and orthographies. A systematic review
Keywords: Primary Education, Teaching Approaches, Teaching/Instructional Strategies, Writing/Literacy
Presenting Author:GIULIA VETTORI, University of Florence, Italy; **Co-Author:**Julie Dockrell, Institute of Education, United Kingdom

Our understanding of teachers' writing practices are limited by a focus on teachers teaching in English and a lack of a systematic comparison across national curricula. A systematic review was completed to explore writing practices in primary schools focussing on the impact of the curriculum and orthography. PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) statement (Moher et al., 2009) and the EPPI-centre (Gough et al., 2017) were followed. Inclusion and exclusion criteria were defined to capture relevant empirical studies. Following an initial review of the literature, key terminology was collated. The key search terms "teaching", "writing" and "primary school" were used and criteria were specified for age range, context, language of instruction and writing components. Initial hits from the databases included publications from PubMed, Web of Science, and Scopus. Data extraction included (1) whether writing models underpin reported teaching practices, which components of the writing process teachers focus on; (2) which strategies are reported to be used by teachers, how they are operationalized and their frequency of use; and (3) which aspects of the teaching of writing vary across different languages and national educational curricula.

A genre-based interconnected reading and writing instruction: effects on writing skills
Keywords: Instructional Design, Reading, Secondary Education, Writing/Literacy
Presenting Author: Moniek Vis, Rijksuniversiteit Groningen, Netherlands; **Co-Author:**Amos van Gelderen, University of Amsterdam / Rotterdam University of Applied Sciences, Netherlands; **Co-Author:**Kees de Glopper, University of Groningen, Netherlands; **Co-Author:**Jacqueline van Kruiningen, Rotterdam University of Applied Sciences, Netherlands

Reading and writing skills are highly interconnected (e.g. Fitzgerald & Shanahan, 2000). Meta-analyses suggest that reading skills benefit from writing instruction and vice versa, and that both reading and writing skills benefit from balancing reading and writing instruction (Graham & Hebert, 2011; Graham et al., 2018a; Graham et al., 2018b). However, there seems to be little research on the effects of interconnected reading and writing instruction (IRWI).
We defined interconnected reading and writing instruction as instruction in both skills aiming at elements that connect them according to functional and (socio-)cognitive models of reading and writing, explicitly addressing relationships between reading and writing. Genre is a core element of IRWI. The aim of our research is to test whether genre-based interconnected reading and writing instruction improves reading and writing skills.
Two genre-based lesson series focusing on news articles and columns respectively were implemented in three Dutch secondary schools. Eight participating

teachers were randomly assigned to the two conditions. For both conditions, two distinct genre elements were the focus of instruction. The column and news article group function as each other's control group. All students took the same pre- and posttests.
Writing assignments were rated using a benchmark procedure (pretest and posttest) and genre characteristics were analytically rated (posttest). Multilevel analyses with these scores on the posttest writing assignments as dependent variables showed significant effects of pretest scores on posttest scores. However, condition did not explain differences in posttest scores which is in contrast to previously found results on reading posttests.

Bilingual adults learning written words in English: orthographic influences of the first language.
Keywords: Bilingual Education, Quantitative Methods, Reading, Writing/Literacy
Presenting Author: Alexia Antzaka, Universidad Internacional de la Rioja-UNIR, Spain; **Co-Author:**Tianjiao Li, University of Bangor, United Kingdom; **Co-Author:**Mina Jevtović, Basque Center on Cognition, Brain and Language-University of the Basque Country, Spain; **Co-Author:**Clara Martin, Basque Center on Cognition, Brain, and Language- Basque Foundation for Science (Ikerbasque), Spain

When learning novel written words monolingual English children rely on larger units compared to monolingual Italian children, thus boosting their word learning performance (Marinelli et al., 2020). Relying on larger units has been related to reading experience in a deep (e.g., English or French) as compared to a shallow (e.g., Italian or Spanish) orthography not only in word learning but also in monolingual reading (Ziegler & Goswami, 2005). In bilinguals, the size of the units used in reading is influenced by both their orthographies. Thus, bilinguals knowing one language with a deep orthography rely on larger units compared to bilinguals knowing two languages which both have shallow orthographies, even when reading in their shallow-orthography (Lallier & Carreiras, 2018). The present study tests whether similar differences can be observed when bilinguals learn written words in the same, second language (English) because of differences in the orthographic depth of their first language (either Spanish-shallow or French-deep). Sixty adult participants were tested online (30 Spanish-English, 30 French-English bilinguals). Participants were taught 24 English-like novel written words with either inconsistent or consistent rhymes. We hypothesised that French-English bilinguals would: a) rely on larger orthographic units thus learning more novel words, b) perform equally well on consistent and inconsistent items due to their greater experience with spelling inconsistencies. Our preliminary results demonstrate that while both bilingual groups learnt a similar number of words, the Spanish-English bilinguals performed worse on the inconsistent items while the French-English bilinguals performed, as expected, equally well.

Executive Functions in School Achievement: The Mediational Role of Learning-Related Behavior
Keywords: Cognitive Skills and Processes, Mathematics/Numeracy, Self-regulated Learning and Behaviour, Writing/Literacy
Presenting Author:carlotta rivella, Unige, Disfor, Italy; **Co-Author:**Paola Viterbori, UNIGE, Disfor, Italy

Executive functions (EFs) have a crucial role in the transition to school. EFs are related to both academic achievement and learning-related behavior (LRB), that is the ability to adapt to the school demands in terms of concentration, compliance with rules, and autonomy. Few studies have examined EF, school performance, and LRB together, taking into account their interconnection.The aim of the present study was to investigate the mediational role of learning-related behavior in the relationship between EF and academic achievement during the primary school transition.Ninety-five first graders completed a performance-based EF assessment through working memory and inhibitory tasks. They also completed literacy and math tasks. Their teacher reported their learning-related behaviors. Results indicate that despite different patterns depending on the EF component or school performance considered, EFs are related to school achievement both directly and indirectly, through the mediational role of learning-related behavior. These findings highlight the importance of EF in early academic performance and the importance to support EF development as a beneficial part of early education curriculum and a target for early intervention for a successful transition to school.

Assessing writing motivation: A systematic review of K-5 students' self-reports
Keywords: Assessment Methods, Motivation, Primary Education, Writing/Literacy
Presenting Author: Aline Alves-Wold, University of Stavanger, Norway; **Co-Author:**Bente Walgermo, University of Stavanger, Norway; **Co-Author:**Erin McTigue, University of Stavanger, Norway; **Co-Author:**Per Henning Uppstad, Norwegian Reading Center, Norway

For attaining success in writing, motivation is essential. Crucially, instruction is dependent on knowing the student's capabilities and inner drives. To date, research on writing has yet to establish a consistent framework for assessing writing motivation, and often fails to acknowledge students' self-reports, rather favoring evaluations of students' writing motivation made by others, such as teachers and researchers. This limbo state originates partly from a general skepticism towards the trustworthiness of elementary students' self-reports. Nonetheless, the validity of such self-reports has been acknowledged in adjacent fields, such as reading. Aiming to establish a knowledge base from studies addressing students' voices, the present study adopts the method of a systematic review and investigates how writing motivation has been assessed in empirical studies (1996-2020) through K-5 students' self-reports. Of the 7,047 studies identified through database search, 56 met the inclusion criteria and are examined in this review. Results indicate that (a) *storytelling* is the genre most used to operationalize writing in the investigations, (b) surveys and interview questions measuring students' *attitude* towards writing are the most common type of self-report used, and (c) students' voices are weighted differently across the studies. Findings suggest that future research should (1) work to counteract existing biases in writing tasks, (2) provide a rationale for their choice/design of measure of motivation, and (3) report clearly whose voices are being heard (e.g., students', teachers', or researchers') and the appropriateness of this choice regarding study purpose, design, and findings.

Moroccan EFL University Instructors' Perceptions and Self-Reported Practices on Teaching Writing
Keywords: Higher Education, Quantitative Methods, Teaching Approaches, Writing/Literacy
Presenting Author: Abderrahim Mamad, University of Szeged, Doctoral School of Education, Hungary; **Co-Author:**Tibor Vígh, University of Szeged, Hungary

The majority of students in higher education lack proficiency (e.g., in writing words correctly and distinguishing a sentence from a phrase) and encounter many obstacles in many areas of writing (e.g., grammar, vocabulary, organization, and sentence construction). This illustrates the challenging nature of the writing skill and the teachers' emphasis on the product rather than the process of writing instruction. Thus, this study aims to compare the product- and process-based approaches to writing according to English as a Foreign Language (EFL) professors' perceptions and self-reported practices. For the purpose of this exploratory quantitative study, a 42-item questionnaire was developed to collect data face-to-face and online from 51 EFL professors in Moroccan public universities. Since the questionnaire items regarding their perceptions and practices were identical and they covered five subscales which are governed by both the product and process approach to writing, comparisons could be made. The findings demonstrated that the professors agreed on the value of the subscale, engagement in the writing revision process, more than the other subscales. The professors also reported that the writing practices described in the two subscales, engagement in the writing revision process and writing as a final product, were most frequently used. Based on the comparison between the professors' perceptions and their self-reported practices, consistencies were found in all five subscales. This study not only validated the questionnaire on the two approaches to teaching EFL writing in Moroccan universities, but it also showed how university professors' perceptions and self-reported practices matched.

Development of Creative Thinking via Fractions and Rhythm
Keywords: Cognitive Development, Creativity/Divergent Thinking, Learning Approaches, Mathematics/Numeracy
Presenting Author: Libby Azaryahu, The Academic College Levinsky Wingate, Israel; **Co-Author:**Orit Broza, Levinsky College of Education, Israel; **Co-Author:**Shai Cohen, Bar-Ilan University, Israel; **Co-Author:**Sara Hershkovitz, Levinsky College of Education, Israel; **Co-Author:**Esther Adi-Japha, Bar-Ilan University, Israel

The present study examines the effectiveness of learning fractions and rhythm using explicit instruction and its impact on the creative thinking of 4th graders (N=86) in both math and music. For the purpose of the study, an intervention program was used focusing on creative thinking of fractions and rhythm. Three classes received identical MusiMath instruction that explicitly links math and music. These classes received additional instruction regarding patterns of creative thinking differing in focus: Creative Math class, Creative Music class, and Creative Math and Music class. The fourth class was used as a control class that learned math and music in a standard way without creative intervention. To collect the data, we developed software that enabled the students to perform musical and mathematical tasks that included questions with only one correct answer, and questions that invited original and varied answers that encouraged creative thinking. Pre- to post-intervention analyses indicated that the experimental groups outperformed the control group on fractions and rhythm. All experimental groups developed their creative thinking in both math and music with an advantage to the Creative math and music class.

Children's mathematical anxiety in primary school: The role of sex, age, and spatial ability
Keywords: Anxiety and Stress, Cognitive Development, Gender Issues, Mathematics/Numeracy
Presenting Author: Wenke Möhring, University of Basel, Switzerland; **Co-Author:**Leonie Moll, University of Basel, Switzerland; **Co-Author:**Marta Szewczyk, The John Paul II Catholic University of Lublin, Poland; **Co-Author:**Magdalena Szubielska, The John Paul II Catholic University of Lublin, Poland

Several students suffer from mathematical anxiety in school, and thus experience strong, negative emotions in mathematics education. In the present study, we aimed to investigate whether math anxiety can already be measured in primary school, whether there are any age- and sex-related differences, and whether spatial skills (mental rotation, spatial scaling) would mediate the potential relation between sex and children's math anxiety. A sample of 6- to- 8-year-old children (N = 168) took part in two spatial tasks (assessing mental rotation and spatial scaling), solved several mathematical problems, and were asked about their mathematical attitudes and anxiety using acknowledged questionnaires. Our findings suggest a sex difference with girls showing higher math anxiety and lower attitudes even shortly after entering primary school (see Fig. 1). However, this relation between sex and math anxiety was not mediated by spatial skills (see Fig. 2) which contrasts several recent adult studies. Therefore, it seems that spatial skills (and spatial anxiety) may mediate the relation between sex and math anxiety in adult samples, whereas the same does not hold for primary school children. Differential mechanisms across age and educational implications will be discussed.

Eye-tracking for investigating students' local vs. global view of data
Keywords: Cognitive Skills and Processes, Eye Tracking, Mathematics/Numeracy, Mixed-method Research
Presenting Author: Saskia Schreiter, University of Education Heidelberg, Germany; **Co-Author:**Markus Vogel, Heidelberg University of Education, Germany

Distribution comparisons are a central component of statistics. Research showed that many students struggle to perceive a data distribution as a conceptual entity. These difficulties are reflected in students' tendency to focus on local details of the distributions (*local view of data*) rather than on differences between distributions as a whole (*global view of data*). While many authors refer to students' view of data, there is, to the best of our knowledge, no empirical study that investigated students' actual viewing behavior when comparing distributions. The central assumption of this study was that specific eye-tracking measures constitute indicators for the perceiving and processing of local vs. global distributional features. For this purpose, hypotheses for differences in certain eye-tracking measures (fixation count, saccade amplitude, saccade direction) between students with a local and global view of data were theoretically derived and empirically investigated. A methodological combination of eye-tracking and stimulated recall interviews was used to collect data from 25 6th graders. In line with expectations, students with a global compared to a local view of data had on average significantly fewer fixations, longer saccade amplitudes and a higher relative number of horizontal saccades. These results suggest that eye-tracking can assist in identifying students' conceptions and difficulties related to a local vs. global view of data.

Individual strategies when comparing data sets with boxplots and their corresponding answer patterns
Keywords: Cognitive Skills and Processes, Mathematics/Numeracy, Misconceptions, Quantitative Methods
Presenting Author: Martin Abt, University of Education Freiburg, Germany; **Co-Author:**Timo Leuders, University of Education Freiburg, Germany; **Co-Author:**Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany

One main reason for errors when comparing data sets with boxplots is the counterintuitive meaning of the box area: it is inversely related to the distribution's density and *not* proportionally related to the represented part of the sample—as in other representations. We used congruent and incongruent items to investigate (N=100) whether the occurrence of an area bias depends on incomplete conceptual change. Via cluster analysis we identified a first group, who showed no area bias, a second group who systematically answered with area bias, and two other groups with intermediate knowledge—answering specific items (e.g., when comparing the salient median led to the correct answer) without area bias. The results are in line with our hypotheses: the first group, in contrast to the second group, fully completed the conceptual change necessary, and the incomplete conceptual change in the three groups with intermediate knowledge prevents the area bias only in certain tasks.

Evidence that retrieval of multiplication facts requires inhibitory control
Keywords: Cognitive Development, Cognitive Skills and Processes, Mathematics/Numeracy, Quantitative Methods
Presenting Author: Joanne Eaves, Nottingham University, United Kingdom; **Co-Author:**Camilla Gilmore, Loughborough University, United Kingdom; **Co-Author:**Lucy Cragg, University of Nottingham, United Kingdom

Previous research has demonstrated that inhibitory control skills have a role in mathematics performance. However, the mechanism(s) underlying this relationship are currently unclear. We used an experimental approach to test the proposal that inhibitory control is required when retrieving multiplication facts to resolve interference between related facts. For example, for the multiplication problem '6 × 7', some people might incorrectly answer '48' because it is the correct answer to the neighbouring multiplication problem '6 × 8'. In an online experiment with 450 adult participants, we interleaved trials of established inhibitory control tasks (number or animal Stroop) and a multiplication retrieval task. We found that congruency effects were influenced by the nature of the previous trial, indicating that inhibitory control transferred between trials, and therefore between tasks. This reveals that inhibitory control is involved when resolving interference between related multiplication facts. The nature of the Stroop task did not affect the transfer of inhibitory control, demonstrating that the inhibitory control mechanisms involved were not context-specific but domain-general in nature. Our findings suggest that retrieving knowledge of multiplication facts might be difficult for some individuals not because they lack mathematical knowledge of those facts, but because they have insufficient inhibitory control or a difficulty deploying inhibitory control., As a result, they might struggle to overcome the interference between neighbouring multiplication facts.

Investigation of the Number Sense and Cognitive Flexibility Levels of Preschool Children Aged 5-6
Keywords: Cognitive Development, Cognitive Skills and Processes, Early Childhood Education, Mathematics/Numeracy
Presenting Author:Gürsu Asik, Bahcesehir University, Turkiye; **Co-Author:**Asli Gokdag, Ministry of Education - Turkey, Turkiye

This study has been designed to investigate cognitive flexibility and number sense levels of preschool children aged 5-6. While focusing mainly on the relationship between number sense and cognitive flexibility of preschool children, the study also attempts to examine the effect of demographic factors such as parents' level of education, gender, and number of siblings on the improvement of those two skills. To this end, "Dimensional Change Card Sorting" task and

“Number Sense Brief” were used respectively to measure the level of cognitive flexibility and the ability to use and understand numbers.A total of 100 children from two different public kindergartens participated in the study. Data was collected in 30-minute one-on-one sessions with each child. Independent-sample t-tests, one-way ANOVA and correlation analyses were carried out to investigate the relationship among the variables. It has been found that while there are significant statistical differences between children’s cognitive flexibility and number sense in favor of educated parents, no such difference was observed for gender variable. As for the number of siblings, statistical difference does not exist for cognitive flexibility; however, there seems to be a statistically significant difference as far as number sense is concerned. It has further been understood that there is a significant positive correlation between number sense and cognitive flexibility. The study contributes to our understanding of the role of cognitive flexibility and number sense in the development of 5-6 year-old early-school age children and provides further research suggestions.

Metacognition, creativity, and critical thinking reflect in PBL-based teaching performances
Keywords: Creativity/Divergent Thinking, Critical Thinking, Metacognition, Problem-based Learning
Presenting Author: Rotem Maor, David Yellin College of Education, Israel; **Co-Author:**Nurit Paz-Baruch, Bar Ilan University, Israel; **Co-Author:**Niv Grunspan, Bar Ilan University, Israel; **Co-Author:**Alex Milman, Bar-Ilan University, Israel; **Co-Author:**Zemira Mevarech, Bar-Ilan University, Israel; **Co-Author:**Rotem Levi, Bar Ilan University, Israel; **Co-Author:**Sarit Shlomo, Bar Ilan University, Israel; **Co-Author:**Michal Zion, Bar-Ilan University, Israel

The integration of 21st-century skills (e.g., critical thinking, communication, collaboration, and metacognition) in teaching is essential for the quality of education and to prepare students for the challenges of 21st-century skills. One teaching method that can improve these skills among students is project-based learning (PBL). However, teachers themselves should be proficient in these skills to achieve this goal. The present study focuses on three skills: metacognition, creativity, and critical thinking, which are considered cognition-related 21st-century skills; integrating them in PBL settings may improve teaching and learning performances. This study aims to examine whether and in what way there are relationships between components of metacognition, creativity, and critical thinking in self-reported teaching performances in PBL settings. To examine the research question, we analyzed 29 journals in which teachers described a project they had planned, which was carried out by students using a mixed method design model. We used a self-reported teaching performance index developed for this study. The results show significant associations between metacognition, creativity, and critical thinking and revealed that these correlations are reflected the most in projects engaging in environmental issues. These results emphasize the importance of metacognition, creativity, and critical thinking combination in PBL settings that can be employed to improve teaching and learning processes and underpin the connection between 21st-century skills and environmental education.

Personal Data Literacy Empowerment: A theoretical framework
Keywords: Competencies, Critical Thinking, Digital Literacy and Learning, Instructional Design
Presenting Author: Eleni Kyza, Cyprus University of Technology, Cyprus; **Co-Author:**Andria Agesilaou, Cyprus University of Technology, Cyprus

Children while exploring the digital environment, leave digital traces behind, and are often exposed to data disclosure requests from commercial parties. Commercial organizations collect and analyze children’s data to gain insights on their online activities and preferences to create user profiles, which in turn are used to provide targeted ads and services. However, children are reported to have difficulties in identifying and understanding the techniques of data harvesting or acknowledging the value of their data. In addition, evidence shows that if they understand to some extent these issues, they do not know how or are not willing to employ strategies to protect their personal data. In other cases, children choose to disclose rather than to protect their personal data in favor for incentives and prizes. Scholars have advocated that to protect children’s data rights and increase their agency in the data economy, children should be empowered to develop the necessary knowledge and competencies to recognize the data mining practices and effectively respond to them. Aiming to address this challenge, this article focusing on children and youth, proposes the “Personal Data Literacy Empowerment” framework, which contains the following steps: Data visualizations and representations; Awareness of data privacy, data ownership, and data mining issues; Deeper understanding of the data mining industry; Questioning the data mining practices and one’s own data contributions; and Behavior change and adoption of resilient practices. The article concludes by discussing implications of this framework for future education and research around the area of children’s understandings of personal data.

Effects and experiences from playing a game against disinformation in different classroom settings
Keywords: Cognitive Skills and Processes, Critical Thinking, Game-based Learning, Mixed-method Research
Presenting Author: Thomas Nygren, Uppsala University, Sweden; **Co-Author:**Carl-Anton Werner Axelsson, Uppsala University, Sweden; **Co-Author:**Jon Roozenbeek, University of Cambridge, United Kingdom; **Co-Author:**Sander van der Linden, University of Cambridge, United Kingdom

This study investigates how the Bad News game can be implemented in classroom settings and to what extent it has an impact on students' skills to evaluate digital misinformation. In a quasi-experimental design, with 771 upper secondary school students from Sweden, we also investigate to what degree this game may have an impact upon students’ constructive attitudes - namely positive attitudes towards access to reliable news without fostering overconfidence. We find that the overall effect size across three conditions (playing individually, in pairs or competing with the class) was *d*=.30 which is similar to previous studies using Bad News (e.g., Roozenbeek & van der Linden, 2019). We also find that students in the more competitive class condition perceived the educational intervention as more interesting and fun than students in other educational settings. The correlation between self-rated internet skills and their actual skills to assess misinformation in the post-test indicates that the education intervention did not boost students’ overconfidence. Students made more considerations about the design of misinformation after the intervention, suggesting that the game may be especially useful to play with students who are unaware of online misinformation strategies.

Using reflection to analyse student insights of critical & creative thinking skill development
Keywords: Creativity/Divergent Thinking, Critical Thinking, Problem Solving, Teaching/Instructional Strategies
Presenting Author: Kelly Benati, Monash University, Australia; **Presenting Author:**Jacqueline O'Toole, Monash University, Australia; **Co-Author:**Francesco Interrigi, Monash University, Australia; **Co-Author:**paul murphy, Monash University, Australia

Businesses are calling for business graduates who can think critically and creatively to develop innovative solutions to business problems. It has been identified that there are several different forms of graduate capital associated with employability and career success (Tomlinson, 2017), which all reinforce the requirement for critical and creative thinking skills. However, it has been suggested that the higher education system is not effectively teaching or cultivating these in their future graduates. Students also expect to acquire general and social skills, attitudes, and broader abilities as well as discipline specific knowledge (Nicolescu et.al., 2009), however there is limited information regarding their understanding of the skills and abilities they will need obtain to ensure their future career success. This research evaluates the students’ perceptions and understanding of their learning of critical and creative thinking while working in teams to

develop sustainability solutions for a selected organisation. It aims to better comprehend students' insights regarding the meaning and relevance of critical and creative thinking as an important employability attribute, while ascertaining appropriate pedagogies for enabling this learning.

Learning of working life competencies through collaborative problem-solving in higher education
Keywords: Competencies, Cooperative/Collaborative Learning, Higher Education, Problem Solving
Presenting Author: Niina Impiö, University of Oulu, Finland; **Co-Author:**Signe Siklander, University of Oulu, Finland; **Co-Author:**Bhavna Rawat, University of Oulu, Finland

As working life follows in a continuum from education, working life and education should not be dissected separately (Lucas & Unwin, 2009). Universities are often accused of neglecting the idea that higher education (HE) should lay a path to the workplace (Tynjälä et al. 2016). In our master's degree programme, we educate experts in the field of learning, education and technology, and the students are expected to excel at various working life situations in their future work. Therefore we focus on enhancing competences of collaboration and co-operation as well as problem-solving in our study context. Aim of our study is to dissect from students' perspective which working life competences they have learnt during the collaborative problem-solving process. International HE students (N=53) took part in the study, which took place within the four courses (each 10 ects). The courses were planned in accordance with a pedagogical design of collaborative problem-solving (CPS) (Author, Author, & Author, 2021). Theoretically it relies on the learning sciences, specifically on collaborative learning and co-regulation of learning. The data was collected by online questionnaires and responses for open questions were analyzed thematically. The results reveal that the development of students' working life competencies through CPS process is the combination of four aspects: students' skills *(social skills, cognitive skills, technical skills, problem-solving)*), will (*motivation for learning, emotional skills, ownership for own learning)*), attitudes (*open for collaboration, open mindedness, valuing of ongoing learning*) and knowledge (*learning theories, awareness of own competencies and 21st century skills, technological knowledge*).

Do students in different courses of study think the same way in complex problem solving?
Keywords: Cognitive Skills and Processes, Higher Education, Problem Solving, Reasoning
Presenting Author: Gyöngyvér Molnár, University of Szeged, MTA-SZTE Digital Learning Technologies Research Group, Hungary; **Co-Author:**Hao Wu, University of Saint Joseph, Macao

This study aims to identify the similarities and differences in the thinking of students in different courses of study while they solve complex problems (CPS). Participants (N=852) were freshers in four faculties (medicine, the humanities, economics and the sciences) at a large Hungarian university. CPS, inductive reasoning (IR) and combinatorial reasoning (CR) were assessed. Results indicated large differences in CPS, IR and CR skills between the students in different courses of study. Path analyses models demonstrated that the students in the various faculties typically think differently in a CPS environment. That is, IR and CR showed different effects on their CPS skills. This study contributes to our understanding of the nature of CPS and identifies the differences in the way of thinking between students in various courses of study.

Social, Dimensional, and Temporal Comparison Effects on Students' Self-Concepts: A Meta-Analysis
Keywords: Achievement, Cognitive Skills and Processes, Competencies, Self-concept
Presenting Author: Fabian Wolff, Universität of Koblenz, Germany; **Co-Author:**Jens Möller, Kiel University, Germany

The 2I/E model provides a framework to examine the joint effects of social, dimensional, and temporal comparisons on students' subject-specific academic self-concepts. To date, it has been tested in 12 empirical studies. However, integration of these findings is lacking. We therefore conducted an individual participant data meta-analysis, in which we reanalyzed the data used in all prior 2I/E model studies (N = 45,248). This meta-analysis provided strong support for the 2I/E model: There were moderate social comparison effects, small to moderate dimensional comparison effects, and small temporal comparison effects on students' math and verbal self-concepts. Moreover, several moderating variables affected the strength of these effects. However, all moderating effects were small in size.

Academic Buoyancy and Coping: Are Buoyant Students Using More Effective Coping Strategies?
Keywords: Achievement, Cognitive Skills and Processes, Emotion and Affect, Secondary Education
Presenting Author: Tahrim Hussain, Liverpool John Moores University, United Kingdom; **Co-Author:**Dave Putwain, Liverpool John Moores University, United Kingdom; **Co-Author:**Martin Daumiller, University of Augsburg, Germany; **Co-Author:**Reinhard Pekrun, University of Essex, United Kingdom

Academic buoyancy is defined as the ability to bounce back from academic setbacks and minor academic adversities, including the pressure of taking examinations. It would be expected for academic buoyancy to show positive relations with adaptive coping. Although previous studies have shown small or negligible relations, they have used a limited range of coping strategies to measure relations with academic buoyancy. The present study aims to examine the relations between academic buoyancy and a more extensive repertoire of nine coping strategies used by upper secondary students when an examination did not go as well as hoped for. The participants were 535 upper secondary students (male = 138, female = 376) with a mean age of 16.4 years (SD= .52). Academic buoyancy was measured using the Academic Buoyancy Scale. Coping was measured using the Cognitive Emotion Regulation Questionnaire.Academic buoyancy showed positive correlations with positive refocusing, refocus on planning, positive re-appraisal, and putting into perspective, and negative correlations with acceptance, self-blame, rumination, and catastrophising. Regressions showed Academic buoyancy was a statistically significant positive predictor of academic achievement, over and above coping. Network analysis showed academic buoyancy was situated closely and positively to putting into perspective and positive reappraisal and negatively to catastrophising and other-blame. In contrast to earlier studies, academic buoyancy was related to coping strategies. Cognitive strategies to perceive difficult situations as something to learn from and put into perspective, along with taking personal responsibility, are key in building buoyant students who can cope with academic adversities.

Effects of Executive Function Training in Children and Adolescents: a Meta-Analysis
Keywords: Achievement, Cognitive Skills and Processes, Educational Neuroscience, Meta-analysis
Presenting Author: Sophie McMullin, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Steve Masson, Université du Québec à Montréal (UQAM), Canada

Executive functions (EFs) are top-down control mechanisms that enable goal-directed behavior (Miyake & Friedman, 2012). They include working memory, inhibitory control, and cognitive flexibility. These cognitive processes have been linked to academic success (Bowmer *et al.*, 2018). As a result, many researchers have sought to develop EFs training. However, the results are inconsistent across studies. The problem lies in the likelihood of observing transfer, i.e. the influence of past learning on current or future learning (Perkins et Salomon, 1992). Typically, in the field of cognitive training, only near transfer is observed, i.e. transfer occurs when the training and assessment tasks are somewhat similar, and far transfer, when the tasks are dissimilar, seems more elusive (Sala & Gobet, 2017). However, this ignores other conceptualizations of transfer, and then potentially masks effects of cognitive training. Considering this point, we therefore used a detailed taxonomy of transfer (Barnett and Ceci, 2002) to realize a meta-analysis combining 103 studies of various cognitive trainings with neurotypical children and adolescents aged 3 to 18 years. Our results show that working memory seems to be the EF that benefits most from cognitive training,

regardless of the training goal. Furthermore, we observed that long delays between training and assessment, as well as substantial modifications of the social context between training and assessment, seemed to impair transfer. These results offer new perspectives on the effects of cognitive training. More importantly, they propose a new way to analyze of cognitive training studies.

A preliminary study of the brain activation during science problem solving using MEG method
Keywords: Cognitive Skills and Processes, E-learning/ Online Learning, Problem Solving, Science Education
Presenting Author: Fang-Ying Yang, National Taiwan Normal University, Taiwan

The purpose of the study was to explore the brain activation during science problem solving before and after a computerized learning task by using Magnetoencephalography (MEG) which is a neuroscience tool measuring the magnetic fields produced by brain's electrical currents. A computerized learning program on the topic of “Moon Phases” was developed as the instructional intervention. To assess conceptual understanding, we constructed two tests with multiple-choice questions as pre- and post-tests. Twenty-six university students were paid to participate in the study. They were asked to do pretest in the MEG system, and then play with the learning program. Afterward, they did post-test in the MEG system again. Participants were grouped into successful and unsuccessful problem solvers according to their test result. Brain activation was indicated by the normalized powers of brain waves (alpha & beta waves) and connectivity between different brain regions. *T*-test was applied for group comparisons while correlation analysis was used to examine the brain connectivity. It was found that when learners answered different types of test items, different patterns of brain activation appeared. Most students who succeeded in the post test showed a tendency of reduction in their brain activation when solving simple items but the activation became stronger when solving the complex ones. Meanwhile, the connectivity between brain regions decreased in the post-test.

The Impact of Executive Functions on Physics Learning in Secondary School Students.
Keywords: Cognitive Skills and Processes, Quantitative Methods, Science Education, Secondary Education
Presenting Author: Konstantinos G Tsigaridis, University of Cambridge, Greece; **Co-Author:**Rui WANG, University of Cambridge, China; **Co-Author:**Jiayin Zheng, University of Cambridge, UK, United Kingdom; **Co-Author:**Michelle Ellefson, University of Cambridge, United Kingdom

Physics is one of the fundamental science domains in secondary education. Teachers raise concerns about the insufficient development of physics skills in high-school students. Hence, it seems essential to investigate the possible impact of cognitive skills, in this case, executive functions, on physics learning. Recent findings suggest that executive functions correlate with physics learning. However, it seems important for research in cognitive psychology and science education to investigate if these correlations are differentiated in dependence on students’ engagement with physics courses. As such, we administered a battery of executive function skills and physics learning tasks to a sample of 15- to 17-year-old students from Greece (N = 403, M_{age} = 15.78 years, SD_{age} = 0.74). For science students (they select to attend extra courses in physics), we noticed that executive function skills and physics learning share strong correlations. In contrast, executive function skills seem to have less significant links with physics learning for non-science students (no extra courses for physics). These findings highlight the importance of including students’ engagement with physics courses when examining the links between executive functions and physics learning. Thus, it seems essential for further research to explore the complex cognitive processes underlying secondary physics learning. Results from such studies can, in the long run, lead to breakthrough physics curricula for enhancing students’ physics skills.

Biology Education Levels and General Cognitive Ability Influence Conceptual Learning of Biology
Keywords: Cognitive Skills and Processes, Knowledge Construction, Quantitative Methods, Science and STEM
Presenting Author: Rui WANG, University of Cambridge, China; **Co-Author:**Konstantinos G Tsigaridis, University of Cambridge, Greece; **Co-Author:**Aidan Feeney, Queen's University Belfast, United Kingdom; **Co-Author:**Michelle Ellefson, University of Cambridge, United Kingdom

One obstacle to conceptual learning in science is intuitive theory. Recent work indicates that intuitive theories coexist with rather than being replaced by the correct scientific theories during the process of conceptual learning in science. Hence, transitioning from intuitive theories to scientific theories is complex, as it requires the efficient suppression of intuitive theories while accessing and applying scientific theories. Recent findings suggest that executive functions and science education experience are associated with people’s ability to suppress intuitions about science. Although it is known that general cognitive ability shares reliable links both with executive functions and science education experience, few studies have examined the influence of general cognitive ability on the suppression of intuitions about science. Thus, in this study, we investigated the role of general cognitive ability and biology education experience in intuition suppression in a sample of adult students (N = 262, M_{age} = 23.45 years, SD_{age} = 6.53 years). We administered two biology tasks consisting of items to which intuitive and formal scientific theories gave consistent or inconsistent answers. General cognitive ability was significantly associated with people’s accuracy and response time when solving counterintuitive biology questions. Moreover, biology education experience was positively associated with students' accuracy rather than response time. These results shed light on the links between general cognitive ability, science education experience and processes of conceptual learning in science.

Session A 26

22 August 2023 12:15 - 13:45
UOM_GYM
Roundtable
Learning and Instructional Technology, Teaching and Teacher Education

Teacher Professional Development

Keywords: Attitudes and Beliefs, Conceptual Change, In-service Teachers, Mindsets, Pre-service Teachers, Qualitative Methods, Reading, Secondary Education, Teacher Professional Development, Teaching Approaches, Well-being

Longitudinal changes in teachers’ attitudes towards innovations in implementation processes
Keywords: Attitudes and Beliefs, Conceptual Change, Reading, Teacher Professional Development
Presenting Author: Mareike Ehlert, University of Muenster, Germany; **Co-Author:**Elmar Souvignier, University of Muenster, Germany

Implementing evidence-based innovations in everyday school practice requires favourable attitudes by teachers, such as their perception of an innovation’s acceptability and feasibility. It is likely that teachers’ attitudes change at different moments in the implementation process, e.g., when teachers gain first experiences with an innovation in practice. As a consequence, the support teachers receive in the implementation process should be geared to these experienced changes. This study therefore aims at exploring significant attitudinal changes in teachers’ acceptability and feasibility before, during and after implementing an innovation. N = 68 primary school teachers currently participate in a professional development programme on a differentiated reading intervention. From January to July 2023, they will implement the prepared reading material into their classroom. Teachers’ acceptability and feasibility of the reading material will be assessed (1) after a teacher training that precedes classroom implementation, (2) two months after implementing the material, and (3) at the end of the school year. To investigate if teachers’ acceptability and feasibility towards the innovation change over time, an ANOVA will be conducted. The direction of these changes will be examined exploratively. Understanding the dynamics of teachers’ attitudes will provide information about when teachers need additional support in implementation processes.

Experiential learning as a means for personal development and wellbeing in Slovak teachers
Keywords: Mindsets, Teacher Professional Development, Teaching Approaches, Well-being
Presenting Author: Lenka Janik Blaskova, University of Exeter, United Kingdom

Thirty years ago, Slovakia became an independent, democratic country, but schooling and teacher training practice have not catch up with the needs and trends of 21st century education. A substantial educational reform has not taken place, and 19 changes in the ministers of education post have not allowed for any

long-term strategy implementation. In 2021, teachers revealed alarming rates of perceived stress (95%) and 25% perceived school atmosphere as harmful to their mental health. Private and the third sector offer workshops and short-term programs to improve the mental health of teachers. However, it is not clear how evidence-based and effective these programs are.In response, an international pilot involves the co-creation and delivery of experiential learning, targeting the personal development and wellbeing of Slovak teachers. Using cultural-historical activity theory (CHAT), it examines how participating teachers might respond to well-established training methods developed by the Social and Health Education Project in the Republic of Ireland. The pilot sets the ground for further work on developing an evidence-based nationwide curriculum aiming to promote socio-emotional competencies in Slovak teachers and children.This roundtable discussion seeks to understand how we can assist teachers in developing 21st century skills that we ask them to support in children and young people. How feasible is it to adapt a western-based curriculum on personal development to traditional education? Can co-creation of the curriculum support teachers in becoming aware of and getting equipped to support societal change? The researcher will reflect on the initial phase of the pilot.

Mapping the quality of teacher learning during lesson study: a digital ethnographic perspective
Keywords: In-service Teachers, Qualitative Methods, Secondary Education, Teacher Professional Development
Presenting Author: Katelijne Barbier, University of Antwerp, Belgium; **Co-Author:**Elke Struyf, University of Antwerp, Belgium; **Co-Author:**Ellen Vandervieren, University of Antwerp, Belgium; **Co-Author:**Vincent Donche, University of Antwerp, Belgium

In this study we aim to examine the quality of teacher learning, when mapped using an ethnographic research tool, called Ethos. This digital app enables us to map teacher learning experiences online and in situ. Using the framework of teacher learning patterns, making empirically based distinctions between reproduction oriented, meaning oriented and survival oriented teacher learning, we aim to unravel the distinct quality of learning experiences when teachers participate in a lesson study. Lesson study is a professional development method in which teachers work in groups and are actively and repeatedly stimulated to reflect upon their teaching practices. In this study, 16 mathematics teachers (grades 7 to 10) divided in 7 teacher teams, conduct 2 lesson studies in their classrooms. A rich experience sampling data stream is collected in a longitudinal way by using the Ethos app. In this app, teachers will receive a repeated set of open and closed questions during both lesson studies. In addition, they will have the opportunity to share multimedia content related to their entire learning trajectory. This study can provide important insights for theory development on the quality of teacher learning during lesson study or more broadly, when teachers participate in more long term active and collaborative professional development activities. If the qualitative results are enriching, it can also point at the added value of using digital ethnographic research tools and experience sampling, to map teacher learning in situ.

'Stories to live by' in early career teachers' professional identity development
Keywords: In-service Teachers, Pre-service Teachers, Qualitative Methods, Teacher Professional Development
Presenting Author: Gonny Schellings, Eindhoven University of Technology, Netherlands; **Co-Author:**Douwe Beijaard, Eindhoven University of Technology, Netherlands

'Stories to live by' pertain to dominant conceptions of teaching and learning in a school and affect a teachers' professional identity. Developing a professional identity is a key element of beginning teachers' growth. The current study analyzes the 'stories to live' by of 56 early-career teachers by identifying themes that may direct their reflection on the professionals they are and want to become. Stories assigned to certain themes seemed to have more impact on teachers' professional identity than stories associated with other themes. The round table will present some exemplar stories, highlight the different themes and discuss how peer discussions about 'stories to live by' reach deep reflection on beginning teachers' professional identity.

Workshop
Teaching and Teacher Education

Instrumental Enrichment thinking skills program

Keywords: Cognitive Skills and Processes, Dialogic Pedagogy, Metacognition, Reasoning
Interest group:

The goal of the workshop is to introduce the participants to the theory and practice of the thinking skills program called "Instrumental Enrichment" (IE) and offer them hands-on experience with some of the IE tasks. Rather than being taught frontally, the IE program is implemented in the classroom via a dialogical mediated learning technique. The main objective of this technique is to shift the emphasis from the "products" to the process of learning and problem-solving. Using the IE program as an example the workshop participants will be encouraged to discuss the advantages and disadvantages of "stand-alone" cognitive programs vs. cognitive infusion into curricular subjects. In addition, the participants will discuss the research demonstrating that the IE program proved to be effective also in changing the teachers' own cognitive and problem-solving skills. The workshop participants will work with two types of IE tasks – perceptual "Organization of Dots" and more conceptual "Comparisons" and review the possibilities of transferring the target cognitive skills to various curricular areas.

Instrumental Enrichment thinking skills program

ICT Demonstration
Educational Policy and Systems

Calibration of an Academic Analytics Tool for At-Risk Students Policy in Higher Education

Keywords: Assessment Methods, At-risk Students, Educational Policy, Learning Analytics
Interest group: SIG 04 - Higher Education

Please bring your own device if you are attending this ICT demonstration.Learning and academic analytics have become crucial tools in higher education policy. While learning analytics provides feedback for the individual student, academic analytics entails data tools that influence and support policy. Using design-based research with data simulation techniques, this EARI-ICT-demonstration aims at describing a calibration process, and showcasing how an academic analytics tool can be used to better understand why at-risk students have a higher chance of failing in high-selection freshman years. Using four different case studies using simulated data, we detail the strengths and limits of such an academic analytics tool for both course level and program level educational policy creation and monitoring.

Invited Symposium
Cognitive Science, Instructional Design

Synthesizing Cognitive Load and Self-Regulated Learning: Four years of EFG MRE Research

Keywords: Cognitive Skills and Processes, Instructional Design, Learning Strategies, Metacognition, Problem Solving, Quantitative Methods, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Anique de Bruin, Maastricht University, Netherlands
Organiser: Julian Roelle, Ruhr University Bochum, Germany
Discussant: Matthias Nückles, University of Freiburg, Germany

The Emerging Field Group 'Monitoring and Regulation of Effort' was founded in 2018 to unravel how bringing together Cognitive Load Theory and Self-regulated Learning Theory can advance our understanding of learning in contexts where managing mental effort is at stake and learners (partially) self-regulate the course of their learning. In this invited symposium, we describe state-of-the-art scientific insights related to this topic. The contributions provide a diversity of learning contexts and research questions where mental effort and self-regulation of learning interact. The contribution by Seufert and Hamm addresses the relations between task difficulty, subjective cognitive load, and learners' engagement in strategies of self-regulated learning. Waldeyer et al. examine whether in complex tasks, learners' metacognitive monitoring strategies can be supported by informing learners about how to monitor diagnostic cues before they engage with the respective tasks. In De Bruin et al. a conceptual framework on how to support self-regulation of effort when engaging with difficult but beneficial learning activities (i.e., 'desirable difficulties') is proposed. Finally, in Sidi et al., a specific type of self-regulation of effort is studied, that is, the "opt out" decision in problem-solving tasks. They consider motivational considerations, task design, and general success as moderating factors. Given the joint focus of the studies on understanding monitoring and regulation of effort as well as the methodological diversity, the symposium will point to fruitful conclusions and directions for future research concerning the self-regulation of mental effort during (complex) learning.

The interplay between Cognitive Load, learners' resources and self-regulation
Presenting Author: Tina Seufert, Ulm University, Germany; **Co-Author:**Verena Hamm, Ulm University, Germany

Self-regulated learning depends on task difficulty and accordingly learners' resources and cognitive load, as described in the model of Seufert (2018) by an inverse U-shaped relation: with easy tasks resources are high and load is low and hence there is no need to regulate, while with difficult tasks load is too high and resources too low to regulate. Only on a medium level of task difficulty learners regulate as resources and load are balanced. To validate this model, 67 participants reported their strategy use for four exams with different levels of difficulty. They specifically rated their perceived task difficulty, cognitive load, and the available resources (prior knowledge, interest, content-related self-concept). A multilevel analysis revealed an inverse U-shaped relationship between the task difficulty and the use of cognitive learning strategies. For metacognitive strategies and resource strategies, we only found a positive linear relationship. The increasing cognitive load mediates these relational patterns. The role of learners' resources as a mediator however needs further research.

Focusing Learners on Comprehension- or Performance-Based Cues in Fostering Monitoring Accuracy
Presenting Author: Julia Waldeyer, Ruhr-University Bochum, Germany; **Co-Author:**Tino Endres, University of Freiburg, Germany; **Co-Author:**Martine Baars, Erasmus University Rotterdam, Netherlands; **Co-Author:**Julian Roelle, Ruhr University Bochum, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany

Interventions that are intended to help students use comprehension-based cues are a promising means to enhance monitoring accuracy in learning from texts. Theoretically, emphasizing comprehension-based cues when acquiring problem-solving skills should also be beneficial. However, it is also conceivable that performance-based cues might be similar or even more effective than comprehension-based cues when acquiring problem-solving skills. To investigate the effects of focusing learners on comprehension- or performance-based cues in acquiring problem-solving skills, we conducted two experiments in mathematics. In Experiment 1 ($N = 135$), we found that focusing students on performance-based cues yielded higher monitoring accuracy. This effect occurred regardless of whether students were informed about the to-be-monitored cues before they engaged in problem-solving. In Experiment 2 ($N = 268$), we found that providing students who were focused on comprehension-based cues caught up with their counterparts when they additionally received instruction on how to use the respective cues and were engaged in self-explanation activities during problem solving. For students who were focused on performance-based cues, these support measures did not entail beneficial effects. We conclude that in acquiring problem-solving skills, focusing learners on comprehension-based cues is less effective than focusing learners on performance-based cues unless learners additionally receive guidance concerning the monitoring process and are engaged in comprehension-focused learning activities.

Self-regulating Effort towards Desirable Difficulties: A Conceptual Framework
Presenting Author: Anique de Bruin, Maastricht University, Netherlands; **Co-Author:**Felicitas Biwer, Maastricht University, Netherlands; **Co-Author:**Luotong Hui, Imperial College London, United Kingdom; **Co-Author:**Erdem Onan, Maastricht University, Netherlands; **Co-Author:**Louise David, Maastricht University, Netherlands; **Co-Author:**Wisnu Wiradhany, Bina Nusantara University, Indonesia

Desirable difficulties are learning conditions that are often experienced as effortful, but have a positive effect on learning results and transfer of knowledge and skills (Bjork & Bjork, 2011; Bjork, 1994). Learners often do not appreciate the beneficial effects of desirable difficulties, and the negative experiences of high effort and perceived low learning make them resistant to engage in desirable difficulties (Biwer et al., 2020a). This ultimately limits learning outcomes and academic achievement. With the increasing emphasis on self-regulation in education, characterized by higher learner agency and abundant choices in what, when, and how to study, the field of educational psychology is in need of theoretical and empirically testable assumptions that improve self-regulation in desirably difficult learning conditions with the aim to foster self-regulation abilities, learning outcomes, and academic achievement. Here, we present a framework that describes how to support self-regulation of effort when engaging in desirable difficulties; the 'Start and Stick to Desirable Difficulties (S2D2)' framework. The framework builds on the Effort Monitoring and Regulation Model (de Bruin et al., 2020). The aim of this framework is (1) to describe evidence for the central role of perceived effort and perceived learning in (dis)engagement in desirable difficulties, and (2) to review evidence on, and provide an agenda for research to improve learners' self-regulated use of desirable difficulties to help them start and persist when learning feels tough, but is actually effective.

Opting out leveraging strategic effort regulation
Presenting Author: Yael Sidi, the Open University of Israel, Israel; **Co-Author:**Rakefet Ackerman, Technion - Israel Institute of Technology, Israel

Effort regulation is the basis for effectively engaging in cognitive tasks in diverse work, daily life, and educational contexts. This regulatory process is at the core of research on self-regulation, and has received much attention in both metacognitive theory and Cognitive Load Theory. Such research on self-regulation of effort in problem-solving tasks has mostly used forced-response paradigms, in which participants must provide concrete solutions, even when having low confidence in the chance to succeed. However, in real life, people often opt out. Basic research has demonstrated that opting out can be an effective strategy

that improves success rates in responses chosen to be provided. However, research into opting out utilization is nascent. In the present study, we used multiple-choice analogies, a verbal problem-solving task, to shed more light on opting out while considering motivational considerations, task design, and general success in the task as moderating factors. Findings demonstrate that having the option to opt out can generally benefit problem-solving outcomes even for weak performers. They also expose the roles of motivation scheme and task design for optimizing these effects.

Invited Symposium
Learning and Social Interaction

Social Presence and Telepresence in Online Social Learning

Keywords: Computer-supported Collaborative Learning, E-learning/ Online Learning, Social Aspects of Learning and Teaching, Social Interaction
Interest group:
Chairperson: Emmy Vrieling, Open University of the Netherlands, Netherlands
Organiser: Karel Kreijns, Open University of the Netherlands, Netherlands
Organiser: Derya Orhan Göksün, Turkiye
Organiser: Kamakshi Rajagopal, Belgium
Organiser: Maartje Peters, Open University of the Netherlands, Netherlands
Organiser: Joshua Weidlich, German Institute for International Educational Research (DIPF), Germany
Discussant: Armin Weinberger, Saarland University, Germany

While online social learning allows for time and place independence, it is at the same time more difficult to support the learning process because of transactional distance (Moore, 2013) and psychological distance (Trope & Liberman, 2010). These distances give a feeling of isolation with negative consequences for social interaction and thus on social learning. Social presence and telepresence are seen as concepts that help to bridge psychological distance. Social presence is the feeling that distant others are ‘transported' to you whereas telepresence is the feeling of your ‘transportation' to others (e.g., in the remote or virtual environment). It is, however, unclear what the role of telepresence alongside social presence in online social learning is and how both presences reinforce each other. During this symposium we will involve the participants in a *World Café setup* to explore and discuss how social presence and telepresence may impact online communication, collaboration and social interaction. The output will further determine our EFG research agenda. In groups, facilitated by one of us, the following focus areas will be probed: (1) Human interaction; (2) Modes of communication; (3) Data driven regulation; and (4) Supporting technologies. The abstracts below each describe one of the focus areas.

Human interaction
Presenting Author: Karel Kreijns, Open University of the Netherlands, Netherlands

(Online) social learning builds on human interaction, which, as a joint transactive activity among two or more humans, is multilayered and complex. In addition to the contents of speech, face-to-face communication also includes nonverbal aspects like intonation, articulation, rhythm, and pitch. Beyond auditory features, nonverbal aspects of communication also include facial expressions, gestures, posture, and much more. These latter features are often referred to as social cues, which are processed by humans as part of social cognition (Bandura, 1992; Frith, 2008). When we learn with others, representations of our peers are guided by the development of schemas, attributions, and stereotypes (Uleman & Kressel, 2013), influencing rapport, emotions, and motivations toward our communication partner, with important downstream effects for social learning.Experiences of social presence and telepresence, as emergent phenomena of human communication, be it in virtual reality or text-based communications, are similarly determined by socio-cognitive and socio-emotional processes (Kreijns & Kirschner, 2018; Weidlich & Bastiaens, 2022). For example, we form impressions of our conversation partners using social cues over time (Walther, 1992). When social cues are sparse, for example in text-based communication, we infer and generalize from minuscule social signals (Bacev-Giles & Haji, 2017), sometimes incorrect and guided by stereotypes (Fiske & Taylor, 2013), with important implications for how social learning unfolds online. Robust investigations into online social learning must build on these established research lines from social psychology, cognitive science, and communication research and extend them to account for social presence and telepresence experiences.

Data driven regulation
Presenting Author: Derya Orhan Göksün, Adiyaman University, Turkiye

The concept of “data-driven” for educational systems refers to the use of data and evidence to inform and guide educational decision-making and practice (Zeide, 2017). It can involve collecting and analyzing data on various aspects of education, such as student learning, teacher effectiveness, and course performance, and using the insights gained from some analysis (especially learning analytics) to inform decisions about lots of processes such as instructional methods, curriculum development, and designing interaction of education. These design processes can be named as data-driven regulation (Cooper, 2007; Kurilovas, 2020). Data-driven regulation in distance learning can be a valuable tool for ensuring that online education programs are effective and meet the needs of students. In addition, the data shows more than learning and can be received via distance learning environments easily. Data-driven regulation is important for supporting social presence and telepresence in distance learning because it allows educators and regulators to collect and analyze data on student performance and engagement in order to identify areas where improvements can be made (Levin & Datnow, 2012; Zhu, 2018). For example, if data shows that students are struggling to connect with their peers or teachers in a distance learning environment, regulators can use this information to identify strategies for improving social presence and telepresence. By gathering data on student performance and engagement, regulators can also identify best practices and successful strategies for supporting social presence and telepresence in distance learning programs.

Supporting technology
Presenting Author: Kamakshi Rajagopal, AE - Adapt & Enable, Belgium; **Presenting Author:**Maartje Peters, Open University of the Netherlands, Netherlands

Technology can be used to improve social presence and telepresence in distance learning environments to enhance feelings of connectedness and engagement. Teachers can encourage students to use chat platforms, messaging features, social media or other online platforms to create groups or forums where students can discuss course material, ask questions, and share resources (Branon & Essex, 2001; Clark, 2020; Rice, 2016). This can foster a sense of community and support among students.Teachers can also use video conferencing tools such as Zoom, Skype, Teams or Google Meet to organize virtual class sessions. This allows students to see and hear their classmates and the teacher and can help to create a sense of connection and engagement (Clark, 2020). If teachers encourage students to use their webcam or microphone during virtual class sessions, this can enhance social presence and engagement (Zhang et al., 2022). Besides these communication systems, online tools such as Google Docs or Trello can provide students with opportunities to collaborate on projects or assignments. This can help to foster a sense of teamwork and cooperation. Consider using virtual reality or other immersive technologies to create a more interactive and engaging learning experience for students. Overall, it's important for teachers to be proactive in creating a sense of connection and community among students in a distance learning environment, and to use technology to facilitate peer interaction and teacher/student interaction because the regulation of these forms of interaction do not occur naturally (Vrieling-Teunter et al., 2022).

Modes of communication
Presenting Author: Joshua Weidlich, German Institute for International Educational Research (DIPF), Germany

In a technology-rich world, human relations are increasingly mediated through the interfaces of our digital devices. Accelerated by COVID-19, this now applies to the educational sector more than ever before (Bond et al., 2021). While increasingly sophisticated communication technologies may coax our senses, an important fact remains that mediated communication changes the availability of social cues, impacts processes of social cognition and, thus, has interpersonal

ramifications. Invoking the concepts of telepresence and social presence is an attempt to better understand how this affects online social learning. Due to this shift, different modes of communications in educational contexts have proliferated, e.g., fully online and blended/hybrid modes, asynchronous and synchronous methods, text-based, video-based, videoconference, and, increasingly, augmented and virtual reality. Importantly, a deficit-model of mediation is unproductive, in which face-to-face communication is considered the gold standard and we only begrudgingly make use of technology-mediated alternatives for their practical benefits, mainly independence of time and place (Hodges et al., 2020). Decades of research have accumulated to support the notion that mediated communication indeed can bring particular challenges, but it is not per se deficient; It is qualitatively different and can also bring unique possibilities. Social presence and telepresence, albeit influenced by affordances of communication media (Weidlich & Bastiaens, 2019), emerges in the first instance *between humans*. Although it can appear organically over time, it can also be fostered deliberately, and there is a multitude of influencing factors, not least the expectations and desires of the communicating person (Weidlich et al., 2022).

Session B 3

22 August 2023 15:00 - 16:30
AUTH_T002
Symposium
Teaching and Teacher Education

Applying the Theory of Planned Behavior in Inclusive Education

Keywords: Attitudes and Beliefs, In-service Teachers, Inclusive Education, Self-efficacy, Teacher Efficacy, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 15 - Special Educational Needs
Chairperson: Olli-Pekka Malinen, University of Helsinki, Finland
Organiser: Olli-Pekka Malinen, University of Helsinki, Finland
Discussant: Tuomo Virtanen, University of Jyväskylä, Finland

The theory of planned behavior (TPB) has been used across various domains to predict and understand human behavior. The key concept of the TPB is behavioral intention that is influenced by attitude toward the behavior, perceived behavioral control (self-efficacy), and subjective norm concerning the behavior (Ajzen & Kruglanski, 2019). Inclusive education means that teachers in various countries, are now required to provide quality education for increasingly diverse learners in their classrooms. This symposium will feature four papers which all apply the TPB in the context of inclusive education by studying teachers in three countries.
Paper 1 studies teacher intentions and behavior related to differentiated instruction by using survey and observation data from 180 teachers in the Netherlands. Paper 2 investigates the relationships between sources of self-efficacy, attitudes toward inclusive education, self-efficacy, and inclusive behavior with survey data from 656 teachers in Eastern Finland. Paper 3 will test a TPB-based structural equation model by using survey data from approximately 700 teachers in Southern Finland. Paper 4 utilizes survey data from 290 German teachers to investigate how inclusive practices are explained by their self-efficacy, and intentions to implement inclusive education. The four papers of the symposium offer mutually complementing and theoretically founded perspective to teacher intentions and behavior to implement inclusive practices in their classrooms.Reference Ajzen, I., & Kruglanski, A. W. (2019). Reasoned action in the service of goal pursuit. *Psychological review*, *126*(5), 774.

Differentiated teacher practices in secondary education: Planned or improvised behavior?
Presenting Author: Elisa Kupers, University of Groningen, Netherlands; **Co-Author:**Anke de Boer, University of Groningen, Netherlands; **Co-Author:**Lisette de Jonge-Hoekstra, University of Groningen, Netherlands; **Co-Author:**Alexander Minnaert, University of Groningen, Netherlands

A cornerstone of inclusive education is teachers' ability to respond adequately to different educational needs of students in their diverse classroom. Differentiated instruction is a means to meet the educational needs of students of different ability. For teachers, however, differentiation is also a highly complex skill that requires careful and pro-active preparation of lessons. This makes teachers' intentions with regards to differentiated instruction particularly relevant. In two studies, we looked at teachers' intentions from different perspectives. In study A, a cross-sectional study where teachers (*n*=180) filled out an online questionnaire, we examined whether teachers' intentions to differentiate could best be predicted with regression models based on either the Self-determination theory (SDT), or the Theory of Planned Behavior (PBT). Both the SDT model as well as the TPB model significantly predicted teachers' intentions (p

Sources of teacher self-efficacy in inclusive education within the framework of the TPB
Presenting Author: Akie Yada, University of Jyväskylä, Finland; **Co-Author:**Olli-Pekka Malinen, University of Helsinki, Finland; **Co-Author:**İpek Gülsün, University of Jyväskylä, Finland; **Co-Author:**Hannu Savolainen, University of Eastern Finland, Finland

Teachers' attitudes and self-efficacy in inclusive education are perhaps the most frequently addressed factors in previous literature for implementing inclusive education. Recently, there has been an increasing number of studies investigating the two constructs within the framework of the theory of planned behavior (TPB) that posits a coherent model for understanding of an individual's attitudes and behavior (Ajzen & Madden, 1986). This study aims to investigate the role of sources of self-efficacy (Bandura, 1997) in the light of the TPB. The data were gathered from 656 Finnish in-service teachers. An electronic survey was conducted to collect data regarding teachers' attitudes, self-efficacy, sources of self-efficacy, and behavior (their self-perceived inclusive practices). The results of structural equation modeling indicated that mastery experience is the only predictor of teacher self-efficacy among the four sources of self-efficacy. In addition, teacher self-efficacy mediated the effect of mastery experience on behavior. The finding suggests that supporting teachers' positive mastery experience in inclusive practices is crucial for developing teachers' self-efficacy, which in turn enhances their inclusive behavior.

Finnish teachers' intentions and inclusive behaviours via the theory of planned behaviour
Presenting Author:İpek Gülsün, University of Jyväskylä, Finland; **Co-Author:**Hannu Savolainen, University of Eastern Finland, Finland; **Co-Author:**Olli-Pekka Malinen, University of Helsinki, Finland; **Co-Author:**Akie Yada, University of Jyväskylä, Finland

Inclusive education is one of the most significant educational reforms in Europe and around the world. Teachers' attitudes toward inclusive education, their self-efficacy for inclusive practices, their subjective norms, and their intentions in implementing inclusive education are considered to play a key role in the implementation of successful inclusion. Therefore, this study aims to examine in-service teachers' intentions in implementing inclusive education and their inclusive practices in Finland. An additional aim is to examine whether intentions are influenced by teachers' attitudes toward inclusion, their inclusive teaching efficacy, and subjective norms in implementing inclusive education based on the "Theory of Planned Behaviour (TPB)". In autumn 2022, data was collected with an electronic survey from 7 municipalities in the Keski-Uusimaa region in Finland from 88 schools that are part of the "Kaikille yhteinen koulu (School for All)" project. The participants of the survey were teachers working in those schools. The following scales, which were translated into Finnish, were used: Attitudes towards Inclusion Scale (AIS), Teacher Efficacy for Inclusive Practice (TEIP) Scale, Subjective Norm Scale, Intention to Teach in Inclusive Classroom Scale (ITICS) and Inclusive Practices Scale (IPS). The Mplus software programme will be used to carry out Structural Equation Modelling (SEM). The results of the study will further our understanding of the dynamics between teacher attitudes, efficacy beliefs, subjective norms, intentions, and practices in the context of inclusive education. The results will also have significant implications for the development for the teachers' professional development in inclusive education.

Prerequisites for primary school teachers' practices in the inclusive classroom
Presenting Author: Marwin Felix Loeper, Paderborn University, Germany; **Co-Author:**Gamze Görel, Paderborn University, Germany; **Co-Author:**Frank Hellmich, Paderborn University, Germany

Within the rationale of the Theory of Planned Behaviour (Ajzen, 1991), we investigated in our study whether the inclusive practices of N = 290 primary school teachers in heterogenous learning groups can be explained by their behavioural intentions to implement inclusive education and their self-efficacy beliefs. Furthermore, we examined if teachers' attitudes towards inclusion, their perceptions of their principals' expectations concerning the implementation of inclusive education in the classroom, and their self-efficacy beliefs are predictive for their behavioural intentions. Unfortunately, the current state of research turns out to

be inconsistent in this regard (e.g., Malak, Sharma, & Deppeler, 2018; Yan & Sin, 2014). Thus, further investigations are highly recommended to determine the prerequisites for teachers' successful inclusive practices in heterogenous learning groups. The results of our structural equation analysis revealed a significant relationship between teachers' inclusive practices and their behavioural intentions for one thing. Then again, we found out that teachers' attitudes towards inclusion, their perceived principals' expectations and their self-efficacy beliefs explain their behavioural intentions.Overall, our findings highlight the importance of teachers' attitudes towards inclusion, their perceived principals' expectations, and their self-efficacy beliefs for their behavioural intentions and their inclusive practices in the classroom. In conclusion, our results contribute to clarify the Theory of Planned Behaviour in the context of inclusive education.

Session B 4

22 August 2023 15:00 - 16:30
UOM_CR
Symposium
Learning and Instructional Technology

Designing effective digital learning environments – reviewing the evidence

Keywords: Achievement, Computer-assisted Learning, E-learning/ Online Learning, Educational Technologies, Immersive Technologies for Learning, Instructional Design, Meta-analysis, Multimedia Learning, Science Education, Teaching/Instructional Strategies, Video-based Learning
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Ingo Kollar, University of Augsburg, Germany
Organiser: Andreas Gegenfurtner, University of Augsburg, Germany
Organiser: Ingo Kollar, University of Augsburg, Germany
Discussant: James Slotta, OISE, University of Toronto, Canada

Practitioners put high hopes in digital learning environments to support student learning at different educational levels. However, it is not easy to keep track of the empirical evidence on the effects of different digital learning environments on cognitive, motivational, and affective learning outcomes. This symposium provides a sneak peak into a recent volume from the EARLI book series that includes 20 chapters that summarize the (predominately meta-analytical) evidence of different technological tools and approaches on learning in different educational settings. After an overview of the volume by its editors, the four papers of the symposium present single chapters in more detail: Paper 1 talks about the effects of web-based inquiry science environments to advance student learning. As the authors show, their effects seem to strongly depend on the provision of automated, adaptive guidance for learners. Paper 2 focuses on the effects of instructional videos on learning. Thereby, the authors provide six evidence-based tips for their effective design. Paper 3 presents empirical evidence on the effects of immersive virtual environments for learning. There, available evidence points to the importance of immersion, interaction, and embodiment to foster learning. Paper 4, finally, summarizes empirical research on the effects of flipped classrooms on cognitive learning outcomes. Based on the rather small effect sizes from related meta-analyses, the authors identify several deficits in the realization of flipped classrooms that need to be overcome to possibly arrive at larger effects. The symposium will be concluded with a discussion by a renowned expert on technology-enhanced learning.

Assessing Web-based Inquiry Learning Environments Using Knowledge Integration Pedagogy
Presenting Author: Sarah Bichler, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Marcia Linn, University of California-Berkeley, United States; **Co-Author:**Libby Gerard, University of Berkeley, United States

We report on the impact of Authoring and Customizing Environments (ACEs) using the lens of Knowledge Integration Pedagogy on classroom science inquiry learning. Recently, web-based ACEs have emerged that empower partnerships of classroom teachers, discipline experts, software designers, and researchers to create and customize inquiry instruction. The KI pedagogy and other constructivist views have informed designs of ACEs. The KI pedagogy draws on four processes to promote integrated science understanding through ACEs designs: (1) Eliciting learners' current ideas, including encouraging learners to generate the reasoning behind their ideas; (2) Discovering new ideas, for example, from scientific models, publicly available data, or peers; (3) Distinguishing among current ideas and new discoveries; and (4) Reflecting on this repertoire of ideas, connecting and sorting them into a coherent view. Many blended and online learning science platforms such as edCrumble, Go-Lab Software, Inq-IT, nQuire-it, and WISE have features of ACEs including authoring opportunities, support for collaboration, visualizations, and hands-on science. The effectiveness of these environments depends on personalized guidance from both the online platform and the classroom teachers. Meta-analyses of the impact of inquiry environments that include ACEs and reviews of inquiry instruction document the impact of inquiry instruction for pre-college science learning. Recently ACEs have added tools that connect teacher and automated guidance to optimize student learning outcomes. In this presentation we summarize the evidence for the impact of digital inquiry environments including ACEs, describe an example of a unit leveraging cutting-edge ACE features to support teachers guiding inquiry, and recommend next steps.

Six evidence-informed tips on how to optimize learning from instructional videos
Presenting Author: Vincent Hoogerheide, Utrecht University, Netherlands; **Co-Author:**Stoo Sepp, University of New England, Australia, Australia

Learning from instructional video is incredibly popular for people of all ages and at all educational levels. The effects of studying instructional videos on learning outcomes have traditionally been examined by two main research traditions. Research inspired by social-cognitive theories has focused mostly on the effects of video modelling examples, which are how-to demonstration videos in which a person shows and explains how to complete a task or solve a problem. Research inspired by cognitive theories predominantly examined the effects of other types of videos, such as short knowledge clips explaining a concept or longer recordings of lectures. In this narrative review, we synthesize the findings from both research lines and provide six evidence-informed tips that can help educators and educational content developers decide how to design their instructional videos and how to support instructional video learning. Based on the available evidence, we suggest to (1) avoid seductive details and redundancy, (2) provide cues to direct attention, (3) segment and pause (longer) videos, (4) show the presenter of the video on the screen, (5) show a demonstration from a first-person perspective, and (6) encourage learners to engage in generative learning activities, such as answering practice questions, summarizing, and generating explanations. This review thereby offers clear recommendations for educational practice and provides possibilities for cross pollination between the two main research traditions in terms of for instance research questions, theoretical underpinnings, and outcome measures.

Designing Effective Immersive Virtual Learning Environments
Presenting Author: Guido Makransky, University of Copenhagen, Denmark; **Co-Author:**Gustav Petersen, University of Copenhagen, Denmark

In this paper, we summarize the current body of research evidence related to learning with immersive virtual reality (VR). We build on recent reviews and meta-analyses to provide an overview of the most important findings in the field. This is followed by a summary of recent theories including the Cognitive Affective Model of Immersive Learning, the Immersion Principle in Multimedia Learning, and the Cognitive-Affective-Social Theory of Learning in digital Environments, which describe the important factors that play a role in learning in immersive environments. The theories and research evidence are then used to develop an iVLE design framework, which is a theory- and research-based model that can be used to guide the development of immersive learning content. This is followed by a future research agenda in light of recent developments such as the increased focus on immersive learning due to the COVID pandemic and the potential impact of the Metaverse.

Effectiveness of Flipped Classrooms
Presenting Author: Marlene Wagner, University for Continuing Education Krems (Danube University Krems), Austria; **Co-Author:**Andreas Gegenfurtner, University of Augsburg, Germany; **Co-Author:**Detlef Urhahne, University of Passau, Germany

Over the past decade, flipped classroom instruction has attracted increasing attention and popularity among educational practitioners and researchers. Flipped classroom, also known as inverted classroom, refers to an instructional approach in which students study educational materials at home and complete homework assignments in class. Myriad empirical studies have been conducted in the past years to examine the effectiveness of flipped classroom in various educational settings and across different disciplinary fields. The extensive body of research has already been synthesized in several meta-analyses as well as

second-order meta-analyses. The aim of this paper is (1) to elaborate the theoretical underpinnings of flipped classroom, (2) to provide an overview of meta-analytic evidence for the effectiveness of flipped classroom instruction in school and higher education, and (3) to propose reasonable explanations for the low to medium effect sizes that were found in previous meta-analyses. Particular focus is placed on instructional design characteristics of flipped classroom instruction, which have an impact on the effectiveness. Such design characteristics include the use of formative assessments (e.g., quizzes), pre-class activities (e.g., pre-class discussions), in-class learning activities (e.g., group-based activities), and learning management systems (e.g., Moodle). The paper concludes with a set of guidelines for a successful implementation of flipped classroom in different educational settings.

Symposium
Motivational, Social and Affective Processes

New insights on the relation between children's mathematics attitudes and their performance

Keywords: Achievement, Anxiety and Stress, Attitudes and Beliefs, Developmental Processes, Mathematics/Numeracy, Parents' Beliefs and Affect, Primary Education
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Jo Van Hoof, University of Turku, Finland
Organiser: Jo Van Hoof, University of Turku, Finland
Organiser: Hilma Halme, University of Turku, Department of Teacher Education, Finland
Discussant: Reinhard Pekrun, University of Essex, United Kingdom

Ample studies showed that mathematics attitudes are related to mathematics performance; however there are still many open questions in the literature. The objective of this symposium is to extend the research field on the role of mathematics attitudes, especially mathematics anxiety, in children's mathematics achievement in two ways.
First, the directionality of the relation between mathematics attitudes and performance is still under debate. To address this important issue, the first study of the symposium investigates the bi-directional longitudinal relationship between general mathematics attitudes and mathematics achievement using a representative dataset including approximately 600.000 elementary school learners. The second study complements this by zooming into one specific mathematics attitude, namely mathematics anxiety, to examine its developmental associations with mathematics performance in a large group of elementary school students.
Second, the symposium extends the above mentioned and previous research by investigating specific factors that might influence the relation between mathematics anxiety and mathematics performance. More specifically, the third study adds insights into intergenerational relations to discuss the extent to which mathematical abilities of children are associated with the mathematical anxiety of their parents. Lastly, the fourth study emphasizes that the previous research should be expanded to consider differences across various mathematical tasks and mathematics anxiety measures.
Taken together, this symposium will give a glance at (1) how learners' mathematics attitudes and performance (co)develop and (2) which factors should be considered while investigating these relations. During the symposium, particular attention will be given to both theoretical and educational implications of the different studies.

Doing Well and Thinking Positively: The Unbalanced Relation Between Math Attitudes and Achievement
Presenting Author: Michael Slipenkyj, Georgetown University, United States; **Co-Author:**Tsz Tan Lau, The University of Western Ontario, Canada; **Co-Author:**Ian Lyons, Georgetown University, United States; **Co-Author:**Daniel Ansari, University of Western Ontario, Canada

Past work shows that children with more positive math attitudes tend to have a higher level of math achievement (e.g., Dowker et al., 2019). However, it is unclear how this relationship manifests across development and in a large-scale educational setting. Specifically, do earlier math attitudes predict later math achievement? Does earlier math achievement predict later math attitudes? Or both? In the present study, we investigate the bi-directional longitudinal relationship between math attitudes and math achievement using four cohorts from a large (total N = approximately 600,000) Canadian province-wide dataset. Students completed math tests and answered attitude questionnaires in grades 3, 6, and 9. To assess the developmental trajectory of attitudes and achievement, we used a traditional cross-lagged panel model (CLPM), as well as a random intercept cross-lagged panel model (RI-CLPM) to account for between-subject variability (Hamaker et al., 2015; Bailey et al., 2020). Results demonstrate improved model fit for the RI-CLPM, with both models showing positive autoregressive and bi-directional paths. Notably, the cross-lagged paths were stronger for achievementà attitudes compared to the other way around. Broadly, our findings demonstrate that in an educational context, the developmental relationship between math attitudes and math achievement is bi-directional, but with stronger effects from earlier achievement to later attitudes. This study was preregistered on the Open Science Framework.

Developmental relations between mathematics anxiety, number processing and arithmetic fluency
Presenting Author: Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Anna Widlund, Åbo Akademi University, Finland

Although the negative link between math anxiety and performance is well documented, there is a lack of longitudinal studies investigating elementary school students. Therefore, we investigate developmental relations between math anxiety (MA), number processing (NP) and arithmetic fluency (AF) within a school year in grades 4, 5 and 6 (N=1000). Students´ complete digital measures of MA, NP and AF in the beginning and end of the school year. Confirmatory factor analyses in T1 showed that MA was negatively related to AF but not to NP. AF and NP were clearly separable constructs and were differentially related to MA. Multigroup latent change score modelling will be used to investigate how change in MA is related to changes in NP and AF across grades 4, 5 and 6. This study will advance our knowledge on developmental dynamics between MA, NP, and AF in elementary school students across three grade levels.

The association between parents' math anxiety and children's math anxiety and achievement
Presenting Author: Elien Bellon, KU Leuven, Belgium; **Co-Author:**Kiran Vanbinst, KU Leuven, Belgium; **Co-Author:**Bert De Smedt, KU Leuven, Belgium; **Co-Author:**Ann Dowker, University of Oxford, United Kingdom

Although there is evidence for negative moderate association between math anxiety and mathematics achievement and subsequent educational outcomes, the origins of math anxiety remain unclear. Few studies have explored the role of intergenerational factors in this association. We therefore investigated the extent to which math anxiety of parents is associated with their offspring's mathematical achievement and math anxiety, while also considering parental educational level and parents' mathematical achievement. We examined this before the start of formal schooling (i.e., 83 preschoolers; 5–6-year-olds), and before the start of secondary school (i.e., 172 primary school children; 11-12-year-olds). In both studies, both biological parents completed a mathematical anxiety questionnaire, and their educational level and mathematical achievement were measured. Children performed age-appropriate tasks to investigate their mathematical achievement. Primary school children also completed a math anxiety questionnaire. The results in preschoolers indicated that parents' math anxiety was strongly correlated with their own math achievement but not to that of their children. In primary school, only maternal math anxiety was associated with that of their child. Math anxiety of primary school children was associated with parental educational level. These findings suggest a complex familial basis for math anxiety and mathematics achievement in primary school. These data help us understand individual differences in between academic achievement and affect in children. They might suggest novel ways to detect children at risk for developing negative affect or mathematical difficulties at early stages and might lead to the development of early preventive educational interventions that also involve parents.

Trait and state mathematics anxiety relate to performance across tasks in primary school
Presenting Author: Hilma Halme, University of Turku, Department of Teacher Education, Finland; **Co-Author:**Kelly Trezise, University of Chicago, United States; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Jo Van Hoof, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Mathematics anxiety negatively relates to students' mathematical achievement already in primary school, but there is little research on its effects beyond whole

number knowledge. The current study aims to examine how state and trait mathematics anxiety relate to performance across five tasks that are relevant for mathematics development in primary school. These tasks include non-symbolic quantities, whole numbers, and rational numbers. The participants were 406 students attending the 5th grade and 6th grade (i.e., 11-12 years old). Our results showed that students' self-evaluated state and trait mathematics anxiety had varying negative relations with performance depending on the task type. Overall, our results indicate that existing accounts on the role of mathematics anxiety in mathematics performance should expand to consider differences across task type and measures of anxiety.

Session B 6

Symposium
Teaching and Teacher Education

Knowledge about Language and the Teaching of L1 Writing: International Perspectives

Keywords: Cognitive Skills and Processes, Communication Skills, Dialogic Pedagogy, L1/Standard Language Acquisition, Qualitative Methods, Reasoning, Teaching Approaches, Writing/Literacy
Interest group: SIG 12 - Writing, SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Debra Myhill, University of Exeter, United Kingdom
Organiser: Annabel Watson, University of Exeter, United Kingdom
Discussant: Xavier Fontich, Autonomous University of Barcelona, Spain

The role of linguistic and metalinguistic knowledge in supporting L1 writing development is a burgeoning research area. This symposium examines this in the context of how writing is taught in school, starting with a study of the earliest years of school education in Norway (age 6-7), moving through the final year of Primary education in England (age 10-11), to the first years of English Secondary schooling (age 11-14), and then considering student teacher metalinguistic knowledge in the Netherlands. Together, the papers present the opportunity to reflect on important emerging knowledge concerning (a) how young writers exhibit linguistic and metalinguistic knowledge through talk and writing, (b) the relationship between declarative knowledge revealed in talk and procedural application in writing, (c) the role that pedagogic dialogue plays in bridging this gap, and (d) the challenges experienced by teachers in developing confident understanding of metalinguistic concepts. The symposium develops theoretical understanding of the interaction between knowledge about language and writing development across the school years. Looking across papers will allow us to probe assumptions relating to how the explicit teaching of linguistic repertoire might influence writing, particularly concerning the sophistication of the personal repertoire of early writers, problems of transfer from declarative to procedural knowledge, and the complex demands it places on teachers. Crucially, the symposium responds to the theme of 'Education as Hope' by focusing on the opportunities as well as challenges presented by writing pedagogies which seek to develop young writers' ability to express ideas with confidence, deliberation, and metacognitive awareness.

Young pupils' knowledge about language expressed through writing and in dialogues
Presenting Author: Mari Nygård, NTNU, Norway; **Presenting Author:**Randi Solheim, Faculty of Social and Educational Sciences, Norway

This study draws on a large-scale mixed methods RCT-study, *Functional writing in primary school*. Quantitative analyses show no effect on pupils writing development, which points to the need for closer qualitative analyses aiming towards a more nuanced understanding of pupils' competence. We thus ask: *How is young writers' grammatical competence made visible through writing? And how are pupils' individual knowledge and experiences of language expressed in writing and text dialogues in various learning contexts?* Our analyses draw on different types of empirical data: pupils' texts, classroom observations and language dialogues.Our analyses are two-fold, one part providing an overview of a larger text sample, and one part providing closer insight into individual competences. The overall aim is to obtain a more fine-grained picture of pupils' linguistic meta-competence. The analyses show that grammatical competence is comprised of several sub-competencies: *repertoire*, *complexity*, *variation,* and *choice*. Contrary to traditional views, we do not model linguistic progression as linear, from repertoire to writers' choices. Rather, awareness about purposes of writing may help pupils to see themselves as *writers*, even for those who do not master linguistic conventions. We relate our findings to different levels of linguistic and meta-linguistic competence. Our study may contribute methodological, theoretical, and didactic insights to the field of early writing. Through analyses of various types of empirical data, understood through different theoretical lenses, we argue for the need for teachers to recognize different aspects of linguistic meaning making and to make these visible for the pupils.

What transfers and how? Examining how contextualised grammar teaching influences students' writing.
Presenting Author: Annabel Watson, University of Exeter, United Kingdom

This paper presents qualitative data gathered during a large-scale randomised control trial funded by the Education Endowment Foundation in England. This investigated the impact of contextualised grammar teaching on the writing development of children aged 10-11. It found no statistically significant impact, and this paper explores one potential reason why, examining what did and did not transfer from the explicit grammar teaching of the intervention into children's writing. Lesson observations and writing samples were collected from two classes undergoing an intervention cycle which focused on teaching persuasive writing with embedded attention to grammatical forms, using mentor texts, dialogic talk and writing tasks to develop metapragmatic and stylistic reflection on language. Classroom discourse was coded thematically, building on a theoretical model of Metatalk to explore how declarative knowledge was constructed through dialogue, and how shared writing and oral rehearsal supported transfer to procedural application. Linguistic coding of writing samples identified where and how children used the taught grammatical features in their writing. Comparison across datasets identified how the understandings, partial understandings and misunderstandings captured in the lesson observations manifested in children's writing. Findings contribute to the development of linguistically-orientated pedagogies for writing which attend to the need to support transfer between procedural and declarative knowledge, particularly contributing (1) evidence of reciprocity between declarative and procedural knowledge; (2) evidence that word and text level features are easier to transfer; (3) tentative evidence of the interference of previous learning, and the potential for ingrained patterns to inhibit application of new, more sophisticated, structures.

Metalinguistic modelling in writing instruction: bridging learning about text and individual writing
Presenting Author: Ruth Newman, University of Exeter, United Kingdom

Working with 7 teachers and their Key Stage 3 classes (students aged 11-14) in the South West of England, this ESRC funded study continues to investigate and develop an evidence-based pedagogy for the development of metalinguistic talk about writing. Pedagogical strategies, co-constructed iteratively with teachers, emphasise the role of authentic texts in writing instruction – for stimulating metalinguistic discussion and as models for students' own writing. The generation of a multi-layered, inter-related dataset of observational and textual data drawn from sample classes (75 lessons) has enabled an investigation of how this metalinguistic talk about text models informs and shapes students' writing choices. This paper highlights the complexity of this learning transfer – from talk about text to writing – and explores the potential of a particular pedagogical strategy, metalinguistic modelling, as a 'bridging' mechanism in this process. This paper, and the findings arising from the wider project, contribute to theoretical understandings of metalinguistic talk and learning transfer in writing instruction, whilst contributing pedagogical strategies that may support teachers and students in implementing metalinguistic talk.

L1 student teachers' processing of different linguistic arguments in grammatical discussions
Presenting Author: Jimmy van Rijt, Tilburg University, Netherlands

An important skill for L1 language teachers when teaching grammar is the ability to produce and quickly evaluate arguments that underpin a grammatical analysis. Previous research has revealed that the strongest arguments in favor of a particular grammatical analysis are based on linguistic manipulations (LM) rather than on rules of thumb (RoT). This makes it critical for teachers to be able to handle arguments based on LM. If LM are considered too difficult to process compared to RoT, however, teachers may avoid linguistic argumentation based on LM altogether, and they might struggle to evaluate students' LM-based linguistic argumentation. The current study has therefore examined whether LM impose a higher cognitive load on Dutch student teachers than RoT, using grammatical discussion tasks in which participants (N=298) from eight teacher training institutions evaluated arguments based on RoT and on LM. Multilevel

analyses indicate that LM are indeed more difficult to process than RoT, as measured by response times, correct classifications and perceived difficulty ratings. This effect is partly influenced by students' need for cognition and their willingness to engage in grammar. The implications of this for educational practice will be discussed.

Instructional Design

Powerful learning environments for 4-7-year-olds: Interactive picture book reading

Keywords: Communication Skills, Early Childhood Education, Instructional Design, Mathematics/Numeracy, Quantitative Methods, Teaching/Instructional Strategies
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Joke Torbeyns, KU LEUVEN, Belgium
Organiser: Joke Torbeyns, KU LEUVEN, Belgium
Organiser: Hilde Van Keer, Ghent University, Belgium
Discussant: Maria T. Sikkema-de Jong, Leiden University, Netherlands

Decades of research in the domain of early literacy and language convincingly demonstrated the potential of interactive picture book reading (IPBR) for young children's development in these domains (Hindman et al., 2019; Mol & Bus, 2011). In IPBR, interaction with children is purposefully provided during reading by discussing meanings of words, asking open-ended questions, and elaborating on children's responses (August et al., 2018). Based on prior findings, researchers started to analyze mechanisms that might explain IPBR's effectiveness and explore its potential for competencies acquisition in other domains. Deepened understanding of these underlying mechanisms in the domain of early literacy and language and beyond can help to improve current educational IPBR practices. This symposium brings together four empirical studies on IPBR effectiveness for 4-7-year-olds' language and STEM development. In the first contribution an intervention on the effectiveness of IPBR for enhancing preschoolers' problem-solving skills is presented. The second contribution focuses on mathematics, and also analyzes the mechanisms underlying IPBR effectiveness in this domain. The authors of the third and fourth contribution investigate the characteristics of the words in the picture book explicitly focused on during IPBR respectively the reading style as variables contributing to IPBR effectiveness in the domain of language acquisition. Together, these contributions deepen current insights into IPBR as powerful learning environments for 4-7-year-olds. These insights are important for current educational practice, teacher training and professional development initiatives, as will be discussed by Marga Sikkema-de Jong, expert on IPBR and emergent literacy in young children.

Enhancing problem-solving skills in preschool through interactive picture book reading
Presenting Author: Joris Van Elsen, University of Antwerp, Belgium; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium

Problem solving is an important 21st century skill and plays a key role in learning and living in an ever-changing society. Preschool age is considered the ideal time to enhance problem-solving skills. However, teaching problem-solving skills in the preschool classroom is not easy. This paper examines the effectiveness of interactive picture book reading (IPBR) for the development of problem-solving skills in preschoolers. A total of 130 4-to-6-year-olds participated in a pretest-posttest quasi-experiment with non-equivalent control group. Problem-solving skills were measured with two pictorial multiple solutions tasks. Multilevel analysis indicates that IPBR can improve preschoolers' flexibility, fluency and originality in coming up with possible solutions to a visually presented problem. In addition, we found that preschoolers' emotional reactions to the test situation influenced test scores. The findings demonstrate that preschoolers are able to suggest different solutions to a problem and that IPBR is an effective way to stimulate creative problem solving. Further research is needed into the effectiveness of interaction processes and possible approaches to assess problem-solving skills in preschoolers in a valid and reliable way.

The Effects of a Quantitative Mathematical Language Intervention on Number Line Skills and SFON
Presenting Author: David Purpura, Purdue University, United States; **Co-Author:**Connor D. O'Rear, Purdue University, United States; **Co-Author:**Alexa Ellis, Purdue University, United States; **Co-Author:**Lauren Westerberg, Purdue University, United States; **Co-Author:**Mackenna Vander Tuin, The University of Texas, United States; **Co-Author:**Patrick Ehrman, Purdue University, United States; **Co-Author:**Yemimah A. King, Spelman College, United States

The focus of the current intervention was on examining the effects of a quantitative language intervention on children's number line and spontaneous focus on number (SFON) skills. These effects were examined because number line and SFON are two potential mechanisms that explain why quantitative language interventions have been shown to also impact numeracy skills. As part of a larger intervention study, children were randomly assigned to conditions including a quantitative language intervention and an active control group. Interventions were conducted in small groups using researcher-designed picture books. The picture books for the quantitative language condition had quantitative language (e.g., words such as *many, most, same, different, few, fewest*) in the text and in interactive reading prompts embedded on each page. The picture books for the active control condition were designed similarly and did not contain quantitative language terms. Reading sessions occurred for three sessions per week over eight weeks (total possible sessions = 24). Regression analyses indicated no statistically significant effects on either SFON or number line skills, but the effect size for number line skills was meaningfully important (d=-0.36). These findings suggest that a quantitative language intervention may have impacts on number line skills. Future research should investigate this as a potential mechanism explaining the impact of quantitative language interventions on numeracy development.

What's in a word: impact of interactive book reading on 1st-graders' expressive target vocabulary
Presenting Author: Silke Vanparys, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

Interactive book reading (IBR) as a context for vocabulary learning is studied widely in kindergartners. In the present study, we build on and aim to elaborate the prior knowledge base in this respect for that age group by studying the effects of a five-week IBR intervention on first graders' expressive target vocabulary growth. A repeated measures design with two experimental conditions (researcher-imposed target words vs. teacher-selected target words) was set up. 240 children (age M=5.8, SD=0.55) and their 15 first-grade teachers from 7 schools in Flanders (Belgium) participated in this study. Repeated measures ANOVA confirmed the expected positive effects of IBR on first graders' expressive target vocabulary, measured via the TEVOC test. In follow-up analyses, characteristics of the targeted words were considered to study potentially differential intervention effects. More particularly, the age of acquisition (AoA) and tier of vocabulary of each target word was taken into account. No differences were found as to the impact of IBR on the learning of low, medium, and high AoA words and the effects of the intervention were comparable for tier 2 and tier 3 words. These findings indicate that IBR is an excellent context to teach challenging and domain-specific vocabulary.

The effect of interactive picture book reading on language competence in early childhood education
Presenting Author: Chiel van der Veen, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Sharisse van Driel, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Femke van der Wilt, VU Amsterdam, Netherlands

Although research has shown that interactive picture book reading can promote young children's language skills, many teachers use a passive reading style as they find it challenging to support effective interaction. The aim of the present study is to investigate the effect of an intervention based on dialogic teaching during interactive picture book reading on young children's language competence. A total of 403 children aged 4-7 from 21 classrooms participated in the current randomized experimental study. All teachers read, during six subsequent weeks, each week a picture book repeatedly to the entire classroom and made video recordings of all sessions. Teachers in the intervention condition received the Model2Talk intervention consisting of a workshop on dialogic classroom talk and the use of dialogic talk tools, a teacher manual and coaching sessions. Before and after the book reading intervention children were individually assessed on their communicative functions, vocabulary and narrative skills. Multilevel models were used to examine differences between the control and intervention

condition regarding children's language competence. No significant differences appeared between the intervention and control condition. However, findings show that the language competence significantly improved for all children suggesting that different strategies for interactive picture book reading result in improved language competence. Findings reveal that teachers can use different strategies for supporting children's language competence during interactive picture book reading.

Session B 8

22 August 2023 15:00 - 16:30

Symposium
Higher Education, Lifelong Learning, Teaching and Teacher Education

Studying Professional Learning Communities of pre-service teachers, principals & university faculty

Keywords: Cooperative/Collaborative Learning, Higher Education, Mixed-method Research, Peer Interaction, Pre-service Teachers, School Effectiveness, School Leadership, Sustainable Development, Teacher Professional Development
Interest group: SIG 14 - Learning and Professional Development
Chairperson: Peter Theurl, Austria
Organiser: Loucas Louca, European University Cyprus, Cyprus
Discussant: SOFIA AVGITIDOU, Aristotle University of Thessaloniki, Greece

For a number of years, Professional Learning Communities (PLCs) have led to a paradigm shift in teachers' professional development approaches across Europe and beyond. PLCs are viewed as an alternative form of professional learning providing teachers a framework in which they act as learners and schools as learning communities. The proposed symposium seeks to comparatively investigate and discuss PLCs in 4 different contexts, in 5 different countries, from 3 different research programs, focusing on similarities and differences of PLCs in different levels and contexts. Contexts include investigation of PLCs at the (1) pre-service teacher level by investigating the affordances of PLCs as early as pre-service teachers' practical pedagogical studies (internship) in Austria and Spain; (2) school principal level by investigating how the PLC structure and the use of actions plan affect professional development in a principals' PLC, and also how it affects their schools in Sweden; (3) school leaders level by examining the motivation of the school leaders to participate in their own PLC, milestones of the establishment and conditional and constituent factors of the school leaders PLCs in Germany; (4) university faculty level by examining PLCs as the structure for evidence-based teaching reform within the university faculty teaching practice and factors related to the willingness to engage in PLCs and sources of information which participants highlighted as important in shaping their teaching reform at a small university in Cyprus.

An Investigation of the Introduction Faculty Professional Learning Communities in Higher Education
Presenting Author: Loucas Louca, European University Cyprus, Cyprus; **Co-Author:**Theopisti Skoulia, European University - Cyprus, Cyprus; **Co-Author:**Marios Vryonides, European University - Cyprus, Cyprus

Moving from an approach of educating faculty about new teaching and learning approaches, to supporting them in their attempts to utilize paradigmatic changes in their teaching, this study explores the potential introduction of faculty Professional Learning Communities (PLCs) as an innovative way to enhance instructors' teaching competencies in higher education. Specifically, the study seeks to identify faculty PLCs structures that could encourage evidence-based teaching reform within the faculty members' teaching practice. Data were collected from 127 faculty using an online questionnaire in June 2022. Analysis showed factors related to the willingness to engage in PLCs and sources of information which participants highlighted as important in shaping their teaching reform. The study's implications point towards new directions of supporting faculty in their effort to enhance their teaching competencies to enrich university students' learning experiences and opportunities. The policy implications of this investigation point to a novel way of supporting faculty in their effort to enhance their teaching competencies in the context to improve university students' learning experiences and opportunities.

Professional learning communities extended as a method for leadership development
Presenting Author: Katja Kansteiner, Pädagogische Hochschule Weingarten, Germany

During the past ten years first explorations to adapt PLCs to school leaders (school heads) have been successfully run in some US-American school districts. In a European project School Leaders-PLCs (SL-PLCs) were also set up, facilitated, and evaluated. In Germany, additional data were collected to inquire about the motivation of the school leaders to participate in a SL-PLC, milestones of the establishment, and conditional and constituent factors of the SL-PLCs. By Grounded Theory Methodology we developed a model for the establishment of SL-PLCs. It is the interaction of continuous investment of the PLC members and the assurance of constant benefit that secures the establishment as much as the raising liability in the cooperation and a jointly growing understanding of how PLCs work. We found it is mainly the positive attitude to innovation and the interest to forward school development that motivates the school leaders the engagement in the SL-PLC. We will present the model and point out how this adaptation of PLCs to leadership development has the potential to serve innovation in schools.

Professional Learning Communities of Pre-Service Teachers in Internship
Presenting Author: Peter Theurl, University of Teacher Education Vorarlberg, Austria; **Co-Author:**Eva Frick, University of Education Vorarlberg, Austria; **Co-Author:**Elvira Barrios, Universidad de Málaga, Spain; **Co-Author:**Carmen Sanchidrián, Universidad de Malaga, Spain

Since the early 1990s, Professional Learning Communities (PLCs) have been a proven, widespread, and well-researched means of school- and instructional development, as well as the development of school leaders. The present study is one of the first to systematically examine the possibilities and potential of PLCs for pre-service teachers in their practical pedagogical studies (internship) in Austria and Spain. In particular, the study examines whether and how Student-Teacher-PLCs (S-PLCs) can be implemented in pre-service education, how the acceptance of S-PLCs is among pre-service teachers, whether there is evidence of the development of professional knowledge and skills associated with teaching, particularly reflexivity as a crucial competence, and whether the pre-service teachers were able to acquire PLC-relevant competencies. A total of 59 students from the University of Teacher Training Vorarlberg and the University of Málaga were surveyed using an online questionnaire and focus group interviews. The data collected show that S-PLCs is a profound form of (cooperative) learning and development of professional and PLC-relevant competencies for students. Analysis of the qualitative data furthermore shows that S-PLCs are spaces where the reflection and analysis of teaching-related topics are stimulated, supported, shared, and encouraged.

The importance of structure and action plans in a professional learning community for principals
Presenting Author: Anne Berit Emstad, Norwegian University of Science and Technology (NTNU), Norway; **Co-Author:**Bård Knutsen, NTNU - Norwegian University of Science and Technology, Norway; **Co-Author:**Morten Krogstad Strand, Kattem skole, Trondheim, Norway

Fahey (2011) argues that principals can learn to build learning-focused, reflective professional communities by developing and participating in their own Professional Learning Community (PPLC). By participating, they are experiencing how to be a part of a reflective culture, assess their own leadership practices, de-private their own practice and how to both give and receive feedback and reflect on their own principal role. Since 2014, a municipality in Sweden has had a requirement that all principals must participate in a professional learning community. Since their inception, they have preferred to build on Williams' (2008) model for teachers who work in learning communities to develop their assessment skills through the use of action plans about what he or she wants to change, and a fixed structure at all meetings. In the paper we present a study in which we have investigated how structure and use of actions plan affect professional development in this PPLC in Sweden, and also how it affects their schools. Our interest lies in being able to contribute to increased knowledge in the importance of principal professional learning community.

Effects of the COVID-19 pandemic on student achievement

Keywords: Achievement, Competencies, Mathematics/Numeracy, Meta-analysis, Pandemic, Primary Education, Reading, School Effectiveness, Secondary Education
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Natalie Foerster, University of Münster, Germany
Organiser: Natalie Foerster, University of Münster, Germany
Discussant: Andreas Frey, Goethe-Universität Frankfurt, Germany

In spring 2020, the world experienced a global pandemic triggered by the coronavirus. When governments announced the shutdown of schools to limit the spread of the coronavirus, more than 1.5 billion students in over 190 countries had to stay at home. This led to immediate concern about long-term educational consequences. Today, there are several studies showing that concerns may be justified, pointing to a decline in student achievement and a widening of learning gaps because of pandemic-related school closures. In this symposium, we add to the existing literature on the impact of the COVID-19 pandemic on education with new evidence from German-speaking countries and a new meta-analysis on student learning loss over the course of the pandemic. The first paper presents results on second-grade students' reading growth in Germany during the first and second years of the pandemic compared to students' growth in the four school years prior to the pandemic. In the second presentation, growth rates of Austrian third graders in mathematics in the first half-year with distance learning periods are compared to growth rates in the second half-year without distance learning. Results from Swiss students are presented in the third contribution. Using data from 2019 to 2021, student performance in core subjects of mathematics, German, English, and French is compared before and during the pandemic. The final presentation will present a new AI-supported meta-analysis of average student learning loss over the course of the pandemic, including moderator analyses of pandemic phase, subject, and grade.

Effects of the COVID-19 Pandemic on Reading Performance of Second Grade Children in Germany
Presenting Author: Natalie Foerster, University of Münster, Germany; **Co-Author:**Boris Forthmann, University of Münster, Germany; **Co-Author:**Mitja D. Back, University of Münster, Germany; **Co-Author:**Elmar Souvignier, University of Muenster, Germany

In education, among the most anticipated consequences of the COVID-19 pandemic are that student performance will stagnate or decline and that existing inequities will increase. Although some studies suggest a decline in student performance and widening learning gaps, the picture is less clear than expected. In this study, we add to the existing literature on the effects of the COVID-19 pandemic on student achievement. Specifically, we provide an analysis of the short- and mid-term effects of the pandemic on second grade reading performance in Germany using longitudinal assessments from over 19,500 students with eight measurement points in each school year. Interestingly, the effects of the pandemic established over time. Students in the first pandemic cohort even outperformed students from the pre-pandemic cohorts and showed a tendency towards decreased variances during the first lockdown. The second pandemic cohort showed no systematic mean differences, but generally had larger interindividual differences as compared to the pre-pandemic cohorts. While the gender achievement gap seemed unaffected by the pandemic, the gap between students with and without a migration background widened over time – though even before the pandemic. These results underline the importance of considering effects of the pandemic across cohorts, large samples, and fine-grained assessments. We discuss our findings considering the context-specific educational challenges and in terms of practical implications for teachers' professional development.

Third Graders Mathematic Growth amid the Second Corona School Year in Austria
Presenting Author: Christoph Helm, Johannes Kepler University Linz, Austria; **Co-Author:**Christoph Weber, University of Education Upper Austria, Austria; **Co-Author:**David Kemethofer, University of Education Upper Austria, Austria

Since spring 2020, the COVID pandemic has led to repeated school closures across Europe and beyond. There is growing evidence that school closures and related remote teaching negatively affected student learning. Moreover, research suggests that school closures more strongly affected already disadvantaged students, thus widening social and ethnic disparities in achievement. In this study, we focus on the growth in mathematics skills of 279 Austrian 3rd graders during the second COVID school year 2020/2021. Applying piecewise latent growth curve modeling to learning progress assessment data (8 measurement points throughout the school year), we compare the learning gains (slope means) during the first half-year, which was disrupted by two remote teaching periods of a total of 7 weeks, with the learning gains of the second half year without remote teaching. The results do not show significant differences in the learning gains between the two half years. Although there are expected social and ethnic disparities at the beginning of the school year, there were no significant associations between learning gains and socioeconomic status and ethnic background (migration background, non-German family language), respectively. Thus, this study neither supports a learning loss, nor a widening of social and ethnic disparities during school closures and remote teaching.

Effects of the Covid-19 pandemic on the school performance of Swiss students
Presenting Author: Valentin Unger, St.Gallen University of Teacher Education, Switzerland; **Presenting Author:**Fabian Grünig, St.Gallen University of Teacher Education, Switzerland; **Co-Author:**Michael Kickmeier-Rust, University of Teacher Education, Switzerland; **Co-Author:**Jan Hochweber, St. Gallen University of Teacher Education, Switzerland; **Co-Author:**Nicolas Hübner, University of Tübingen, Germany; **Co-Author:**Christoph Helm, Johannes Kepler University Linz, Austria

In January 2020, the World Health Organization reported the first infections with the Covid-19 virus in Europe. To control the infections, schools all across the world, including Switzerland, were closed. As a result, students in Switzerland were in distance education for eight weeks – a short time compared to other countries. The school closures hit the stakeholders unprepared and revealed a wide range of questions and challenges. Studies on the impact of school closures suggested that beyond increased stress levels and mental health problems student performance severely suffered from school closings. However, the available evidence on learning losses due to the Covid-19 pandemic is characterized by a high degree of heterogeneity, which results besides other aspects from the fact that different coun-tries implemented different policies. To obtain evidence on effects of the Covid-19 pandemic policies enacted in Switzerland on students' achievement, we will evaluate longitudinal data from the digital learning support system "Lernpass plus". Data is available for grade levels 7 to 9 for 2019 (before school closures), 2020 (the year of school closure) and 2021 (the year when the pandemic persisted but school life returned to a fragile "normal" state) for core subjects.

Students' learning loss over the course of the COVID-19 pandemic – A Meta-Analysis
Presenting Author: Andrea Wisenöcker, Johannes Kepler University Linz, Austria; **Co-Author:**Christoph Helm, Johannes Kepler University Linz, Austria; **Co-Author:**Cornelia S. Große, Johannes Kepler University Linz, Austria, Austria

In spring 2020, the COVID-19 pandemic led to a global disruption of student's education around the world. Widespread school closures led to a shift from in-person learning at school to remote learning, with changes in education persisting over the following years. Our goal was to examine the average effect of the COVID-19 related school closures on k-12 students' achievement as well as to shed light on the development of achievement over the past two years. We did so by means of an AI-supported meta-analysis. The results indicate an average learning loss of Cohen's d = -0.176 (SE = 0.019, $p < 0.001$, 95% CI [-0.214, -0.138]), i.e., a learning loss within the range of summer learning losses. The moderator analyses yielded a significant effect of measurement time during the pandemic, while students' grades did not have a significant impact. Potential explanations as well as practical implications are discussed.

Through the student's eyes: Perspective taking in student problem behavior
Keywords: Learning and Developmental Difficulties, Primary Education, Teacher Efficacy, Teacher Professional Development
Presenting Author: Hinke Endedijk, Leiden University, Netherlands; **Co-Author:**Tim Mainhard, Leiden University, Netherlands

Teachers often feel inefficacious when dealing with student problem behavior in class. During daily interactions teachers tend to deal with such behavior based on general implicit internal representations of a student, instead of taking a situational approach. These representations, however, are prone to various biases. The attribution error for example describes the tendency to attribute behavior to student-factors and underestimate situational factors. Building teachers' perspective taking skills is promising to change the teachers' view of student behavior and increase teachers' use of responsive strategies. Perspective taking encompasses the effort to understand a student's feelings, thoughts, motivations, and intentions in a given situation. We randomly assigned teachers to a control condition (N=45) in which teachers described a specific, real classroom situation or an experimental condition (N=29) in which they described the situation from the student's perspective (first person). Perspective taking, causal attributions and teacher's responsiveness were coded. A manipulation check confirmed more perspective taking in the experimental group (p = .001). Moreover, student behavior was explained more often by teacher behavior in the experimental group (p = .037). There was no indication of a difference in teacher's responsiveness. Based on these findings and following a perspective taking intervention (Mascio et al., under review), we constructed a guided perspective taking intervention for teachers consisting of a stepwise reflective process, in which teacher's describe a recent situation from the student's perspective, consider diverse contextual explanations, and plan ways to check their explanations in class. Initial findings of this ongoing project will be presented.

Arithmetic development from Grade 1 to 3 – The role of domain-specific and domain-general predictors
Keywords: Learning and Developmental Difficulties, Mathematics/Numeracy, Primary Education, Quantitative Methods
Presenting Author: Riikka Mononen, University of Oulu, Finland; **Co-Author:**Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Markku Niemivirta, University of Eastern Finland, Finland

Basic arithmetic skills set the ground for later mathematics learning. Yet, we have relatively few longitudinal studies investigating arithmetic development and simultaneously effects of domain-specific and domain-general factors on this development. This study explored Norwegian children's (n = 261) development in arithmetic skills (addition and subtraction) from first to third grade, including four measurement time points. Arithmetic development was predicted by domain-specific (symbolic numerical magnitude processing and verbal counting) and domain-general (non-verbal reasoning, working memory, rapid automatized naming, attention) factors. Using latent growth curve modeling, first, we found an overall increase in arithmetic skills over time, with individual differences in both the initial level and change over time. Second, symbolic numerical magnitude processing, verbal counting, and central executive component of working memory were significant predictors of the initial arithmetic performance level at the first grade, while symbolic numerical magnitude processing and rapid automatized naming predicted growth. We conclude that both domain-specific and domain-general factors have a role in the development of arithmetic skills. Especially processing skills, both general and number-related, seem to influence the developmental change in children becoming more fluent in their calculations.

Diagnostic assessment of special educational needs in the field of learning disorders
Keywords: Educational Policy, In-service Teachers, Learning and Developmental Difficulties, Learning and Developmental Disabilities
Presenting Author: Ann-Kathrin Hennes, University of Cologne, Germany; **Presenting Author:**Lisa Dortants, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Julie Philippek, Universität zu Köln/ University of Cologne, Germany; **Co-Author:**Alfred Schabmann, University of Cologne, Germany; **Co-Author:**Barbara Schmidt, University of Cologne, Germany

In German federal states, the diagnosis of special educational needs (SEN) represents the formal basis for receiving special education support. In order to assess whether or not SEN are given and if so, in which specific area (e.g. learning) teachers must conduct a diagnostic process in which they consider the criteria for a determination of SEN. However, the legal framework only provides vague criteria. As a consequence, teachers must determine for themselves what criteria to using, meaning that SEN assessments are influenced by teachers' personal biases. To examine to what extent teachers really differ in the diagnostic procedures and criteria they use, the present study took a closer look at diagnostic practice. Therefore, 39 SEN assessments focused on learning disabilities carried out by different teachers in the federal state of Schleswig-Holstein were analyzed using criteria defining the procedure and content of an ideal SEN assessment. The results show that teachers use different criteria when deciding whether or not special education support is needed. The most frequent reason for the decision was the child's intelligence. Furthermore, most assessments were not fully comprehensible in terms of theoretical foundation and diagnostic methods used. In light of those results, the potential benefits of diagnostic standards and possible principles that could underlie them are discussed.

A meta-analysis of teacher screening and progress monitoring assessments: Preliminary findings
Keywords: Achievement, Inclusive Education, Meta-analysis, Special Education
Presenting Author: Serap Keles, Knowledge Centre for Education, University of Stavanger, Norway; **Co-Author:**Dieuwer ten Braak, University of Stavanger, Norway; **Co-Author:**Åste Marie Mjelve Hagen, University of Oslo, Norway; **Co-Author:**Monica Melby-Lervåg, University of Oslo, Norway

The three-tier model, which has been in use for several years in, for example the US and Finland, has been a recommended approach for inclusive education to tackle the diversity of learning challenges and special educational needs. It serves as a framework for structuring and systematizing educational support in various tiers (i.e., general support, intensified support, and special support) in line with the students' needs (Sundqvist et al., 2019). A critical issue for the successful implementation of the three-tier model is correctly allocating children to tiered interventions of appropriate intensity. Screening and progress monitoring assessments are often used to detect the need of extra support and a variety of instruments have been used for this purpose. However, it is unclear which of these assessments are valid in placing children in the different tiers and whether screening is an effective preventive method that improves children's future academic outcomes. Hence, the aim of this meta-analysis is to evaluate the validity and effectiveness of teacher screening and progress monitoring assessments within the three-tier model across academic achievement outcomes. Through a comprehensive literature search of both published and grey literature in six databases and search engines, 9961 studies were identified in line with the a priori defined inclusion criteria. We are currently in the process of a two-stage independent double screening. Preliminary findings of the eligible studies included through the screening procedure will be presented.

Beliefs and mathematics achievements : association with attitudes and motivation
Keywords: Attitudes and Beliefs, Educational Attainment, Mathematics/Numeracy, Motivation
Presenting Author: Achmad Hidayatullah, University of Szeged, Doctoral School of Education, Indonesia; **Co-Author:**Csaba Csíkos, University of Szeged, MTA-SZTE Metacognition Research Group, Hungary

Describing the factors behind students' achievement in mathematics is a challenge for mathematics educators and researchers. Some researchers suggested that beliefs, attitudes, and motivation were factors that played key roles in determining students' achievements. However, there is a scarcity of investigations into the simultaneous contribution of these factors in mathematics. The purpose of this study is to examine the relationship between beliefs, attitudes, motivation, and mathematics. This study involved 894 (boys = 448 and ladies = 446) students from fifth and sixth grades in Surabaya, the capital of East Java Province in Indonesia. Participants completed questionnaires consisting of items on beliefs, attitudes, motivation, and self-report achievements in mathematics. Structural equation modeling (SEM) was performed to analyze the data. The results suggest that beliefs, attitudes, and motivation significantly influence students' achievements. Beliefs also significantly influence attitudes and motivation. Attitude partially mediated the relationship between beliefs and achievements. Motivation also mediated beliefs and achievements. The finding of this study contributes to unpacking the relationship between beliefs, attitudes, motivation, and mathematics achievement in mathematics learning.

Profiles of control, value and achievement emotions in primary school mathematics lessons.
Keywords: Achievement, Educational Attainment, Emotion and Affect, Primary Education
Presenting Author: Dave Putwain, Liverpool John Moores University, United Kingdom; **Co-Author:**Wendy Symes, University of Potsdam, Germany; **Co-Author:**Stephanie Lichtenfeld, Universität Hamburg, Germany

Achievement emotions are posited to arise as a result of control-value appraisals. However, it is unclear how these beliefs relate to combinations of emotions, and how these combinations relate to achievement. The present study performed a latent profile analysis of control and value beliefs, and emotions, to investigate heterogeneity in emotion profiles in a large sample of primary school students during mathematics lessons. Four profiles emerged: Profile one (the 'high enjoyment' profile) was characterized by the highest levels of control, values and enjoyment, and the lowest levels of anxiety and boredom, whilst profile two (the 'high boredom' profile) was characterised by the opposite pattern. Students in profile three (the 'moderate enjoyment' profile) had higher intrinsic value, control and enjoyment than students in profile four, whilst students in profile four (the 'moderate boredom' profile) had higher boredom. Overall, the largest differences were found between students' intrinsic value and enjoyment and boredom, suggesting that this type of value may be particularly important in the development of primary school students' emotions. Students in profile one had significantly higher mathematics test scores at the end of the study (controlling for prior achievement) than students in profiles three and four, but not profile two. Our findings suggest that it may be beneficial to further investigate how different profiles of control and value beliefs and emotions interact to influence learning and achievement.

State-Trait Analyses of STEM Students' Math-Related Motivations In Low-Stakes Achievement Settings
Keywords: Interest, Motivation, Science and STEM, Self-concept
Presenting Author: Daria Katharina Benden, University of Bonn, Germany; **Co-Author:**Fani Lauermann, University of Bonn, Germany

Students in science, technology, engineering, and mathematics (STEM) majors often experience achievement difficulties and motivational declines, especially at the beginning of their studies. Motivation research has increasingly focused on the students' situation-specific motivations, showing that short-term motivational changes can be a warning sign of long-term declines. However, little is known about the extent to which students' motivational beliefs in a given achievement situation are driven by general attitudes towards math or by specific features of the situation (e.g., the math content students are asked to work on), and whether different groups of students differ in their trait-like versus situation-specific motivations. Building on Eccles' *situated* expectancy-value theory, we examined interindividual differences in trait versus state proportions of students' situation-specific expectancy-value beliefs while taking a low-stakes math test of math prerequisites for studying in a STEM field, provided by the state ministry of education. Beginning postsecondary students enrolled in STEM programs took the test during class time and were randomly assigned to different math content (N=3,217). Multigroup multitrait-multistate models showed that a substantial amount of variance was due to trait rather than state factors (i.e., content-independent consistency). Multigroup comparisons revealed few gender differences but interindividual differences emerged for students' prior achievement. Students with lower math grades and those who had taken regular rather than advanced math courses in high school had generally more stable motivations about tested content. These findings show that trait-like beliefs about math may overshadow situation-specific experiences so that students' motivations can be difficult to change in some settings.

The Role of Effort in Students' Mathematics Development: Investigating its Predictors and Outcomes
Keywords: Engagement, Motivation, Secondary Education, Self-regulated Learning and Behaviour
Presenting Author: Robin Nagy, UNSW, Australia; **Co-Author:**Andrew Martin, University of New South Wales, Australia; **Co-Author:**Rebecca Collie, University of New South Wales, Australia

Effort has been identified in many theories of education and psychology as an essential component of students' academic development and driver of key learning processes and outcomes. However, despite ubiquitous references in major theoretical frameworks, little research has been conducted into effort itself. The present research defines effort as active, purposeful and energetic investment in learning, operationalised through cognitive, operative, and social-emotional dimensions, resulting in an overarching higher-order effort factor. The aims of this research are to examine how the key antecedents of student motivation and teacher-student relationship predict gains in students' effort in the mathematics classroom, and to explore the relation between these gains in effort and gains in students' mathematics achievement over a six-month period. Data were collected at two timepoints (Term 2 and Term 4 2020) from 1,548 secondary school students and 72 teachers in 114 mathematics classes from years 7-10 in nine Australian independent schools. Data were analysed using multilevel confirmatory factor analyses and multilevel path analyses. Longitudinal results demonstrated: 1) motivation and teacher-student relationship as unique predictors of student effort gains; 2) motivation and teacher-rated effort as unique predictors of achievement gains; and 3) classroom-average motivation as a unique predictor of classroom-average effort gains.

School improvement capacity in average-performing schools
Keywords: Communities of Learners and/or Practice, Mixed-method Research, Qualitative Methods, School Effectiveness
Presenting Author: Beat Rechsteiner, University of Zurich, Switzerland; **Co-Author:**Lisa Maria Schaefer, Johannes Gutenberg University of Mainz, Germany; **Co-Author:**Claudia Marusic-Würscher, Zurich University of Teacher Education, Switzerland; **Co-Author:**Katharina Maag Merki, University of Zurich, Switzerland; **Co-Author:**Andrea Wullschleger, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland

If we claim that education is "a hope in uncertain times" capacity for change is an indispensable factor for schools and educational systems. In school

improvement research, we are investigating factors for sustainable and effective change. Synoptic models and theories on school improvement factors show considerable overlap and consistency for decades, while in practice, the percentage of schools that show all the required ingredients for “baking the cake of school improvement” remains low. We argue that transfer difficulties here might be caused by the focus of school improvement research itself. The ongoing discussion reveals a need for more attention on schools that are neither high- or low-performers or turn-around schools. These schools are the majority and provide practical knowledge that is not only based on organizations that perform best practices. There is also a need for understanding of the root causes of the difficulties and interrelations of different improvement factors leading to a deeper understanding of the individual school's situation. To address these shortcomings, in our study, we focused on average-performing schools, which we identified based on profile building with 59 primary schools in a mixed methods sequential design. We, thereby, combined different multi-level perspectives and mixed methods strategies for a more differentiated understanding of the underlying mechanisms of improvement activities. For a type of average-performing school - the harmonic-avoiding type - our findings reveal that the staff members' aspiration for harmonic climate on the team level is prohibiting a discussion on dissent and a goal-oriented formal implemented school improvement.

A Model of Complex Data Analysis for Improving Student Achievements
Keywords: Achievement, Assessment Methods, School Effectiveness, School Leadership
Presenting Author: Pavels Pestovs, University of Latvia, Latvia; **Co-Author:**Dace Namsone, University of Latvia, Latvia

Countries all over the world are trying to improve schools to enhance the skills of their youth and to reduce the inequalities within society. The study aims to pilot a model of complex data analysis for improving student achievements and identify complex causal structures of student achievements. The model is conceptualised in terms of basic systems models with inputs, processes, outputs, and context of schools. Specifically, it investigates national-level students assessment data, teacher performance in the classroom, elements of school leadership practices and teacher collective efficacy as key variables to explore student achievements and develop school improvement plan. Data triangulation helps to identify relationships between model components and hypothesise complex causal structures of student achievements.

Research as an Institutional Practice: Problems and Suggested Improvements
Keywords: Qualitative Methods, Quantitative Methods, Researcher Education, Synergies between Learning / Teaching and Research
Presenting Author: Mark WHite, University of Oslo, Norway

The propagation and continuation of problematic research practices poses an important challenge to the validity of research knowledge. Many problematic research practices have been well-known for decades, but the prevalence of these problematic practices has, if anything, spread across time. Explanations for the propagation of problematic research practices, focused on structural features of the scientific field are incomplete, implying that scientists intentionally engage in problematic practices to get ahead. This paper proposes an alternative, but consistent, explanation of the propagation and continuation of problematic research practices. Namely, as research practices spread, they develop into institutionalized methodologies (i.e., well-defined sets of practices) that address specific key problems in drawing valid conclusions. As such, a logic of confidence arises around methodologies, taking for granted their ability to address key problems. This logic of confidence is never challenged within the daily usage of research methodologies, as many methodologies do not provide evidence of their applicability to a specific instance (e.g., estimating $p< 0.05$ does not provide strong evidence for whether the p-value can be used to support the inductive inference, rather one must first accept the p-value is valid and then interpret it). Bolstered by the logic of confidence and without any contravening evidence, the effectiveness of research methodologies becomes an object of faith. Combating the spread of problematic research practices, then, involves rethinking the design of methodologies, such that the usage of a methodology provides evidence for the validity of conclusions drawn from using the methodology.

Navigating the invisible boundary, factors that support the transition to secondary school.
Keywords: Educational Policy, Parental Involvement in Learning, Qualitative Methods, Secondary Education
Presenting Author: Emma Cunningham, University of Waikato, New Zealand

Transitions are an immanent feature of lifespan development, as all individuals experience distinct turning points, usually followed by periods of adjustment (Pallas, 1993). Gale and Parker (2014) define “transition as the capability to navigate change” (p. 737). Studies conducted in Aotearoa New Zealand and internationally highlight that ill-planned transitions into secondary school can impact negatively on student wellbeing, motivation and academic achievement (Benner, 2011; Ministry of Education, 2010). Positive transition experiences for students beginning secondary school are strongly correlated with student retention until graduation (Boonk et al., 2018; Mac Iver et al., 2015). This presentation shares on the experience of navigating the transition to secondary school through the intersection of data from two complementary, qualitative studies. Theoretically, both studies adopt an ecological lens to examine the micro and mesosystemic role of schools and parental support during the transition to secondary school (Bronfenbrenner & Ceci, 1994). The first study investigated the transition through the storied experiences of a group of Pacific students and their parents. The second study examined collaborative practices occurring between middle school and secondary school leaders responsible for facilitating the transition of students to secondary school. Triangulation of both data sets emphasised the dual contribution of parental support and school leadership practices to promote positive experiences during the transition to secondary school.

Signaling, self-explanations, and situational interest in preservice professional vision training
Keywords: Cognitive Skills and Processes, Instructional Design, Pre-service Teachers, Video-based Learning
Presenting Author: Meg Farrell, Technische Universität München, Germany; **Co-Author:**Monika Martin, University of Education Freiburg, Germany; **Co-Author:**Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany; **Co-Author:**Werner Rieß, PH Freiburg, Germany; **Co-Author:**Karen Könings, Maastricht University, Netherlands; **Co-Author:**Jeroen Van Merrienboer, Maastricht University, Netherlands; **Co-Author:**Tina Seidel, Technische Universität München, Germany

Video-analysis offers opportunities for preservice teachers to apply conceptual knowledge of teaching and learning toward real-world settings. This noticing and reasoning training about core teaching practices helps them develop professional vision skills. While learning with video can be motivating, processing challenges can arise for novices due to the transient nature of information flow. Multimedia learning research emphasizes the use of instructional design techniques to offer support, such as signaling keyword cues during video viewing, or presenting analysis self-explanation prompts focused on target knowledge for application. This study investigates the professional vision performance (i.e., describing and interpreting relevant noticed events) of 130 preservice teachers participating in a video-analysis training focused on small group instruction. We examine the overall effectiveness of the training, and inquire whether the instructional design techniques of signaling cues and focused self-explanation prompts offer further support. Finally, we explore the moderating role of situational interest on technique effects. We found that preservice teachers’ professional vision skills significantly improved after the video-analysis training, but cues and focused-prompts did not offer further support. However, moderation results indicate that when preservice teachers have low interest, videos with cues supported their professional vision more than without cues. Findings suggest that for preservice teachers lacking interest, the cueing effect may compensate for the generative processing boost typically associated with situational interest. Implications for research and practice are to consider situational interest as a powerful instructional design component for generative processing support, but when interest is difficult to elicit, cues may help.

Video-based intervention to foster pre-service teachers' professional vision of feedback
Keywords: Feedback, Pre-service Teachers, Teaching Approaches, Video-based Learning
Presenting Author: Anna Holstein, Leuphana University Lueneburg, Germany; **Co-Author:**Christopher Neil Prilop, Aarhus University, Denmark; **Co-Author:**Kira Elena Weber, Kiel University, Christian Albrecht Universität zu Kiel, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Marc Kleinknecht, Leuphana University Lueneburg, Germany

Professional vision is an important element of a teacher's professional competence and comprises noticing and interpreting (describing, explaining, generating alternative courses of action) relevant classroom events. Most studies that focus on professional vision concentrate on classroom management, whereas other teaching dimensions, such as teacher-student-feedback, are hardly taken into account. Yet, recent studies show that (pre-service) teachers have trouble providing effective feedback and already need practice opportunities during teacher training. So the study at hand examines to what extent a video-based intervention about teacher-student-feedback (intervention group) can foster pre-service teachers' professional vision of feedback compared to a control group. Our results display that the intervention group yielded significantly better results when it comes to noticing relevant feedback events. For knowledge-based reasoning, the intervention group was also significantly better at describing the events. Yet, there were not significant differences for the facets explaining and generating alternative courses of action.

Potentials of different perspectives of classroom videos for fostering teachers' professional vision
Keywords: Eye Tracking, Higher Education, Teacher Professional Development, Video-based Learning
Presenting Author: Sara Mahler, PH FHNW Switzerland, Switzerland; **Co-Author:**Kerstin Baeuerlein, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Corinne Wyss, FHNW School of Education, Switzerland

Working with classroom videos in teacher education has become increasingly prominent over the last fifteen years worldwide. The potential that classroom videos offer for teacher education has been investigated and documented in numerous studies (Gaudin & Chaliès, 2015). So far, mainly recordings from the "observer's perspective" have been used. Thanks to mobile eye tracking technology (MET), it has become possible to see the teaching through the teacher's eyes. MET recordings show the gaze of teachers during teaching and thus open up new possibilities for working with classroom videos in teacher education. However, such recordings have rarely been used so far (Stürmer et al., 2017) and findings on didactic benefits are still scarce.This study investigates the specific potential of different perspectives of classroom videos to foster professional vision (Seidel & Stürmer, 2014). Pre-service (n=32) and in-service (n=20) teachers viewed excerpts from classroom videos that were recorded with MET as well as from two different "observer perspectives" (student and teacher perspective). Structured interviews were used to investigate what the subjects observed and how they interpreted the observed classroom events (professional vision) depending on the video perspective. The results show specific potentials and limitations of the different video perspectives. Depending on the perspective, other classroom features are perceived. For example, the observer perspective supports a holistic perception (e.g., the classroom climate), while the MET videos draw the focus more to specific details (e.g., an individual student's learning behaviour). Consequences for the use of classroom videos to foster professional vision are discussed.

Which explainer video is "the one to choose"? Insights into how teachers select explainer videos
Keywords: In-service Teachers, Multimedia Learning, Qualitative Methods, Video-based Learning
Presenting Author: Felicitas Licht, University of Giessen, Germany; **Co-Author:**Marie-Christin Krebs, University of Giessen, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany

We investigated what teachers know about effective video design according to multimedia design principles, and whether they actually use this knowledge to select the (likely) most effective videos for educational purposes. In an online study, we asked teachers first about their use of videos in their (online) teaching and their previous selection criteria for suitable videos. Then, we presented them with a short teaching scenario, and asked them to watch two short video sequences that adhered more to cognitive design principles, to motivational design principles, or to neither of the two. After that, the teachers selected one of the video sequences for the scenario and stated the reasoning for their selection. Preliminary results suggested that most of the teachers (60%) relied on previously self-set criteria, while another part relied solely on their gut feeling (15%). On average, the accuracy of the content was the most important factor for the teachers when selecting a video. When given a choice, the teachers selected a video sequence in line with motivational design principles (63%) to a similar extent than a video sequence in line with cognitive design principles (61%). In about 40% of the cases the teachers chose a video that neither adhered to cognitive nor motivational design principles. Overall, our findings suggest that evidence-based principles on effective video design are not sufficiently known and applied in educational practice. Consequently, this should be a stronger focus in teacher education and training.

This study aims at investigating the predictive value of an orientation track, personal characteristics, and guidance and support of freshmen on their study efficiency, length of study and likelihood of obtaining a Bachelor degree. A longitudinal design was set up over a course of nine years, combining data regarding all variables. This data was analysed using descriptive statistics, correlations and regression models. This study showed that the results after the first examination period were most predictive for the academic success of students in higher education, combined with some personal characteristics, such as gender and prior academic experience in secondary education. Based on these results, students in higher education with specific characteristics or results after the orientation track can be targeted sooner in order to increase their academic success or to redirect the student to another bachelor's or associate degree. Additionally, by investigating data over a course of nine years, specific trends regarding the enrollment of students with specific characteristics (personal, results of the orientation track or results after the first examination period or resit) can be detected. This is important information for the policy and decision making process in the higher education institution. Lastly, the analyses of big data and learning analytics yielded important information and tips and tricks in order to repeat this study every three or five years. The tips and tricks can also be transferred to other research including big data collections and data analysis.

Promoting Access through Affordability: A Systematic Review of Open Educational Resources
Keywords: Economics of Education, Educational Attainment, Higher Education, Inclusive Education
Presenting Author: Amber Mullens, University of Central Florida, United States; **Presenting Author:**BOBBY HOFFMAN, University of Central Florida, United States

The escalating cost of higher education creates economic and academic hardships for many students. Adopting free materials such as open educational resources (OER) is one strategy for reducing educational costs. OER are typically electronic instructional materials that are copyrighted under a license that

allows for free student use. Effective implementation of OER requires a consideration of user perceptions, resource efficacy, and barriers to adoption. Thus, 96 peer-reviewed journal articles published between 2002 and 2022 were systematically reviewed (Newman & Gough, 2020) using PRISMA standards (Page et al., 2021) to answer three research questions: (a) what are student and faculty perceptions of OER, (b) which incentives and barriers impact OER adoption and use, and (c) what is the impact of OER on student achievement? Findings suggested that students have positive views of OER and believe the resources facilitate engagement. Faculty generally affirm that OER are of similar quality to paid instructional materials, but administrative obstacles inhibit adoption. Student academic performance is stable when using OER, and especially beneficial for at-risk student achievement. Practical implications for instructors and researchers are advanced to mitigate barriers toward OER utilization and to enhance the potential for academic equity and effectiveness.

How do students with the diagnosis autism specter disorder master higher education
Keywords: At-risk Students, Educational Policy, Inclusive Education, Qualitative Methods
Presenting Author: Liv Håberg, Volda University College, Norway; **Presenting Author:**Kari Rygg, Inviro, Norway

The aim of the study is to investigate how students with the diagnosis autism specter disorder (ASD) master higher education (HE), and to examine the extent to which the institutions inform and offer relevant support in the students' course of study. The study was carried out in Norwegian HE, which has clear guidelines and political goals to facilitate students in need of extra support and facilitation. The study has used two kinds of approaches. Firstly, by examining what information can be found on the HE institutions' websites about accommodation for students with ASD. Secondly, through interviewing 6 students who themselves have the diagnosis. The data collection has been carried out in autumn 2022. Preliminary findings show that the websites from HE in Norway deal to a small extent with students with ASD. The information is fragmented and to some extent not readily available. The interview data will later be analyzed and interpreted much more thoroughly, but preliminary findings point to that students with ASD may find it difficult to ask for help. The findings are discussed in the light of both the Norwegian educational policy for HE, and the special needs associated with the diagnosis of ASD, such as structure and predictability in unfamiliar situations. When HE does not provide sufficient support, socio-economic inequalities can manifest to a greater extent, which hits students with ASD extra hard. Education then no longer becomes a hope in an uncertain time.

Examination experiences of university students with disabilities before and during the pandemic
Keywords: Assessment Methods, Higher Education, Inclusive Education, Qualitative Methods
Presenting Author: Margaret Bearman, Deakin University, Australia; **Co-Author:**Joanna Tai, Deakin University, Australia; **Co-Author:**Paige Mahoney, Deakin University, Australia; **Co-Author:**Rola Ajjawi, Deakin University, Australia; **Co-Author:**Jo Dargusch, Central Queensland University, Australia; **Co-Author:**Mary Dracup, Deakin University, Australia; **Co-Author:**Lois Harris, Central Queensland University, Australia

As a form of assessment, examinations are designed to determine whether university students have met learning outcomes. However, many students with disabilities report challenges with exams that lead to feeling ‘othered’ and increase stress and anxiety. To ensure examinations do not contribute to the systematic exclusion of students with disabilities, it is important to explore their experiences. In this paper, we use a sociomaterial sensibility to attune to how examination arrangements impact upon inclusion. Interview and asynchronous data were collected from 51 students with disabilities across two universities during a period of upheaval, as assessment paradigms rapidly shifted due to the Covid-19 pandemic. Both prior to and during the pandemic, students were excluded through emergent combinations of social and material arrangements. Access to material conditions occurred in tandem with staff acceptance and implementation of access requirements. Pandemic-related changes such as shifting examinations online, using technology, increasing time limits and moving to open-book examinations contributed to increased inclusion for many, but not all, students. While some exclusionary behaviours persisted, the pandemic upheaval may have also created space to move towards positive long-term changes, reducing the need for adjustments and facilitating broader inclusion.

Examining the psychometric power of the SRL Profile and Self-diagnostic scale
Keywords: Learning Strategies, Metacognition, Self-regulated Learning and Behaviour, Tool Development
Presenting Author: Allyson Hadwin, University of Victoria, Canada; **Co-Author:**Ramin Rostampour, University of Victoria, Canada; **Co-Author:**Michelle Bahena-Olivares, University of Victoria, Canada; **Co-Author:**Philip Winne, Simon Fraser University, Canada

This study examined psychometric adequacy and predictive validity of the self-regulated learning profile and self-diagnostic instrument (SRL-PSD). The SRL-PSD makes three important contributions to research and practice. First, subscales tap into phases and facets of SRL underrepresented in other measures of SRL (e.g., Task understanding, Metacognitive monitoring, and Adaptation). Second, the scale assesses academic difficulties students encounter in five areas relating to academic success (e.g., cognitive, behavioural, motivational, socio-emotional, and metacognitive challenges). Third, the scale provides immediate diagnostic information as a personalized profile to guide future strategy choice and intervention. Findings confirmed the measurement adequacy of (a) 6 academic challenges strongly associated with semester academic performance (GPA), (b) 8 self-regulated learning practices strongly associated with academic challenges and academic performance (GPA), (c) 3 SRL self-efficacy factors and 3 SRL importance factors strongly associated with GPA. Analyses of the predictive validity of factors within each subscale demonstrate need for research examining nuances in the ways specific SRL practices and academic challenges function together to contribute to academic outcomes

Fostering Self-Regulated Learning with a Learning Diary: Success Factors
Keywords: Emotion and Affect, Learning Strategies, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Thomas Martens, Medical School Hamburg, Germany; **Co-Author:**Diana Pistoll, Medical School Hamburg, Germany

The effect of a learning diary fostering self-regulated learning is examined in two combined longitudinal and intervention studies. Specifically, self-reflection processes on learning methods and strategies were promoted that aim at the intention phase of the Integrated Model of learning and Action (IMLA). In a first study n=157 7th and 8th grade pupils were examined at a district school in Northern Germany, of which two 8th classes with n=29 took part in the 6-week intervention. Each week a learning method, such as mind-mapping, was tried out with the help of the learning diary. This was supported by short weekly one-to-one interviews with university students. Before and after the intervention period all pupils completed a questionnaire with the most important constructs of the IMLA and a scale on social emotional support. The analysis of the data was done with the Rasch model as well as ANOVAs with repeated measures and moderator analysis. In a second study at the same school n=128 6th and 7th grade pupils were examined with roughly the same intervention and the same methods. The invention group was composed of two 7th classes with n=36. This time trained pupils from the upper secondary school implemented and supervised the learning diary. In study 1, the results show a significant effect on self-efficacy and success experience in the learning diary group. Perceived social emotional was identified as moderator. In study 2, these results could not be replicated. General success factors for implementing a learning diary for self-regulated learning are discussed.

The impact of SRL instruction in task understanding, academic challenges, and performance
Keywords: Educational Attainment, Learning and Developmental Difficulties, Metacognition, Self-regulated Learning and Behaviour

Presenting Author: Michelle Bahena, University of Victoria, Canada; **Co-Author:**Allyson Hadwin, University of Victoria, Canada; **Co-Author:**Ramin Rostampour, University of Victoria, Canada; **Co-Author:**Muqing Nie, University of Victoria, Canada

Task understanding (TU) is a critical and understudied phase in the self-regulated learning process (Winne & Hadwin, 1998). In this study, SEM was used to examine whether self-regulated learning instruction moderates the impact of task understanding practices on reports of academic challenges during studying. We hypothesized that SRL instruction would better prepare students to leverage task understanding practices in ways that minimize experiences with academic challenges (N = 431). Findings indicated that TU practices negatively predicted all six academic challenges: goal and time management, initiating and sustaining engagement, motivation, cognitive, metacognitive, and social-emotional challenges. Moreover, results showed SRL instruction significantly moderated TU practices' influence on five challenges, except for social and emotional challenges. In other words, the potency of task understanding for mitigating challenges is increased when students have been trained in effective use of SRL practices.

Self-regulated learning of teachers and its connections to the competencies of their students
Keywords: In-service Teachers, Learning Strategies, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Yves Karlen, University of Zurich, Switzerland; **Co-Author:**Silke Hertel, Ruprecht-Karls-Universität Heidelberg, Germany; **Co-Author:**Johannes Jud, University of Zurich, Switzerland; **Co-Author:**Carmen Nadja Hirt, University of Zurich, Switzerland

Competencies in self-regulated learning (SRL) are considered important educational goals (OECD, 2019) as SRL skills are essential for successful learning in school and beyond. Thus, promoting SRL in the classroom is an important aspect of everyday school life. To promote SRL, teachers need to have professional competencies in SRL. So far, teachers' SRL and students' SRL are rarely studied together. Based on a multilevel approach, this study investigates the relevance of teachers' professional competencies and their SRL promotion in class for students' SRL competencies. N = 2,443 lower secondary school students (48.9% female; M_{age} = 14.45) from N = 158 classes and their teachers (44.4% female; M_{age} = 44.34) participated in this study. The results of the multilevel analyses indicate that teachers' self-efficacy is related to their SRL promotion in class but not to their beliefs and knowledge. The results underline the importance of teachers' SRL promotion for students' metacognitive strategies usage and motivational regulation skills. However, teachers' SRL promotion was not related to students' metacognitive knowledge about strategies. Overall, the results highlight the importance not only of supporting teachers in how to teach strategies but also of showing them how to develop the metacognitive knowledge of their students.

Entrepreneurship Competence in VET: results from Italy
Keywords: Assessment Methods, Competencies, Teaching/Instructional Strategies, Vocational Education and Apprenticeship Training
Presenting Author: Daniele Morselli, Free University of Bolzano, Italy

This study is part of larger study commissioned by CEDEFOP on how an entrepreneurship competence is developed in VET and leans on the case study. The research In Italy has implied: the analysis of policy documents at the State level; interviews with experts, and field research at selected six VET institutions. The data were analysed according to a qualitative and descriptive approach. Through integrating various types of sources such as policy documents, interview to stakeholders and field research at VET institutions, this research is meaningful in that it offers a full picture on how an entrepreneurship competence is developed in the Italian VET system.

Exploring VET student, workplace and school tutor viewing and evaluation of work practice
Keywords: Assessment Methods, Feedback, Video-based Learning, Vocational Education and Apprenticeship Training
Presenting Author: Sietse Brands, University of Twente, Netherlands; **Co-Author:**Bas Kollöffel, University of Twente, Netherlands; **Co-Author:**Elwin Savelsbergh, Universiteit Utrecht / Hogeschool Utrecht, Netherlands; **Co-Author:**Maaike Endedijk, University of Twente, Netherlands

Dual vocational education students receive guidance both at school and at the workplace. But the feedback they receive at the workplace differs from that received at school. While organizational priorities play a role, we hypothesize that situatedness (work experience and work culture) of tutors influences their view on practice and ultimately the guidance they give to students. In the current study we explored how school and workplace based tutors and students view video recordings of common work situations. In electrician education, eleven students, eleven school tutors and seven workplace tutors viewed five recordings and evaluated the task performances. Participant verbalizations were transcribed and analysed based on the framework of situational awareness. We explored perceived task elements, interpretations and evaluation quantitatively and qualitatively. Students were found to notice less elements and differ in their interpretations and evaluations from tutors. Workplace and school based tutors also differ in their perspectives on good practice. While these groups did not differ in the perceived elements of performance, their interpretations and evaluations differed. Showing that standardized safety protocols were interpreted very differently. We conclude that students are prone to pick up approaches taught at their workplace, which might lead to problems when these are not conform protocols. The differences in school and workplace based tutors perspectives on practice can form a problem for uniform educational outcomes. Future research could focus on ways to help students notice and evaluate workplace situations and make sense on different perspectives on practice in their field.

Digital measurement of hands-on skills? Validation of a computer-based automotive repair test
Keywords: Assessment Methods, Competencies, Engineering Education, Vocational Education and Apprenticeship Training
Presenting Author: Stefan Hartmann, Ludwigsburg University of Education, Germany; **Co-Author:**Emre Güzel, Ludwigsburg University of Education, Germany; **Co-Author:**Tobias Gschwendtner, Ludwigsburg University of Education, Germany

We investigate the ecological validity of the test score interpretations from a computer-based assessment tool (CBA) that utilises scripted video vignettes to measure the maintenance and repair skills of apprentice light vehicle technicians. The intended purpose of this tool is to complement traditional hands-on assessment formats at the German journeymen's exams. We hypothesise that the CBA test scores reflect procedural knowledge and therefore are valid predictors of hands-on performance. Apprentices in the third year of apprenticeship carried out repairs on three car systems (brake, lighting, and engine), while experts examined their performance. Afterwards, the examinees worked on our CBA which aims at the same systems. The association between hands-on performance and the CBA scores was low for most repair actions, indicating insufficient ecological validity of the intended test score interpretation. However, there is promising evidence at the item level, as the results of *some* CBA items correspond highly with the related hands-on tasks. We discuss the results in the light of a wider validation framework that combines validity evidence from different sources for our CBA. We conclude that while it seems generally possible to develop ecologically valid computer assessments that aim on certain hands-on skills, several of the items in our tool do not yet meet our expectations in regard of ecological validity. We make suggestions for the development of future tests, and we hope that our findings also contribute to a broader discussion about the psychometric quality of exams.

Same, but different? Digital Transformation of Vocational Schools in Germany and Switzerland
Keywords: Digital Literacy and Learning, Quantitative Methods, School Leadership, Vocational Education and Apprenticeship Training
Presenting Author: Andreas Harder, University of Konstanz, Germany; **Co-Author:**Stephan Schumann, University of Constance, Germany; **Co-Author:**Serge

Imboden, HES-SO Valais-Wallis, Switzerland

Various theoretical approaches show the multifaceted character of digital transformation in the school context. The *Maturity Model for Educational Organizations* by Ifenthaler and Egloffstein (2020) delineates six content dimensions: Strategy and leadership, Equipment and technology, Organization, Employees, Culture, and Digital learning and teaching. In order to measure the digital status of these dimensions we conducted two (online) surveys in which n = 466 school management members from Switzerland and n = 117 respondents from Germany participated. Our research questions focus on the investigation of how the different aspects of digital transformation are perceived in both countries, whether differences can be identified between Switzerland and Germany and – since school management is considered to play a central role in shaping digital development processes – what importance is attached to the dimension of Strategy and leadership. While the development state of digital transformation is generally perceived as (rather) positive, the findings also show that there are country-specific differences regarding the perception of the various dimensions. While the *prioritization of digital transformation* is higher in Germany ($p = .002$; $d = 0.31$), *technological* ($p < .001$; $d = -0.65$) and *pedagogical* IT support ($p = .004$; $d = -0.29$) are perceived better in Switzerland. Furthermore, multivariate analyses show that the dimension of Strategy and leadership makes a substantial contribution to explaining the perceived digital status quo in both countries. On this basis, education policy measures such as the degree of autonomy of school management at the individual school level are discussed.

Chairperson: Dorit Bosse, University of Kassel, Institute of Educational Science, Germany

How do Variables Relate to K12-Students Self-Beliefs? A Second-Order Meta-Analysis
Keywords: Meta-analysis, Motivation, Self-concept, Self-efficacy
Presenting Author: Thorben Jansen, Leibniz-Institut für die Pädagogik der Naturwissenschaften und Mathematik, Germany; **Co-Author:**Jennifer Meyer, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**John Hattie, The University of Melbourne, Australia; **Co-Author:**Jens Möller, Institute of Psychology of Learning and Instruction, Kiel University, Germany

Positive self-beliefs (i.e. self-concept, self-efficacy, self-esteem) are known to be central to students' motivation and well-being. Importantly, research has considered variables that relate to self-beliefs, aiming to understand determinants that might be useful to transform self-beliefs in constructive ways. However, the comparative strength of the relations of self-beliefs with different variables is unclear but relevant in fostering positive self-beliefs effectively. In this second-order meta-analysis, we systematize the body of meta-analytic research from multiple research traditions investigating how variables relate to self-beliefs. We summarize research from 93 meta-analyses including 385 effect sizes and data from 8.5 million students. Further, we analyze the transparency and reproducibility of meta-analyses. To calculate mean effect sizes, we conducted a multi-level second-order meta-analysis, accounting for primary study overlap and for dependencies in the data. Results for student variables showed large effect sizes of associations of self-beliefs with achievement (d=0.52) and socioemotional variables (d=0.58), moderate associations with cognitive abilities (d=0.39), and small associations with background variables (d=0.20). Regarding interventions, the largest effect sizes were found for interventions targeting students' self-beliefs (d=0.48) and physical activity interventions (d=0.36). Interventions focusing to improve learning and teaching (d=0.18), socioemotional environment (d=0.19), and technology (d=0.13) showed smaller effect sizes. The methodological analyses showed that meta-analyses lack to publish their data and analyses code diminishing their transparency. Overall, by providing a comprehensive overview of empirical work in the field of self-beliefs we hope this systematic review can inspire fruitful discussions about understanding the development of positive self-beliefs and the role of education.

Influencing procrastination – results from a course
Keywords: Emotion and Affect, Higher Education, Learning Strategies, Well-being
Presenting Author: Henna Asikainen, University of Helsinki, Finland; **Co-Author:**Telle Hailikari, Häme University of Applied Sciences, Finland; **Co-Author:**Nina Katajavuori, University of Helsinki, Finland

The aim of our study is to explore the relationship between procrastination, organised studying and psychological flexibility as well as the changes in them during an ACT-based course which included also time management training. The aim is also to explore the effects of organised studying and psychological flexibility on procrastination. The study was made with an experimental design in an ACT-based wellbeing course which also included time management training. The participants were 109 students participating the course and 27 waiting list students. Our results show that organised studying, psychological flexibility and procrastination were related to each other, and all changed during the course. In addition, both organised studying and psychological flexibility had impact on the change in procrastination during the course. The results are further discussed in the conference.

"I have a sense of accomplishment": An Investigation into Chinese International Student Engagement
Keywords: Emotion and Affect, Engagement, Higher Education, Multicultural Education
Presenting Author:- Dangeni, Newcastle University, United Kingdom

Existing research on the growing number of Chinese international postgraduate students learning tends to take a narrow view of their experiences, mostly identifying challenges and barriers, yet lacking insights into their nuanced and multifaceted experiences, particularly regarding what they bring to this international learning experience and how they make sense of their experiences and interactions. This paper employs the meta-construct of student engagement to explore Chinese Master's students' experiences at two UK universities. The year-long collection of monthly audio diaries from 22 Chinese international students was analysed to seek an in-depth understanding of their everyday learning throughout an academic year. Thematic analysis was conducted guided by Kahu's conceptual framework of Student Engagement (2013), which is considered helpful and insightful to illuminate and indicate contextual trajectories, student engagement and success. One of the key findings, that this presentation will focus on is this cohort's reflected emotions attached to this international learning journey. While existing research on emotions and learning as well as international students' emotions were largely limited to negative emotions, e.g., 'stress', 'pressure' and 'confusion' (Cheng et al., 2019; Zheng, 2017), the findings from students' accounts help to identify a number of the positive emotions that they experienced and the reasons behind the emotional responses. This presentation will provide suggestions for key stakeholders involved in teaching and supporting international students, including HE institutions, programmes, staff members and international students as to how students can be best prepared for and supported in their international developmental trajectories.

Can Video Testimonials Augment the Refutation Effect in Climate Change Misconceptions?
Keywords: Misconceptions, Multimedia Learning, Reading, Video-based Learning
Presenting Author: Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Marcel 't Lam, Open Universiteit, Netherlands; **Co-Author:**Dorothy Duchatelet, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Debunking misconceptions is crucial in our current society in which false information is spread very fast over the internet. Finding strategies to do this most effectively is very important, especially in case of controversial topics for which debunking interventions are not always successful or might even backfire. Refutation texts have been proven powerful in realising this, however research on multimodal refutation messages is rather scarce in which different rhetorical devices are combined (e.g., video and text). This research explores whether video testimonials can be used to augment the refutation effect when debunking commonly held misconceptions on climate change. Video testimonials have a power to personally affect somebody and effectively convey a message and can therefore be used to enhance refutation texts. However, also the testimony (being an expert or a peer) can make a difference in how the message is perceived. This study investigates whether a video testimonial can augment the refutation effect. A between-subjects design was used in which students either saw a testimonial by an expert, a peer or no testimonial before reading a refutation text on the greenhouse effect. Prior knowledge, post knowledge and delayed post knowledge was measured. Results demonstrate that students seeing an expert testimonial performed better on the immediate posttest than students seeing a peer testimonial. This study demonstrates the opportunities and risks of using multimodal refutation messages to debunk misconceptions.

Evidence-based design guidelines for multimedia testing
Keywords: Assessment Methods, Comprehension of Text and Graphics, Eye Tracking, Multimedia Learning
Presenting Author: Andrienne Kerckhoffs, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**José Janssen, Open University of the Netherlands, Netherlands; **Co-Author:**Ron Pat-El, Open University, Netherlands; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Multimedia testing can increase test *authenticity* and *attractiveness,* but can also result in increased mental effort, longer processing times, and lower test performance. Surprisingly, no evidence-based guidelines exist on how to design multimedia assessments. While guidelines for designing multimedia *learning* provide a starting point, they are not one-to-one applicable to testing. The research presented in this poster contributes to the development of a Cognitive Theory of Multimedia Assessment by systematically studying how to design valid and reliable multimedia assessments in various domains within a higher education context. Following a design-based research approach, existing multimedia test items in the domain of Cultural Science will be redesigned in line with guidelines for multimedia learning. The effects of the redesign on item score, mental effort and response times will be established based on data (both logging and self-reported) of at least 400 students. Eye-tracking data will be collected for a subsample of about 30 students to enable a more detailed investigation of how students cognitively and perceptually process these test items. A similar experimental study will be carried out in another domain to explore external validity of the findings.

Investigating Content-Relevant Background Color as Retrieval Cue in Multimedia Learning
Keywords: Achievement, Cognitive Skills and Processes, Instructional Design, Multimedia Learning
Presenting Author: Felix Krieglstein, Chemnitz University of Technology, Germany; **Co-Author:**Felicia Meusel, Chemnitz University of Technology, Germany; **Co-Author:**Nadine Scheller, Chemnitz University of Technology, Germany

Previous studies on retrieval cues mainly neglected the effects of background color on learning performance, focusing on music and odor as retrieval cues as well as on the learning of simple word lists. The present study investigates the effects of retrieval cues on learning performance in a multimedia learning environment. As background color is a cue that is always present in such learning environments, we investigated if background color can serve as retrieval cue in multimedia learning. We further investigated whether a background color that relates to the content of the learning text increases the retrieval cue effect. Therefore, we divided a learning text into four parts and presented each part on a separate page with a different background color. Preliminary results from 36 participants indicate that retention and transfer performance are increased when the background color from the learning phase is presented again during the testing phase compared to when the colored background is present only during learning but not during the testing phase. Concerning cognitive load, a significant interaction was found. When background color was used both during learning and testing, related background colors resulted in lower cognitive load than unrelated background colors. It was not found
that related background colors compared to unrelated background colors enhanced the retrieval cue effect in terms of learning performance.

The Role of Emotions in Goal Revision and Performance: A Computational Modeling Approach
Keywords: Emotion and Affect, Goal Orientations, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Wy Ming Lin, University of Tübingen, Germany; **Co-Author:**Lily FitzGibbon, University of Stirling, United Kingdom; **Co-Author:**Maria Theobold, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Jasmin Breitwieser, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Garvin Brod, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Kou Murayama, University of Tübingen, Germany; **Co-Author:**Michiko Sakaki, University of Tübingen, Germany

The effects of emotional experiences on self-regulation are important to consider as they may influence performance and motivation. However, studies on the effects of emotions on goal revision, an important component of self-regulation, have yielded inconsistent findings. Such inconsistent findings may be due to the complex dynamics across emotions, achievement performance, and goals. In our study, we propose to apply a computational modeling approach to empirical data collected in an education setting to ascertain the dynamic interactions across them. Computational modeling allows us to specify complex psychological phenomena as equations and to estimate posterior distributions, or a highly probable approximation, of parameters of interest. We developed a model to separately estimate the effects of emotions on goal revision and performance revision, as well as the effects of goal/performance on emotions. We first applied the model to data from a simple math task. Results showed that positive emotions led to higher goals set and negative emotions to lower goals. The model was then applied to data from German medical students who studied for up to 40 days towards a high stakes exam. Results showed that the model was also able to capture the effects of emotions on goal revision in such everyday learning settings. The results from this study will help us begin to ascertain the effects of emotions on goal revision in learning contexts and to spark discussion for the use of computational modeling in education research.

Effects of Performance Goals and Self-Efficacy on Cheating in an Academic Test
Keywords: Achievement, Goal Orientations, Motivation, Self-efficacy
Presenting Author: Melissa Özsoy, University of Augsburg, Germany; **Co-Author:**Tanja Fritz, Augsburg University, Germany; **Co-Author:**Martin Daumiller, Augsburg University, Germany

Previous research revealed inconsistent results on the effects of performance goals on academic cheating, possibly due to unexplored moderators. Therefore, we investigated whether task- and cheating-related self-efficacy influenced the effect of performance goals on cheating in a test. We conducted an experiment with performance goal induction with a sample of $N = 238$ German University students (66.1 % female). Performance goals and task-related self-efficacy were assessed within the experiment and cheating-related self-efficacy with additional interviews. Cheating was assessed both by integrated unsolvable tasks and by observation.Significant direct effects of the performance goal induction, cheating- and task-related self-efficacy as well as interaction effects of cheating-related self-efficacy were found depending on how cheating was measured. Future research could especially focus on the role of cheating-related self-efficacy.

Intentions to study secondary science: A latent profile analysis from a multiple goals perspective
Keywords: Goal Orientations, Motivation, Science Education, Secondary Education
Presenting Author: Nathan Berger, Western Sydney University, Australia; **Co-Author:**Erin Mackenzie, Western Sydney University, Australia; **Co-Author:**Kathryn Holmes, Western Sydney University, Australia; **Co-Author:**Jennifer Archer, The University of Newcastle, Australia

Achievement goals describe patterns of mastery and performance orientation which impact school achievement and motivation. While person-centred analyses have become more prevalent in educational research, few studies have applied this technique to adolescents' science achievement goals and intentions to take science in secondary school. In this Australian study, 461 students completed a questionnaire about achievement goals in science (mastery, performance approach, and performance avoid), and intentions to study secondary science subjects. A latent profile analysis of achievement goals revealed five latent profiles. Reflecting the multiple goals perspective, each latent profile differed on each of the achievement goals. One profile was characterised. Within this profile, girls were overrepresented compared to boys. Two profiles had medium achievement goals. Two profiles had high achievement goals, which were differentiated by performance avoid goals. One of these profiles had high performance avoid goals, while the other had performance avoid goals similar to the lower achievement goal profile. Prior achievement in science was associated with latent profile membership. Students in the lower goal profiles had lower prior achievement compared to students in the higher goal profiles. There was also an association with intentions to study biology, chemistry, and physics. Students in the two high goal profiles were more likely to indicate an intention to take those subjects compared to students in the lower goal profiles. The findings suggest that fostering adaptive science achievement goals may help address concerns about declining participation in biology, chemistry, and physics in secondary school.

Motivation During the PhD: Development of Achievement Goals Depending on Contextual Factors
Keywords: Goal Orientations, Higher Education, Lifelong Learning, Motivation
Presenting Author: Raven Rinas, Augsburg University, Germany; **Co-Author:**Martin Daumiller, University of Augsburg, Germany; **Co-Author:**Stefan Janke, University of Mannheim, Germany; **Co-Author:**Oliver Dickhaeuser, University of Mannheim, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany

Researchers generate knowledge for society. However, they themselves can also be viewed as learners who acquire academic working skills, especially during early career stages. Educational psychologists have highlighted the role of different achievement goals for cognitions and behaviors in achievement contexts. They are often considered as relatively stable personality factors, however, to understand the variability of achievement goals more thoroughly, consideration of temporal variability and context specificity is necessary. Academia as a workplace is characterized by highly formalized vocational transitions as well as strong interindividual differences in working conditions, which should impact achievement goals over time. We tracked the course of mastery and performance goals in 137 PhD students (79 females, age: $M = 29.4$, $SD = 5.0$ years) at 4 time points over a period of two years and linked it to contextual factors such as rewards and obligations. As hypothesized, there was a significant decline in mastery goals ($t = -2.12$, $p = .03$). Performance goals showed no global trends but high variance in interindividual trajectories ($Var = 1.3\text{-}1.8$, p

Thought patterns of students with a positive or negative self-evaluation bias of competence
Keywords: Anxiety and Stress, Goal Orientations, Primary Education, Qualitative Methods
Presenting Author: Anne-Laure de Place, Université Paris 8 - Vincennes - Saint Denis, France; **Co-Author:**Laurent Lima, Université Grenoble Alpes, France; **Co-Author:**Fanny Verkampt, Université Toulouse - Jean Jaurès, France; **Co-Author:**Pascal Pansu, Université Grenoble Alpes, France

This paper aims to explore the antecedents of self-evaluation biases of school competence by collecting autobiographical data from students who exhibit a stable positive or negative bias of their competence in a specific school subject (here, their first language skills). To identify the thought patterns of students who chronically under- or over-estimate their language competence, we used an interview procedure inspired by the cognitive interview for children. 33 students in their last year of primary school (17 with a positive bias of language competence, 16 with a negative bias) were asked to recall a time when they failed a language evaluation. Of those, 19 were interviewed a second time to recall a successful experience. A lexical analysis of their comments revealed that the thought patterns of both positively and negatively biased students were similar when recalling a success, with a discourse articulated around two poles, one referring to the characteristics of the evaluation and the other to its execution. In contrast, when recalling a failure, the situation described by negatively biased students was much more imbued with stress, without the distinction between the two poles described above, whereas positively biased students displayed a thought process similar to the one they had when speaking about a success. We suggest that this singular emphasis on fear of evaluation among negatively biased students denotes a focus on performance-avoidance goals, the deleterious effects of which on learning and performance are well-known, while positively biased students manage to mobilize both performance and mastery goals.

Conceptualizing Prosocial Motivation: Contributing to benefit others in Collaborative Group Contexts
Keywords: Cooperative/Collaborative Learning, Goal Orientations, Motivation, Social Interaction
Presenting Author: Toni Rogat, Purdue University, United States

This poster presentation aims to synthesize relevant literature and theorize prosocial forms of motivation. The aim is to extend our conceptualization of motivation constructs to better account for the motivational experience of learners in collaborative group and interpersonal contexts. The social dynamics of learning are more prominent in small groups, with potentially important implications for motivational processes. In particular, this presentation presents prosocial motivation to include a social instrumental or altruistic direction for the following constructs: achievement goals, value beliefs, competence, and situational interest. Ultimately, prosocial forms of motivation have potential for expanding access or broadening pathways to motivation by supporting a fuller range of the motivational experience beyond exclusively self-ends.

Looking for talent: discover and stimulate talent-awareness in preschool with a digital portfolio
Keywords: Early Childhood Education, Multimedia Learning, Resilience, Well-being
Presenting Author: Saar Steverlinck, Hogeschool PXL, Belgium; **Co-Author:**Hanne Rosius, Hogeschool PXL, Belgium; **Co-Author:**Dorien Jansen, Hogeschool PXL, Belgium

XPO 2.5 is a method for achieving talent-centred education in preschool. The project is designed with a clear vision, based on the growth mindset (Dweck, 2018), self-determination theory (Deci & Ryan, 1999) and talent (Dewulf, 2018 & 2020; Buckingham & Vosburgh, 2001). Based on our theoretical framework and the results from focus groups, a number of valuable materials were created according to the phases of the model of Educational Design Research . First, we developed a set of didactic materials (posters, storyboards, stories, drawing boards) to concretize and give language to the concept of talent at the preschool level. Second, we constructed a triptych of apps and an online tool for the pre-schooler, the teacher and parents to record and show talents of pre-schoolers to the world. Thirdly, a practical guide with concrete tips and good practices was written to inspire teachers to get started in their classrooms. To support the teacher a set of digital micro lessons were created to introduce the theoretical framework, the materials, and apps/tools. XPO 2.5 stands out as a project by its concrete and practical materials that can be used immediately in the classroom.

Measuring School's Contribution to Students' Mental Health: Validation of a New Scale
Keywords: Emotion and Affect, Health-care Education, Secondary Education, Well-being
Presenting Author: Christian Brandmo, University of Oslo, Norway; **Co-Author:**Hanne Nissen Bjørnsen, Norwegian University of Science and Technology (NTNU), Norway; **Co-Author:**Gunnar Bjørnebekk, Department of Special Needs Education, Norway

Over the last decade, there has been a growing interest in mental health literacy (MHL) in health promotion, largely motivated by increased awareness of MHL as a modifiable determinant of mental health. Accordingly, MHL has been associated with the health-promoting school approach emerging over the last 20 years. To succeed in promoting MHL, it is important to evaluate working strategies and interventions to address it using validated instruments. The current study describes the revision and psychometric testing of a modified version of the 10-item adolescents' positive MHL measure, the MHPK-10, the only identified instrument measuring adolescents' positive MHL. The MHPK-10 was adjusted to address the previously documented ceiling effects. It was further optimized for use in schools by reworking it to measure learning rather than self-reported knowledge, becoming the new nine-item Mental Health Learning Scale (MHLS-9). The MHLS-9 was tested on a national sample of N = 2,012 Norwegian 9th graders. Data were analyzed by confirmatory factor analysis (CFA) and tests of reliability and validity. The revised CFA model for the MHLS-9 showed an improved fit over the original CFA model for the MHPK-10. The MHLS-9s' CFA model revealed excellent factor determinacy (.95) and scale reliability (ω = .91). Thus, the MHLS-9 is an improved measure for the positive component of MHL for use in school settings, enabling researchers and practitioners to evaluate and target positive MHL interventions in schools using a short, reliable, and valid measure for adolescents' learning about the factors promoting good mental health.

Testing the effectiveness of a physical activity program on adolescent resiliency
Keywords: Developmental Processes, Emotion and Affect, Quantitative Methods, Well-being
Presenting Author:yuhan hu, Eramus University Rotterdam, Netherlands; **Co-Author:**Brian Godor, Avans University of Applied Sciences, Netherlands; **Co-Author:**Guus Smeets, Eramus University Rotterdam, Netherlands; **Co-Author:**Ruth Van der Hallen, Eramus University Rotterdam, Netherlands

Since the world is experiencing unprecedented changes with ever-accelerating globalization and technological advancements, fostering social and emotional development (SED) has become a good way to help adolescents confront the uncertain world. The present study evaluated the effectiveness of an after-school physical activity intervention targeting SED in promoting resilience in adolescents. A total of 137 adolescents from inner-city schools participated in a 20-week intervention (male: 80, female: 53; M_{age} = 11.20, SD = 1.04). Results indicated that this intervention significantly improved overall resilience ($F(1,32) = 11.86, p < .01$), in particular sense of relatedness and emotional reactivity ($F(1,32) = 7.08, p < .05$; $F(1,32) = 5.90, p < .05$), among adolescent with low resilience at T0. This study provides evidence of the effectiveness of physical activity interventions on inner-city adolescents' well-being, enriching SED programs that serve at-risk adolescents.

Meet Them Where They Are: An Investigation of Social Media and Stress in College Students
Keywords: Anxiety and Stress, Higher Education, Social Media, Well-being
Presenting Author: Suzanne Lindt, Midwestern State University, United States; **Presenting Author:**Stacia Miller, Midwstern State University, United States; **Presenting Author:**Christina Janise McIntyre, Midwestern State University, United States

Recent research purports that the prevalence of social media use may be to blame for elevated rates of anxiety and stress in college students (Sahin Baltaci, 2021). The purpose of this pilot study was to investigate whether learning about the harmful effects of social media could impact college students' behaviors and mental health. Participants completed a perceived stress survey, readiness to change assessment, and a social media usage report. Participants in the treatment group will be given articles about the benefits of reducing social media use and will provide a brief summary of the article. After comparing baseline data to previous research, students in our sample may have higher than average stress for others their age. Furthermore, results on readiness to change suggest that many students in our sample do not feel that they need to change their social media habits. Although preliminary results show that students may not be ready for change, their levels of stress suggest that intervention is critical. In the classroom, students with greater anxiety and depression may have lower academic outcomes and be at risk for successfully completing their college degrees.

What works best? 3 years of designing & piloting a stress management and resilience intervention
Keywords: Anxiety and Stress, Higher Education, Resilience, Well-being
Presenting Author: Natalie Peters, TU Dresden, Faculty of Business and Economics, Chair of Business Education and Management Training, Germany

Living in a rapidly changing world has taken its toll on students in higher education. Mental health issues, such as symptoms of depression or burnout, insomnia, eating disorders and others are on the rise, as various studies in the last years have found (e. g. Auerbach et al., 2016). This development was recently accelerated through the worldwide COVID-19 pandemic (e. g. Chen & Lucock, 2022). Adding to that, the recent and precarious situation of warfare in Europe marks the particular circumstances of uncertain times and an uncertain future. Hence, it is more important than ever, to not only form young minds in higher education, but to support them in preparing for and coping with adversity and uncertainty. One way to strengthen students' mental health is through promoting individual resilience and stress management. This is often achieved through training interventions that target the adaption or change of behavior towards healthy and adaptive coping with stressors and adverse situations. These interventions have shown to be effective in numerous studies before (e. g. Conley, Durlak & Kirsch, 2015). Therefore, a pilot intervention for students in higher education was implemented into the curricula of Master students at a large German university. In total, 164 students took part in the ongoing study. After three years of differing designs and their implementation, the intended goal for this proposal is to give an overview of the different designs of the pilot as well as cumulative results and implications for future research and interventions.

Relationships between School-related outcomes and general variables: A tentative comprehensive model
Keywords: Achievement, Anxiety and Stress, School Effectiveness, Well-being
Presenting Author: Clément PERRIN, Université Grenoble Alpes, France; **Co-Author:**Pascal Bressoux, Université Grenoble Alpes, France; **Co-Author:**Pierre De Oliveira, Laboratoire Psy-DREPI, Université de Bourgogne-Franche-Comté, France

School climate has been extensively studied over the past decades. Despite a consensus on its impact on several students' outcomes (achievement, school satisfaction, stress, and perceived social support), no comprehensive model is clearly accepted in the research community. This study proposes a model of school climate that describes its dimensions and relationships with both students' school-related outcomes (school satisfaction, achievement, stress, perceived social support) and more general variables such as sleep, mental health, and self-esteem. Using structural equation modelling, we show that school climate as well as the general variables are related to students' school-related outcomes. There is also a direct link between school climate and general variables. To the best of our knowledge, this work is the first one that proposes a comprehensive model of the relationships between school climate, school-related outcomes and

general variables.

Can early childhood education in Kosovo contribute to the reduction of educational inequality?
Keywords: Achievement, Early Childhood Education, Large-scale Assessment, Mathematics/Numeracy
Presenting Author: Saranda Shabanhaxhaj, University of Graz, Institute of Education Research and Teacher Education, Austria; **Co-Author:**Heike Wendt, University of Graz, Austria

The relationship between family characteristics, early childhood education and educational achievement is quite well researched for western industrialized countries. The generalizability of theories and findings for post-war contexts and newly established countries, such as Kosovo, remains unclear. Apart from the TIMSS international report of 2019 (Mullis et al., 2020), documenting significant higher achievement results in mathematics, for those children who attended an ECE institution and had early numeracy activities at home, little to nothing is known about ECE in Kosovo. The paper aims to contribute to filling this research gap by analyzing attendance patters and relationships between ECE attendance, family background, early childhood activities in the family and mathematical achievement for children in Grade 4 using TIMSS 2019 data for Kosovo. We find substantial disparities in ECE attendance by economic and cultural indicators as well as parental aspirations, with ratio differences up to 50%. With regard to achievement differences in mathematics, attenders significantly outperform non-attenders by 24 points, with no differences between attenders and long-attenders. Attendance in ECE remains a significant predictor of math achievement, when controlling for home educational resources, home learning support and educational aspiration. We conclude that ECE may have a compensatory potential for socially disadvantaged children in Kosovo.

Electrophysiological correlates of processing numerical order and their association to arithmetic
Keywords: Achievement, Cognitive Skills and Processes, Educational Neuroscience, Mathematics/Numeracy
Presenting Author: Stephan Vogel, University of Graz, Austria; **Co-Author:**Clemens Brunner, University of Graz, Austria; **Co-Author:**Roland Grabner, University of Graz, Austria

Numerical order, i.e., the knowledge about the relative position of numerals, is a significant predictor of arithmetic abilities. Despite its functional relevance, little is known about the neurocognitive mechanisms that support ordinal knowledge and their association with arithmetic. A central characteristic of ordinal processing is a significant decrease in reaction times and/or error rates when individuals verify the correctness of adjacent ordered numbers (e.g., 2-3-4) in contrast to non-adjacent (e.g., 2-4-6). Neuroscientific studies using electroencephalography (EEG) have indicated a significant association between ordinal processing and event-related potentials (ERP) at around 210-240ms and 310-510ms on parietal and frontal electrodes. The neurocognitive functions of these spatio-temporal patterns and their role for arithmetic are, however, unknown.To further investigate the brain characteristics of ordinal processing and their association with arithmetic, we collected behavioral and 64-channel EEG data from adults who performed a numerical ordinal verification task, i.e., they indicated whether a sequence of numerals was in-order (e.g., 2-3-4) or not (e.g., 2-4-3). Arithmetic abilities were assessed with a timed paper-pencil test measuring arithmetic fluency. Our analyses indicate more accurate judgements for adjacent numbers compared to non-adjacent ordered numbers. This behavioral distance effect is mirrored by a modulation in ERPs at parieto-occipital electrodes at around 210-240ms. Furthermore, we identified a significant brain-behavioural correlation between the ERP signal for in-order compared to non-order trials at 500-750ms and arithmetic fluency at the midline central (C). Results of this work provide crucial insights into the neurocognitive mechanisms of order processing and their functional role for arithmetic.

Reading Metacognition and Mathematical Literacy: A Cross-Country Comparison of Taiwan and Germany
Keywords: Achievement, Large-scale Assessment, Mathematics/Numeracy, Metacognition
Presenting Author: Su-Wei Lin, National University of Tainan, Taiwan; **Co-Author:**Anselm Strohmaier, Technical University of Munich, Germany; **Co-Author:**Pei-Ming Chiang, National University of Tainan, Taiwan

The purpose of this study was to explore profiles of knowledge about reading metacognition for Taiwanese and German students, and to compare the relationships of these derived profiles and mathematical literacy for these two countries. This study adopted the multigroup latent profile analysis (LPA) and hierarchical linear model (HLM) to analyse the Programme for International Student Assessment (PISA) 2018 Taiwanese and German data. The result showed that four profiles of reading metacognition were the optimal model in both countries, but the distribution of students differed. After controlling for gender, as well as the economic, social and culture status (ESCS) of students and schools, the associations of reading metacognition profiles and mathematical literacy were similar for both countries. This indicated that metacognition is relevant for solving mathematical problems in both countries, but is not able to explain country differences in achievement.

Numerical Competencies in Preschoolers with Language Difficulties
Keywords: Achievement, Cognitive Development, Learning and Developmental Difficulties, Mathematics/Numeracy
Presenting Author: Kirsten Schuchardt, University Hildesheim, Germany; **Co-Author:**Claudia Maehler, University of Hildesheim, Germany

School children with specific language disorders (SLI) often experience massive learning difficulties concerning both literacy and numeracy. The study investigates whether preschool children with SLI already show abnormalities in basic numerical skills and whether these are accompanied by impairments in the visuo-spatial sketchpad of working memory. In a three-group design, the group of SLI-children (n=25) is contrasted with two control groups: (1) children of the same chronological age without signs of language deficits (CA, n=25), and (2) a group of children on the same level of language development as the SLI-group, i.e. of the same language maturity (LA, n=25). Results show that counting abilities and performance in early numerical competence are comparable to those of the younger control group, thus showing a developmental delay corresponding to the delay in the childrens' language skills. In contrast, performance in numeral knowledge and comprehension of quantity lies between the two control groups. Numerical developmental abnormalities are not associated with a reduced capacity of the visuo-spatial sketchpad. Our results support the language deficit hypothesis, according to which developmental language abnormalities are considered a barrier to the development of age-appropriate numerical competencies.

Mapping across different types of representations in preschool
Keywords: Achievement, Cognitive Development, Early Childhood Education, Mathematics/Numeracy
Presenting Author: Josetxu Orrantia, University of Salamanca, Spain; **Co-Author:**Laura Matilla, Univeresity of Salamanca, Spain; **Co-Author:**Rosario Sánchez, University of Salamanca, Spain; **Co-Author:**Verónica Carretón Jareño, University of Salamanca, Spain; **Co-Author:**David Munez, National Institute of Education / Nanyang Technological University, Singapore

Learning how to map across symbolic and non-symbolic representations of number is quite challenging for young children. Prior research has largely focused on mapping between verbal number words, written digits, and non-symbolic quantities such as dot arrays. However, it is also possible representing numbers with finger configurations. Indeed, it has been suggested that finger configurations are processed in the same way as other symbolic representations. In the

present study, 3- and 4-year-old children (N = 215) were presented with tasks assessing the mapping between number words, Arabic digits, dice patterns, and finger configurations for the quantities one to seven. Results from a mixed model revealed that the probability of mapping efficiently across different numerical representations differs across types of mapping. Globally, mappings involving quantity were more difficult than mappings between symbolic representations, including finger configurations. In addition, performance on a symbolic comparison task was predicted by the mappings between fingers and other number representations, even when the effects of age, memory, cardinal number knowledge and mappings between number words, digits, and quantities were controlled for. These findings provide further support to the symbolic properties of finger configurations and the role that these configurations may have for the acquisition of basic numerical abilities at early stages in development. Our findings support educational practices encouraging the representational role of finger patterns as a potential bridge between number words and digits and the quantities they represent.

Finger numeral recognition predicts arithmetic performance in primary school
Keywords: Achievement, Classroom Assessment, Cognitive Development, Mathematics/Numeracy
Presenting Author: Josetxu Orrantia, University of Salamanca, Spain; **Co-Author:**Rosario Sánchez, University of Salamanca, Spain; **Co-Author:**Laura Matilla, Univeresity of Salamanca, Spain; **Co-Author:**Verónica Carretón Jareño, University of Salamanca, Spain; **Co-Author:**David Munez, National Institute of Education / Nanyang Technological University, Singapore

Identifying the precursors of arithmetic performance enables us to ensure that children receive adequate mathematical instruction and can manage numbers and calculations with ease. Prior research has focused on the relationship between symbolic and non-symbolic representations and arithmetic. But little is known about the influence of finger processing in arithmetic. In this sense, the vast majority of research has concentrated on the influence of finger gnosis in number processing and arithmetic skills. Nevertheless, few studies have investigated whether finger numeral representations at the start of formal schooling can predict subsequent development in single-digit arithmetic, specifically, fact retrieval in sums. For this purpose, in the present study, 110 elementary school students were assessed in two different moments (grade 1 and grade 2). At the middle of first grade, we administered the measure of intellectual ability as well as numerical processing measures (rapid digit naming, symbolic numerical magnitude comparison, counting and finger numeral representations recognition). Our longitudinal data reveal that children's accuracy recognizing finger numeral representations in first grade was predictively related to their future competence retrieving facts from memory in single-digit arithmetic. This association remained even when age in months, intellectual ability, rapid digit naming, and the numerical processing measures are additionally controlled for. Our findings suggest that finger numeral representations recognition skills at early stages of development precede children's arithmetic performance and fact retrieval when solving single-digit sums problems.

Words Matter: Public Perceptions of Climate Change Terminology
Keywords: Emotion and Affect, Environmental Education, Science Education, Sustainable Development
Presenting Author: Laurel Kruke, University of Southern California, United States; **Presenting Author:**Gale Sinatra, University of Southern California, United States; **Co-Author:**Wandi Bruine de Bruin, University of Southern California, United States; **Co-Author:**Norbert Schwarz, University of Southern California, United States

“Global warming” and “climate change” have historically been used interchangeably to describe the same phenomenon, with studies showing that people may interpret their meanings differently and express varying levels of concern or willingness to act based on personal experiences and belief systems (Schuldt et al., 2011; Soutter & Mottus, 2020; Weber & Stern, 2011; Whitmarsh, 2009). Bruine de Bruin and colleagues (2021) also found that people can misinterpret common climate change terms, which causes confusion and can contribute to inaction. This roundtable will present findings from a follow-up study to Bruine de Bruin et al. (2021), conducted to test whether more recently introduced terminology such as “climate crisis,” “climate emergency,” and “climate justice” incites more concern and urgency to act to reduce the impacts of climate change. The study will use a nationally representative sample of 6,000 participants from the USA using the Understanding America Study participant pool. Respondents will be randomly assigned to one of the five terms of interest (“global warming,” “climate change,” “climate crisis,” “climate emergency,” and “climate justice”) and asked to answer survey questions related to their concern and willingness to take climate action. The findings will be analyzed to understand whether these newer, more urgent terms are effectively increasing concern and a willingness to act, and if so, which term is more effective at spurring action. Uncovering the public perceptions of these terms can help climate communicators, including educators, utilize language that will engage students with climate solutions.

There is no planet B, so what now? Measuring climate literacy in teenagers
Keywords: Competencies, Environmental Education, Large-scale Assessment, Secondary Education
Presenting Author: Monika Martin, University of Education Freiburg, Germany; **Co-Author:**Magdalena Stadler, University of Education Freiburg, Germany; **Co-Author:**Josef Künsting, University of Education Freiburg, Germany; **Co-Author:**Werner Rieß, PH Freiburg, Germany

Climate change is one of the most complex and urgent challenges we face. With a lack of knowledge about the causes, impacts and solutions to climate change being one of the greatest barriers for individuals to engage in climate action, education systems form one of the *social tipping elements* crucial in fighting climate change. Thus, there is a need for a valid and reliable instrument to monitor climate change education and to derive approaches for further measures. In the present project, we are developing a competence test for measuring climate literacy in 15-year-olds. In a first step, we developed a competence model adapted from the framework for scientific literacy in PISA assessments. Based on four competence aspects (e.g., knowledge application) and four content domains (e.g., mitigation and adaptation strategies), we developed a pool of test items. While climate change education in schools currently mostly focuses on the scientific basics (e.g., the greenhouse gas effect), the content domains covered in the climate literacy test explicitly integrate socio-scientific, economic, political, and ethical aspects. Currently, we are piloting our test items with a sample of 500 students. After data collection, we will determine item difficulties using Rasch analysis and modify the test items. In the roundtable contribution we want to discuss ideas to further develop the test instrument as well as possibilities and limitations for its use.

Contributing to the innovative culture: Creating a progression-game gamified instructional design

Keywords: Engagement, Game-based Learning, Higher Education, Instructional Design
Interest group: SIG 06 - Instructional Design

The present paper proposes an instructional design framework (IDF) workshop, during which the participants will have the opportunity to acquaint themselves with the use of an award-winning IDF and create an own teaching/learning route. The ID is rooted in Comenius' core didactic principles, the principles of gamified teaching, and the principle of sustainability. The IDF was inspired by orienteering, and it is conceived as an open framework, which makes possible the creation of gamified teaching and learning experiences in an array of subject areas. In 2022, the IDF has won both an international first prize and a national first prize for the best student-centered teaching practice in tertiary education. The workshop will contain a brief presentation of the IDF followed by a hands-on activity. The participants are welcome to bring in their own study content and employ the IDF to create an own teaching route using the most basic digital tools such as Microsoft Documents, Microsoft Excel, or EdForm. The participants are also invited to bring in their laptops as the digital tools to be employed work better on computers than on tablets. The main learning outcome for the participants is to become able to adopt game design-elements to the content of their choice to create gamified learning experiences.

Teaching and Teacher Education

Creating opportunities for self-regulated learning:setting up participatory design-research studies.

Keywords: Curriculum Development, Higher Education, Self-regulated Learning and Behaviour, Teacher Professional Development
Interest group: SIG 04 - Higher Education

Students in Higher Education are expected to behave as active self-regulated learners. However, many do not meet these expectations. Although most teachers consider themselves responsible for the development of their students' self-regulated learning skills, few teachers find themselves sufficiently capable. An important factor which obstructs students' development of self-regulated learning skills is the fact that the curriculum is often strongly teacher controlled and therefore do not avail development. Moreover, research shows that teachers lack sufficient knowledge of effective interventions to develop self-regulated learning skills. In this workshop we introduce a conceptual model for participatory design-research together with teachers to develop evidence-informed practices that support students' SRL- skills. Participants will be invited and activated to explore how to set-up participatory research-design studies which will yield ecological valid solutions to the teachers' dilemma.

Creating opportunities for self-regulated learning:setting up participatory design-research studies.

Interest group: SIG 04 - Higher Education

Please bring your own device if you are attending this ICT demonstration.Feedback is a key element of successful classroom practice that improves student learning outcomes. However, feedback is still a rarely used instrument in higher education, especially in large courses. As the COVID-19 pandemic forced all education providers to move their complete teaching concepts online, the distance between teachers and students increased highlighting the importance of feedback. At the same time, online environments allow the collection of trace data as students interact with the learning environment. Such data can be leveraged using learning analytics methods to design feedback interventions. In this ICT demonstration we introduce [blinded_for_review], a Moodle plugin which helps teachers provide written feedback in large courses. This tool also prompts students to reflect on the feedback they received and allows teachers to explore if such feedback helps students to understand their learning behavior and improve their learning performance. Our tool is intended to work as an educational intervention and an instrument of dialogue between teachers and students and thus closing the feedback loop. At the same time, the plugin can be a relevant research tool as it allows us to better understand how students perceive the feedback and self-reflect. During the demonstration, participants will have access to a Moodle installation with various learning activities and will be able to configure and examine the feedback plugin.

Closing the Feedback Loop - A Moodle Plugin for (Semi-)automated Feedback

ICT Demonstration
Learning and Instructional Technology

Microsofts' Immersive Reader as translanguage-enabling technology in second language acquisition.

Keywords: Foreign and Second Language Acquisition, Immersive Technologies for Learning, Inclusive Education, Teaching/Instructional Strategies
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.

Can Microsoft's Immersive Reader (IR) promote educational equity and the increased inclusion of second language (L2) learners? L2 learners are often grouped together in complex multilingual classrooms, where their lack of proficiency in the language of instruction (L2) constitutes a stark contrast to their level of proficiency in their first languages (L1). Translanguaging research positions students' pre-existing knowledge as a valued resource, indicating how a learner's L1 can scaffold the acquisition of L2. Ideally, L2 learners would have language instructor(s) proficient in all the respective L1s, but this is improbable in any classroom. There is, however, technology which might facilitate extensive L1 support. We aim to present the Immersive Reader (IR) as translanguage-enabling technology with the potential to promote language learner's multilingual competence and facilitate L2 acquisition. The IR is a free built-in tool in Office365, making it highly and easily accessible to many. In the ICT demonstration we present and discuss its features, which can be combined to support the individual's language learning. This includes translation into over 100 languages, a read aloud function, reading pace options, a picture dictionary, grammatical categorization and adjustable text preferences like font and spacing. Participants will be able to try, discuss and share their experiences with this or similar tools. The session is hands-on and practical but builds on our ongoing research project about translanguaging and technology, where we have interviewed L2 learners about their experiences using the IR.

Invited Symposium

Raising awareness about online readers' awareness: digital competence in multiple-text contexts

Keywords: Digital Literacy and Learning, E-learning/ Online Learning, Educational Technologies, Higher Education, Metacognition, Pre-service Teachers, Primary Education, Reading, Writing/Literacy
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Christian Tarchi, University of Florence, Italy
Discussant: Elena Florit, University of Verona, Italy

When reading online, people must integrate several complex processes to deeply elaborate the content. People need digital competences to seek information on the web, evaluate the credibility of the sources and integrate information across texts. Awareness represents a key process for readers to self-regulate and sustain their reading activity until aims are achieved. At the same time, teachers' need to be aware too of what processes are involved in online reading to support their students.We present four studies with the purpose of discussing the role of metacognitive awareness of one's cognitive and motivational processes while reading. One study investigated what strategies children use and which dimensions of reading competence they set in motion when seeking information online. One study investigated the structure of credibility evaluation when adolescents read and evaluated multiple online texts. One study investigated whether students were aware of the strategies used when integrating information across content. Finally, one study investigated the issue from the perspective of teachers by examining their perceptions of integration processes, of the challenges of teaching integration, and of best instructional practices.The symposium contributes to our understanding of online reading processes across different ages (from primary school students to adults) and actors (students and teachers). It emphasized the importance of awareness in promoting reflective behaviors when we turn to the Internet to increase our knowledge about complex topics. On an educational level, the symposium provides useful indications on how students' and teachers' awareness should be targeted to increase online reading performance.

Eight-year-olds seeking information with Ipads: dimensions of reading competence
Presenting Author: Eva Brante, Malmö University, Germany; **Co-Author:**Robert Wallden, Malmö University, Sweden; **Co-Author:**Kim Ridell, Malmö University, Sweden

Children use digital environments at an early age and should be supported from the start of school to a conscious and critical way of navigating the internet. Previous studies show that children have vague ideas about how the information has ended up on the internet, how it should be read and evaluated. In this exploratory study, we investigated how children start an internet search, how they formulate their search query and what they pay attention to when the search result is obtained, as well as how they read the information from the screen. 15 eight-year-old children performed the searches in small groups, using one tablet in joint searches. The children's speech and screen activity were recorded. The data was analyzed with the help of Luke and Freebody's resource model to call in different dimensions of reading competence that are actualized when students initiate searches and navigate search results. The results show that the students can use speech and writing to quickly search for specific information. At the same time, they are disinclined to stop and reflect on the relevance, credibility, and sender of the search results. With interactional support, some students were able to identify the sender of the information and reason about which

type of sender might be credible. To reach a more developed thinking and awareness that digital information has a sender, teaching that promotes critical information awareness and multimodal text competence is required.

Successful Evaluation of Online Texts Requires Skills to Confirm and Question the Credibility
Presenting Author: Carita Kiili, Tampere University, Finland; **Co-Author:**Eija Räikkönen, University of Jyväskylä, Finland; **Co-Author:**Ivar Braten, University of Oslo, Norway; **Co-Author:**Helge Stromso, University of Oslo, Norway; **Co-Author:**Michelle Schira Hagerman, University of Ottawa, Canada

Previous research has widely assessed students' credibility evaluation skills with different types of measures and indicators. Consequently, results are fragmented and difficult to compare. Further, there is no clear understanding of the structure of credibility evaluation. The present study examined the structure of credibility evaluation when students read online texts. The participants were 265 sixth grades (M_{age}= 12.45) recruited from five Finnish elementary schools. Students' credibility evaluation skills were measured with a web-based task in which students read four online texts on sugar effects. Two texts were more credible (a popular science text and a newspaper article) and two were less credible (a laypersons' blog text and a commercial text). After reading each text, students evaluated the author's expertise, the author's benevolence, and the quality of the evidence. After completing all evaluations, students were asked to rank the texts according to credibility. Four competing measurement models of students' credibility evaluation were compared. The model termed the Genre-based Confirming-Questioning Model reflected the structure of credibility evaluation best. This model suggests that credibility evaluation reflects the source texts and requires two latent skills: confirming the more credible texts and questioning the less credible texts. The skills of confirming and questioning the credibility were positively associated with students' ability to rank the texts according to credibility The study suggests that the structure of credibility evaluation might be more complex than previously conceptualised. Instruction should ensure that students have opportunities to carefully analyse different credibility aspects of more and less credible texts.

Readers' awareness in the use of intertextual strategies when reading multiple texts
Presenting Author: Lidia Casado Ledesma, University of Florence, Italy; **Co-Author:**Christian Tarchi, University of Florence, Italy

Multiple text comprehension tasks are increasingly required at university. These activities demand making connections across the sources and put into practice intertextual strategies. Multiple text comprehension tasks require the activation of high order skills as metacognition. Despite the role that metacognitive awareness plays in reading processes, there are no known antecedents of studies in which it has been related to strategies specifically linked to intertextual integration when reading texts with conflicting information. Therefore, the present study has the following objectives: 1) to assess undergraduate students' awareness of the use of intertextual integration strategies when reading texts with conflicting information and producing argumentative essays on the topic and 2) to analyze the impact of readers' awareness of intertextual strategies on the multiple text comprehension, inferred through the quality of the argumentative essays. Seventy-three university students participated in the study. The students read the texts on the subject of red meat consumption and its relation to cancer. After the reading, they were asked to write an argumentative essay expressing their opinion about the topic. They were then presented with reflection questions about the intertextual integration strategies they had employed in their essay (refutation, weighing or synthesizing). The analysis reveals a lack of awareness in the application of intertextual integration strategies. Also, we found a significant difference in the argumentative quality of the essays in favor of students in whom a correspondence is observed between the strategy report and its effective use.

Teachers' Perceptions of Multiple-Text Integration: Instructional Challenges and Practices
Presenting Author: Liron Primor Grunfeld, Hemdat Academic College, Israel; **Co-Author:**Sarit Barzilai, University of Haifa, Faculty of Education, Israel

Teachers' knowledge of reading- and writing-related concepts has gained interest due to students' difficulties in developing adequate literacy skills. Multiple-text integration is an important but highly complex 21st century literacy skill. To better understand language arts teachers' knowledge of multiple-text integration, we examined teachers' perceptions of integration processes, of the challenges of teaching integration, and of best instructional practices. Fifty-four teachers answered open-ended questions using an online questionnaire. Teachers' answers were analyzed in light of the MD-TRACE model (Rouet & Britt, 2011). Results suggested that teachers are familiar with the steps of selecting information, organizing it, and identifying relationships between texts. However, teachers did not refer to source evaluation, to the recursiveness of reading and writing, and to metacognitive monitoring. The most common teaching challenges were coping with students' low basic reading and writing skills as well as lack of motivation. As for instruction, teachers mostly focused on teaching how to integrate, whereas instructional practices aimed at understanding the value of this task and standards of integration quality were scarce. In sum, the results demonstrate that teachers have rich knowledge of multiple-text integration and view this as a difficult task that pushes the boundaries of students' literacy skills. Teachers respond to these challenges by breaking-down the task and focusing on integration processes. These attempts could potentially be strengthened by paying more attention to students' appreciation of the importance and meaning of integration and by fostering their self-regulation skills.

Invited Symposium

Educating the developing mind: an overarching theory for development and learning

Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Learning and Developmental Difficulties, Problem Solving, Social Aspects of Learning and Teaching
Interest group:
Chairperson: ANDREAS DEMETRIOU, Cyprus
Organiser: ANDREAS DEMETRIOU, Cyprus
Discussant: Roger Saljo, University of Gothenburg, Sweden

The symposium outlines a recent book presenting an integrated theory of intellectual development and its implications for education. The architecture of the human mind, its development, and the factors associated with individual differences are described. The notion of developmental priority is central in the theory. It postulates that the cognitive processes defining general cognitive ability change at successive periods of development. Action control, attention control and representational awareness, inductive reasoning and inferential awareness, and deductive reasoning and truth awareness dominate in infancy, preschool, primary school, and secondary school, respectively. These interact with conceptual domains, such as mathematics, language, space, and social relations, defining learning and problems solving. Neurodevelopmental disorders are also discussed. The book was a collective enterprise. In the symposium authors present chapters of the book. Andreas Demetriou outlines the theory and its general educational principles. Samuel Greiff focuses on implications for problem solving. Mari-Pauliina Vainikainen focuses on social and cultural context of learning as integrated in the theory. George Spanoudis focuses on using the theory for diagnosis and treatment of developmental disorders such as autism, ADHD, and dyslexia. Roger Saljo will provide an overall discussion of the theory and the symposium.

Sustainable learning in digital futures: ethics and values in data-driven educational practices

Keywords: Artificial Intelligence, Assessment Methods, Conceptual Change, Cultural Diversity in School, Educational Policy, Educational Technologies, Ethics, Higher Education, Learning Analytics, Morality and Moral Development, Qualitative Methods, Science and STEM, Teacher Professional Development, Tool Development
Interest group: SIG 04 - Higher Education, SIG 14 - Learning and Professional Development, SIG 27 - Online Measures of Learning Processes
Chairperson: Giulia Messina Dahlberg, University of Gothenburg, Sweden
Organiser: Ylva Lindberg, Jönköping University, Sweden
Organiser: Teresa Cerratto-Pargman, Stockholm University, Sweden
Discussant: Anders Buch, Denmark

This symposium brings together empirical and conceptual research on Education from different European regions and different epistemological perspectives about the relationship between data-production by digital systems and so-called data-driven educational practices. Digital data, as a sociotechnical constructed entity, ontologically bears moral values of what is legitimate in a particular context and for certain groups of users. The tension embedded in the theme “sustainable learning in digital futures” concerns how to make sense of the pedagogical value accorded to data and that this value is pluri-faceted and related to norms. In particular, this symposium explores the ethical problems that arise when learning is enmeshed in data generation processes wherein participants are not only active contributors but are also expected to be literate in how to interpret and use the data they produce to make informed decisions (Shibani, Knight & Buckingham Shum, 2022). The studies aim to spark the dialogue on the issues above in two ways: firstly, they trouble the epistemologies of “data” by considering data creation and its use in relation to “sustainable learning” that is, if technology is constantly learning and so are participants in data-driven educational practices, where is the boundary between who/what is learning, how, what, and why? How do we account for these shifts and create understandings of the learning of tomorrow? Secondly, they discuss how different imaginaries of sustainable learning in digital futures are inevitably linked to hierarchies of what counts as relevant knowledge, competences and skills to cope with current and future global challenges.

Visualizing data packets to reveal data infrastructures and data assets: The InfraReveal Tool
Presenting Author: Marie Utterberg Modén, Department of Applied IT, University of Gothenburg, Sweden; **Co-Author:**Svea Kiesewetter, University of Gothenburg, Sweden; **Co-Author:**Annika Bergviken-Rensfeldt, Department of Applied Information Technology, University of Gothenburg, Sweden, Sweden; **Co-Author:**Thomas Hillman, Department of Applied Information Technology, University of Gothenburg, Sweden, Sweden

As schools increasingly digitalize their work, they also generate immense data flows that build on student data. In line with this, student users turn into valued assets and valuable investment for the future revenue, apart from the evidenced commercial interests in data from infrastructural providers and third-party developers. With this study, we aim to increase the awareness of the production of data and data flows by revealing the data infrastructures and values at stake for schools and teachers as data and student users become assets. Our work is based on a participatory design project which involved secondary school teachers. By using data packet tracing techniques, we developed the InfraReveal tool, that visualizes the otherwise hidden and opaque data packet traffic exchanged across the world when individuals access the internet. Our results show how teachers respond to visualizations of data packet tracing and what data tracing tools can reveal about data infrastructures and data assets. This paper contributes to the symposium through its focus on value issues at stake arising in the relationship between school data generation, data-driven practices, and the value of data for different parties.

Ethics of AI-driven automated systems for assessment
Presenting Author: Alexandra Farazouli, Stockholm University, Sweden

Applications of Artificial Intelligence in Education (AIED) promise to facilitate student learning and take the burden from university teachers’ workloads. In particular, AI-driven automated systems for assessment in education are often presented as enriching and advancing assessment procedures supporting teachers and administration staff. Notwithstanding the potential benefits that such systems could bring to educational contexts, several ethical concerns remain regarding; their accuracy in predicting grades, the pedagogical choices made by the end-users when engaging with these systems, and their influence on teachers’ decision-making. This conceptual paper focusing on automation in assessment aims to highlight the multifaceted nature of AI-powered automated grading systems (AGS) in education and discuss their ethical considerations for sustainable future learning environments. Such considerations are central to contributing to sociotechnical imaginaries of automation in education that are grounded in the realities of teachers’ and students’ everyday practices.

Focusing Bias Analyses: Responsible Learning Analytics in the Context of STEM Identity Development
Presenting Author: Adrian Grimm, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Anneke Steegh, IPN-Leibniz Institute for Science and Mathematics Education, Olshausenstraße 62, D-24118 Kiel, Germany, Germany; **Co-Author:**Marcus Kubsch, IPN-Leibniz Institute for Science and Mathematics Education, Olshausenstraße 62, D-24118 Kiel, Germany, Germany; **Co-Author:**Knut Neumann, IPN-Leibniz Institute for Science and Mathematics Education, Olshausenstraße 62, D-24118 Kiel, Germany, Germany

Navigating 21st century challenges requires competent science, technology, engineering and mathematics (STEM) professionals. A contemporary approach to support students in their STEM competence development are learning analytics. Learning analytics are mainly discussed in the context of STEM competence development. However, we propose to discuss learning analytics in the context of STEM identity development. Students who develop stronger STEM identities are more likely to have STEM career aspirations and persistence – and eventually become STEM professionals. At the same time, STEM identity development differs across different groups of students as the students bring diverse experiences and backgrounds to schools. STEM identity development opens up new perspectives on how bias analyses of learning analytics systems need to be performed and which analyses to focus on. Through selected examples from a STEM education project in secondary schools in Germany, we show the implications a STEM identity development perspective has for bias analyses in learning analytics. Ultimately, we aim at enabling all students to develop STEM identities.

CANCELLED: Data-imaginaries Tacit Ethics in AI-Research (...)
Presenting Author: Joakim Juhl, TU Munich, Germany

This presentation has been cancelled and will not be presented at EARLI 2023.
This paper investigates the political space for higher education and what kind of futures that are imagined for data-driven educational practices both by AI researchers and within the broader society. Data-driven practices have significantly increased over the past two decades and transpire into evermore areas each day. Corresponding policies attempt to both promote and harness this technological transformation while also guide, steer and govern its directions and impacts. By studying recent initiatives in AI research, data-oriented innovation and national tendencies in higher education, this paper will use the concept of sociotechnical imaginaries as a bi-directional kaleidoscope to illustrate how contemporary cultural formations collectively see future technological directions as basis for their reading of the past, and how collective values and ethics present themselves in envisioned moral practices and expertise hierarchies on datafication. The analysis will highlight the asymmetries between investments in ‘hard’ computer science to promote technological developments and impacts,

and the reduced attention to social sciences and humanities (SSH) as capable resources for guiding, steering and integrating potential impacts in socially desirable ways. By exploring how AI researchers express tacit ethics in their work, the paper will propose new potential inroads for SSH to aid and steer future direction of data-driven practices both in education and in broader society.

Assessment and Evaluation

What do we get if we measure teaching quality? Validity and stability of different approaches

Keywords: Assessment Methods, Classroom Assessment, Meta-analysis, Quantitative Methods, School Effectiveness, Teacher Effectiveness
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Sebastian Röhl, University of Tübingen, Germany
Organiser: Sebastian Röhl, University of Tübingen, Germany
Discussant: Mark WHite, University of Oslo, Norway

Good and effective teaching is expected to be associated with a high level of subject learning achievement but also of cross-curricular, motivational, and affective outcomes. For this purpose, teaching quality research focuses on learning-conducive characteristics of teaching, here understood as a social practice that is co-constructed around content by students and teachers. In this context, measurement of these learning-conducive characteristics is crucial.In the scientific literature, a variety of different dimensional frameworks of teaching quality can be found; some based on theoretical considerations, others on empirical findings. Based on the empirically founded framework of the three generic basic dimensions, the first paper uses observer ratings of current and 20-year-old teaching videos to analyze the stability of this dimensional framework and changes in teaching quality over this period.Furthermore, student surveys are often used to measure teaching quality. In a meta-analysis, the second paper investigates the correlation of student ratings with learning achievement in classes. Focusing on possible measurement bias, contribution three analyses response shifts in the case of multiple use of the same questionnaire with the same students.Finally, the last paper focuses on the very relevant question for practical school development, to what extent the ratings of teaching quality of school inspectors, students, and teachers differ and how far they are useful as a source of information for possible requirements for development.Summarizing, the findings are discussed regarding their significance for further teaching quality research.

Teaching quality: What has changed in the last twenty years?
Presenting Author: Wida Wemmer-Rogh, University of Zurich, Switzerland; **Co-Author:**Leonie Gossner, University of Zurich, Switzerland; **Co-Author:**Patrick Schreyer, University of Kassel, Germany; **Co-Author:**Urs W. Grob, University of Zurich, Switzerland; **Co-Author:**Eckhard Klieme, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Anna-Katharina Praetorius, University of Zurich, Switzerland

Classroom management, cognitive activation and student support are key dimensions of teaching quality. To investigate changes in teaching quality over time, classroom videos from two studies conducted over two decades apart, the TIMSS Video Study Germany 1995 and the TALIS Video Study Germany 2018, were empirically re-analyzed. Trained raters conducted new standardized evaluations of n=44 videos from each study (total N=88). Long-term changes in teaching quality are examined based on (a) analyzing measurement invariance between the two studies and (b) group comparisons of means of the teaching quality dimensions in cases when sufficient measurement invariance is given. For cognitive activation, which was modeled two-dimensionally, scalar measurement invariance was found between the two sub-samples making a meaningful interpretation of the latent mean differences possible. The factor representing the potential of cognitive activation is significantly higher in 2018 compared to 1995, while the factor covering the cognitive activity of the students shows no significant difference. Measurement invariance could not be demonstrated for the other two dimensions of teaching quality; therefore, mean comparisons were not possible in a meaningful way. The results provide insight into the changes of teaching processes in German classrooms between 1995 and 2018 and beg the question whether teaching quality can be considered a stable construct over this long timespan.

Effects of Student Ratings of Teaching Quality on Learning Achievement – A Meta-analysis
Presenting Author: Sebastian Röhl, University of Tubingen, Germany; **Co-Author:**Ann-Kathrin Jaekel, University of Tuebingen, Germany

In K-12 education, student ratings are an inexpensive, effective, and low-threshold way to capture teaching quality from the students' perspective. The validity and reliability of student ratings for assessing teaching quality along different quality dimensions has been demonstrated in previous research (Kuhfeld, 2017; Wagner et al., 2013). Additionally, several studies have shown the relevance of students' perceptions of their learning environment for learning different outcomes (e.g., Kane & Staiger, 2012; Wallace, Kelcey, & Ruzek, 2016). Nevertheless, the question of explicitly the ratings of students are associated with student achievement measures from a meta-perspective has not been addressed in recent research in detail. The present study therefore seeks to investigate in a meta-analysis how different dimensions of teaching quality, rated by students, are associated with their academic achievement. For the categorization, we used a comprehensive scheme which serves for the coding of the studies published since the year of 1980. Preliminary analysis points to a significant mean weighted effect of r = .188 between students' perceptions of teaching quality and learning achievement. In deepening moderator analyses, we found a significant higher effect for students' perception of content selection and presentation, whereas the level of analysis (e.g., student or class level) and the study design (longitudinal or cross-sectional) revealed no significant associations.

Changing Teaching or Changing Perspectives? Response Shifts in Student Ratings of Teaching Quality
Presenting Author: Jonathan Schweig, RAND Corporation, United States; **Presenting Author:**Jose Felipe Martinez, University of California, United States

Student ratings are often used to understand and monitor teaching quality and other important aspects of the classroom learning environment that have been positively linked to student learning outcomes. Policymakers and practitioners are often interested in monitoring change in climate quality from year to year (e.g., Klosterman et al. 2014). However, response shifts (changes in internal standards of measurement) can potentially compromise inferences about change over time. While this phenomenon has been studied widely in other fields, it has received relatively little attention in educational research. Utilizing data collected as a part of a large-scale study in Nigeria, we analyzed survey responses from 160 primary school classrooms. We found evidence that students recalibrate their use of survey scales across administrations, suggesting that their internal standards of measurement may also change over time. We show how accounting for this recalibration can alter inferences about true changes in teaching quality over time and discuss the implications for the use of indicators derived from student surveys for teacher formative and summative evaluation.

Teaching Quality in Dutch Schools from the Perspectives of School Inspectors, Students, and Teachers
Presenting Author: Hannah Bijlsma, University of Twente, Netherlands; **Co-Author:**Adrie Visscher, Univ. of Twente, Netherlands; **Co-Author:**Cees Glas, University of Twente, Netherlands

Because teaching quality (TQ) is the most important, malleable factor that impacts student achievement, it is important for the Dutch Inspectorate of Education to monitor the quality of teaching in Dutch secondary schools. In a collaborative project between the University of Twente and the Inspectorate, the inspector, teacher and student perspectives of TQ were measured in 946 lessons. We analysed the three perspectives using an IRT and GT modelling approach to indicate whether the three perspectives differ in ratings and item difficulty. We also conducted deepening analyses to investigate to what extent potentially related factors at the classroom, teacher and school levels are associated with the inspector ratings of teaching quality. In our presentation, we will discuss the implications of the differences between the ratings of the three rater types and how findings can be used in research and in the practice of schools and school inspectors.

Symposium
Higher Education

Factors supporting successful transition from higher education to working life

Keywords: At-risk Students, Competencies, Curriculum Development, Higher Education, Mentoring and Coaching, Metacognition, Qualitative Methods, Quantitative Methods, Self-efficacy, Social Interaction
Interest group: SIG 04 - Higher Education
Chairperson: Heidi Hyytinen, University of Helsinki, Finland
Discussant: Maaike Endedijk, University of Twente, Netherlands

Transition to working life can be challenging for many graduates because academic degree as such does not necessarily guarantee success in working life. This symposium with four studies utilizing various methods advocates better understanding how higher education can better support students' transition to working life, and what kind of factors contribute to early career success. First longitudinal study explores employability factors and their association with this transition and with early career success. Second study investigates how well different study programmes prepare students to learn various generic skills. Third study analyses how graduates perceive coaching practices in higher education and how coaching prepares them to make a successful transition, while fourth study concentrates on the role of networks in the phase of transition. The present symposium provides new knowledge about key employability factors and how higher education institutions can better support graduates' transition to working life.

Transition to working life - which employability factors contribute graduates' early career success?
Presenting Author: Tarja Tuononen, University of Helsinki, Finland; **Co-Author:**Heidi Hyytinen, University of Helsinki, Finland

The transition from university to working life is a challenging phase for graduates. The focus in the present longitudinal study is on employability factors and their association with this transition and with early career success. The participants were 43 graduates who were interviewed at the time of their graduation and filled in a follow-up questionnaire three years later. The data were analysed using qualitative content analysis. The results revealed five employability factors relating early career success: (1) career plans and goals, (2) perceived competences related to the degree, (3) self-efficacy beliefs, (4) activity and (5) work experience and networks. Three transition groups emerged based on the differences in employability factors and career success, which we labelled smooth transition, progressive transition and a rocky road. The results revealed individual variation in employability factors and in the kind of challenges these graduates encountered in the transition phase and in their early career. An awareness of the ways in which graduates differ could help educators to develop practises that better support students and graduates in the transition to working life. These findings highlight the importance of active career planning during one's studies.

Discipline-specific Profiles for Learning Opportunities of Generic Skills in Higher Education
Presenting Author: Katharina Lohberger, Justus Liebig University Giessen, Germany; **Co-Author:**Edith Braun, Justus-Liebig-University Giessen, Germany

The link between education and professional career is well known, especially generic skills are an central aim of higher education. But not much is known on how well different study programmes prepare students to gain generic skills, which are required on the labour market. To address this issue, we adapted a questionnaire, which was developed for graduates, in a students´ survey, asking for learning opportunities for generic skills. 6,982 students from different study programmes filled in the questionnaire. Cluster analyses revealed three different clusters of learning opportunities, with one cluster of providing good opportunities to gain diverse areas of generic skills, one cluster of less opportunities, and one cluster where especially physical work is fostered. Furthermore, the learning opportunities for generic skills differ between the fields of study. It shows that fields like humanities seem to have higher learning opportunities for generic skills. Our results provide an empirical basis for a discussion of which generic skills are supported in study programmes, which can be useful in the area of quality management of teaching and learning as well as for the accreditation and for evidence-based curriculum development.

How does coaching facilitate students' education-to-work transition?
Presenting Author: Niels van der Baan, Maastricht University School of Business and Economics, Netherlands; **Co-Author:**Simon Beausaert, Maastricht University, Netherlands; **Co-Author:**Wim Gijselaers, Maastricht University School of Business and Economics, Netherlands; **Co-Author:**Inken Gast, Maastricht University, Netherlands

The school-to-work transition challenges many graduates. More than half of the graduate employees leave their first job because they fail to adjust. It requires employability competences, such as lifelong learning skills, to adjust to the requirements of the workplace. To equip students with essential employability competences higher education institutes have introduced coaching as part of their teaching programs. However, it remains unclear whether this is effective from an educational perspective. The present study evaluates coaching practices in higher education, as perceived by recently graduated employees. We conducted semi-structured interviews with starting employees who participated in coaching activities in higher education (N= 16). We coded the interviews deductively and inductively and analysed them thematically. Preliminary results suggest that graduates were satisfied with the coaching they received in higher education, and they believed that coaching has prepared them for their school-to-work transition. We identified reflection as the main mechanism for developing employability competences. Graduates indicated that the coaching practice helped them to acquire reflection skills that helped them to continuously develop their employability competences at the workplace. The present study shows that the coaching practice in higher education prepares graduates for the workplace by creating a habit of reflection. These results add to the transition literature by demonstrating how graduates successfully adjust to the workplace. Results also provide insights into how higher education can best prepare students for their transition to the workplace.

Graduates navigating on the labour market: A social network perspective
Presenting Author: Ayla De Schepper, University of Antwerp, Belgium; **Co-Author:**Noel Clycq, University of Antwerp, Belgium; **Co-Author:**Eva Kyndt, Swinburne University of Technology, Australia

Young graduates are embarking on their careers in increasingly competitive and challenging settings. A successful transition to work is no longer just about educational advantage based on the quality of the degree. Specifically, gaining access to the 'right' resources and applying them strategically is crucial. This implies graduates need to understand the role of covert mechanisms and gain insight into which resources have a (signalling) value to create an advantage in a specific context. However, developing this 'feel for the game' in a new context and being able to identify valuable resources is challenging. To develop this 'feel for the game', graduates mainly rely on interactions with actors from their social network. As graduates with vulnerable socio-economic backgrounds generally have more limited networks with fewer resources, the transition could be increasingly precarious for them. To grasp these mechanisms and understand how graduates engage with them, our longitudinal interview-diary study (n = 36) focuses on the role of ego networks in influencing graduates' understanding of the labour market. More specifically, we examine the role of network resources, structure and composition in how graduates develop an understanding of what it takes to make a successful transition. The preliminary results show that graduates mostly rely on strong family ties during their first weeks on the labour market. During this period the resources that were shared most often were information about what career to pursue and how working life will be. Only a few graduates had professional contacts who could help with instrumental tasks.

Symposium
Motivational, Social and Affective Processes

Predictors and outcomes of heterogeneity in motivational development in early secondary school

Keywords: Achievement, Developmental Processes, Emotion and Affect, Instructional Design, Mathematics/Numeracy, Motivation, Reading, Secondary Education, Self-concept
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Wendy Symes, University of Potsdam, Germany
Chairperson: Rebecca Lazarides, University of Potsdam, Germany
Discussant: Barbara Flunger, Utrecht University, Netherlands

Research examining the development of motivation across a range of academic subjects has typically adopted a variable-centred approach. Whilst this approach has been useful for identifying factors which may influence, or be influenced by, motivation, they are limited in that they assume all students follow a similar developmental trajectory. Adopting an expectancy-value perspective, the four papers included in this symposium seek to examine ways in which developmental trajectories of self-expectancy and value differ between groups of students, and to identify predictors and outcomes of this heterogeneity. The studies presented in this symposium cover a range of subjects (e.g. Maths and Reading), school years (grades 5 to 10), predictors (e.g. gender, instructional design) and outcomes (e.g. competence, wellbeing), yet all of them provide evidence of heterogeneity in motivational development. Three of the studies adopt person-centred approaches (e.g. latent transition analysis) to identify groups of students who differ in their motivational trajectories in one academic subject over time, whilst the fourth uses structural equation models to examine how the development of motivation in two academic subjects simultaneously changes as a function of age. Taken together, these studies highlight ways in which different combinations of expectancy and value can differentially develop and influence student outcomes. The findings from these papers could be used by schools and teachers to identify students who are most at-risk of lower or declining motivation, and poorer outcomes, allowing them to direct their resources to support their most vulnerable students more effectively.

Comparison Effects of Students' Achievements on Self-Concepts and Task Values in Secondary School
Presenting Author: Hanna Gaspard, TU Dortmund University, Germany; **Co-Author:**Ann-Kathrin Jaekel, University of Tuebingen, Germany; **Co-Author:**Richard Goellner, University of Tuebingen, Germany

Drawing on the internal/external frame of reference model (Marsh, 1986), prior research has found that students' self-concepts and task values are informed through an external frame of reference in which students compare their achievements socially (i.e., with those of their peers) and an internal frame of reference in which students compare their own achievements dimensionally (i.e., across domains). Although prior research has pointed towards stronger comparison effects for older students, more systematic research is missing to test such comparison effects for students' self-concepts and task values. The present study therefore aimed to examine the extent to which social and dimensional comparison effects on students' self-concepts and task values in math and students' native language varied depending on students' grade level. Students' achievements, self-concepts, and task values in math and German language arts were assessed in a German sample of 6,479 students in Grades 5 through 10 out of different school types. Structural equation models provided evidence for social and dimensional comparison effects of students' grades and tests scores on self-concepts and task values across grade levels. Moreover, both social and dimensional comparisons were more pronounced for students in higher grade levels. This increasing use of social and dimensional comparisons can help to explain the processes underlying the development of students' self-concepts and task values.

Stability and Change in Students' Motivation Profiles: The Role of the Instructional Design
Presenting Author: Tanja Held, University of Bern, Switzerland; **Co-Author:**Julia Morinaj, University of Bern, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland

Student motivation can be considered as a manifold phenomenon to which different motivational characteristics contribute. Existing research has shown that different motivational profiles can be identified and that these profiles may change over time. According to the expectancy-value theory, students expectancies and values play an important role for student motivation. Thus, the first research question of our study was to examine students' motivation profiles based on the expectancies and values in lower secondary education. Second, we investigated how these motivation profiles change during Grades 7, 8, and 9. Third, we included characteristics of the instructional design (perceived autonomy support, competence support, instructional style, error culture) to investigate how they influence the changes between motivation profiles. Using Latent Profile Analysis (LPA), motivation profiles of 605 lower secondary school students were recorded based on their reported expectation of success, utility value, attainment value, intrinsic value, and cost. Subsequently, the transition probabilities between the profiles were estimated using Random Intercept Latent Transition Analysis (RI-LTA). Finally, the factors of the instructional design were included in the RI-LTA. Results revealed three motivation profiles: a 'low value, high cost profile', a 'high value, low cost profile', and an 'average and low utility profile'. RI-LTA revealed a high stability of profile membership over time. However, the instructional design predicted changes in profile membership. These results may help to identify and address students who might be at risk for a motivational decline and point to the role of the instruction for students' motivation development.

Motivational Profiles in Mathematics - Stability and Links with Educational and Emotional outcomes
Presenting Author: Anna Widlund, Åbo Akademi University, Finland; **Co-Author:**Heta Tuominen, University of Eastern Finland, Finland; **Co-Author:**Johan Korhonen, Åbo Akademi University, Finland

Grounding on expectancy-value theory, this study investigated change and stability in adolescent students' (N = 508) motivational profiles in mathematics during the last year of comprehensive education, and how these relate to relevant educational outcomes (mathematics performance and aspirations) and students' well-being (study-related exhaustion and general depressive symptoms). Latent profile and transition analysis revealed four motivational profiles among students: *Positively motivated* (high expectancy and value beliefs, low costs), *Struggling ambitious* (high expectancy and value beliefs, high costs), *Indifferent* (low expectancy and value beliefs, low costs), and *Maladaptive* (low expectancy and value beliefs, high costs). Although some fluctuations were detected in profile memberships within the school year, the majority of the students (80%) displayed stable mathematics motivation across 9th grade. Students who remained *Positively motivated* also performed well, aspired for an education that required high mathematical skills, and experienced the least problems with their well-being (study-related exhaustion, depressive symptoms), whereas students in the most negative motivational profile (*Maladaptive*) showed the opposite patterns. However, interestingly, students who experienced high math-related costs, despite having positive value beliefs, performance and aspirations (i.e., *Struggling ambitious*), also experienced one of the highest levels of study-related exhaustion and depressive symptoms. Elevated levels of exhaustion and depressive symptoms were also associated with negative motivational transitions in general (i.e., moving from *Positively motivated* to *Struggling ambitious*, or from *Indifferent* to *Maladaptive*), highlighting the importance of supporting students' well-being and reducing perceived study-related costs in schools as well.

Interindividual differences in the development of reading self-concept and value in secondary school
Presenting Author: Wendy Symes, University of Potsdam, Germany; **Co-Author:**Rebecca Lazarides, University of Potsdam, Germany; **Co-Author:**Jan Retelsdorf, University of Hamburg, Germany

Adopting a situated expectancy-value theory perspective (SEVT), this study examined interindividual differences in intraindividual development of reading self-concept and values throughout early secondary school, and associated predictors and outcomes. Reading self-concept, intrinsic value and importance value, and reading competence data was collected from 1507 (49% girls) German secondary school students throughout grades 5, 6 8 and 9. Growth mixture modelling indicated there were four heterogeneous developmental trajectories: *Trajectory 1*: Low but increasing values, low and stable self-concept; *Trajectory 2*: Moderate and declining importance value, low and stable self-concept and intrinsic value; *Trajectory 3*: High and declining values, moderate and stable self-concept; and *Trajectory 4*: High and declining self-concept and values. Students following *Trajectory 4* were more likely to be female than students following *Trajectory 1 or Trajectory 3*, and were more likely to be of higher SES than students following any of the other three trajectories. Students following Trajectory 4 also attained the highest reading competence scores in grade 9, although their scores were significantly higher than students following Trajectory 2 only. Findings provide support for SEVT, especially in relation to the impact of socialisation on interindividual differences in intraindividual development. However, they also suggest that both the level of expectancy and value beliefs, as well as the developmental trajectory followed, are related to performance.

Symposium
Learning and Instructional Technology

How to design effective educational video?

Keywords: Comprehension of Text and Graphics, Computer-assisted Learning, Eye Tracking, Instructional Design, Multimedia Learning, Video-based Learning
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Kevin Ackermans, Netherlands
Organiser: Kevin Ackermans, Netherlands
Discussant: Mireille Bétrancourt, University of Geneva, Switzerland

The forced large-scale implementation of Emergency Remote Teaching during the COVID pandemic has uncovered how little we know about designing effective educational video. This symposium focuses on the design of educational video, contributing to the questions of these uncertain times. Should you use emotional design, talking head, subtitles or prompts or in your educational video? The first paper by Endres et. al. dives into the world of emotional design of educational video. The authors investigate the narrative frame and its effects on different phases of learning. The second paper by Sonderman et.al. tackles a question asked by many teachers; are my students distracted by my talking head on video? The authors investigate the effects of instructor presence in educational videos on knowledge and picture recognition task performance. The third paper by Pannatier et. al. explores learning from video content in a second language. A topic of exceptional relevance in the turmoil of today's world. The authors investigate if language proficiency matters more than captions or subtitles. The final paper by Krebs et. al. focusses on the question if prompts can help teachers implement educational video to scaffold learning.

A narrative frame is essential in emotional design:The role of value in evoking situational interest
Presenting Author: Tino Endres, University of Freiburg, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany; **Co-Author:**Alexander Renkl, Universität Freiburg, Germany

Instructional videos in the internet that are emotionally designed frequently begin with a narrative frame highlighting the value of the to-be-learned content. We asked whether the (non-)use of such a frame can partly explain the mixed effects in emotional-design research. We analyzed the effects of emotional design and a value-related narrative frame on learning outcomes using a between-subjects design (N = 128). We expected emotional design with the narrative frame to increase learning especial-ly at the later phases of learning. Therefore, we implemented a repeated measures factor on learning outcome (three video sections). We found a three-way interaction of video format, narrative frame, and video sections with respect to learning outcomes. The narrative frame was essential for that in-crease in learning. Without the narrative frame, emotional design hampered learning.

Distracted by a Talking Head? Effects of Instructor Presence in Educational Videos
Presenting Author: Christina Sondermann, German Institute for Adult Education, Germany; **Co-Author:**Markus Huff, Eberhard Karls Universität Tübingen, Germany; **Co-Author:**Martin Merkt, Deutsches Institut für Erwachsenenbildung, Germany

Should the instructor in educational videos be visible in addition to the actual learning content? Theory and prior research indicate both potential advantages (e.g., deeper processing) and disadvantages (e.g., distraction) of instructor presence in learning videos. Therefore, we conducted an eye tracking experiment in which N = 96 participants watched eight short videos with narrated slides on different topics while their eye movements were recorded. Using a within-subjects design, we varied whether a talking head (TH) was present next to the learning content or not. We aimed to investigate how the TH affects knowledge test performance (recall), picture recognition task performance, video ratings (e.g., satisfaction), and visual attention (fixation duration of the learning content). Preliminary analyses revealed no effect of the TH on knowledge test performance and picture recognition task performance. Pending analyses of the eye tracking data will examine whether the influence of the TH on learning measures is moderated by visual attention on the learning content. Potential explanations for the findings and possible implications of the pending analyses are discussed.

Learning from video with captions vs. subtitles: when second language proficiency matters
Presenting Author: Maria Pannatier, University of Geneva, Switzerland; **Co-Author:**Mireille Bétrancourt, University of Geneva, Switzerland

Learning from expository video content in a second language (L2) has become a commonplace practice in internet-delivered blended and distance learning courses. A typical format is the video recording of live lectures or conferences. In order to help the multilingual audience overcome video comprehension barriers, a concurrent onscreen text transcript of the audio narration can be provided. However, no consensus has been achieved so far in multimedia research regarding the effects of the transcript. Moreover, research on whether these effects are dependent on the language of the transcript, or the learner's L2 proficiency level is scarce. This study aims to explore if the language of the transcript and the learner's L2 proficiency level affect their learning outcomes, cognitive load, and situational interest. 131 French-speaking students were recruited for an online study. They were assessed for L2 proficiency and allocated to elementary, intermediate, and advanced levels. Then they studied a video-recorded conference in three conditions: with captions (in English, same as audio), with subtitles (French translation), or no transcript. No main effect of the transcript condition was found on performance, cognitive load, or interest, nor any interaction between the transcript condition and L2 proficiency. However, there was a main effect of language proficiency on inference and transfer outcomes, as well as on extraneous cognitive load and maintained situational interest, which confirmed the leading role of L2 proficiency level not only for L2 learning with video but in the context of video content learning in L2.

Let me think about it for a moment: Do prompts support learning with explainer videos?
Presenting Author: Marie-Christin Krebs, University of Giessen, Germany; **Co-Author:**Katharina Braschoß, University of Giessen, Germany; **Co-Author:**danielle pelzer, University of Giessen, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany

We investigate in two experiments whether and when explainer videos foster subsequent learning from lecture materials. In Experiment 1 (N=137), students watched an explainer-video (vs. read the respective video-script), then received prompts (vs. not), and then studied from textbook lecture materials. We found explainer videos to support subsequent learning from textbook compared to reading the video script first, especially when students also received prompts after watching the explainer videos. Results from Experiment 1 thus suggest that explainer videos best scaffold subsequent learning when the risk of superficial processing is reduced by prompts. Experiment 2 (planned N = 128) seeks to replicate and potentially extent this result to subsequent learning from lecture video, where less scaffolding might be needed compared to the textbook. Students will watch an explainer-video (vs. read the respective video-script), receive prompts, and then watch a lecture video (vs. read the textbook). Again, we expect explainer video with prompts to best scaffold subsequent learning, albeit to a lesser degree when subsequently learning from a lecture videos. Results of Experiment 2 will be presented at the conference.

Learning and Social Interaction

Creating Supportive Learning Settings for Refugee and Migrant Students

Keywords: Bilingual Education, Cooperative/Collaborative Learning, Cultural Diversity in School, Migrant / Refugee and Minority students, Multicultural Education, Qualitative Methods, Social Development, Well-being
Interest group: SIG 05 - Learning and Development in Early Childhood, SIG 21 - Learning and Teaching in Culturally Diverse Settings
Chairperson: Emilia Andersson-Bakken, Norway

The challenges of using co-creation in schools: The case of the Empowering Young Translators Club
Keywords: Bilingual Education, Cultural Diversity in School, Migrant / Refugee and Minority students, Qualitative Methods
Presenting Author: Sarah Crafter, The Open University, United Kingdom; **Co-Author:**Guida de Abreu, Oxford Brookes University, United Kingdom; **Co-Author:**Nelli Stavropoulou, The Open University, United Kingdom; **Co-Author:**Eleni Stamou, Oxford Brookes University, United Kingdom

This presentation focuses on some of the affordances and challenges of using co-creation and participatory approaches for a school-based intervention aimed at child language brokers. Child language brokers are children and young people who translate and interpret for family members and peers. School is one of the most frequent and important sites where the practice of language takes place (Angelelli, 2016). Sometimes the role of language brokers within school is formalized but in many instances, young people undertake this role on an ad hoc basis in ways that can be both advantageous and burdensome (Crafter et al. 2017). Existing programmes to support young translators in schools mainly focus on pragmatic language skills or buddying systems but pay less attention to the cultural, social and emotional wellbeing elements. Our pilot action involved the development of an after-school club known as the 'Empowering Young Translators' club which took place in a secondary school in a culturally diverse and social deprived neighbourhood in England. The club took place across one academic year (Oct 2021 – July 2022) and involved young people aged between 11-14 years old. Based on detailed fieldnotes, recordings of dialogue with the young people and teaching staff, audio-visual material and semi-structured interviews, we discuss two particular barriers to co-creation 1) the tensions between educational cultural practices embedded in the school institution (e.g. behaviour management) and the young people's burgeoning co-creation empowerment and 2) the impact of age on young people's and the research team's expectations and aspirations for co-creation.

Helping Italian school teachers design multilingual activities through a co-participative approach
Keywords: Bilingual Education, Cooperative/Collaborative Learning, Migrant / Refugee and Minority students, Multicultural Education
Presenting Author: Paolo Della Putta, University of Turin, Italy; **Co-Author:**Cecilia Andorno, Università di Torino, Italy; **Co-Author:**Rosa Pugliese, Alma Mater Studiorum Università di Bologna, Italy; **Co-Author:**Silvia Sordella, Università di Torino, Italy; **Co-Author:**Greta Zanoni, University of Bologna, Italy

This presentation focuses on a co-creative intervention (pilot action) using participatory approaches with teachers to enhance pluralistic approaches to multilingualism with migrant children in two Italian schools. In Italy the educational system has become increasingly multilingual; nevertheless, teachers' education and training have rarely taken into account multilingualism and multilingual competences as a base in school activities and curricula, and top-down training approaches proved to be ineffective in changing teachers' practices and beliefs in respect to pupils' multilingual repertoires. We focus here on an intervention (known as a pilot action) called '*Teacher Training and Family Involvement in Pluralistic Approaches to Language Educatioh*(TTPA), whose aim is to create conditions and activities so that multilingual skills are valued as a resource and an opportunity in the school curriculum. TTPA takes place in two schools of Turin and Forlì, two superdiverse educational contexts. The TTPA follows a co-creative planning model that has three phase 1) an the analysis of the context (questionnaires, interviews); 2) the co-creation and implementation of classroom activities led by the teachers which were observed by the research team and 3) an evaluation of the pilot action (focus groups). In this presentation we place the emphasis on the participatory process of TTPA that has proven helpful in reaching positive teacher training results. Moreover, we also critically discuss teachers' and parents' concerns and some teaching challenges encountered during the co-participative process.

Co-construction in learning settings: Unaccompanied migrant youth of 'errant' mobility
Keywords: Cooperative/Collaborative Learning, Migrant / Refugee and Minority students, Qualitative Methods, Well-being
Presenting Author: Charlotte Menin, COMBO, France

This presentation focuses on a co-creative and multi-modal intervention (known as a pilot action) that aims at reconnecting unaccompanied minors of errant mobility with education. The pilot action did this through initiation into participatory art practices that foster reflexivity, like photography, music and video-making, and through pedagogical activities that show the importance and the benefits of acquiring and sharing knowledge. This group, often hailing from the North African geographical area, is considered to be of 'errant mobilty' because they are characterized by a significant trans-European mobility, a process that leads to a nearly systematic distancing from education, which is a fundamental right of these young people, but which most of them cannot access. The pilot action took place across three workshops, each lasting approximately two weeks in the cities of Melilla, Marseille and Barcelona. The workshops involved groups of 11-14 unaccompanied 'errant' migrant young people who either lived on the street, in precarious housing (squat) or a sheltered minor's facility. Co-creative and multi-modal approaches involved activities such as music workshops, photography and other digital literacy methods. The findings detail the opportunities, challenges and barriers of setting up a pilot action with unaccompanied minors of errant mobility at both an institutional and local level. Negotiations with Local Ministries was complex and the notion of 'education' and 'school' a significant barrier to the young people's participation. In the presentation we will reflect on how the use of multi-modal methods helped to break with the top-down framework of formal education through artistic practices.

Spanish and English Proficiency of Latino Children of Immigrants to Predict Behavioral Adaptations
Keywords: Bilingual Education, Cultural Diversity in School, Multicultural Education, Social Development
Presenting Author:brian collins, Hunter College, City University of New York, United States; **Co-Author:**Claudio Toppelberg, Harvard University, United States

Given the large and growing population of Latino children of immigrants in U.S. schools, it is important to identify factors in early school years associated with their school success. Research has demonstrated the important role of children's dual language abilities in behavioral adaptation and academic success. This study investigates Spanish and English proficiencies of 228 Latino children of immigrants during the early school years. Analyses of longitudinal data from school records (K-6) and direct language assessments demonstrate Spanish and English proficiency significantly predict later academic behaviors. These findings have potential to inform educational practices and interventions that support behavioral well-being.

Students' collaboration dispositions across diverse online collaborative problem solving skills
Keywords: Attitudes and Beliefs, Competencies, Computer-supported Collaborative Learning, Problem Solving
Presenting Author:Päivi Häkkinen, University of Jyväskylä, Finland; **Co-Author:**Shupin Li, University of Jyväskylä, Finland; **Co-Author:**Johanna Pöysä-Tarhonen, University of Jyväskylä, Finland

Collaborative problem solving (CPS) has been considered as one of the vital 21st century skills. To be successful in CPS requires not only CPS skills but also positive attitudes towards collaboration (i.e., collaboration dispositions). However, the relationship between CPS skills and collaboration dispositions has not been studied much, especially among early adolescent students. The purpose of this study is to investigate the dimensions of students' collaboration dispositions and their relationship to assessed students' CPS skills. Data were collected from 214 Finnish sixth-grade students ($Mean_{age}$ = 12.44, SD_{age} = 0.32, female = 116, 54.21%) in 2019. Students' CPS skills were assessed based on the log file data collected from student pairs' participation in four tasks in a computer-based assessment environment. Collaboration dispositions were measured through a self-report questionnaire. Exploratory factor analysis was

applied to investigate the dimensions of students' collaboration dispositions. In addition, analysis of variance was utilised to examine the dimensions of students' collaboration dispositions across their diverse social and cognitive CPS skills. Three dimensions of students' collaboration dispositions were identified, namely negotiation, team leadership and cooperative mindset. Further, we found that the early adolescent students' CPS social skills, but not cognitive skills, were associated with their perceived collaboration dispositions. Based on our results, we argue that it is crucial to provide systematic and rigorous interventions and/or models to pay attention not only to integrating CPS skills with subject studies in schools, but also to make students aware of their collaboration dispositions.

Effects of Strategy Training & Advance Organizer in a Cooperative Online Format using Video Analysis
Keywords: Cooperative/Collaborative Learning, Higher Education, Learning Strategies, Peer Interaction
Presenting Author: Agnes Eckart, Justus-Liebig-University Giessen, Germany; **Co-Author:**Vanessa A. Völlinger, Justus-Liebig-Universität Giessen, Germany

Due to the high level of knowledge interdependence in the cooperative jigsaw method, learners rely on the explanatory skills of their group members and take a passive role in listening. We examined whether strategy training for asking questions and giving answers and an Advance Organizer (AO) could enhance students' knowledge acquisition in cooperative learning. A quasi-experimental 2x2 design (training vs. no training; AO vs. no AO) was conducted due to Covid-19 within three sessions: a pretest, a training session, and a posttest. Group work at the pretest and posttest was videotaped. A knowledge test was given at the end. No significant effects of training and AO on knowledge acquisition were found. However, there was a training effect on the number of questions asked and answers given. Those who asked more questions also performed better on the knowledge test. The initial results suggest that asking questions in cooperative online formats should be more encouraged.

A group concept mapping study on perceptions of synchronous distance education
Keywords: Computer-assisted Learning, Computer-supported Collaborative Learning, Educational Technologies, Teaching/Instructional Strategies
Presenting Author: Iwan Wopereis, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Synchronous education is an important constituent of educational programs at many distance teaching universities. This paper presents a group concept mapping study (GCM) that identifies critical features of this constituent as perceived by students and teachers. The GCM data collection consisted of the generation, sorting, and rating of these features. Rating aimed at importance and feasibility. Data analysis included multidimensional scaling (MDS), hierarchical cluster analysis (HCA), and semantic analyses. Students and teachers of a DTU in Western Europe generated a 4-cluster concept map that distinguished features related to complex (group) learning, openness (inclusion), connectedness (community/enculturation), and modality (synchronous online, onsite and/or hybrid). Interestingly, the latter cluster of features was considered the least important implying that this is relatively easy to achieve in times of abundance of educational technology. Of greater importance was good instructional design where attention is paid to learning in interaction and in which every student can participate equally. Openness is an important aspect of good teaching at DTUs, and it is fortunate that the results of this GCM study support this premise.

Uncertainty Markers as Cues to Form Group Uncertainty Awareness in Online Discussions
Keywords: Computer-supported Collaborative Learning, Peer Interaction, Quantitative Methods, Social Media
Presenting Author: Lenka Schnaubert, University of Nottingham, United Kingdom; **Presenting Author:**Anna Radtke, Ruhr-University Bochum & CAIS, Germany

With the ubiquity of social learning technologies, cognitive and social functions blend when learners discuss academic topics with known or unknown peers in social media. To purposefully interact with learning partners, learners need group awareness, i.e., the salient perception of relevant aspects of learning partners or a group. However, little is known about how learners form group awareness during collaboration, what cues they use, and how they process social information. In our within-subject design study (N = 233), we varied the integration of linguistic uncertainty markers in forum discussions and measure the impact on group uncertainty awareness. To account for sequence effects, we additionally varied if learners received material with or without markers. Results show that uncertainty markers have a highly significant and positive effect on perceived group uncertainty. Another interesting effect we found was that the sequence in which markers were presented seems to play a role in the sense that learners seem to perceive the contrast between material with and without uncertainty markers more strongly when being confronted with markers first. We can thus conclude that learners are sensible towards uncertainty markers and use them as cues to form group uncertainty awareness. Additionally, the sequence effect indicates that group awareness is not only rooted within the acute social situation, but needs to be contextualized within a longer learning episode.

Effects of stimulated reflection on collaboration in an agent-based medical simulation
Keywords: Computer-supported Collaborative Learning, Higher Education, Reasoning, Simulation-based Learning
Presenting Author: Constanze Richters, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Laura Brandl, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Matthias Stadler, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Martin Fischer, LMU University Hospital, Institute of Medical Education, Germany; **Co-Author:**Ralf Schmidmaier, LMU University Hospital Munich, Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

Collaborative diagnostic reasoning (CDR) is relevant to many professional practices. CDR involves high complex and demanding collaborative diagnostic activities (CDAs). Recent meta-analytic and experimental evidence suggests that structured reflection phases as a form of scaffolding in simulations are particularly effective in fostering such complex skills for learners with high prior knowledge due to relatively low external guidance. However, an open research question is whether a higher degree of structure of reflection can benefit learners with low prior knowledge. This study investigatesthe effects of low- and high-structured reflection addressing CDAs on CDR, considering prior knowledge in an agent-based medical simulation. Intermediate medical students (N = 195) diagnosed diseases of fictitious patients in collaboration with an agent-based radiologist. While collaboratively diagnosing, students randomly either received low-structured or high-structured scaffolding with questions, stimulating them to reflect on CDAs, or no additional support. Contrary to previous assumptions, the results showed that learners with low rather than high prior knowledge benefited from both forms of structured reflection. Low prior knowledge learners improved their CDR by reflecting on CDAs, suggesting that both forms offered sufficient guidance for these learners while they were probably redundant for more advanced learners. These findings can help to adapt reflection guidance to learners' knowledge on collaboration. This study contributes to research the moderating role of prior knowledge on the effects of reflection on the learning of complex skills. It further highlights that reflection on collaboration may be different from reflection on individual (diagnostic) reasoning and problem solving.

Effects of a collaboration script and a reflection prompt on the evaluation of Internet sources.
Keywords: Competencies, Computer-supported Collaborative Learning, Higher Education, Reading
Presenting Author: Carolin Baumgarten, Ruhr-Universität Bochum, Germany; **Co-Author:**Heiko Krabbe, Ruhr-University Bochum, Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany; **Co-Author:**Marc Stadtler, Ruhr-University Bochum, Institute of Educational Science, Germany

When using Internet sources for informational or learning purposes, Internet users must assess the reliability of the sources used. However, since this is often difficult for them, the promotion of source evaluation skills is of great relevance. The present study was conducted in a 2x2 between-subjects-design, testing the effects of a collaboration script and a reflection prompt on the evaluation of Internet sources in a computer-based, dyadic learning setting. We expected positive effects of the collaboration script on the frequency of source evaluations in dyads' interactions, knowledge of source evaluation strategies, assessment of website reliability and self-efficacy regarding source evaluation. These effects should be particularly pronounced when the script would be accompanied by a reflection prompt that helps the internalization of the script. To test these hypotheses, *N*=118 young adults worked together in dyads on two different research tasks that involved assessing the reliability of websites. As expected, the results show more frequent source evaluations in dyads from the script condition, especially in interaction with the reflection prompt. Participants in the script condition also recalled more strategies for source evaluation than their counterparts. Here, however, the reflection prompt had no influence. Regarding the assessment of website reliability, contrary to the hypotheses, no condition-dependent differences emerged. Self-efficacy regarding source evaluations increased across all conditions from pre- to posttest. The results indicate that further research should test longer phases working with a collaboration script to ensure script internalization and larger effects on source evaluation.

Analysing educational dialogue around shared artefacts in technology-mediated contexts
Keywords: Computer-supported Collaborative Learning, Dialogic Pedagogy, Educational Technologies, Inquiry Learning
Presenting Author: Sara Hennessy, University of Cambridge, United Kingdom

This presentation explores the role that digital technology can play in mediating dialogue that is productive for learning as learners, or teachers and learners, together construct and manipulate digitally represented knowledge artefacts. It considers the methods that researchers and teachers can use to understand the learning taking place in technology-supported settings where verbal and nonverbal interactions with technology are inter-connected and entangled with activities and material learning resources. These interactions can support rich new forms of dialogue that highlight differences between participants' perspectives and make ideas and reasoning processes more explicit. The talk presents a 13-category coding scheme that can be applied at different levels of granularity (including turns and episodes) and to dialogue that may or may not have a verbal element. Application is illustrated with examples of dialogic interaction across diverse technology uses by both school-age and adult learners located in classrooms or remotely. The talk discusses the methodological issues around capturing dynamic multimodal dialogue as it unfolds in real time.

A Framework for Success of Virtual and Hybrid Collaboration: A Systematic Review
Keywords: Cooperative/Collaborative Learning, Pandemic, Peer Interaction, Social Interaction
Presenting Author: Ascha Ahmed, University of Mannheim, Germany; **Co-Author:**Viola Deutscher, University of Mannheim, Germany

Current studies indicate that workplace interactions will continue to be virtual or hybrid even after COVID-19. Given the weaknesses of such collaboration types, e.g. in knowledge sharing, trust building etc., there is a conceptual need for quality models of successful collaboration or team performance and empirical evidence on the factors for success. After systematically reviewing 448 studies, we propose an adaption or extension of existing quality models for successful collaboration/team performance in the virtual or hybrid workplace by including, among others, the leadership perspective, and the collaboration type, which have proven to be influential on the process and outcome of collaboration.

What is colored in and what is colored out? Democracy training in vocational programs
Keywords: Citizenship Education, Qualitative Methods, Secondary Education, Vocational Education and Apprenticeship Training
Presenting Author: Linda Ekström, Political science, school of social sciences, Sweden

In 2019, 48.4 % of the upper secondary pupils in the EU attended a vocational program. According to the ICCS results, these students have lower scores in civic capacities and are therefore in need of high-quality democracy training. In Sweden, however, the trend has been the opposite. These students receive few teaching hours in civics and meet a limited civics' syllabus. Further on, civics teachers in vocational program are also required to integrate theory and practice in their civics teaching; they are supposed to link the future work of their vocational students to the civics teaching. This instructional strategy is in Sweden referred to as a *coloring practice.* How does this instructional approach tend to strengthen or challenge the democracy training of these students? What is colored in and what is colored out in the strive to integrate theory and practice in civics teaching in vocational programs? Are certain themes more easily integrated in relation to the future work of these students while others are left behind? In this discourse analytical study, I have interviewed 16 civics teachers in vocational programs about their work with coloring practices. The results show that this instructional strategy tend to further increase an ongoing tendency to deprioritize democratic training within the vocational program. For example, while issues regarding private economy and the labor market are easily connected to the vocational students working context, issues such as human rights and democracy is neglected since they are difficult to connect to vocational students' future professions.

Rehearsing Teacher-in-Role: a Door Opener for Intercultural Learning and Democratic Citizenship?
Keywords: Citizenship Education, Foreign and Second Language Acquisition, Metacognition, Pre-service Teachers
Presenting Author: Michel Cabot, Western Norway University of Applied Sciences, Norway; **Co-Author:**Gunn Tone Iversen, Western University of Applied Sciences, Norway

Norway's latest curriculum points to a connection between intercultural learning and democratic citizenship. However, both internationally and nationally, there is little research on how democratic citizenship can be promoted through intercultural learning in primary school teacher education in English as a foreign language. This qualitative case study analyses student teachers' reflections on how process drama, more specifically teacher-in-role based on Roald Dahl's novel Matilda, can promote intercultural learning and democratic citizenship. It was conducted as part of the research project "Rehearsing Teaching Professionally", funded by the Norwegian Council of Research. It draws on McDonald et al.'s (2013) concept of rehearsing during four different phases on campus and in practice schools. The main research question is: how can student teachers use teacher-in-role based on Roald Dahl's novel Matilda to promote their own intercultural learning and democratic citizenship? This longitudinal study is based on video observations, obligatory assignments, video-stimulated recall interviews and term papers written by six student teachers throughout their first semester at a Norwegian teacher training college. To analyse the data, we integrated diverse definitions of intercultural competence (e.g, Deardorff, 2006) and Byram's (2008) "savoir" concepts into a new model. The findings suggest that well-planned "critical incidents" (e.g. Butterfield et al., 2005) may lead to intercultural learning (e.g. self-monitoring and decentering as internal outcome) and democratic citizenship (e.g. empathy as external outcome). This study emphasises the importance of rehearsing teacher-in-role as a method to strengthen intercultural learning and democratic citizenship and develop critical intercultural citizenship in EFL teacher education.

Economics as elective subject – How do students with the subject economics differ from others?
Keywords: Citizenship Education, Quantitative Methods, Secondary Education, Social Sciences and Humanities
Presenting Author: Lucy Haag, University of Tübingen, Germany; **Co-Author:**Luis Oberrauch, University Tuebingen, Germany

Facing globalized markets and rapidly changing economic landscapes, economic education becomes increasingly important to make well informed and

thoughtful decisions, for instance, regarding financial matters. However, teaching economics is also criticized. One reason for that is the possible influence of students towards a more egocentric, profit-maximizing attitude. Two different theories, self-selection and indoctrination, can be used to explain why economics students might behave differently than other individuals. The indoctrination hypothesis states that economics teaching encourages students to adjust their attitudes towards orthodox economic theory, whereas self-selection assumes that students possess certain traits already before studying economics.This article investigates whether a selection effect exists, whereby German students with different demographic characteristics, preferences, personality traits, or normative attitudes may self-select themselves into economics at the secondary school level. Our data shows that besides neuroticism as the only personality trait as well as gender and two out of four normative attitudes, no other variables show significant correlations. In conclusion, results do not meet expectations of economists being less altruistic, as no difference between students who select economists and other individuals is evident regarding preferences. Results contribute both to the scientific discussion. They also inform the current debate on the implementation of mandatory economic education in Germany and other countries.

Do I Need to Know the Unemployment Rate? Connecting Knowledge to Welfare Attitudes via Deservingness
Keywords: Attitudes and Beliefs, Citizenship Education, Misconceptions, Secondary Education
Presenting Author: Jakub Sowula, University of Teacher Education Berne, CH// University of Tuebingen, GER, Switzerland

Forming elaborate welfare attitudes is a crucial political task for democratic citizens, requiring key democratic competencies such as civic-mindedness and knowledge and critical understanding of one's political surroundings. Formal education ideally assists students in becoming democratically and politically competent citizens. However, there is a lack of theoretically founded empirical research aiming to find out what information could be beneficial for students in their processes of democratic competencies development. This study contributes to filling this gap by investigating Swiss secondary school students' (N=1061, 8th/9th-grade) unemployment-related knowledge and welfare attitudes via the welfare deservingness heuristic through an online survey. Deservingness describes the extent to which target groups are seen as worthy of receiving social welfare. It is a strong determinant of welfare attitudes, and previous research with adults showed that it is influenced by peoples' welfare-state-related misinformation. Deservingness research could thus help detect information educators can thematise in formal education. However, it is unclear if youth also rely on deservingness thinking in welfare attitude formation and whether (not) knowing specific information is related to their deservingness assessments. The study displays mixed results regarding the knowledge items. While the students are aware of some aspects (e.g., lower spending on unemployment than on other social policy areas), they strongly overestimate the unemployment and fraud rates. However, only the fraud rates are significantly related to their deservingness assessments. Moreover, students' deservingness assessments are strongly related to their welfare attitudes (e.g., benefit generosity). Implications of results and recommendations for educational practice and political education are discussed.

Conceptions of functional thinking of mathematics educators: an international interview study
Keywords: Attitudes and Beliefs, Mathematics/Numeracy, Qualitative Methods, Teacher Professional Development
Presenting Author: Kerstin Frey, Ludwigsburg University of Education, Germany; **Presenting Author:**Ute Sproesser, PH Ludwigsburg, Germany; **Co-Author:**Martina Geisen, University of Koblenz - Landau, Germany; **Co-Author:**Veronika Hubeňáková, Pavol Jozef Šafárik University in Košice, Slovakia; **Co-Author:**Monika Krišáková, Pavol Jozef Šafárik University in Košice, Slovakia; **Co-Author:**Nowińska Edyta, Universität Osnabrück, Germany; **Co-Author:**Marios Pittalis, University of Cyprus, Cyprus; **Co-Author:**Miroslawa Sajka, Pedagogical University of Krakow, Poland; **Co-Author:**Michiel Veldhuis, Hogeschool IPABO Amsterdam/Alkmaar, Netherlands

Functional thinking is a key element of mathematics education, but also plays an important role outside of the classroom in everyday life. It is for example required when relating two quantities like distance and time (extra-mathematical) or to describe the relationship between *x* and *y* in a given function (intra-mathematical). To deal with such relationships, mathematical prerequisites, like for example understanding variables and symbols, are also crucial for functional thinking. However, for the development of functional thinking, various curricula highlight the importance of using extra-mathematical contexts. Such different entailments of functional thinking and a variety of corresponding definitions might lead to different conceptions among mathematics educators which can result in different teaching practices and consequently in heterogeneous student learning. More concretely, for educators, the needed mathematical prerequisites might suggest an intra-mathematical focus in their teaching of functional thinking while omitting extra-mathematical contexts. In this study, 34 expert interviews were conducted in five European countries to collect mathematics educators' conceptions of functional thinking. The results were analyzed using qualitative content analysis. This paper focuses on these mathematics educators' conceptions of using functional thinking in intra- and extra-mathematical contexts and necessary mathematical prerequisites. In line with the literature, the results emphasize the importance of using extra-mathematical contexts for developing functional thinking but also the relevance of mathematical prerequisites. The findings suggest to address such mathematical prerequisites for functional thinking when dealing with extra-mathematical contexts. These results are intended to inform pre- and in-service teachers in order to support their students' functional thinking.

Examining the effect of a deep lecture notetaking intervention on mathematics deeper understanding
Keywords: Cognitive Skills and Processes, Learning Strategies, Mathematics/Numeracy, Self-regulated Learning and Behaviour
Presenting Author: Mengsi Liu, The University of Tokyo, Japan; **Co-Author:**Yuri Uesaka, The University of Tokyo, Japan

In this experiment, we examined whether the intervention on deep lecture notetaking, intentionally taking cognitive and metacognitive contents, fosters a deeper understanding in math class. The effectiveness of encouraging students to take notes directly on the textbook was also measured in terms of the cognitive load required for notetaking. High school students (N = 94) were randomly assigned to four groups. This experiment had a 2×2 factorial design with between-subject factors deep notetaking strategy (intervention or no intervention) and medium for notetaking (textbook versus notebook). A two-way ANOVA revealed a significant main effect (partial $\eta 2 = .10$) for the deep notetaking instruction, yet neither the medium nor interaction effects yielded significant results. This study verified that teaching students deep notetaking strategies improve a deeper understanding of math classes. The findings of this study may shed light on how to cultivate lecture notetaking strategies among students for enhanced learning in educational settings.

Early childhood education: Understanding mathematics teachers' diagnostic competence
Keywords: Early Childhood Education, Mathematics/Numeracy, Primary Education, Teacher Professional Development
Presenting Author: Maike Hagena, University of Hamburg, Germany; **Co-Author:**Michael Besser, Leuphana University of Lüneburg, Germany

School beginners have a variety of numerical skills, which are also referred to as early numerical competencies. These early numerical competencies are considered essential for the development of later mathematics competencies. Accordingly, to be able to support school beginners in their individual development processes from the very beginning, teachers must first obtain an overview of the early numerical competencies of school beginners. For this, teachers need diagnostic competence in the field of early numerical competencies. Therefore, evidence-based professional development supporting teachers in

building up such diagnostic competencies for the assessment of early numerical competencies of school beginners is necessary. Aiming at designing, implementing and evaluating such a professional development concept, a qualitative preliminary study was conducted. Within this study twelve primary school mathematics teachers were interviewed regarding their knowledge of early numerical competencies, of diagnostic instruments, and of supportive organizational structures for the successful implementation of diagnostics in the school entry phase. Results and implications of this study are reported below.

Mathematics teacher educators as a role model: What do preservice teachers learn about it?
Keywords: Pre-service Teachers, Primary Education, Qualitative Methods, Teaching Approaches
Presenting Author: Helena Montenegro, Universidad de Chile, Chile; **Co-Author:**Salomé Martínez, Universidad de Chile, Chile; **Co-Author:**Flavio Güíñez, Universidad de Chile, Chile

Mathematics teacher educators play a crucial role as models for preservice teachers: they impact the student teachers' perspectives of teaching mathematics through their teaching practices. Hence, researching this role as a model becomes crucial since it is a medium that can enhance mathematics teacher education. However, modeling effective teaching practices do not ensure that preservice teachers can learn and apply them in their own teaching. Therefore, it is fundamental to inquire about what preservice teachers learn and think when they are experiencing the process of learning to teach mathematics. Their insights, learning, and point of view are valuable information for improving and aligning teaching and learning processes inside teacher education programs. This study aims to understand the mathematics teacher educators' role models from the preservice teacher perspective. For that, we inquired what prospective teachers look at and scrutinize when the mathematics teacher educator is teaching about teaching. Data was collected through focus groups when participated forty-eight preservice teachers from seven Chilean primary school preservice teacher education programs, and the focus groups were analyzed using thematic analysis. Results showed that preservice teachers highlighted four main issues related to the mathematics teacher educators' role as models: (1) personal attributes expected from a teacher; (2) instructional practices carried out; (3) the experience of a congruent teaching approach; and (4) the teaching practices that they do not want to perform when they become teachers. These findings have implications for both practice and future research.

Assessing Conceptual Change around Reform-Based Math Practices in Ghanaian Pre-Service Teachers
Keywords: Attitudes and Beliefs, Conceptual Change, Pre-service Teachers, Teaching/Instructional Strategies
Presenting Author: Dionne Cross Francis, University of North Carolina at Chapel Hill, United States; **Co-Author:**Pavneet Kaur Bharaj, University of North Carolina, United States; **Co-Author:**Kathryn Habib, University of North Carolina at Chapel Hill, United States; **Co-Author:**Anna Hinden, University of North Carolina, United States; **Co-Author:**Anna Gustaveson, University of North Carolina at Chapel HIll, United States

Teachers' beliefs related to teaching and learning mathematics are highly connected to the practices they use in the classroom. We combined the beliefs-first and practice-first approach as we designed an 8-week secondary mathematics course for Ghanaian pre-service teachers. Employing both problem-solving practices and refutation texts allowed us to observe shifts in PSTs' opinions related to reform-oriented beliefs using the open-ended self-designed questionnaire. Findings suggest promise in using interventions that combine beliefs-first (refutation texts) and practice-first (reform-based learning experiences) approaches while working on PSTs' beliefs. The study also points out the importance of examining the cultural context of teacher beliefs and implications for future work on teacher development.

Exploring Classroom Goal Structures Based on Students' Own Words
Keywords: Goal Orientations, Mixed-method Research, Motivation, Peer Interaction
Presenting Author:József Balázs Fejes, University of Szeged, Hungary

Achievement goal theory research has identified a number of factors that can help to create a positive climate in terms of motivation. Research within this framework related to environmental factors has mainly focused on teachers' practices, usually from a deductive perspective. However, this appears to hinder a fuller understanding of all the factors that influence students' perceptions of the classroom goal structures. Therefore, using a combination of inductive and deductive approaches, a series of three studies were conducted to identify new elements in students' perceptions of the classroom goal structures in relation to mathematics. In Study 1 (n = 340, 5th–7th graders), a self-reporting Hungarian-language questionnaire was developed to measure classroom goal structures. In Study 2 (n = 250, 7th graders), this questionnaire was supplemented with open-ended questions about the classroom climate. Based on a qualitative analysis of these open-ended questions, new scales related to the social elements of the classroom (helping peers, recognition by peers, and image of the classroom community) were created in Study 3 (n = 438, 6th–8th graders) to explore their relationship to classroom goal structures. Factor analysis confirmed the expected structure, except for recognition by peers, which had to be divided into two factors, with the new construct known as teasing peers. Findings confirm the relevance of a combined, inductive–deductive approach in examining classroom goal structures.

Momentary Achievement Goal Profiles: Associations with Learning Activities, Interest, and Anxiety
Keywords: Goal Orientations, Motivation, Quantitative Methods, Science Education
Presenting Author: Junlin Yu, University of Helsinki, Finland; **Co-Author:**Jussi Järvinen, University of Helsinki, Finland; **Co-Author:**Veli-Matti Vesterinen, University of Helsinki, Finland; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

Although students' achievement goals are thought to be contextually sensitive, they are typically measured as stable individual orientations. In addition, students often pursue multiple goals simultaneously rather than one at a time. To capture the dynamic nature of achievement goal pursuit, this study combined momentary assessments and pattern-centered analyses to identify students' momentary achievement goal profiles. It also examined the role of learning activities (e.g., listening to lectures, group work) in predicting profile membership, and how these profiles were associated with interest and anxiety. A total of 1507 responses were collected from 140 upper secondary school students in science classes via experience sampling method. Latent class analyses revealed three momentary achievement goal profiles: Moderate Mastery Goals (25%), Moderate All Goals (48%), and High All Goals (27%). Group work predicted an increased likelihood of experiencing High All Goals. Moreover, the High All Goals profile was associated with higher situational interest than Moderate Mastery Goals and Moderate All Goals profiles. The findings underscore the importance of studying situational goal profiles in addition to stable goal orientations.

Investigating Cheating in the Lab: Effects of Performance Goals and Evaluation Focus
Keywords: Assessment Methods, Goal Orientations, Higher Education, Motivation
Presenting Author: Tanja Fritz, University of Augsburg, Germany; **Co-Author:**Hernán González Cruz, University of Mannheim, Germany; **Co-Author:**Stefan Janke, University of Mannheim, Germany; **Co-Author:**Martin Daumiller, University of Augsburg, Germany

Wanting to be perceived as competent is considered an important motivation for academic cheating behavior (Anderman & Koenka, 2017). However, while theoretically reasonable, performance goals frequently do not directly translate into cheating behavior (e.g., Daumiller & Janke, 2020; Krou et al., 2021), which could be due hitherto unexplored aspects of the performance task itself. We present a preregistered experiment on the moderating effect of the evaluation focus (result vs process) on the relationship between performance goals and cheating behavior (N = 238, number of semesters: M = 4.5, SD = 1.8, 67.0% female,

1.3% diverse). Participants worked on various tasks under four conditions (factor 1: performance goal induction vs no induction; factor 2: result v. process focused evaluation). Cheating behavior was measured as indicating having solved an actually unsolvable task, as well as observed behavior in the form of unauthorized aids (e.g., internet research). Performance goals had a significant main effect on observed cheating (25.5% in goal-induction groups vs 15.8% in no-goal-induction groups, p = .041, OR = 1.79), but were not significantly moderated by the evaluation focus. However, the evaluation focus showed a significant main effect in reporting having solved an unsolvable task (44.6% result-focus groups vs 31.6% process-focus groups, p = .017, OR = 1.78). An optimal task design, which is easier to influence than personal goals, could therefore be an effective lever to counteract cheating behavior. Based on our findings, we discuss strengths and weaknesses of the experimental design and methodological implementations in research on academic cheating.

Relationships Between Students' Achievement Goals and Social Network Centrality in the Classroom
Keywords: Motivation, Peer Interaction, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Alla Hemi, Bar Ilan University, Israel; **Co-Author:**Nir Madjar, Bar-Ilan University, Israel; **Co-Author:**Yisrael Rich, Bar Ilan University, Israel; **Co-Author:**Martin Daumiller, University of Augsburg, Germany

Achievement goals matter for important student outcomes, including their well-being, collaboration with peers and academic achievement. Theory and research also indicate that achievement goals are related to students' social context. Considering that interaction with peers is a key part of the everyday school context, peer relationships should also be relevant for students' achievement goals. Given the sparse research on this topic, we examined relationships between students' achievement goals and their role in social networks. Specifically, we hypothesized that mastery-approach goals are positively associated, and performance-avoidance goals are negatively associated with social network centrality in the classroom. Multilevel social network analyses of 472 high-school students (52% female; Mage = 15.71) from 23 classrooms revealed that mastery-approach goals were positively associated with outdegree, closeness and betweenness centrality measures, while a negative association emerged between performance-avoidance goals and indegree centrality. Interestingly, students' performance-avoidance goals were negatively associated only with indegree, while the correlation between performance-avoidance and outdegree was positive. It is possible that students with enhanced performance-avoidance goals might be trying to engage in more social interactions with their peers, but these attempts seem to be ineffective. These findings help illustrate the role of achievement goals for students' social positioning in the classroom, helping to inform interventions to support both adaptive achievement goals and central social positioning in the classroom.

Learning spurious associations from mathematics textbooks: A replication and extension study
Keywords: Instructional Design, Mathematics/Numeracy, Primary Education, Teaching/Instructional Strategies
Presenting Author: Lennart Schalk, PH Schwyz, Switzerland; **Co-Author:**Parvaneh Babari, Pädagogische Hochschule Schwyz, Switzerland; **Co-Author:**Bruno Rütsche, Schwyz University of Teacher Education, Switzerland

Understanding and doing algorithmic operations with rational numbers (e.g., fractions, decimals) is among the most important, but also the most difficult topics children encounter during primary school mathematics education. To explain the source of such difficulties, Braithwaite and Siegler (2018) provided evidence that children learn spurious, mathematically irrelevant associations between fraction arithmetic operations and operand features, which arise from the unbalanced and non-random distribution of the arithmetic tasks in mathematics textbooks. We replicated Braithwaite and Siegler's investigation on fraction arithmetic by analysing Swiss elementary school mathematics textbooks and testing 105 sixth graders. Moreover, we extended their study by including decimal arithmetic, too. We observed that Swiss mathematics textbooks also show unbalanced distributions of arithmetic tasks and that Swiss students learn mathematically irrelevant associations both between fraction and decimal arithmetic operations and operand features that parallel these distributions. Our results are thus consistent with Braithwaite and Siegler's (2018) results. We discuss the implications of our findings for educational practice, especially focussing on the potential drawbacks of forming such spurious associations.

Learning through space: spatializing information as a determinant of academic skill development
Keywords: Cognitive Development, Cognitive Skills and Processes, Mathematics/Numeracy, Primary Education
Presenting Author: Jolien Moorkens, UGENT, Belgium; **Co-Author:**Jean-Philippe van Dijck, Thomas More University College, Belgium; **Co-Author:**Wim Fias, UGENT, Belgium

Numbers are known to be mentally represented as a mental number line (MNL). Recently, it has been discovered that also series of items in working memory are spatially represented as positions on a line (Working Memory Line, WML; van Dijck et al., 2011). It is still unknown how these spatial representations develop and how they relate to the acquisition of academic skills like mathematics or reading and writing. In a large cross-sectional study in 547 children from third and fifth grade we tested the degree of spatialization of number and working memory representations and correlated these measurements with scores on standardized reading, spelling and math tests. The results of this study show that the MNL and the WML don't develop simultaneously: children who use space in a number task, don't necessarily use space in a working memory task. The independence of the two types of spatialization is also reflected in the relations with academic skills. Whereas there is no relation at all in third grade, the results show that, from fifth grade on, having a MNL is associated with good mathematical skills, while having a WML seems to be more related to good spelling skills. Possible implications for education and instruction will be discussed.

Benefits of errors: Noticing young learners' mathematical thinking through confusions and mistakes
Keywords: Eye Tracking, Mathematics/Numeracy, Pre-service Teachers, Primary Education
Presenting Author: Fanni Biró, University of Szeged, Doctoral School of Education; MTA-SZTE Metacognition Research Group, Hungary; **Co-Author:**Csaba Csíkos, University of Szeged, MTA-SZTE Metacognition Research Group, Hungary; **Co-Author:**Judit Szitányi, ELTE Eötvös Loránd University, Hungary

Noticing – as an important component of teacher expertise – has received remarkable attention in the past decades on an international level, however, Hungarian teacher education has yet to build on the accumulated theoretical and empirical results. Our aim was to conduct an exploratory case study on the noticing of elementary students' mathematical thinking through errors and confusions during mathematics lessons in a country where teacher education does not take into consideration the international literature of noticing, and where recording pre- or in-service teachers' lessons is not a common practice. The results indicate that only teacher educators reached Focused and Extended Noticing Levels, while in-service and prospective teachers cycled back and forth between Baseline and Mixed Noticing Levels. Our findings suggests that renewal of Hungarian elementary teacher education by means of incorporating noticing as a valuable teacher competence should be built on empirical results that take account of both international developments and local traditions. The current results show that there is much place for progression, and the benefits of errors and confusions appear not only in children's thinking, but in teachers' video-based noticing as well.

Assessing second grader's proportional vocabulary and proportional reasoning abilities
Keywords: Cognitive Development, Early Childhood Education, Mathematics/Numeracy, Primary Education
Presenting Author: Karen De Keersmaeker, KU Leuven, Belgium; **Co-Author:**Elien Vanluydt, KU Leuven - University of Leuven, Belgium; **Co-Author:**Patrick

Onghena, KU Leuven, Belgium; **Co-Author:**Wim Van Dooren, KU Leuven, Belgium

Proportional reasoning, or the reasoning about the relationship between two ratios is omnipresent in our lives. As the relationship between two ratios can also be expressed through words such as *half* and *three times more*, proportional reasoning might have a linguistic aspect. We examined whether second graders' proportional reasoning abilities were associated with their proportional vocabulary knowledge, or their understanding of proportional reasoning vocabulary words. Due to the absence of a proper proportional vocabulary task in the early elementary grades, our first step consisted of developing one. In a later step, this instrument was, together with a task tapping proportional reasoning abilities, administered to 145 second graders. The results showed a correlation between second graders' proportional vocabulary understanding and proportional reasoning abilities. Moreover, proportional vocabulary was still a unique predictor for proportional reasoning abilities after controlling for gender, age and socio-economic status. Our study confirms the importance of mathematical vocabulary for mathematical achievement. It is advised for future research to examine if enhancing proportional vocabulary in young children improves proportional reasoning.

6-yearolds' structural awareness and arithmetic skills
Keywords: Cognitive Skills and Processes, Competencies, Mathematics/Numeracy, Primary Education
Presenting Author: Camilla Björklund, University of Gothenburg, Sweden; **Co-Author:**Angelika Kullberg, University of Gothenburg, Sweden

To develop successful arithmetic skills, it is assumed that students need to learn about numbers' part-whole relationship and how to make use of such relations in arithmetic problem solving. The aim of this study is to explore in what ways 6-yearolds experience numbers' cardinality when arranged in structured sets, as a prerequisite for arithmetic skills. The specific research question is how different ways of seeing numbers' structural features are related to the ability to determine cardinality. Task-based interviews were done with 289 6-yearolds at the beginning of their first compulsory school year. The aim of the interviews was to capture their ways of seeing numbers' structural features before formal education in arithmetic strategies. The task chosen for analysis captures the students' ways to solve tasks asking for how they identified the number of objects in a canonical pattern (six dots in a triangle shape). Variation theory of learning was used as a theoretical framework to analyze how students experienced the group of objects. The analysis focused on how the students identified the quantity as a structured set of objects, and how they made use of any identified structure to determine the exact number of dots. 40% of the students were able to identify some kind of structured sets. A qualitative interpretation indicates that students may discern quantities as composed units but do not necessarily discern the relationship of the units being parts of a larger whole and therefore cannot determine the number of dots without having to use single-unit counting.

Instruction of Reception Goals as a Method to Direct the Processing of Uncertain Information
Keywords: Goal Orientations, Immersive Technologies for Learning, Informal Learning, Quantitative Methods
Presenting Author: Stefanie Aberle, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Manuela Glaser, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Stephan Schwan, Leibniz-Institut für Wissensmedien, Germany

Based on the model of processing evidence and its uncertainty values, previous research has shown that there is a bias to process certain and neglect uncertain information (Glaser et al., 2022). The present paper examines whether instructing particular reception goals can avoid this bias and direct information processing in order to provide learners with an understanding of the evidential nature of the learning content, and at the same time have them elaborate on particular contents, irrespective of their status of scientific uncertainty. Participants were assigned either a learning goal or a research goal. They were then presented a desktop virtual reality reconstruction of a historic building which included architectural elements of different degrees of uncertainty. Uncertainty was expressed both visually by stop light colours and verbally in accompanying audio explanations. Retention of the appearance of architectural elements, the uncertainty values, and their verbal scientific justifications were measured in both reception goal conditions. Results showed that with a learning goal, the appearance of certain elements was better retained than the appearance of uncertain elements, whereas with a research goal, the appearance of architectural elements was similarly retained across all elements. The retention of uncertainty values and their verbal scientific justifications was similar for uncertain, medium, and certain elements in both goal conditions. The study extends existing theories by showing that goal setting can change the processing of uncertain information and that orchestrating basic characteristics of learning technologies with carefully chosen instructional strategies is especially important for learning material containing uncertain information.

Using VR to Train Situation Awareness in Road Construction Operators: The Effect of Debriefing
Keywords: Immersive Technologies for Learning, Mixed-method Research, Science and STEM, Vocational Education and Apprenticeship Training
Presenting Author: Ilona Friso-van den Bos, University of Twente, Netherlands; **Co-Author:**Bas Kollöffel, University of Twente, Netherlands

Road construction operators need a strong sense of what is going on around them, a skill termed Situation Awareness (SA). With Virtual Reality technology, it becomes possible for students to train their SA before facing a real-life work situation. In this study we tested a recently developed VR training for the acquisition of SA in asphalting education to assess whether students show progress in their SA performance, and whether variation in learning gains was a function of debriefing. Participants were 55 students from vocational engineering education who took part in four VR sessions aimed at compaction. SA was tested using queries at the end of each session. Participants were distributed over three conditions: a group receiving feedback in a debriefing session with video playback, a group receiving a debriefing without video playback, and a group with no debriefing. Results showed that there was growth in Situation Awareness acuity during the training, which can be fully attributed to a sharp incline in scores between the first two sessions. There was no difference in gains between students taking part in various conditions, from which it can be concluded that debriefing did not propagate gains in performance. Recommendations for future research include an investigation of the roles of expertise and motivation, while practical recommendations include developing the VR to include more interactive elements.

Methodological challenges in evaluating the potential of Virtual Reality for classroom management
Keywords: Assessment Methods, Immersive Technologies for Learning, Instructional Design, Pre-service Teachers
Presenting Author: Jolien Mouw, University of Groningen, Netherlands; **Co-Author:**Marjon Fokkens-Bruinsma, University of Groningen, Netherlands

Our qualitative study has shown that second-year PSTs greatly appreciate our VR-kindergarten classroom as a didactical tool to develop CMS. However, validly capturing VR-supported overtime CMS development and empirically evaluating the added value of our VR kindergarten poses major methodological challenges, for example, regarding which assessment methods are best suited to measure VR-supported over-time development of multifaceted skills and the unsuitability of traditional instruments to gauge PSTs' conscious observations of disruptive behaviors. Using data collected at different time points and through different research designs, we will exemplify the methodological challenges we encountered and discuss what we can(not) learn from and discuss what we can (not) conclude from our findings.

Predicting self-regulated learning support needs during learning
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Educational Technologies, Self-regulated Learning and Behaviour
Presenting Author: Rick Dijkstra, Radboud University Nijmegen, Netherlands; **Co-Author:**Max Hinne, Radboud University, Netherlands; **Co-Author:**Eliane Segers, Radboud University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University, Netherlands

When children learn using Adaptive Learning Technologies, these technologies take over their ability to self-regulate their learning. This results in children learning less self-regulated learning (SRL) skills. To build a system that supports children to engage in SRL, it first is necessary to assess their support needs. Therefore, we identify what level of SRL support children need *after learning*, based on clustering trace data from the learning technologies. Subsequently, we predict what level of SRL support children need *during learning* by determining to which cluster they belong while they are making exercises. We identified nine different clusters, which, when interpreted on learning and SRL behaviour metrics, map to four different levels of SRL support needs. While predictions at chance level give an accuracy of 11%, they are accurate 38% of the times after the first set of 12 exercises and improve up to 90% after 53 problems. These results demonstrate that it is possible to identify support needs *during learning*.

Monitoring in Multimedia Learning: Does Monitoring one's Learning Process Affect Learning?
Keywords: Comprehension of Text and Graphics, Metacognition, Multimedia Learning, Self-regulated Learning and Behaviour
Presenting Author: Emely Hoch, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Katharina Fleig, Leibniz-Institut für Wissensmedien (IWM) | Knowledge Media Research Center, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany

The ability to control one's own learning process plays an important role in learning, especially in multimedia learning, where learners often rely on a multimedia heuristic (i.e., overconfidence). We investigated whether explicitly monitoring, that is, reflecting and evaluating one's learning process, affects overall monitoring accuracy and learning performance. Results showed that in line with the multimedia heuristic, learners were overconfident about their level of learning; learners who were instructed to monitor their learning process, though, were pretty accurate about their level of learning. There was no significant difference in learning performance for participants who monitored or did not monitor their learning process. However, the relation of monitoring and performance was mediated by subsequent learning behavior. The results suggest that monitoring improves metacognitive accuracy and that learning outcomes might be improved by regulating subsequent learning behavior.

The promotion of self-regulated Learning: A video-based classroom study
Keywords: Metacognition, Mixed-method Research, Secondary Education, Teaching/Instructional Strategies
Presenting Author: Amina Rosenthal, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Carmen Nadja Hirt, University of Zurich, Switzerland; **Co-Author:**Johannes Jud, University of Zurich, Switzerland; **Co-Author:**Tabea Daria Eberli, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Yves Karlen, University of Zurich, Switzerland

Self-regulated learning (SRL) is an important educational goal as it supports students to become successful lifelong learners. Teachers play a crucial role in developing their students' SRL. However, still little is known about how teachers at the lower secondary levels promote SRL in their classes and which professional competences influence teachers' SRL promotion. Video-based classroom observations of $N = 54$ lower secondary teachers were conducted to assess their direct and indirect promotion of SRL. In addition, teachers' knowledge and beliefs about SRL were assessed using knowledge tests and an online self-report questionnaire. The results of this mixed-method study revealed that teachers lacked content knowledge about metacognition and had an average level of pedagogical content knowledge about SRL. Further, teachers reported having consistent beliefs about SRL. Regarding the promotion of SRL, the results revealed that teachers promoted SRL mainly implicitly and less often directly. Implications for teachers' professional training programs emerge from the findings: They could benefit from learning about explicit instruction of SRL and becoming more familiar with the concept of metacognition.

Promoting self-regulation during the COVID-mandated home-schooling period – Insights from interviews
Keywords: E-learning/ Online Learning, Pandemic, Primary Education, Self-regulated Learning and Behaviour
Presenting Author: Rutmer Ebbes, University of Amsterdam, Netherlands; **Co-Author:**Jaap Schuitema, University of Amsterdam, Netherlands; **Co-Author:**Marjolein Zee, Erasmus University Rotterdam, Netherlands; **Co-Author:**Brenda Jansen, University of Amsterdam, Netherlands; **Co-Author:**Helma Koomen, Research Institute of Child Development and Education, Netherlands

For prolonged stretches of time in 2020 and 2021 Dutch primary schools were closed due to Covid-19. During this time, children received education at home in an online format. In the current study we aimed to get more insight into the problems Dutch primary school teachers faced when supporting children's self-regulation during the Covid lockdowns. Moreover, we investigated what different approaches teachers used to support self-regulation during this time. To this end, we interviewed ten primary school teachers (M_{age} = 36.8 year, SD = 9.7, 90% females) teaching in grades 3 - 8. Teachers mentioned several main challenges of the Covid-mandated home-schooling period. Most mentioned was keeping track of student's progress and problems. Moreover, teachers experienced trouble making and maintaining a real connection with the children. We also asked teachers how they supported children with self-regulation during this period of home-schooling. Most mentioned was providing extra structure for specific children and, if necessary and possible, some teachers also asked parents to take on a somewhat larger role in helping their children regulate their work. Moreover, in most classes the children's program was adapted to fit children's academic ability, as well as their ability to self-regulate during the periods of independent work. Insights from this study can help us prepare better for mandated school lockdowns in the future. Moreover, the overview of ways teachers supported children with self-regulation during this period could inspire teachers currently trying to find ways to support SRL in similar situations.

University teachers' self-efficacy beliefs
Keywords: Higher Education, Self-efficacy, Teacher Efficacy, Teaching/Instructional Strategies

Presenting Author: Irene Douwes-van Ark, University of Groningen, Netherlands; **Co-Author:**Marjon Fokkens-Bruinsma, University of Groningen, Netherlands; **Co-Author:**Jan Folkert Deinum, University of Groningen, Netherlands; **Co-Author:**Hanke Korpershoek, University of Groningen, Netherlands

The purpose of this study is to contribute to the understanding of university teachers' self-efficacy beliefs. For this purpose, we developed an instrument regarding six teaching domains: course design, instructional strategies, creating a positive learning climate, student engagement, assessment and professional development. Research on this topic is scarce, which hampers evidence-informed teacher professionalization at the university level. A survey was administered to a sample of 105 university teachers. Our findings suggest that university teachers had the highest self-efficacy beliefs on course design, instructional strategies and creating a positive learning climate; but their beliefs regarding assessment, student engagement and professional development were slightly lower.

Teachers' teaching profiles and self-efficacy as measured through the HEAT inventory
Keywords: Higher Education, Quantitative Methods, Self-efficacy, Teaching Approaches
Presenting Author: Liisa Postareff, HAMK University of Applied Sciences, Finland; **Co-Author:**Juulia Lahdenperä, Häme University of Applied Sciences, Finland; **Co-Author:**Telle Hailikari, Häme University of Applied Sciences, Finland; **Co-Author:**Anna Parpala, University of Helsinki, Finland

Higher education (HE) teachers' approaches to teaching, i.e.teaching processes and intentions, have been explored since the early 1990's. The exploration has been mainly done using quantitative instruments, although criticized for being too narrowly examining the dimensions of teaching. The HEAT (Higher Education Approaches to Teaching) instrument aims to capture the dimensions of HE teaching more broadly using the previous quantitative and qualitative research on approaches to learning as a basis. The aims of the study are 1) to validate the HEAT inventory measuring dimensions of approaches to teaching, and scale measuring self-efficacy, and 2) to explore what kind of individual teaching profiles can be identified among higher education teachers and 3) how the profiles are related to the teachers' self-efficacy beliefs. The results showed that HEAT is a valid instrument to measure teachers' approaches to teaching in a wider HE context. Teachers' ability to reflect their teaching has an important role in teaching and should, thus, be developed in HE context. Moreover, the results show that different profiles of approaches to teaching emerge among HE teachers, and that the profiles differ in terms of self-efficacy.

Teachers' social self-efficacy as a predictor of teacher-child relationships quality in Greek ECE
Keywords: Early Childhood Education, Social Interaction, Teacher Efficacy, Tool Development
Presenting Author: Anastasia Vatou, International Hellenic University, Greece; **Co-Author:**Athanasios Gregoriadis, Aristotle University of Thessaloniki, Greece; **Co-Author:**Nikolaos Tsigilis, Aristotle University of Thessaloniki, Greece; **Co-Author:**Vasileios Grammatikopoulos, International Hellenic University, Greece

The importance of teacher-child relationships for students' development and teachers' wellbeing is well established in the context of Early Childhood Education and Care (ECEC) (OECD, 2020). Teachers' competence to enhance supportive relationships with students is a crucial aspect of their professional role (Rimm-Kaufman et al., 2003). Teachers with high sense of competence in developing positive relationships with their students, reflect this also in their sense of social self-efficacy (Vatou et al., 2022). The purpose of this study was twofold. The first aim was to test the validity of the Teacher Social Self-Efficacy Scale (TSSES) in the Greek educational context. The second purpose was to investigate whether the teachers' social self-efficacy beliefs predict the teacher-student relationships quality. The sample included 488 early childhood teachers to investigate the construct validity of TSSES. A second sample of 112 teachers completed the TSSES and also completed the Student-Teacher Relationship Scale (Koomen et al., 2012) for their students (N=897) to obtain evidence for the predictive validity of TSSES. Results provided convincing evidence for the factor structure, reliability, and validity of the TSSES. The TSSES displayed good psychometric properties for measuring teachers' social self-efficacy. Results from the ICC provided initial support for using a multilevel approach (.354 for closeness, .138 for conflict, and .432 for dependency). Multilevel analyses found that teachers' social self-efficacy positively contributed to closeness and negatively associated with conflict. Collectively, findings highlight the importance of supporting teachers' social self-efficacy. Limitations and implications for policy makers, practitioners and education researchers are also discussed.

Teachers' self-efficacy and intercultural classroom practices in diverse classroom contexts
Keywords: Competencies, Cultural Diversity in School, In-service Teachers, Teacher Efficacy
Presenting Author: Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Paul Leseman, Utrecht University, Netherlands; **Co-Author:**Bodine Romijn, Utrecht University, Netherlands; **Co-Author:**Valentina Pagani, Università di Milano Bicocca, Italy

The concept of teacher efficacy plays an important role in explaining differences in overall teacher effectiveness and is a positive factor in helping teachers deal with the challenges and uncertainties in education. Little attention is devoted to teacher efficacy in ethnically diverse classrooms, despite the increasing cultural diversity in society. This cross-national study provides new insights in teacher efficacy in today's culturally diverse classrooms using survey data of 269 early childhood and primary school teachers in England, Italy, the Netherlands and Poland. Teacher efficacy can be viewed as a two dimensional concept in which both general beliefs are measured alongside (diversity-related) domain-specific beliefs. These beliefs are related to the cultural classroom context and the use of intercultural classroom practices. Teachers working in more diverse classrooms, feel more efficacious working with diverse student populations and report they are more often engaged in intercultural classroom practices, which in turn provides them with new opportunities to build up their self-efficacy. Our results indicate that policies and professional development targeted at the reciprocal relation between diversity-related efficacy and practices are important when preparing teachers for working in diverse classroom contexts.

Effects of Supplemental Instruction on Grades, Well-being and Belonging: a Field Experiment
Keywords: Higher Education, Peer Interaction, Teaching/Instructional Strategies, Well-being
Presenting Author: Izaak Dekker, Amsterdam University of Applied Sciences (AUAS), Netherlands; **Co-Author:**Jantien Stam, Faculty of Education, Amsterdam University of Applied Sciences, Netherlands

Supplemental Instruction (SI) is a form of structured peer guidance attached to a specific course, provided by an experienced and trained student to a group of students. Previous studies show a positive effect of SI on learning outcomes, some found effects on well-being, and sense of belonging. However, literature on SI lacks randomized controlled trials and does not fully address the risk of self-selection bias. The current study tested whether SI has an effect on grades, mental well-being, and sense of belonging with a pre-registered randomized controlled trial and a sample of 493 Dutch first-year students. Students who were offered SI obtained significantly higher grades (d = 0.26) but did not score significantly different on mental well-being or belonging.

Peer support in enhancing students' sense of belonging, study engagement and life satisfaction
Keywords: Emotion and Affect, Peer Interaction, Secondary Education, Well-being
Presenting Author: Sanna Ulmanen, University of Helsinki, Finland; **Co-Author:**Lotta Tikkanen, University of Helsinki, Finland

Previous research suggests that, for adolescents, peer support is an essential enabler of students' sense of belonging in peer interaction and correlates with study wellbeing and general wellbeing. However, it remains unclear what the underlying mechanism explaining these relationships is. Therefore, this study

examined whether the effect of peer support on life satisfaction is mediated by a sense of belonging in peer interaction or study engagement. The path model was tested with structural equation modeling (SEM), using a cross-sectional sample of Finnish upper secondary education students (n=280) (69% female, 28% male). The results showed that school-related social support shared among peers is associated with higher levels of sense of belonging and study engagement. Furthermore, the direct effect of school-related peer support on life satisfaction was negative, but indirect effects through study engagement and sense of belonging were positive. The results implied that to enhance upper secondary education life satisfaction, school-related peer support needs to be cultivated so that it enhances students' sense of belonging and study engagement.

What keeps first-year medical students mentally healthy? – A latent profile analysis
Keywords: Emotion and Affect, Higher Education, Resilience, Self-efficacy
Presenting Author: Sabine Polujanski, University of Augsburg, Germany; **Co-Author:**Thomas Rotthoff, Augsburg University, Germany; **Co-Author:**Ulrike Nett, Augsburg University, Germany; **Co-Author:**Ann-Kathrin Schindler, Augsburg University, Germany

AbstractPrevious meta-analytic data have demonstrated the propensity for mental morbidity among medical students. However, there is a lack of research on medical students' varying depression vulnerabilities and predictive factors. The present study aims to achieve a better understanding of the development of mental health morbidity and predictive factors in first-semester medical students. In November 2020 and January 2021, 184 first-semester students from two German medical schools with a reformed competency-based curriculum were surveyed regarding depression (PHQ-9), self-efficacy, resilience, and cognitive self-regulation. Using latent profile analysis, we identified differing depression development profiles. We applied a multinomial logistic regression analysis to determine how self-efficacy, resilience, and cognitive self-regulation and its changes predicted profile membership. Five different profiles of depression development were identified: Profile 1, no depression (53.8%); Profile 2, mild depression (26.1%); Profile 3, depression increase I (9.2%); Profile 4, depression increase II (9.8%); and Profile 5, persistent depression (1.1%). Students with initial high values of self-efficacy, resilience, and cognitive self-regulation were more likely to belong to the no depression group. A decrease in self-efficacy and cognitive self-regulation was associated with both depression increase profiles (I and II), and a decrease in resilience was found to be a predictor for the depression increase II profile. In conclusion, students who enter medical school have varying levels of mental health, and they differ in their vulnerability to developing depressive symptoms. The promotion of resilience, self-efficacy, and cognitive self-regulation strategies may be key in preventing students' depression in the first semester of medical school.

Living better! Self-care for teachers – Effects of a prevention and health promotion intervention
Keywords: Burnout, Health-care Education, Teacher Professional Development, Well-being
Presenting Author: Ingmar Hosenfeld, University of Kaiserslautern- Landau (RPTU), Germany; **Co-Author:**Malte Cramer, University of Koblenz - Landau, Germany; **Co-Author:**Gabriele E. Dlugosch, University of Koblenz - Landau, Germany; **Co-Author:**Teresa Noichl, University of Koblenz - Landau, Germany; **Co-Author:**Inga Wagner, University of Koblenz-Landau, Germany

Teachers are exposed to a variety of stresses in their work context (Klusmann & Waschke, 2018). These can have a negative impact on their physical and mental well-being (Scheuch et al., 2015).
An online intervention for prevention and health promotion for teachers is tested for its effectiveness in an experimental study. The aim of the intervention is to promote self-care and mindfulness among participants and thereby prevent possible consequences of work-related strains, such as stress or burnout, and to strengthen mental health.
The study is designed as a randomized 2*2 factorial wait-list control group repeated-measures design with 4 (treatment group) resp. 6 (wait-list control group) measurement time points. Central dependent variables are measures of self-care, mindfulness, stress experience, emotional exhaustion as an indicator for burnout, self-efficacy and well-being. In order to assess the short- and medium-term effectiveness of intervention participation, these constructs are surveyed 5 weeks and 1 year after the intervention.As expected, the first follow-up (5 weeks after the intervention) shows a significant increase in the variables mindfulness and self-care and a significant decrease in the variables stress and emotional exhaustion. Effect sizes can be rated as medium to large. In addition to the comparison between treatment and wait-list control group, the results regarding the effectiveness of the intervention up to one year later are also presented and discussed.

Session C 19

Patterns of Partnership Practices: Digital Media vs. Face-to-Face Contact?
Keywords: Early Childhood Education, Parental Involvement in Learning, Quantitative Methods, Social Interaction
Presenting Author: Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Theresia Gabriele Hummel, Otto-Friedrich-University of Bamberg, Germany

Previous research has demonstrated that supportive partnerships between the home and preschool setting contribute beneficially to child development (e.g., Clarke et al., 2017). However, a lack of time, different interests, or language barriers often prevent the successful implementation of partnership activities. The use of digital media offers flexibility and increased accessibility for families, and thus the opportunity to overcome existing barriers and establish new approaches to parental involvement (e.g. Hall & Biermann, 2015). Therefore, the present study examines the frequency and intensity of teachers' partnership practices, and the role of digital media in partnership practices. 198 teachers of 88 preschools participated in the study. All data were obtained in the context of the evaluation of a German governmental preschool initiative. Different aspects of teachers' partnership practices were assessed using quantitative diaries. In a total of one-fifth of all diaries (19.7%), teachers reported being involved in partnership practices. On average, professionals spent 44 minutes (*SD* = 41.10) per day cooperating with families. Digital media were used on 16.9% of all days when teachers were involved in partnership activities. Multifunctional media such as tablets (in 32.3% of the situations), smartphones (25.8%) or laptops (22.6%) are used most frequently. The results of the present study highlight that partnership activities are not part of preschool teachers' daily work. When teachers are involved in partnership activities, face-to-face contact predominates. Consequently, training programs should make use of these results to raise teachers' awareness of the opportunities offered by digital media in partnership activities.

Math motivation and math achievement in primary school: Relationship with parents practices
Keywords: Achievement, Motivation, Parental Involvement in Learning, Primary Education
Presenting Author: Francisco Peixoto, ISPA - Instituto Universitário | Center for Research in Education, Portugal; **Co-Author:**Lourdes Mata, ISPA - Instituto Universitário | Center for Research in Education, Portugal; **Co-Author:**Mafalda Campos, ISPA - Instituto Universitário | Center for Research in Education, Portugal; **Co-Author:**Jelena Radisic, University of Oslo, Norway

Parenting practices, beliefs and involvement have been shown to impact the schooling experience of their children significantly. The current study aimed to explore the associations between parent practices on motivation dimensions in mathematics learning and achievement based on the Expectancy-Value (EV) theory and previous research on the mediating role of parent involvement-related variables. Participants were 1839 third and fourth graders who filled out the *Expectancy-Value Scale* (*EVS*) and completed two math tasks. The children's parents completed the Parent Scale, aimed at assessing parents' practices concerning how math was approached in the household and in the relationship between the parents and the child. Math motivation was operationalised by five

dimensions comprising EVS (i.e., perception of competence, attainment value, utility value, intrinsic value, and cost). Parent practices were operationalised by four dimensions, depending on the primary goal of such practices—practices promoting interests, emphasising costs, structuring learning, and practices supportive of learning. Math achievement was operationalised as a joined result on two math tests.Analysis conducted using Structural Equation Modelling allowed us to identify that different parental practices are associated in specific ways with students' values, perception of competence, and academic achievement. These findings have implications for practice—identifying parental practices that can be detrimental to achievement and self-concept, and for research, accentuating the need for more fine-tuned data analyses that enable nuanced differentiation between unfavourable parental practices and what is merely the result of students with lower achievement needing more help.

Family involvement, student behavioural engagement and approach to homework: a longitudinal study
Keywords: Engagement, Learning Approaches, Parental Involvement in Learning, Primary Education
Presenting Author: Carolina Rodríguez Llorente, Universidad de La Coruña, Spain; **Co-Author:**Rocío González-Suárez, Camilo Jose Cela University, Spain; **Co-Author:**María Cabana-Bedoya, Universidad de La Coruña, Spain; **Co-Author:**Emmanuel Manalo, Kyoto University, Japan

Family involvement in the homework process has been proven to improve the quality of students' engagement in the completion of homework and their academic achievement. Similarly, how students behave while completing homework may affect the studying/learning approach they adopt towards it. Taking a longitudinal perspective, this research examined the effect of family involvement and student behavioural engagement in homework on the studying/learning approach to homework (deep and superficial) that students take. Data from 229 students (52.2% male) on family involvement, behavioural engagement, and approach to homework were collected over three consecutive years. Our results show that when students perceive that their parents prioritise homework completion (Grade 4) and when they manage homework time and understand its usefulness (Grade 5), they adopt a deep studying/learning approach to completing their homework (Grade 6). In contrast, when students say their family uses rewards (Grade 4), a superficial approach to completing homework is predicted (Grade 6). However, family confidence (Grade 4) and homework time management (Grade 5) negatively predicted the superficial approach to homework. It is worth noting the long-term effect of rewarding children for doing their homework on how they approach homework (e.g., to avoid punishment or without paying much attention).

Homework Stress and Learning Disability: The Role of Parental Shame, Guilt, and Need Frustration
Keywords: Anxiety and Stress, Learning and Developmental Disabilities, Motivation, Parental Involvement in Learning
Presenting Author: Idit Katz, Ben-Gurion University of the Negev, Israel; **Co-Author:**Marianna Alesi, Ricercatore Università di Palermo, Italy; **Co-Author:**Angelica Moè, University of Padova, Italy

Using a cross-sectional design, this study examined the relationships between parental guilt, shame, need frustration, and homework stress in students with Learning Disabilities (LD) or Typically Developing (TD) and their parents. One hundred and eight parent-child dyads (54 LD, 54 TD) filled in questionnaires to assess homework stress, parental need frustration, guilt, and shame. The results showed that parents of students with LD reported more stress, need frustration, shame, and guilt than parents of TD students. In the LD group, shame mediated the association between parental need frustration and parental and child stress, and guilt mediated the association between parental need frustration and parental stress. The theoretical and practical implications for lessening homework stress for students with LD and their parents are discussed.

Analyzing data in the physics laboratory by pre-service physics teachers'
Keywords: Higher Education, Misconceptions, Pre-service Teachers, Science Education
Presenting Author: Ida Kukliansky, Ruppin Academic Center, Israel

Conceptual change in every subject can be made only after a deep understanding of the misconceptions of the learners. The present research examines the barriers pre-service physics teachers confront with when dealing with data analysis tasks in the introductory physics laboratory. Analyzing and interpreting data, collected in the experiments, helps to bridge the gap between the experiment's results and the theoretical world and to establish a better connection between the scientific experiment and theory. Identifying pre-service physics teachers' misconceptions is very important because the future teachers can transfer them to their students. The novelty of this research is not only in identifying the pre-service physics teacher's misconceptions analyzing data in the introductory physics laboratory, but also in explaining the reasons for them. 25 pre-service physics teachers who had undergone several laboratory courses participated in this study. For examining their knowledge level and identifying their difficulties in data analysis, the Laboratory Data Analysis Instrument (LDAI) was used. The results revealed that the participants evidenced a sixty-nine percent overall average of correct answers. The various misconceptions the pre-service physics teachers encountered in each of the instrument objectives are identified and discussed. Dealing with multiple representations and the use of intuitive rules can explain some of the difficulties. The identification of the data analysis difficulties can be employed by educators in teacher teaching attempting to construct more efficient learning environments for conceptual change.

Characteristics of productive discourse in undergraduate courses for student science teachers
Keywords: Pre-service Teachers, Qualitative Methods, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Hadeel Edrees Dabbah, Ben Gurion University of the Negev, Israel, Israel; **Co-Author:**Orit Ben Zvi-Assaraf, Ben-Gurion University of the Negev, Israel

Productive discourse promotes and encourages collaborative and meaningful learning among students. Science teachers, however, often have difficulty incorporating it into their lessons. To successfully implement such discourse practices, teachers must receive preparation while training as student science teachers in colleges. We used a linguistic ethnographic method to explore the characteristics of the productive scientific discourse in undergraduate science courses for pre-service science teachers in a teachers' college in Israel's Arab sector. The exemplar case presented here shows several features of productive discourse, some related to the lecturer such as: elaboration, uptake question, challenging in order to press for reasoning; and others to the student contributions such as: an expansion on their statement or/and another one made by a classmate. Furthermore, we found characteristics for a hybrid discourse that formed when students and lecturers combined everyday knowledge and discourse resources, often drawn from popular culture, with disciplinary scientific discourse. Such a combination created a new space for learning where it is permissible to laugh and use humor, and where one can share naive knowledge that originates outside the walls of the science classroom (such as media). Based on our findings, we recommend implementing such strategies into preservice professional development, allowing college lecturers conduct similar reflective analyses of examples from their own lectures, so as to identify and develop opportunities for productive scientific discourse.Keywords: productive scientific discourse, preservice science teacher education, multimodal micro-analytic methods, linguistic ethnographic approach.

Facilitating coherent science instruction for pre-service teachers by reflection
Keywords: Educational Technologies, Instructional Design, Pre-service Teachers, Science Education

Presenting Author: Miikka Turkkila, University of Helsinki, Finland; **Co-Author:**Merike Kesler, University of Helsinki, Finland; **Co-Author:**Antti Laherto, University of Helsinki, Finland; **Co-Author:**Jari Lavonen, University of Helsinki, Finland; **Co-Author:**Kalle Juuti, University of Helsinki, Finland

Pre-service teachers (PSTs) have difficulties applying their pedagogical studies into practice. Supporting PSTs reflections during practical training could help with this difficulty and enrich PSTs pedagogical content knowledge. We have designed a tool to facilitate reflection on coherent science instruction. Coherent science instruction is emphasized in several curriculums and is shown to support student learning. The tool can be used to code, in real-time, coherent science instructions observed in practice lesson by a peer PST observing the lesson. The tool then draws a timeline of the coded activities. The aim for using the tool is threefold. It directs the student teacher to plan their practice lessons according to the coherent science instruction principles. It activates and guides PSTs what to observe in a peer's practice lesson. Finally, with the help of the timeline, it makes visible what coherent activities the lesson included. The timeline serves as a basis for post-lesson reflective discussion between mentoring teacher and PSTs, giving a structure to the reflection and helps focus attention on the activity. In the presentation, we show how the use of the tool produces reflection on coherent science instruction and discuss the connection of reflection to the goals of teacher education.

Prospective teachers' use of construal-based intuitive explanations in science instructions
Keywords: Misconceptions, Pre-service Teachers, Primary Education, Science Education
Presenting Author: Sebastian Tempelmann, Institute for Research, & Development, Germany; **Co-Author:**Jakub Sowula, University of Teacher Education Berne, CH// University of Tuebingen, GER, Switzerland; **Co-Author:**Trix Cacchione, University of Teachereducation FHNW (PH FHNW), Switzerland

Science educators' explanations of natural phenomena are often affected by cognitive construals (e.g., *teleology* & *anthropomorphism),* although those often contradict scientifically accepted conceptions and are seen as causes of persistent misconceptions. Simultaneously, using such can facilitate learning. As it is not likely to overcome intuitive explanations (cf. *explanatory coexistence)*, didactic concepts aim to enable students to distinguish between intuitive and scientific explanations with the goal of explicit "bilingualism". While this places great subject-knowledge and didactic demands on teachers and their training, it could enable reasoned use of construals in science teaching and promote learning success. However, while the use of construal-based explanations in science teaching is well documented, systematic research is lacking on why educators rely on them. Both *didactic reasons* and *lack of expertise* are possible, with widely divergent implications for educational practice and teacher training. In this exploratory study, we contribute to this debate by investigating Swiss prospective primary teachers' written explanations of two scientific phenomena of inanimate nature (collision/combustion) towards fictitious recipients with varying expertise (primary students/experts) for construal-based expressions. On average, participants used significantly more construal-based statements when the addressees were students rather than experts. Furthermore, we were able to attribute most of the participants' construal-based explanations to the didactic context (especially for *anthropomorphic* explanations). However, even for the *anthropomorphic* explanations, a considerable proportion of participants used construals due to a *lack of expertise*. Implications of results are discussed, and recommendations for educational practice and (Swiss) primary teacher training are formulated.

The Contributions of Unique Professional Learning Communities with Preservice and Tutor Teachers
Keywords: Communities of Learners and/or Practice, Lifelong Learning, Pre-service Teachers, Teacher Professional Development
Presenting Author: Orna Heaysman, Hemdat College of Education, Israel; **Presenting Author:**ALISA AMIR, Achva College of Education, Israel; **Co-Author:**Orit Avidov-Ungar, Achva College of Education, Israel; **Co-Author:**Revital Amzaleg, Achva College of Education, Israel; **Co-Author:**Yousif.a.l.a3@gmail.com Alamour, Achva College of Education, Israel

The need to promote teachers' life-long learning as well as strengthen the partnership between academia and the educational field has led to the creation of a novel type of professional learning community, that involves preservice (student) teachers learning together with tutor teachers and guided by an academic coordinator. This type of professional learning community, called "Academy–Classroom", was recently introduced by the Ministry of Education in Israel. The goal of the current study was to examine the contributions of participating in the "Academy–Classroom" community according to the participants' perceptions. The research method was qualitative. The study examined two "Academy–Classroom" communities from two primary schools in Israel, including 35 participants. The research tool was semi-structured interviews which were analyzed using the content analysis method via the ATLAS.ti.8 software. The content analysis revealed four main contributions of the communities: collaboration and a sense of belonging, teaching practice and self-efficacy in teaching, a sense of empowerment and autonomy, and motivation to succeed in teaching. In light of the findings, we recommend providing this type of professional learning community as part of the preservice teacher training and as a professional development program for in-service teachers.

Regression Model of Lifelong Learning Competencies for the Teacher Trainers
Keywords: Competencies, In-service Teachers, Lifelong Learning, Teacher Professional Development
Presenting Author: Win Phyu Thwe, University of Szeged, Doctoral School of Education, Hungary; **Co-Author:**Anikó Kálmán, University of Szeged, Doctoral School of Education, Hungary

A lifelong learner is a person who embraces learning and possesses the competencies that are necessary for their lifetime. Researches focused on the lifelong learning and other variables such as motivation, reading motivation, achievement goal, self-directed learning, self-regulated learning, self-competency belief, organizational culture, educational technology, lifelong learning attitudes, perceptions on lifelong learning, lifelong learning tendencies, lifelong learning skills, lifelong learning dispositions and lifelong learning competencies. In the literature review, there was not any study in teacher education that explored the factors to improve lifelong learning competencies of teacher trainers. We used the three instruments such as perception on lifelong learning, lifelong learning competencies and learning strategies together with demographic part. Multiple linear regression analysis was carried out to predict factors affecting on lifelong learning competencies of teacher trainers. The overall model fit was $R^2 = 0.73$ which means that three independent variables explained 73% of the differences in how lifelong learning competencies are acquired. According to the results, personal and professional factors, as well as gender, age, and education level, play little role in determining lifelong learning competencies. Lifelong learning competencies depends on the region they are working, how they perceive the lifelong learning and how they use learning strategies.

A socio-material framework to examine teachers' lifelong professional development trajectories
Keywords: In-service Teachers, Mixed-method Research, Qualitative Methods, Teacher Professional Development
Presenting Author: Giuseppe Ritella, University of Campania Luigi Vanvitelli, Italy; **Co-Author:**Alessio Surian, Università degli Studi di Padova, Italy

We discuss a theoretical-methodological framework to examine teachers' lifelong professional development trajectories across formal and informal learning experiences. Teachers develop their expertise through a wide range of learning activities across formal and informal contexts, often involving the use of several digital tools. Examining teachers' learning thus requires addressing the complexity of the interconnections between the digital, physical and institutional contexts where professional development takes place, the relevant social relationships established and maintained across multiple situations of learning, as well as the

virtual and material objects that the teachers manipulate when engaging in learning practices. The framework is based on the posthuman tradition that emphasizes that materials are not merely mediators of human activities but are constitutive of practice. Methodologically, we adopt a multiple case studies approach with teachers' professional stories as units of analysis. We collect data through interviews based on a life narrative approach, including the drawing of a temporally layered visual representation in addition to answering questions concerning the qualitative nature of the sociomaterial elements composing teachers' learning trajectory. The drawings can be considered as egocentric socio-material networks that can be examined by Social Network Analysis lenses triangulated with the thematic analysis of the transcripts.We conducted an exploratory analysis of 4 cases and compared the sociomaterial networks based on their dimensions, heterogeneity, density and components, as well as on the meanings that each teacher associated with different moments and elements of learning trajectories. We use illustrative examples to discuss the significance and limitations of the proposed framework.

Exploring motivation to transfer in Early Childhood Education teachers in Mexico
Keywords: In-service Teachers, Lifelong Learning, Quantitative Methods, Teacher Professional Development
Presenting Author: Carla Quesada-Pallarès, Universitat Autònoma de Barcelona, Spain; **Co-Author:**Karla Villaseñor, Benemérita Universidad Autónoma de Puebla, Mexico; **Co-Author:**Cristina Torrelles, Institut Nacional d'Educació Física de Catalunya, Spain; **Co-Author:**Carlos Enrique Silva, Benemérita Universidad Autónoma de Puebla, Mexico

Training of in-service teachers is a good strategy to maximize the quality of Early Childhood Care and Education (ECCE). In May 2021, during the covid-19 lockdown, the Puebla Ministry of Education (Mexico) offered five online courses aimed at ECCE teachers. 2,865 successfully completed the courses. Upon completion of the courses, we applied the Quesada-Pallarès et al. (2018) Transfer of Learning Factors Model to analyze the impact of individual factors on learning transfer during the covid-19 pandemic. Two instruments at different times were applied: at the end of training courses and three months later. We conducted both a Confirmatory Factor Analysis and an Exploratory Structural Equation Modelling. Results showed that most teachers were willing to transfer the learning acquired during the courses. The Model predicted that teachers would devise plans and strategies for applying the contents learned guided by their own desire to transfer. In this regard, it might be asserted that the will to transfer is steered by teachers' autonomous drive to transfer. Considering these results is key to understand teachers' learning transfer and to adjust training to their needs and willingness.

The Flow-State of Teachers and the Learning Space: The Role of the Design Conditions
Keywords: Attitudes and Beliefs, Instructional Design, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Tamir Zausmer, Tel-Hai Academic College & Golan Research Institute, Israel; **Co-Author:**Orly Dahan, Tel-Hai Academic College, Israel; **Co-Author:**Irit Sasson, Tel-Hai College, Israel

In recent years there has been growing need to adopt pedagogical changes and design new learning environments. Previous studies examined aspects relating to learning spaces mainly from a pedagogical and architectural design point of view. This study examines learning spaces from an innovative perspective of flow theory. Flow is a state in which a person is in full concentration of his/her mental abilities, causing them to be completely absorbed in his/her activity, directed at achieving peak performance. We raised three research questions: 1) what are the factors that significantly predict teachers' flow-state?; 2) do teachers' flow-state differ between learning spaces? If so, what are the differences?; and 3) how dose age affect the relationship between the learning space design conditions and teachers' flow-state? A total of 119 teachers responded to a close-ended questionnaire, sampling three types of learning spaces: traditional classrooms; innovative, open, and collaborative learning spaces; and forest education. The tracking dimension that refers to structural characteristics such as lighting, temperature, ventilation, and noise significantly predicted teachers' flow-state. Significant differences in flow levels were found between a learning environment in nature compared to traditional classrooms. The age of the teachers was found to significantly moderate the relationship between design conditions of the learning space and the dimension of cognitive control in teachers' flow-state. While the relationship is weak among young teachers, older teachers are strongly affected by low design conditions thus leading to diminishing flow-state levels within this age group.

The Effects of Age and Interactions with the Robots Dash and Dot on Students' Computational Thinking
Keywords: Computational Thinking, Instructional Design, Primary Education, Quantitative Methods
Presenting Author: Yiota H. Diakou, University of Cyprus, Cyprus; **Co-Author:**Vaso Anastasiou, University of Cyprus, Cyprus; **Co-Author:**Charoula Angeli, University of Cyprus, Cyprus

Although there has been an increased interest during the last years in integrating Computational Thinking (CT) in school curricula, the computational thinking theory is still developing (Angeli & Giannakos, 2020). Educational Robotics (ER) is increasingly used in classrooms to develop students' CT skills (Chevalier et al., 2021). However, the existing body of research does not provide robust empirical evidence of learning gains in computational thinking when using educational robotics (Angeli & Valanides, 2019). This study examined the development of CT skills of primary-school children aged 6, 9, and 12 when doing robotic activities with Dash and Dot within the context of two teaching interventions. The findings suggest that the teaching technique differentially affects children's performance in computational thinking. Also, the study reports a statistically significant interaction between the teaching intervention and children's age regarding their assessment of CT tasks. Study findings contribute quantitative evidence to the literature on how educational robotics can be used to develop computational thinking in primary students. In addition, the study has practical significance for curriculum developers, instructional leaders, and classroom teachers, as they can use the results of this study to design curricula and classroom activities with a focus on the broader set of CT skills.

Interleaving Effects in Blindfolded Perceptual Learning Across Various Sensory Modalities
Keywords: Instructional Design, Learning Strategies, Meta-analysis, Metacognition
Presenting Author: Roman Abel, Ruhr University Bochum, Germany; **Co-Author:**Julian Roelle, Ruhr-University Bochum, Germany

Research on sequence effects on learning *visual* categories has shown that interleaving (i.e., studying the categories in a mixed manner) facilitates category induction as compared to blocking (i.e., studying the categories one by one), but learners are not aware of the interleaving effect and prefer blocking. However, almost no attention has been paid to sequence effects in perceptual learning across further sensory modalities. The present (preregistered) research addresses this shortcoming by using *auditory* (birdcalls), *olfactory* (tealeaves), *gustatory* (ingredient mixtures), and *tactile* (stones) stimuli across four analogue experiments respectively. Participants studied six categories (with six exemplars respectively) either interleaved or blocked. The numerical benefits of interleaving reached in no experiment the threshold of significance. We ran a comprehensive meta-analysis based on data across experiments, which revealed a significant small effect of interleaving, demonstrating its applicability to perceptual learning across *all* sensory modalities. Learners in the interleaved condition underestimated their classification performance. Overall, learners judged interleaving not less effective than blocking, opposing previous studies that consistently demonstrated metacognitive preference of blocking. Our findings suggest that learners rely less on conventional beliefs about the effectivity of study sequence when dealing with *un*familiar (blindfolded) perceptual learning tasks.

Integration of everyday life aspects in classroom learning

Keywords: In-service Teachers, Knowledge Construction, Primary Education, Teaching/Instructional Strategies
Presenting Author: Anne-Mai Näkk, Tallinn University, Estonia; **Co-Author:**Inge Timoštšuk, Tallinn University, Estonia

In the framework of learning ecosystems, students' learning paths are diverse and include aspects of their personal lives. Learning is meaningful when one is able to connect the subject content to their everyday life and understand the context. Teachers face a challenge to create well-balanced learning situations that integrate students' lives outside the classroom and the curriculum. Moreover, Estonian middle school students have posited that learning is rather subject-centred, and they perceive little personal meaning of the learning content. In Estonia, last year primary school students are being taught by primary teachers and subject teachers, making it an important transitional period for students. During this period, teacher support is crucially important for experiences of meaningful learning, therefore our aim was to examine last year primary school students' (N = 966) perceptions of integration of everyday life aspects in classroom learning (such as practical usefulness, importance, value). Data were collected via an online questionnaire. Using hierarchical and then K-Means cluster analysis, four profiles were found including *Integrators* (20.6%), *Explainers* (29.2%), *Subject-oriented* (17.6%), and *Inconsistent* (32.6%) profile. Further results revealed that perceptions of *Integrators'* and *Explainers'* teaching practices were statistically different regarding all everyday life aspects, whereas some aspects were not perceived significantly different for *Subject-oriented* and *Inconsistent* profiles. The results contribute to the understanding of establishing a rich learning context from the perspective of students. Furthermore, the results highlight a need to emphasise the value of balancing personal contexts and curriculum in classroom teaching practices to support students' meaningful learning.

Well-being while becoming a teacher? A latent profile analysis among pre-service teachers
Keywords: Pre-service Teachers, Quantitative Methods, Teacher Professional Development, Well-being
Presenting Author:MANUELA HALDIMANN, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Tina Hascher, University of Bern, Institute of Educational Science, Switzerland; **Co-Author:**Doreen Flick-Holtsch, University of Zurich, Switzerland

Teacher well-being is becoming increasingly important not only in research (Hascher & Waber, 2021; McCallum et al., 2017) but also in education policy (Viac & Fraser, 2020). However, studies that empirically investigate the well-being of pre-service teachers are scarce (Bjorklund et al., 2021; Corcoran & O'Flaherty, 2022). The aim of the study is therefore to investigate the well-being of pre-service teachers in a multidimensional, context-specific and person-centred way. Drawing on research from the field of well-being psychology (Diener et al., 2018) and based on Hascher's (2004) six-dimensional model of scholastic well-being, we conducted a latent profile analysis among Austrian pre-service teachers (N = 3111). Results revealed four different pre-service teacher profiles. In addition, significant differences between the identified profiles in terms of resilience as well as the anticipated career satisfaction were found. The results underline the importance of conceptualizing well-being as a multidimensional construct. As individuals scored differently on the various dimensions, using a person-centred approach seems promising for analysing well-being. Impulses for the promotion of well-being during the initial teacher education are discussed.

How do trainee teacher's relationship with their mentor explain how trainees experience their work?
Keywords: Anxiety and Stress, In-service Teachers, Teacher Professional Development, Well-being
Presenting Author: Michael Goller, University of Kassel, Germany; **Co-Author:**Elisabeth Maué, University of Konstanz, Germany; **Co-Author:**Caroline Bonnes, University of Konstanz, Germany; **Co-Author:**Tobias Kärner, University of Hohenheim, Germany

The study aims (a) to identify profiles of trainee teachers in terms of their stress and work experiences and (b) to uncover profile differences in regard to dropout intention and perceived relationship between trainee teachers and their mentors. Based on data from 1,756 German trainee (in-service) teachers, three distinct stress and work experience profiles could be identified. Trainee teachers with high levels of stress and negative work experiences exhibit higher dropout intentions and experience their relationship with their mentors as less transparent, fair and trusting, and more ambivalent compared to trainee teachers with low levels of stress and positive work experiences. The results underline the importance of the relationship between mentors and trainee teachers for the professional development of future teachers.

Adaptation and Validation of a Measure of Preservice Teachers' Positive Mental Health Literacy
Keywords: Pre-service Teachers, Teacher Professional Development, Tool Development, Well-being
Presenting Author: Ma. Jenina N. Nalipay, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Ching-Sing Chai, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Morris Siu-yung Jong, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Ronnel Bornasal King, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Imelu G. Mordeno, Mindanao State University-Iligan Institute of Technology, Philippines

Mental health promotion is increasingly being recognized as an important teacher competency. Hence, teachers should have sufficient mental health literacy (MHL). However, most MHL research and programs for teachers focus on their knowledge of mental disorders, while very few have explored teachers' positive mental health knowledge. To address this limitation, we adapted and validated a measure of positive MHL, the Mental Health-promoting Knowledge Scale (MHPKS), for preservice teachers. The sample included 470 Filipino preservice teachers. Results of confirmatory factor analysis supported both the 1- and 3-factor (i.e., autonomy, competence, and relatedness-promoting knowledge) models of MHPKS. Positive relationships with knowledge of mental disorders, well-being, and teaching engagement and satisfaction were found, indicating construct validity. MHPKS is a valid tool that can be used to measure preservice teachers' positive MHL.

Immersive Virtual Reality as a pedagogical tool for climate change education

Keywords: Environmental Education, Immersive Technologies for Learning, Instructional Design, Secondary Education
Presenting Author: Valdemar Stenberdt, University of Copenhagen, Denmark; **Co-Author:**Guido Makransky, University of Copenhagen, Denmark

The rapid digitalization following COVID-19 necessitates best-practice knowledge on how to use pedagogical tools such as Immersive Virtual Reality (IVR). At the same time, to deal with climate change, we require new ways to embed climate change education in formal education. The current paper explores the use of an IVR simulation on waste management for climate change education. A total of 134 high school students participated in a preregistered intervention investigating the impact of IVR on knowledge and intentions to act pro-environmentally. A 2x2 design was used to compare the type of instruction (Direct Instruction vs. Productive Failure), and type of feedback (Corrective Feedback vs. Exaggerated Feedback). Results indicated that IVR was effective for increasing students' knowledge (η^2 = .38), intentions (η^2 = .14), self-efficacy (η^2 = 0.42), and response efficacy (η^2 = 0.32), and students found the simulation interesting and enjoyable. This suggests that IVR can be an effective pedagogical tool for learning about climate change. Furthermore, interest was found to predict knowledge (B = 0.532, p = .001), self-efficacy to predict intentions (B = 0.396,p = .033), and response efficacy to predict transfer (B = 0.208,p = .018), supporting claims that cognitive and affective factors drive the effectiveness of IVR. No significant differences were found in the effectiveness of the pedagogies, which might suggest boundary conditions of how and when to apply these pedagogies in IVR, calling for more research on when and how they are effective.

Meta-re-analyses of cross-cultural learning strategies in higher education
Keywords: Higher Education, Learning Approaches, Learning Strategies, Multicultural Education
Presenting Author: Alex Shum, The University of Hong Kong, Hong Kong; **Co-Author:**Luke Fryer, University of Hong Kong, Hong Kong; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands; **Co-Author:**Clara Ajisuksmo, Atma Jaya Catholic University of Indonesia, Indonesia; **Co-Author:**Francisco Cano-Garcia, University of Granada, Spain; **Co-Author:**Vincent Donche, University of Antwerp, Belgium; **Co-Author:**Dennis Law, Caritas Institute of Higher Education, Hong Kong; **Co-Author:**Reinaldo J. Martínez-Fernández, Universitat Autónoma de Barcelona, Spain; **Co-Author:**Peter Van Petegem, University of Antwerp, Belgium; **Co-Author:**Ji Yu, Tsinghua University, China

Research investigating the use of processing and regulation strategies across different cultures can shed light on the internationalisation of teaching and learning. Previous cross-cultural studies investigated limited representative samples and relied on geographical stereotypes. Published and unpublished ILS (Inventory of Learning patterns of Students) learning strategy datasets (eight total, seven countries, n=4882) were (re-)analysed. Hofstede's individualism-collectivism (IDV), and power-distance (PDI) country-level indices were employed as cultural indicators. Variable-centred and person-centred (Latent Profile Analysis; LPA) analyses confirmed that contexts corresponding to higher-power-distance and lower-individualism index values reported greater mixed use of meaning-directed and reproduction-directed strategies. Sample-level LPAs revealed different patterns and preferred processing and regulation strategies among profiles of higher-individualism, and lower-power-distance contexts. Four subgroups were found across a mass-LPA over all datasets: Versatile-Achievement, Meaning-Application, Reproduction, Undirected-Problematic. Substantial membership of "Western" countries in Versatile-Achievement subgroup questions the validity of geographical (e.g., Asian) learner stereotypes. Implications are discussed.

Effects of Augmented Reality on knowledge acquisition in learning eye diseases: A mixed-method study
Keywords: Educational Technologies, Immersive Technologies for Learning, Mixed-method Research, Simulation-based Learning
Presenting Author: Juming Jiang, The University of Hong Kong, Hong Kong; **Co-Author:**Anakin Chu Kwan Lai, The University of Hong Kong, Hong Kong; **Co-Author:**Yau Kei Chan, The University of Hong Kong, Hong Kong

With limited manpower and the impact of the COVID-19 pandemic, there is an urgent need for medical schools to integrate new pedagogical methods into the curriculum to maximize teaching and learning efficacy. Augmented reality (AR) technologies could provide opportunities for students to experience how patients feel living with the disease and the inconvenience that comes with it, which could help students gain a deeper understanding of diseases and the difficulties that patients might face in daily life. However, the use of such technologies is still limited in general medical education, not to mention those that are specifically focusing on teaching about eye diseases. To fill in such a gap, present research used a newly developed AR programme that can simulate the visual symptoms of various eye diseases, and examined its effect on medical students' knowledge acquisition in learning visual symptoms of eight eye diseases in a quasi-experimental setting. Fifty-three undergraduate students from healthcare-related disciplines in a university in Hong Kong without receiving any education relevant to visual symptoms of eye diseases participated in the study. Results show that AR intervention in present research had a large effect on knowledge acquisition in all eye diseases, and the majority of participants had a good understanding of patients' difficulties after the AR intervention. With a careful longitudinal experimental design in the future, more potentials of this AR application could be discovered.

Learning Factories as new Learning Environments in Vocational Education and Training
Keywords: Educational Technologies, Learning Approaches, Simulation-based Learning, Vocational Education and Apprenticeship Training
Presenting Author: Sebastian Anselmann, University of Education Schwäbisch Gmünd, Germany; **Co-Author:**Uwe Faßhauer, University of Education Schwäbisch Gmünd, Germany; **Co-Author:**Lars Windelband, Karlsruhe Institute of Technology (KIT), Germany

Learning factories function as complex simulations of real work and production processes, and in particular in order to be able to develop vocational competencies in an "Industry 4.0 typical" skilled work. In this context, learning factories represent cyber-physical systems that are to be designed at vocational schools as both a traditional learning space (learning lab) and a virtual/digital learning space ("digital twin"). This proposal reflects on learning spaces and the development of learning factories in vocational education in Germany, with the aim of laying a first scientific foundation for an explorative descriptive survey on learning factories. Learning factories are considered promising and methodologically highly complex learning spaces, whose components and applications have nevertheless hardly been empirically and comprehensively studied. The instrument presented here represents a first step in successively descriptive and investigative research on learning factories in vocational schools. With 41 items in an online based descriptive questionnaire, the main part of the survey aims at the design of the learning factories, didactic-methodical implementation in the learning process, the process design of the learning factory as well as the degree of digitalization. Within the scope of the survey, the lead actors of each vocational school learning factory were specifically interviewed. In the nationwide survey 75 vocational schools with learning factories took part.

A computerized linguistic analysis of sociomoral language in students' Flipgrid videos
Keywords: Citizenship Education, Developmental Processes, Educational Technologies, Emotion and Affect
Presenting Author: Ziye Wen, The Ohio State University, United States; **Co-Author:**Tzu-Jung Lin, The Ohio State University, United States; **Co-Author:**Michael Glassman, The Ohio State University, United States; **Co-Author:**Shantanu Tilak, The Ohio State University, United States; **Co-Author:**Wonjoon Cha, The Ohio State University, United States; **Co-Author:**Yue Sheng, The Ohio State University, United States; **Co-Author:**Saetbyul Kim, The Ohio State University, United States; **Co-Author:**Monica Lu, The Ohio State University, United States

In this study, we used a computerized text analysis tool to understand the use of logic-oriented language, emotion-oriented language, and sociomoral language derived from 662 Flipgrid videos produced by 120 fourth and fifth graders in social studies classrooms using Flipgrid is an online video-based discussion platform resembling an education version of video-based social media platforms, and was designed to facilitate asynchronous video-based social interactions focusing on complex social issues. In accordance with Eisenberg and Vygotsky's ideas on the role of cognition/logic and emotion in sociomoral development, we explored how the use of logic- and emotion-oriented language predicted the use of sociomoral-oriented language, and the interaction effect of developmental levels on logic- and emotion-oriented language use. Results showed that fifth graders benefited more by involving logic-oriented language into reasoning to proceed with sociomoral topics than fourth graders, while emotion-oriented language played a supportive role in use of spoken sociomoral language irrespective of grade level. Our analysis provided insights into the mechanisms behind spoken expression to highlight the social nuances of such forms of communication. The current findings present our measurement efforts for validating corpus-based indices of logic-oriented, emotion-oriented, and sociomoral languages in social studies classrooms, and for understanding how to design multimodal technology-assisted social studies curricula spurring sociomoral reasoning.

Learning from dialogues and video annotation: A design experiment in teacher education.
Keywords: Dialogic Pedagogy, Educational Technologies, Higher Education, Social Aspects of Learning and Teaching
Presenting Author: Anki Strom, University of South-Eastern Norway, Norway

Teacher students comprise an increasingly diverse student population, that bring a plurality of cultural and linguistic backgrounds into the university. This means that opportunities to meaningfully relate to an advanced academic discourse is unequally distributed among the students. This study addresses this issue by investigating how social organization and technology may support teacher students' argumentation skills. We explore the use of a video annotation tool that allows first-year teacher students to connect situated actions in video clips to relevant concepts in course literature. The findings show how students interact with the video annotation tool and how and if the activity contributes to support relevant reasoned argumentation.

The implementation of formative assessment in inclusive mathematics instruction
Keywords: Assessment Methods, Inclusive Education, Mathematics/Numeracy, Secondary Education
Presenting Author: Kyra Renftel, Leuphana University Lueneburg, Germany; **Presenting Author:**Fynn Töllner, Leuphana University of Lueneburg, Germany; **Co-Author:**Michael Besser, University of Lueneburg, Germany; **Co-Author:**Poldi Kuhl, Leuphana Universität Lüneburg, Germany

Successfully implementing frequent diagnostics and feedback of students' individual and heterogeneous learning processes as central element of formative assessment has become a major issue in (inclusive) education. Based on this, the current paper presents and discusses the results of six expert interviews with teachers of inclusive education at secondary school in Germany, exploring questions about the implementation of diagnostics to accompany the learning process and feedback to promote learning in inclusive mathematics classrooms. The results show that there is a major lack in the implementation of such diagnostics and feedback, underscoring the importance of appropriate materials to support teachers' diagnostics and feedback skills.

The 'ToPPERS' framework of effective teaching principles in prevocational education
Keywords: At-risk Students, Inclusive Education, Secondary Education, Teacher Effectiveness
Presenting Author: Charlotte Arnou, KU Leuven (BE), Belgium; **Presenting Author:**Heline Van Peteghem, Vrije Universiteit Brussel, Belgium; **Co-Author:**Nadine Engels, Vrije Universiteit Brussel (VUB), Belgium; **Co-Author:**Ingeborg Placklé, Vrije Universiteit Brussel, Belgium; **Co-Author:**Machteld Vandecandelaere, KU Leuven, Belgium

Since basic literacy is an essential skill for active participation in society and working life, it is problematic that many learners do not reach basic literacy levels. Furthermore, the increasing diversity of students entering prevocational education creates a challenging context for teachers. In order to effectively educate low-achieving, struggling students, a powerful learning environment (PLE) is crucial. Currently, knowledge on the characteristics of PLEs in prevocational education is lacking. The aim of this study was to close this knowledge gap using a best fit framework synthesis as a systematic literature review to identify important teaching principles that empirical research has shown to be effective in designing PLEs for prevocational education. The systematic review resulted in a framework: Teaching Principles for Powerful Education for sTruggling Students (ToPPERS). ToPPERS consists of twelve principles, categorised into three separate gears that a teacher and their team can use to create PLEs for struggling students in prevocational education. The first gear represents the importance of 'A safe, supportive and positive learning environment', where the student and the class group are at the centre of learning and teaching. The second and third gears illustrate that the 'teacher as a facilitator' and 'the teacher team' are key to get the gears turning. It is important to acknowledge that each principle is mutually dependent and cannot be separated from each other. Furthermore, the gears move in a systemic way, meaning that if one moves, all move, but if one stops moving, the others are hindered as well.

Whole Person Research Productivity: Towards a More Equitable Higher Education Research Environment
Keywords: Educational Policy, Higher Education, Inclusive Education, Researcher Education
Presenting Author: Crishana Benton, University of North Florida, United States; **Co-Author:**Daniel Dinsmore, University of North Florida, United States

There is increasing interest about the experiences of academics within the higher education space. Previous efforts surrounding faculty issues have centered on research productivity (e.g., Ramsden, 1994). However, with the emerging need to ensure representation for diverse student populations, we reimagine Ramsden's initial definition of productivity. Even greater significance for this study is held in a time of educational uncertainty and instability with a nationwide shortage of educators at all levels in the United States. To recruit and retain faculty of color, predominately white institutions (PWI's) faculty must examine their gatekeeping mechanisms. Given that departmental research productivity often holds major significance for an institution's overall ranking, we wanted to explore if and how research productivity might act as one of these gatekeeping mechanisms.

An individual behavioral intervention in Finland and Greece: A single case experimental study
Keywords: Inclusive Education, Primary Education, Quantitative Methods, Special Education
Presenting Author: Mika Paananen, University of Jyväskylä, Finland; **Presenting Author:**Henrik Husberg, University of Helsinki / Niilo Mäki Institute, Finland; **Co-Author:**Anne Karhu, University of Eastern Finland, Finland; **Co-Author:**Athanasios Gregoriadis, Aristotle University of Thessaloniki, Greece; **Co-Author:**Sara Pöntinen, Niilo Mäki Institute, Finland; **Co-Author:**Hannu Savolainen, University of Eastern Finland, Finland

This single-case experimental design (SCED) study aimed to explore the effectiveness of the CICO intervention for students with problem behavior in the Finnish and Greek educational context. Also, the usability of CICO intervention was evaluated. CICO intervention was the first level individual support for the students who did not achieve the behavioral goals set for the universal support. This study is part of larger school-wide positive behavior support (SWPBS) interventions in four European countries.Participating schools from the two countries (N=8) had developed their universal level PBS practices, defined behavioral expectations and trained teachers to use positive behavior specific praise. This study describes the efficacy of the CICO intervention as the first level individual support for 12 participants, mostly with aggressive, noisy, impulsive, and hyperactive behavior. Baseline and intervention phase data were collected and evaluated in a series of single-subject AB designs. During baseline and intervention phases, teachers used daily report cards to assess students' progress in individually defined behavioral goals. The intervention lasted 7-11 weeks. Both visual and statistical analyses were conducted. Visual inspection, and Tau-U values as effect sizes from the daily data showed that all participants improved their behavior in the expected direction. However, according to Tau calculations, not all results indicated a statistically significant intervention effect. Social validity and fidelity ratings indicate good usability of the CICO intervention in both countries. This study shows encouraging results, suggesting that CICO support is potentially effective intervention in multitiered PBS schools in European cultural contexts.

School inclusion 2014 and 2022: How do teachers' behavioral intentions and attitudes change?
Keywords: Attitudes and Beliefs, Inclusive Education, Self-efficacy, Teacher Professional Development
Presenting Author: Henrike Mentel, WWU Muenster, Germany; **Co-Author:**Natalie Foerster, University of Münster, Germany; **Co-Author:**Elmar Souvignier, University of Muenster, Germany

A major structural change in the German school system in the last decade concerns the realization of the UN-CRPD and the inclusion of children with special needs in the classroom. Teachers' individual characteristics play a crucial role for inclusive behavior and realizing inclusion in schools (e.g. Savolainen et al.,

2012) as well as school conditions (e.g. Woodcock & Woodcock, 2019). School conditions for implementing inclusion have changed in recent years (Gasterstädt, 2021; Klemm, 2022), which in turn seems to affect teachers' characteristics (Urton et al., 2014). We used the Theory of Planned Behavior (Ajzen, 1991) to investigate teachers' attitudes, subjective norm, self-efficacy and behavioral intentions in inclusive contexts. This study examines changes in the TPB predictors, changes in their relationship with the behavioral intention and the influence of school conditions. In an online survey, teachers were asked about their attitudes, subjective norm, self-efficacy, behavioral intentions and school conditions. We compare data with same measures from 2014 and 2022 (data collection ongoing). 2014 attitudes (M=2.44), subjective norm (M=2.88) and self-efficacy (M=2.60) were found to be in the mid-range of scales. Attitudes significantly predicted the behavioral intention (β=.60), which in turn was influenced by schools' environmental, financial/personal resources (β=.36) and cooperation (β=.29). Temporal changes will be investigated using a multi-group latent SEM analysis. The results will provide valuable input for interventions and shed light on the influence of external conditions on behavioral intentions and their predictors.

Do you Belong at your University? Belongingness and Authenticity in Higher Education
Keywords: Achievement, Higher Education, Inclusive Education, Quantitative Methods
Presenting Author: Anne-Roos Verbree, University Medical Center Utrecht, Netherlands; **Co-Author:**Gönül Dilaver, University Medical Centre Utrecht, Netherlands; **Co-Author:**Leoniek Wijngaards-de Meij, Utrecht University, Netherlands; **Co-Author:**Marieke van der Schaaf, University Medical Center Utrecht / Utrecht University, Netherlands

Higher education students differ in their sense of belonging, which means the extent to which they feel comfortable in the classroom and experience support from faculty members and their peers. Underrepresented students may have less sense of belonging. However, it is currently unclear which student groups experience less sense of belonging than their peers. It is also unclear whether students experience that other students value their uniqueness or authenticity. This is important as sense of belonging and authenticity may impact student performance and functioning. This study employs a survey research design and, using a large sample of university students, comprehensively examines students' sense of belonging and authenticity based on multiple student characteristics. This includes students' gender, sexual orientation, ethnic background, religion, disabilities, parental education, whether a student is a member of a (student) organization, study phase, and major. In addition, it is examined whether students' sense of belonging and authenticity are related to self-reported academic achievement. Research is relevant both to address the gaps in the literature on sense of belonging and to provide practitioners in higher education with insights into which student groups may need extra attention to make them feel at home and be successful in higher education. Eventually, this may increase equality in educational opportunities for *all* students.

Balancing educational theory and teacher's input in designing teacher dashboards.
Keywords: Learning Analytics, Self-regulated Learning and Behaviour, Synergies between Learning / Teaching and Research, Tool Development
Presenting Author: Susan Janssen, Radboud University Nijmegen, Netherlands; **Co-Author:**Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands; **Co-Author:**Anouschka van Leeuwen, Utrecht University, Netherlands; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands

Artificial intelligence (AI) is reshaping the world in profound ways, including education. Technology has found its way into the classroom through AI applications, such as adaptive learning technologies but also in teacher dashboards that make results from AI algorithms insightful for teachers. The design of these teacher dashboards has been increasingly influenced by both educational theory and the input of stakeholders (teachers). These two views can complement each other. For example, educational theory can guide the design process by providing knowledge of theory and teachers can share their professional knowledge and experiences. However, when input from educational theory and stakeholders is integrated into the design process, potential tension may arise when this input leads to different insights for the teacher' dashboard design. This creates challenges in the co-design process of teacher dashboards. Given that the degree of usability of the dashboard depends on the balance between educational theory and the input of teachers, this roundtable aims to discuss good practices for co-design of teacher dashboards. During the round table, we will present our first experiences with these challenges in the co-design process of an SRL teacher dashboard and invite participants to share their best-practices.

Teaching information evaluation in self-paced e-learning mode: is distributed practice helpful?
Keywords: Comprehension of Text and Graphics, Critical Thinking, E-learning/ Online Learning, Self-regulated Learning and Behaviour
Presenting Author:Mônica Macedo-Rouet, CY Cergy Paris Université, France; **Co-Author:**Jean-Marc Meunier, Université Paris 8, France; **Co-Author:**Anna Potocki, Université de Grenoble, France; **Co-Author:**Jean-Francois Rouet, University of Poitiers, France

For two decades, higher education institutions have developed innovative forms of distance learning, banking upon the affordances of the Web 2.0 for online information access, networking and communication. At the same time, the spread of misinformation on the internet has increased the need to educate students for a critical appraisal of information quality and credibility online. The present study investigates the efficiency of an intervention on information evaluation delivered in self-paced e-learning mode to undergraduate students enrolled in a distance education program. Participants complete two interactive modules and practice exercises with partly automated feedback, via a Moodle course page and a dedicated platform, self-regulating their time on tasks. We expect distributed practice to be positively associated with evaluation performance in the intervention group compared to a business-as-usual condition. Data were being collected at the time of submission.

Supporting teachers' interpretation of multimodal learning analytics to assess student engagement
Keywords: Learning Analytics, Pre-service Teachers, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies
Presenting Author: Megan Wiedbusch, University of Central Florida, United States; **Co-Author:**Roger Azevedo, University of Central Florida, United States

Educators must adapt and improvise their instruction for each student's unique needs and capabilities across contexts by observing their students, evaluating their ongoing learning, and offer individualized scaffolding and feedback to foster sustained growth and development. The recent emphasis for data-driven instructional decision making further requires teachers to become both pedagogical and data experts who are capable of navigating and utilizing teacher dashboards to do so. While dashboards are increasing in popularity, we emphasize the need to understand educator data literacy and how educators are currently approach multimodal learning analytics (MMLA) that report on more than just performance-based outcomes. That is, are teachers capable of utilizing the sophisticated data visualization and analytics researchers are developing? And if so, under what conditions do they consult these visualizations and analytics to make real-time decisions about their instruction? In this on-going work, we describe the development of an in-progress study exploring how teachers currently use fictious MMLA on self-regulated learning (SRL) processes to interpret levels of student engagement and the emerging trends we see from their data. Finally, we postulate what these results suggest about the needs that embedded intelligent pedagogical companions may fill in future dashboard and agent design.

Selecting Didactic Templates for Optimizing Online Education
Keywords: Achievement, E-learning/ Online Learning, Instructional Design, Teaching/Instructional Strategies
Presenting Author: Emre Yilmazturk, Open University, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Kevin Ackermans, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Desirée Joosten-ten Brinke, Open University of the Netherlands, Netherlands; **Co-Author:**Gino Camp, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Much is known from research about how evidence-based pedagogy (such as activating relevant prior knowledge) supports the learning process and what the effects are on learning (e.g., Surma et al., 2019). However, this knowledge is not used by teachers in a systematic way to shape education, especially not in an online course setting (Rapanta et al., 2020). One way of promoting the systematic use of evidence-based pedagogy in educational courses is providing teachers with didactic templates (Dobbs et al., 2009). Didactic templates are preset formats that help teachers to choose and implement particular forms of evidence-based pedagogy for their online course(s) based on academic insights. Teachers using didactic templates can efficiently arrive at an evidence-informed course structure that will impact the quality of their online education (Roksa et al., 2017). During the roundtable, I will briefly present several forms of evidence-based pedagogy rooted in cognitive psychology. I will then discuss with the participants which of these are essential for designing evidence-informed didactic templates, and how their implementation in an online learning environment can make sense for teachers as course developers. The insights gained from the roundtable discussion will be used in further shaping and prioritizing the designs of didactic templates in our design-based research.

ForgetNot – a digital tool for informing teaching and enhancing retention

Keywords: Educational Technologies, Engagement, Teacher Professional Development, Teaching/Instructional Strategies
Interest group: SIG 14 - Learning and Professional Development

Student engagement in learning activities is essential for efficient learning and retention, and therefore one of the main focuses of educators. However, research indicates that around 23% of the class time students only pretend to be engaged in classroom activities (Fuller et al., 2018) and teachers do not have evidence about how much of the class time their students actually actively participate in the study tasks. Also, cognitive-science research on how students learn stresses the importance of distributed retrieval practices, which help to retain information in long-term memory. However, most of the school lessons are spent on learning (i.e. coding) new material, while little attention is paid to practices that help to retain the obtained material. This leads to mass learning and short-term retention, which helps to pass tests but is not sustainable in terms of mastering a topic or a subject. The ForgetNot tool was designed to address these problems to a certain extent. Namely, the tool provides possibilities for the collection of fast student feedback on their engagement in classroom activities, as well as enhances long-term retention, through providing possibilities for distributed retrieval practice, as it enables the distribution of (practice) test questions in smaller chunks on different days.

Building Blocks: An adaptive online platform for foreign language literacy development

Keywords: Computer-assisted Learning, Foreign and Second Language Acquisition, Game-based Learning, Reading
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.Despite the importance of sound-letter connections in learning English as a foreign language, adaptive digital tools using marking cross-linguistic difficulties have not yet been developed for the foreign language learning environment. To remedy this issue, we have developed an integrated oline assessment instrument for (a) testing acquired spelling ability in line with local and national curricula; (b) creating data driven longitudinal developmental models for phonemic awareness acquisition; and (c) modeling motivational changes using the software tools. Software tools have been developed within Japan and Hong Kong in order to test sound-letter acquisition for both opaque and semi-transparent orthography L1 learners. This project aims to provide public elementary schools in Asia and beyond with a tool for improving motivation to read English by providing level appropriate sound-letter instruction.

Invited Symposium
Learning and Instructional Technology

A Multi-Disciplinary Perspective on Immersive Virtual Reality Learning and Instruction

Keywords: Cognitive Skills and Processes, Ethics, Eye Tracking, Immersive Technologies for Learning, Instructional Design, Multimedia Learning, Pre-service Teachers, Self-regulated Learning and Behaviour, Simulation-based Learning
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Vincent Hoogerheide, Utrecht University, Netherlands
Organiser: Andreas Lachner, University of Tübingen, Germany
Organiser: Vincent Hoogerheide, Utrecht University, Netherlands
Organiser: Salome Wagner, University of Tübingen, Germany
Discussant: Tina Seufert, Ulm University, Germany

Virtual reality (VR) technology is increasingly being used in education to create immersive and interactive learning experiences. Despite technological advances and high hopes, the use of VR for educational purposes comes with serious challenges. For instance, immersive VR is not always that effective because its benefits depend on the degree to which the instructional design guidelines match the affordances of the technology. There are also important privacy considerations when people want to use VR in education. This symposium uses a multi-disciplinary perspective with the aim of optimizing the use and effects of using immersive VR for learning and instruction. The first two contributions focused on the student perspective. Johnson-Glenberg et al. (cognitive science perspective) had students manipulate content in immersive VR and examined whether metacognitive prompting would help students' self-regulated learning and learning outcomes. Effects on EEG and pupil dilation were explored. Plechatá et al. (instructional design perspective) examined if the effects of immersive VR on behavioral change depend on whether participants experienced climate change scenarios or were instructed about climate change by a virtual instructor. The third contribution by Huang et al. (teacher education perspective) focused on the teacher perspective, by using VR with an eye tracker to uncover preservice teachers' movement patterns and visual attention in immersive VR. Lastly, the contribution by Kasneci and Bozkir (computer science perspective) discusses the important issue of privacy in educational immersive VR settings. Theoretical and practical considerations are discussed.

Encouraging Learners in VR to be More Reflective and Metacognitive
Presenting Author: Mina Johnson, Arizona State University, United States; **Co-Author:**Shin-Phing Christine Yu, Department of Psychology, Arizona State University, United States; **Co-Author:**Anoosh Kapadia, School of Computing and Augmented Intelligence, Arizona State University, United States; **Co-Author:**Augustine Bennet, School of Speech and Hearing Sciences, Arizona State University, United States

The team at the Embodied Games Lab, with professors from the Mechanical and Structural Engineering departments, have created an engineering lesson in immersive virtual reality (VR) on Tuned Mass Dampers. Dampers are important to attenuate sway in tall buildings that can be excited by earthquakes. The phenomenon is three-dimensional and lends itself to learning in 3D immersive VR. Learners interact with multiple variables in an embodied manner (e.g., shaking a hand controller to create a sine wave that causes an earthquake). Learners explore variables and constraints on building design and damper mechanics. The content is abstract and complex. We know that giving learners metacognitive prompts aids them in comprehension; this has been seen in real-world small groups (Palincsar & Brown, 1984) and with educational videogames (Geden et al., 2020). The goal is to understand how encouraging learners to pause and reflect during the lesson will affect their knowledge gains and cognitive load. A randomized control trial with college students is being run. Undergraduate participants are assigned to either a control condition (low-agentic metacognitive room) or an experimental condition (high-agentic metacognitive room). Preliminary data on biometrics (EEG and pupil dilation) and learning gains will be presented. The hypothesis is that those who were active the three times they were teleported to the metacognitive room and created artifacts will show greater cognitive load, but also greater learning gains. This is in line with the desirable difficulties literature.

Impact of an Experience vs.Information-Based VR Educational Simulation on Green Behavior
Presenting Author: Adéla Plechatá, University of Copenhagen, Denmark; **Co-Author:**Marijke Hiltje Hielkema, Department of Food Science, University of Copenhagen, Denmark; **Co-Author:**Lisa Marie Merkl, Department of Marketing & Consumer Behaviour, University of Bayreuth, Germany; **Co-Author:**Michael Bom Frøst, Department of Food Science, University of Copenhagen, Denmark; **Co-Author:**Guido Makransky, University of Copenhagen, Denmark

Immersive virtual reality (VR) provides the possibility to experience educational content rather than just being passive recipients. In terms of environmental communication, such first-person interactive experiences can be more effective in increasing people's perceived behavioral control over the climate change consequences, i.e., efficacy beliefs, and consequently in promoting pro-environmental behavior (PEB). To study how such a shift from information-based to experienced-based education might change the environmental communication effectiveness, we randomly assigned $N = 167$ participants to a VR experience condition or VR information condition. In the VR experience condition, participants experienced and influenced future climate change scenarios based on their food choices while participants in the VR information condition received the same information from a virtual human. After the VR intervention, participants were offered a meal, and had to choose between three options: beef Bolognese, 50% reduced Bolognese, and vegetarian Bolognese. The VR experience condition led to higher intentions to reduce meat consumption ($r = .20$, $p = .011$) and more PEB in VR ($r = .17$, $p = .028$) and real life ($d = 0.32$, $p = .040$) as compared to the information condition. Mediation analyses confirm that experiential VR environmental education can increase people's efficacy beliefs, which increase their intentions and consequently leads to a reduction in beef consumption. These results indicate that VR interventions benefit from an instructional design that promotes experience-based, rather than verbal instruction in order to successfully increase users' efficacy beliefs and influence their real-life behavior.

Uncover Teachers' Movement Patterns in Immersive VR: Relevance for Visual Attention Performance
Presenting Author: Yizhen Huang, University of Potsdam, Germany; **Co-Author:**Eric Richter, University of Potsdam, Germany; **Co-Author:**Thilo Kleickmann, Kiel University, Germany; **Co-Author:**Dirk Richter, University of Potsdam, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany

Movements and eye movements are closely linked when people navigate a space to perform tasks, such as teaching in a classroom. Teachers' movement characteristics may thus be related to their noticing of relevant classroom events, specifically visual attention to student disruptions in the current study. We investigated this question with an immersive virtual reality (IVR) classroom due to its ability to track both movement and eye movement in a standardized classroom environment. Based on time series data gathered during 21 preservice teachers' instructions, we conducted K-means clustering with movement features. Three distinctive patterns were identified which we labeled as immobile, anchored, and dynamic movement pattern. Dynamic teachers visited locations further away from the teacher's desk and spent less time dwelling in any location. Dynamic movement pattern was also associated with the best visual attention performance—number of fixations on and fixation speed to disruptions in the classroom. Our findings demonstrated that there are unique and differentiable movement patterns among preservice teachers that have implications for teacher noticing/professional vision, teacher–student interaction and instructional quality.

Privacy in Educational Virtual Reality: Challenges for Educational Practices
Presenting Author: Efe Bozkir, University of Tuebingen, Germany; **Co-Author:**Enkelejda Kasneci, Technical University of Munich, Germany

The recent advancements in sensor technologies and artificial intelligence have significantly impacted the utilization of virtual reality (VR) in education. Eye tracking, as an interaction technique, offers a non-invasive means of engagement as well as a deeper comprehension of human visual attention and cognitive processes in VR, facilitated by integrated eye trackers in head-mounted displays. Nonetheless, the employment of VR, especially with integrated eye-tracking, also raises privacy concerns. This contribution discusses recent research in the domains of eye tracking, VR, and privacy in education. With a special focus on eye-tracking in educational VR settings, we encompass current computational approaches to preserve the privacy of eye-tracking data in VR.

Invited Symposium
Teaching and Teacher Education

Teacher learning about and through dialogue and argumentation

Keywords: Argumentation, Dialogic Pedagogy, In-service Teachers, Pre-service Teachers, Social Aspects of Learning and Teaching, Teacher Professional Development
Interest group: SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Christa Asterhan, Hebrew University of Jerusalem, Israel
Discussant: Fritz C. Staub, University of Zurich, Switzerland

Educational research provides robust theories and empirical findings about student learning through dialogue and argumentation and about the role of teacher facilitation and support of these processes. Yet, despite this impressive body of knowledge and numerous intervention programs that have tried to translate it into practice, dialogue and argumentation are still not commonplace in most classrooms. Research on professional development (PD) initiatives has traditionally focused on the effectiveness of particular PD designs to change classroom practice and student outcomes, but less so on the processes of teacher sensemaking and learning that mediate these associations (Horn & Garner, 2022). Thus, whereas teachers play a pivotal role and are the primary target of intervention and PD initiatives, as well as the ones who are expected to carry out the intended changes in practice, they are typically positioned as the “vehicles” (or obstacles) of change, rather than as the object of study. In this symposium, we propose that more focused research attention on teacher sensemaking processes while learning about argumentation and dialogue could provide important insights. This type of research requires the development of new conceptual frameworks for teacher learning, as well as adequate research methods and tools to capture different processes and outcomes. The four presenters in the present session each lead ongoing research and development efforts in this relatively new field of scholarly interest. They share their latest conceptual, methodological and empirical insights, while focusing on different professional learning settings and aspects. Fritz Staub will lead the discussion.

What’s wrong with professional development for dialogic teaching?
Presenting Author: Adam Lefstein, The Hebrew University of Jerusalem, Israel

Changing teaching practice is difficult. This difficulty is especially acute in the case of dialogic teaching, which intensifies the complexity of teaching, often requires shifts in teachers’ beliefs, and increases the demands on teachers’ skills, knowledge, flexibility and judgement. Developing dialogic teaching is therefore a formidable challenge for the individual teacher, and can sometimes appear an insurmountable task for educational improvers who seek to enact dialogic teaching in a sustainable manner and on a wide scale. In this conceptual paper I discuss the challenges dialogic teaching poses for teachers, schools and systems, and the strengths and shortcomings of popular teacher professional development designs for addressing these challenges. I argue for an approach to professional development for dialogic teaching that emphasizes the development of epistemic and social infrastructures to support teacher learning and practice, routines for ongoing discussions of problems of practice, and mutual adaptation of program designs.

Developing transformative tools for teacher and classroom dialogue for learning
Presenting Author: Riikka Hofmann, University of Cambridge, United Kingdom

While research suggests that dialogic pedagogy drawing on students’ ideas can improve learning outcomes, changing practice is often challenging even after effective teacher professional development, hindering scalable change. Research identifies several key mechanisms that hinder change towards more dialogic classroom practices. Teachers often hold deficit models of students, assuming dialogic ideas will not work in their setting, stopping them from trying those. Classroom practices are also strongly shaped by sociocultural norms which extend beyond individual teachers and can distort change or make it superficial. Besides, teachers' perceptions of accountability can also enact against implementing dialogic practices. This presentation will discuss the nature of these barriers and share insights from our research of ways to overcome them through effective professional learning. The presentation will examine and illustrate the need for teacher professional dialogues as a source of learning. Productive professional dialogues which can support change in classroom interactive practices will need to consider the following: Firstly, expanding teachers’ conceptualisations of students through Reflexive noticing (Rainio & Hofmann, 2021); secondly, focusing on the invisible classroom norms and their role in enabling change (Hofmann & Ruthven, 2018); and finally, scaffolding practitioners in articulating desired outcomes to link dialogic practices with existing accountabilities (Hofmann & Ilie, 2021). The presentation will conclude by illustrating a learning tool which embodies these research findings.

Arguments about Facilitating Argumentation: Teachers’ Schemas about Dialogic Pedagogy
Presenting Author: Sherice Clarke, University of California, San Diego, United States; **Co-Author:**Sushil S, University of California San Diego, United States; **Co-Author:**Katherine Dennis, University of California San Diego, United States

Teachers play a critical role in creating meaningful opportunities to learn through science discussions. Prior work has highlighted the challenges in supporting development of teachers’ knowledge of argumentation and transformation of pedagogical practice as a consequence. In this paper we report on data from a 5-year design-based research project that focuses on supporting teacher growth in facilitating science discussions. Focus particularly on *teachers’ schemas*, we focus on teachers’ sensemaking and decision making about facilitating science argumentation discussions. These are the logical reasoning that tethers what is salient about practice in reflections, what meanings they make from representations of practice and decision making in practice. We examine teachers’ schemas in the context of professional development and their instantiation in their classroom facilitation of science discussion. The findings highlight the ways in which teachers’ schemas and ideologies are a substrate for professional learning, and an opportunity for design for professional development.

Promoting productive classroom talk in teacher interventions – A matter for pre-service teachers?
Presenting Author: Alexander Groeschner, Friedrich Schiller University Jena, Germany

Productive classroom talk is a pedagogy that breaks away from interaction patterns that are predominantly steered by the teacher, focusing instead on a classroom culture in which students respect one another and move beyond the boundaries of their own thinking and understanding. To support this, teachers need a broad talk-based repertoire which Alexander (2018) refers to as dialogic teaching. Surprisingly, most research in the field comes from in-service teacher education and has not yet considered learning opportunities in pre-service teacher education. This presentation will bridge the rich evidence from professional development programs and recent approaches to promote productive classroom talk and dialogic teaching in pre-service teacher education. For this purpose, recent studies from the "Learning-to-Teach Lab: Science" (LTL:S) are presented in which we promote productive classroom talk and dialogic teaching in teacher interventions during a teaching practicum. In Study 1, the findings show positive changes in pre-service teachers' knowledge about productive classroom talk; Study 2 reveals a positive change in pre-service teachers' attitudes toward dialogic teaching. Furthermore, a training program is illustrated focusing on pre-service teachers' performance of dialogic teaching as an approximation of practice (Grossman et al., 2009). Challenges and avenues for future research and practice are discussed.

Invited Symposium
Cognitive Science

How learning and education shape the brain

Keywords: Cognitive Development, Cognitive Skills and Processes, Developmental Processes, Educational Neuroscience, Learning and Developmental Difficulties, Mathematics/Numeracy, Reading, Science and STEM
Interest group: SIG 22 - Neuroscience and Education

Chairperson: Dietsje Jolles, Universiteit Leiden, Netherlands
Chairperson: Stephan Vogel, University of Graz, Austria
Discussant: Bert De Smedt, KU LEUVEN, Belgium

How we learn is influenced by the way our brain processes information. However, we often overlook that these brain processes are themselves shaped by the things we learn and experience, both inside and outside of formal education. Thus, to fully appreciate the mechanisms of learning and how the brain impacts learning, we need to implement a systematic, bi-directional approach that captures the dynamics of the learning brain. Over the past two decades, a growing body of research has provided significant insights of how brain structure and function change as we acquire cognitive and academic skills. Findings from diverse domains including reading, mathematics, and science have indicated that the sensitivity and specificity of domain-general and domain-specific brain regions increase with training and experience.
The SIG-22 symposium aims to further explore the dynamic interaction between learning and brain development by investigating different mechanisms of change, individual differences in receptivity to cognitive and academic interventions, and differences in learning trajectories. Using diverse approaches (e.g., large-scale randomized controlled trials, dense-sampling longitudinal data collection) and methodologies (e.g., academic and cognitive assessment, fMRI, EEG, genetic analysis), the invited authors will discuss training of domain-specific skills (e.g., reading), domain-general skills (e.g., executive functions), and a combination of both (e.g., executive functions in the context of reading, math, and science). Taken together, the SIG-22 symposium will provide novel and crucial insights into the mechanisms underlying (individual differences in) successful learning and holds great promise for a critical discussion on the dynamic interaction between learning and (brain) development.

How reading instruction shapes brain responses in individual children
Presenting Author: Alexander Enge, Max Planck Institute for Human Cognitive and Brain Sciences, Germany; **Co-Author:**Michael Artur Skeide, Max Planck Institute for Human Cognitive and Brain Sciences, Germany

While the educational sciences have gathered substantive knowledge about how to best teach children to read, little is known about the neural underpinnings of this developmental process. We use a dense-sampling longitudinal approach based on functional magnetic resonance imaging (fMRI) to track how literacy instruction changes brain responses to written and spoken words in individual children. For this purpose, a reading instruction group and an active control group consisting of children from rural areas in northern India (n = 15 each) participate in bi-monthly fMRI scanning and behavioral testing sessions. Single subject statistical modeling and Bayesian prevalence estimation reveals that reading instruction enhances phonological and semantic brain responses These findings provide a detailed picture of how teaching children to read influences their brain activity, with implications for individualized and neurobiologically motivated teaching methods.

Synchronizing the brain: an executive functions-based reading program for children with dyslexia
Presenting Author: Tzipi Horowitz Kraus, Technion - Israel Institute of Technology, Israel

Dyslexia, a developmental reading difficulty, is characterized by slow and inaccurate reading, which continues into adulthood, despite repeated exposure to literacy. One of the theories explaining the causes of the lack of reading fluency in dyslexia is the asynchrony theory, suggesting that a lack of synchronization between the auditory and visual modalities underlies their reading difficulty. In this talk, findings from training with an executive-functions-based reading program, based on the speed of processing, visual attention, working memory and inhibition among 8-12 y.o children with dyslexia and typical readers, will be shared. Findings suggest that improved reading fluency in children with dyslexia was associated with improved executive functions as well as greater involvement of neural circuits supporting visual and auditory modalities as well as executive functions. The results of these studies point at the central role of executive functions in reading fluency, an important component of the reading process (see also the Simple View of Reading model). It may also suggest that this specific executive-functions-based reading intervention increases the synchronization between the auditory and visual modalities by engaging executive functions. Doing that, it may reduce the neural noise in children with dyslexia.

Stop & Think: development and evaluation of a primary school-based maths and science intervention
Presenting Author: Lucy Palmer, Birkbeck College, University of London, United Kingdom; **Co-Author:**Iroise Dumontheil, Birkbeck, University of London, United Kingdom

Science and mathematics learning requires the integration of new evidence about the world into one's existing theories. In science education, it can be a real challenge for children to acquire knowledge that goes beyond popular beliefs or perception. Behavioural and neuroimaging research suggests that old theories remain even when new ones are learnt, and inhibitory control is thought to allow the suppression of incorrect intuitive concepts. Building on this research, the 'Stop & Think' intervention was designed to encourage children to use their inhibitory control skills when solving potentially counterintuitive science and mathematics problems. The computerised intervention was delivered by teachers and evaluated in a large-scale randomised controlled trial in 7–8 and 9–10-year-old children. The trial showed improvements in performance of standardised mathematics and science tests in 9–10-year-olds when Stop & Think was compared to an active training intervention focusing on socio-emotional skills. While these results are promising and are consistent with the proposed role of inhibitory control in science and mathematics reasoning, further analyses in subsamples with cognitive and neuroimaging data were not able to provide clear evidence of the mechanism of impact of the intervention.

Cognitive, genetic and cerebral factors influencing learning to stop in childhood
Presenting Author: Grégoire Borst, Université Paris Cité - CNRS, France

Executive functions (EFs) – including inhibitory control (IC) are important for academic achievement as well as physical and mental health. A number of cognitive training programs have tested the possibility to improve EFs and have reported in some cases transfer to academic learning. Different behavioral, brain and genetic factors contribute to the receptivity of cognitive training, including the basal cognitive level, the activity and anatomy of the brain, in particular in the prefrontal cortices, and genetic factors in particular in the dopaminergic system. Each of these factors tend to be considered individually providing only a limited comprehension of the rich interplay between these different factors in explaining individual variability in IC receptivity. The present study aimed to do so by investigating the genetic, cerebral and cognitive factors contributing to inhibitory control training receptivity in 57 ten-years-of-age children after a 5-weeks computerized training. Using Structural Equation Modeling and Latent Change Models, we found that the Polygenic Risk Score (PRS) predicted not only IC efficiency before training but also improvement in IC efficiency. In addition, the left Anterior Cingulate Cortex (ACC) volume at pretest and the change in ACC volume due to training were both related to change in IC efficiency due to training. Thus, IC training receptivity seems to be under both genetic and cerebral factors each contributing to different part of the variability of the improvement in IC efficiency.

Instructional Design

The Role of Prior Knowledge in Learning

Keywords: Achievement, Cognitive Skills and Processes, Computer-assisted Learning, Inquiry Learning, Instructional Design, Knowledge Construction, Large-scale Assessment, Mathematics/Numeracy, Primary Education, Quantitative Methods, Reading, Science and STEM
Interest group: SIG 06 - Instructional Design, SIG 20 - Inquiry Learning
Chairperson: Thomas Simacek, University of Trier, Germany
Organiser: Thomas Simacek, University of Trier, Germany
Discussant: Patricia Alexander, University of Maryland, United States

Prior knowledge affects basic knowledge acquisition processes in all content domains and educational contexts. For example, it determines the comprehension of new information, serves as a resource for problem-solving processes, and directs attention. These are reasons why researchers have suggested that prior knowledge may be of the strongest determinants of learning. Recent meta-analyses and reviews highlighted that the effects of prior knowledge on knowledge acquisition processes are heterogeneous. This makes it difficult to predict how prior knowledge affects learning in particular educational settings. Therefore, it is important to better understand the complexity of the underlying mechanisms in learning that are elicited by prior knowledge. This symposium aims to address the influences of prior knowledge on knowledge acquisition from different but interrelated perspectives. Among the presentations are three field studies and one bibliometric analysis. The four contributions comprise research on individual differences, attributes of knowledge elements, instructional methods, and the research literature on prior knowledge. The field studies investigate the role of prior knowledge in understanding fractions, acquiring advanced concepts in physics, and generating sophisticated hypotheses. Participants were secondary school students who attended STEM classes and received analog or digital instruction. The bibliometric analysis covers research on prior knowledge in various fields from approximately 40 years and provides a comprehensive overview of popular and less addressed topics. Combining the findings presented in the symposium leaves room for discussions on the effects of prior knowledge on learning as well as approaches for future prior knowledge research.

Prior knowledge in inquiry learning
Presenting Author: Tessa Eysink, University of Twente, Netherlands; **Co-Author:**Xiulin Kuang, University of Twente, Netherlands; **Co-Author:**Ton de Jong, University of Twente, Netherlands

We present two studies on the relation between prior knowledge and hypothesis generation during inquiry learning. In the first study, the aim was to investigate whether presenting students with basic domain knowledge and/or giving them the opportunity to do exploratory experiments could provide them with the necessary prior knowledge to work effectively in an inquiry-based learning environment. In the second study, the aim was to investigate whether adapting the level and amount of domain information to students' prior knowledge facilitated their performance. Performance was measured by the quality of students' hypothesis generation processes, the quality of the subsequent inquiry learning processes, and their knowledge acquisition. 118 and 69 secondary school students respectively, participated in three experimental sessions in which they worked with an online inquiry learning environment on the physics domain of force and motion. Coding schemes were created to assess students' inquiry learning processes. Knowledge acquisition was measured with a pre- and post-test. Results showed that students' prior knowledge on relevant variables was enhanced by merely providing domain information, but that this did not further result in better performance on hypothesis generation or subsequent inquiry processes. Moreover, adapting this domain information to the prior knowledge level of the students did benefit the quality of hypothesis generation, but it did not affect their knowledge acquisition.

Studies on Prior Knowledge in Learning: A Comprehensive Bibliometric Analysis
Presenting Author: Michael Schneider, University of Trier, Germany; **Co-Author:**André Bittermann, Leibniz-Institute for Psychology Information (ZPID), Germany; **Co-Author:**Danielle McNamara, Arizona State University, United States; **Co-Author:**Bianca Simonsmeier, University of Trier, Germany

The knowledge is power hypothesis describes knowledge as one of the most potent predictors of learning. Research on prior knowledge is manifold. Cognitive scientists investigate the underlying processes in experiments. Developmental psychologists analyze how prior knowledge predicts trajectories of learning in longitudinal studies. Educational researchers develop interventions to activate and utilize prior knowledge or to compensate for detrimental effects of low prior knowledge. Researchers investigate the roles of prior knowledge in perception, attitude formation, racism, work performance, patient education, and many other fields. The size and breadth of these literature strands make it nearly impossible for researchers to keep track of all of them. In the present study, we used a bibliometric analysis to provide a comprehensive overview of prior knowledge research from a birds-eye perspective. A standardized search yielded 13,507 relevant studies. The studies investigated 23 topics that formed a network of five interrelated communities: Education, Learning Environments, Cognitive Processes, Nonacademic Settings, and Language. The investigated knowledge was diverse in terms of its types, characteristics, and representations. It came from more than 25 content domains. Frequently referenced theoretical backgrounds were the 3P Model, Cognitive Load Theory, and Conceptual Change approaches. The results indicate that prior knowledge is a widely used cross-sectional research topic. There remains a need for more integrative theories of when and how prior knowledge causally affects learning. More randomized controlled trials with knowledge gains as outcome measures are needed that investigate these questions with complex, realistic learning materials in practical settings.

How Prior Knowledge and Other Individual Variables Interact with Scaffolds in Learning Fractions
Presenting Author: Sarah Hofer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Frank Reinhold, University of Education Freiburg, Germany; **Co-Author:**Sarah Bichler, Ludwig-Maximilians-University Munich, Germany

Learning depends on how individuals make use of a learning situation. If we want to understand the learning process, we have to consider relevant characteristics of the individual as well as characteristics of the instruction in the context of the content that is to be learnt. Whereas interactions of prior domain knowledge with the degree of guidance during instruction are intensively studied, research on interactions with microlevel instructional scaffolds and, in particular, on interactions between a learning situation and combinations of individual variables beyond prior knowledge is lacking. To learn more about individual learning processes and answer the question who benefits from what type of instructional support, we designed three different scaffolds (visualizations, adaptive tasks, and individualized feedback) to support 335 6^{th}-Grade students from German secondary schools in understanding fractions. Students were randomly assigned to one of the scaffolded conditions or a control group. Prior domain knowledge, engagement, sustained attention, general reasoning, and visual-spatial abilities will be used as profile indicators in a latent profile analysis (LPA) to determine systematically occuring combinations of individual characteristics. We will use multiple-group regression models to examine whether fraction understanding differs as a function of the experimental conditions and the profiles resulting from the LPA. Since data collection has just been completed, we are not yet able to report results.

Preparation for Future Learning in Physics: The Importance of Overlap in Prior Knowledge
Presenting Author: Christian Thurn, ETH Zurich, Switzerland; **Co-Author:**Peter Edelsbrunner, ETH Zurich, Switzerland; **Co-Author:**Ralph Schumacher, ETH Zurich, Switzerland; **Co-Author:**Elsbeth Stern, ETH Zurich, Switzerland

In three sub-studies run within a large-scale longitudinal project, we investigated whether prior knowledge taught in physics instruction in primary school can prepare for future learning of more advanced topics in secondary school. In primary school, students in the intervention group underwent 1-4 inquiry-based teaching units dealing with basic concepts in physics (e.g., floating and sinking) and with experimentation. When these students were in secondary school, they could be compared to classmates who had not undergone these four units in primary school (control group). In secondary school classes, we offered three stand-alone units on magnetism, hydrostatic pressure, and proportionality. These three units differ in knowledge overlap with the four units taught in primary school, which allowed us to investigate what kind of prior knowledge benefits future learning. The unit on magnetism did not overlap in content with the units in primary school but shared the inquiry-based approach requiring experimentation skills. The unit on hydrostatic pressure shared broader conceptual overlap with two of the four units taught in primary school, and the unit on proportionality shared partial conceptual overlap but tested knowledge in the context of mathematics. A comparison of learning outcomes in secondary school revealed an advantage of the intervention group in the units on magnetism and hydrostatic pressure. More detailed analyses within the intervention group indicate that how well students can build on their knowledge gained from the teaching units in primary school depends on the specific overlap with the topics taught later in secondary school.

Motivational, Social and Affective Processes

Multiple Perspectives on Student's Emotions Experienced in Class

Keywords: Achievement, Anxiety and Stress, Attitudes and Beliefs, Citizenship Education, Emotion and Affect, Engagement, Mathematics/Numeracy, Quantitative Methods, Secondary Education, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Social Interaction, Teacher Effectiveness, Teaching/Instructional Strategies
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Lisa Stempfer, University of Vienna, Austria
Chairperson: Elisabeth Graf, University of Vienna, Austria
Organiser: Lisa Stempfer, University of Vienna, Austria
Organiser: Elisabeth Graf, University of Vienna, Austria
Discussant: Reinhard Pekrun, University of Essex, United Kingdom

Students' everyday classroom emotions make a great contribution to shape their overall educational experiences. However, the classroom context as the main academic setting presents researchers with specific challenges. The multitude of influential factors (e.g., inter-individual to intra-individual factors) and the complexity of the (social) situation (e.g., group dynamics) calls for researchers' creativity to realistically depict students' experiences. Therefore, it is the aim of this symposium to deliver a set of studies which investigate students' emotions in class from different angles. These studies not only focus on different contextual antecedents (e.g., teachers, classroom climate) and person-bound factors (e.g., inter- and intraindividual differences) but also include different data types like physiological and questionnaire data, trait and state assessments, cross-sectional and repeated-measures designs. Together, these studies contribute to the knowledge on the relationships between students' emotions and academic performance outcomes, conceptualizing educational success not only as formalized assessments, such as grades, but also real-time problem solving, engagement, and (out-of-school) political participation. Overall, these studies show that while classroom-level factors (study 1, study 3) explain part of the variance in students' emotions, there is a larger amount of unexplored inter- and intra-individual variance in students' emotional lives in class. Students' emotions differ inter-individually within one class (study 2, study 4) and intra-individually, when temporal fluctuations are considered over the course of a lesson (study 4). By providing insights into antecedents of students' emotions, emotion trajectories and regulation strategies, we lay out implications for a more beneficial emotional experience in the classroom setting.

Say it, Feel it: How Emotions in Civic Education Relate to Classroom Climate and Participation
Presenting Author: Elisabeth Graf, University of Vienna, Austria; **Co-Author:**Lisa Stempfer, University of Vienna, Austria; **Co-Author:**Krista Muis, McGill University, Canada; **Co-Author:**Thomas Goetz, Universität Wien, Austria

Given the current political climate, civic education as a tool for strengthening democracies seems more important than ever before. In the context of civic education, the classroom climate during discussions of political and social issues is often considered as an important contextual antecedent of civic learning, as for example civic knowledge, engagement, or participation intention. Although discussions in a classroom with diverse opinions can get very emotional, the role of discrete emotions has rarely been investigated. To address this gap, we examined how the classroom climate during discussions of political and social issues is related to enjoyment, shame, anxiety, and boredom experienced in civic education, and whether these emotions mediate the relationship to political participation. We tested the proposed model based on data from 1,119 students at vocational schools in Austria (grade 10-13). Multilevel structural equation modeling revealed relationships between classroom climate and emotions, but at different levels. While an open classroom climate was positively related to enjoyment at the student level, it was negatively related to anxiety and boredom at the class level. Further, enjoyment mediated the positive relationship at the student level between classroom climate and intended political participation. Taken together, these results imply that fostering a classroom context that is open to diverse opinions can prevent the experience of negative emotions and increase individual students' experience of enjoyment in civic education. There was, however, a broad intra-class variability in students' perception of the classroom climate in civic education and their experienced emotions.

Control, Task-Value, and Emotions Predict Emotion Regulation During Mathematics Problem-Solving
Presenting Author: Kelsey Losenno, McGill University, Canada; **Co-Author:**Krista Muis, McGill University, Canada

Emotion regulation (ER) is an important process that supports students' learning and achievement over time. Choice of ER strategy type is related to differences in learning outcomes. Theorists posit that students' perceptions of control, task-value, and emotional experiences during learning may be important predictors of the ER strategies students use to regulate their emotions, like cognitive reappraisal or expressive suppression. We examined how control, task-value, and emotions relate to students' use of cognitive reappraisal and expressive suppression during a complex mathematics problem-solving activity. Participants included 152 students (72 girls) from grades 3 through 6 from one elementary school. Results demonstrate significant correlations between control and task-value with emotions and both ER strategies, and emotions with ER strategies. Path analysis will be conducted in MPlus to assess the relationships between these variables. Findings may hold important theoretical and educational implications for researchers and educators seeking to support students' ER in classrooms.

Associations between Teacher Heart Rate Variability and Teacher and Student Emotions and Engagement
Presenting Author: Monika Donker, Utrecht University, Netherlands; **Co-Author:**Brianna Kennedy, Utrecht University, Netherlands; **Co-Author:**Sara Scrimin, University of Padova, Italy; **Co-Author:**Tim M. Mainhard, Leiden University, Netherlands

Positive teacher-student relationships benefit both students and teachers. These relationships develop as a result of repeated moment-to-moment interactions composed of emotional exchanges. Students and teachers may experience these emotions both consciously and subconsciously. Subconscious emotional experiences may be indicated by physiological changes. This study analyzed physiological data of 80 Dutch secondary teachers during one lesson in order to assess the potential value of heart rate variability (HRV) for the study of classroom interactions and emotions and the development of student-teacher relationships. In this study, statistical relationships existed between HRV and both teacher and student emotions as well as student engagement. These findings show promise for the role of broader physiological measures, and specifically HRV, in understanding how interactions between teachers and students develop in real time and impact individuals.

Beyond the Mean Score: Inter-Individual Differences in Temporal Fluctuations of Student Boredom
Presenting Author: Lisa Stempfer, University of Vienna, Austria; **Co-Author:**Thomas Goetz, Universität Wien, Austria

Classroom boredom impairs performance. While this has repeatedly been demonstrated from a variable-centered perspective, it is unclear whether it applies equally to all students. An important aspect has hardly been considered so far – the variability of emotional experience over time. This variability cannot be represented with mean scores, but could differentially impact performance. An Experience Sampling design (N = 177 secondary-school students) was used to look behind the mean score and explore this heterogeneity. Time-sensitive indicators were used to quantify students' fluctuation of boredom intensity over the course of a 90-minute lesson. We showed that there is indeed considerable heterogeneity between students' boredom trajectories. Students with higher mean boredom levels tended to fluctuate more frequently and the intensity of their fluctuations was more variable. Correlations with test performance were significant for mean boredom but not for time-sensitive indicators of classroom boredom. Our findings encourage a critical view on the use of mean scores to operationalize classroom boredom, since the existing heterogeneity cannot be adequately displayed. In the next step, person-centered analyses will be used to further explore a potential relationship between trajectory profiles and performance.

Session D 6

Reading in Digital Contexts: Effects of Distractions and Multitasking

Keywords: At-risk Students, Cognitive Skills and Processes, Comprehension of Text and Graphics, Digital Literacy and Learning, Eye Tracking, Metacognition,

Reading
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Lucia Mason, University of Padova, Italy
Organiser: Lucia Mason, University of Padova, Italy
Organiser: Ladislao Salmerón, University of Valencia, Spain
Discussant: Ivar Bråten, University of Oslo, Norway

When reading on Internet-connected devices, students are often exposed to the simultaneous presentation of information that is superimposed on the material being read (Baccino & Drai-Zerbib, 2021). Students may also be distracted by advertisements and notifications from social media, or may engage in active multitasking when using two or more media simultaneously, or switching between media (Simola et al., 2011). As our attentional and working memory capacities are limited, disruption during reading may have negative effects on reading processing, comprehension, and meta-comprehension (Hong et al., 2004; Liu & Gu, 2020; Clinton-Lisell, 2021). Against this backdrop, the goal of the symposium is to present a coherent and integrated set of empirical studies that examine various effects of reading in digital contexts. Presentation 1 investigates the role of undergraduates' multitasking reading habits in text comprehension and calibration of performance. Presentation 2 examines the influence of metacognitive scaffolds on reading comprehension and calibration in adults with and without ADHD, considering the role of mind wandering. Presentation 3 studies the effects of on-screen distractions on university students' perception of cognitive load, eye movements during the immediate and delayed text processing, comprehension, and calibration of performance. Presentation 4 investigates university students' reading behavior using eye movements and electrodermal response during and after being interrupted by another reading task, and text comprehension. Finally, a joint discussion will be stimulated by a renowned discussant. The expected outcome of the symposium is a deeper understanding of the impact of digital reading with common disruptions.

Media Multitasking Habits While Reading: Effects on Students' Calibration and Comprehension
Presenting Author: Ladislao Salmerón, University of Valencia, Spain; **Co-Author:**Mario Romero, University of Valencia, Spain; **Co-Author:**Pablo Delgado, University of Sevilla, Spain; **Co-Author:**Lidia Altamura García, University of Valencia, Spain

Much of what we know about the relationship between media multitasking and text comprehension comes from studies that assess the consequences of multitasking during a reading episode. Less is known about the relation between reading media multitasking habits and text comprehension, in reading situations where no multitasking takes place. The goal of this study was to fill in this gap. Forty-three undergraduates read two lengthy expository texts without any distraction either on screen or in paper, predicted their comprehension and answered text comprehension questions. Our results extend previous evidence by showing that, after controlling for relevant individual differences such as topic prior knowledge and reading comprehension skills, students' multitasking reading habits related negatively to text comprehension performance, and positively with overconfidence. Reading media did not affect such relation. We discuss potential mechanisms for such relationships, and suggest the need to reduce multitasking practices during reading.

Metacognitive Scaffolding, Digital Reading, and Mind Wandering in Adults With and Without ADHD
Presenting Author: Adi Brann, Open University of Israel, Israel; **Co-Author:**Yael Sidi, the Open University of Israel, Israel

Digital reading might exacerbate difficulties in sustaining attention and escalate reading comprehension and monitoring differences between learners with and without attention deficit hyperactivity disorder (ADHD). Moreover, learners with ADHD may not sufficiently benefit from general instructions to use strategies that promote in-depth processing (e.g., summary generation). However, one possible affordance of digital environments is the possibility to gradually incorporate learning scaffolds. The current study examined the influence of metacognitive scaffolds on reading comprehension and monitoring of adults with and without ADHD. The mediating role of mind-wandering, a prominent phenomenon associated with sustained attention difficulties, was further examined. Participants (N = 315, 19-50, 43% with ADHD) were randomly assigned to a control or scaffolding condition. In both conditions participants read a lengthy expository digital text, generated a summary, evaluated their mind-wandering, and then answered reading comprehension questions while evaluating their confidence. In scaffolding conditions, further instructions were gradually incorporated to direct attention and encourage self-regulation. In the control condition, the ADHD compared to the non-ADHD group scored significantly less on reading comprehension. Furthermore, only the ADHD group showed negative resolution (relative monitoring accuracy). In the scaffolding condition, there were no reading comprehension or resolution differences between the groups. Furthermore, mind-wandering moderated reading comprehension differences between participants with and without ADHD, but only in the control condition. For learners with ADHD, gradual incorporation of metacognitive scaffolds may enhance the effect of in-depth processing encouragement on monitoring, and minimize the negative effect of mind-wandering on reading comprehension.

Effects of Reading With On-Screen Digital Distractions
Presenting Author: Angelica Ronconi, University of Padova, Italy; **Co-Author:**Lucia Mason, University of Padova, Italy; **Co-Author:**Lucia Manzione, University of Padova, Italy; **Co-Author:**Anne Schueler, Leibniz-Institut für Wissensmedien, Germany

During digital reading on Internet-connected devices, students may be exposed to a variety of on-screen distractions, such as advertisements and social media notifications, as in the current study. It investigated the effects of on-screen distractions during reading on text processing as revealed by eye movements, perception of cognitive load, comprehension, and metacomprehension as calibration of performance. Fifty-five university students participated in a within-subjects design. They read two digital expository texts, one with and the other without distractions, one on Archimedes' principle and the other on seasonal change. Texts shared the same structure with six areas of interest presented on two slides. Participants' eye movements were recorded during reading. Process variables were the first-pass and second-pass fixation times on text areas, and the fixation time on distractions. Cognitive load was measured using a self-report questionnaire. Text comprehension was assessed by multiple-choice questions and metacognitive calibration bias was the difference between judgment of performance and actual performance. Working memory (WM) was taken into account as possible moderator of outcome variables, while controlling for prior knowledge and topic. We performed linear mixed models to consider both fixed and random effects. The main effect of distractions emerged during the immediate text processing as readers' first-pass fixation time was longer with on-screen distractions. Perception of cognitive load, text comprehension, and calibration were not affected by distractions. The interaction distractions x WM was never significant. Very usual on-screen distractions do not seem particularly harmful in university students' learning performance, but have a processing cost.

The Impact of Attentional Disruption During Digital Reading: Tracking the Reading Eyes
Presenting Author:Véronique DRAI-ZERBIB, Université de Bourgogne, France; **Co-Author:**Guillaume Chevet, University of Burgundy, France; **Co-Author:**Marine Michelin, University of Burgundy, France; **Co-Author:**Annie Vinter, University of Burgundy, France; **Co-Author:**Thierry Baccino, University of Paris 8, Italy

A particular dimension of digital reading is the simultaneous presentation of information that is superimposed on the medium being read and the possible interruptions of reading by the arrival of messages likely to disrupt the attention focused on the information being processed. This study investigated how readers are able to retrieve the course of reading once they were interrupted and the interrupted distractor message disappeared. Twenty-six volunteers had to read 4 texts (17 pages) exposing the jobs of archaeologist, croupier, optician, auditor. Half of the participants had the objective of gathering as much information as possible about the job of archaeologist and the other half about the job of croupier. Thus, the targeted information was considered relevant, the rest being irrelevant. The interrupting task consisted in reading a short emotional text. Eye movements and electrodermal response were co-recorded to observe reading behavior during and after interruption. Memory and recall of the text were also evaluated. Results of eye movements showed 1) when reading is interrupted, longer fixation duration in the sentence following the interrupted phrase for relevant information; 2) a larger pupil dilation for positive than negative valence of the distractor, 3) a strategy to resume the reading into the interrupted phrase, or two phrases preceding or following the interruption. Moreover, the comprehension is not disrupted at all, even if verbatim recall is more important for relevant information (compared to irrelevant).

Symposium
Assessment and Evaluation

Rubrics: old and new research

Keywords: Achievement, Classroom Assessment, Cognitive Skills and Processes, Emotion and Affect, Eye Tracking, Meta-analysis, Qualitative Methods, Quantitative Methods, Self-regulated Learning and Behaviour
Interest group: SIG 01 - Assessment and Evaluation
Chairperson: Ernesto Panadero, Spain
Organiser: Ernesto Panadero, Spain
Discussant: Jeff Greene, United States

Rubrics are quite popular tools worldwide as educational instruments. However, the research built around them has not always been strong (e.g., validity problems, poor research design) and there is repetition about the topics that have been investigated. Additionally, rubrics are rarely implemented by following the best practices from research (e.g., students and teachers are not always trained to effectively make use of rubrics). This symposium will tackle these flaws by reviewing what is known about rubrics effects and presenting new lines of research. The first presentation will meta-analyze the effects of rubrics on academic performance, as to evaluate what the existent research can show us regarding rubrics impact on academic success. The second presentation will discuss the co-creation of rubrics, a line of research that is gaining interest, from a novel approach: a socio-cultural analysis of student, teacher and researcher agency in assessment co-design, drawing on a diverse qualitative dataset. The third and fourth presentation employed the same data collection method –i.e. eye tracking-, with similar purposes. The third presentation used eye tracking to investigate what information students looked at when receiving formative rubric feedback. The fourth presentation explored how students used the rubric at “first sight” and also while receiving four different types of feedback. We believe our symposium represents an interesting balance between summarizing what the “old” research can inform us about rubrics effects -first presentation- and advancing the field via “new” research that offers insights in the use of rubrics -second, third and fourth presentations.

A meta-analysis on the effects of rubrics on academic performance
Presenting Author: Anders Jönsson, Kristianstad University, Sweden; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Leire Pinedo, Universidad de Deusto, Spain; **Co-Author:**Belen Fernandez Castilla, Universidad Nacional de Educación a Distancia, Spain

Empirical research on the use of rubrics has grown rapidly during the last decade (Dawson, 2017). From this research, we know that the use of rubrics can have significant and positive effects on students’ learning, academic performance, and self-regulation – provided that the design and implementation of rubrics are adequate. However, in parallel to this research, there is also a strong critique against the use of rubrics for formative purposes (Panadero & Jonsson, 2020). The critique has obvious repercussions for the use of rubrics, since rubrics are probably the most common way of sharing explicit assessment criteria with students. As these concerns are widespread, despite the accumulated empirical support for mainly positive effects, the aim of this study is to perform a meta-analysis on research about the use of rubrics, in order to investigate: (a) whether, and to what extent, the use of rubrics has an impact on students’ academic performance and other important variables related to student learning, and (b) if there are additional factors that may influence the relationship between the use of rubrics and students’ academic performance. The search for relevant research to include was conducted in several databases (e.g., PsycINFO and ERIC), using combinations of keywords. In total, 3,848 records were identified from the databases, but after removing duplicates and publications not meeting all inclusion criteria, 30 studies were left and included in the meta-analysis. Analyses of the data is currently ongoing, and findings will be presented at the conference.

Agency in rubric co-design: a participatory action research approach
Presenting Author: Juuso Henrik Nieminen, The University of Hong Kong, Finland; **Co-Author:**Jani Hannula, University of Helsinki, Finland

We know a great deal from scholarly research about how and why rubrics could promote student learning, yet this knowledge does not always find its way to actual classrooms. This is certainly the case in the exam-driven context of Finnish mathematics education. At the same time, practice-oriented case studies in this field have tended to be undertheorised and potentially repetitive. This study takes a novel perspective of participatory action research to examine how rubric co-design might enhance students’ and teachers’ agency in assessment. We report an in-depth case study of 19 students, their teacher (Jani) andan assessment researcher (Juuso) working together to co-design a rubric and the accompanied assessment practices in Finnish lower secondary mathematics education. The study builds on a socio-cultural analysis of student, teacher and researcher agency in assessment co-design, drawing on a diverse qualitative dataset. Based on the findings, we reframe rubric co-design not only as a way toenhance student learning, cognition and self-regulation, but as a way to promote the values of democratic education. This is important since students and teachersare not always given agency in the debates over assessment practices and policies. We propose participatory action research as a way of closing the research-practice gap when it comes to rubrics, developing this methodology further in the particular context of assessment.

A new view on rubrics – an eye tracking study of formative rubric feedback
Presenting Author: Lieselotte Schmidt Postmes, UMC Utrecht, Netherlands; **Co-Author:**Renske de Kleijn, UMC Utrecht, Netherlands; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Marije Lesterhuis, UMC Utrecht, Netherlands; **Co-Author:**Marieke van der Schaaf, University Medical Center Utrecht / Utrecht University, Netherlands

Rubrics can help generate internal feedback by acting as an external information source. In this study we used eye tracking to gain insight into what information students look at when receiving formative rubric feedback. During a subsequent stimulated recall, the students’ recorded eye movements were discussed to uncover the cognitive processes that are taking place while viewing the rubric. The results show that all students study their supervisor’s feedback and that within student viewing behavior is quite constant. Differences between students lie especially in whether other than the scored quality descriptors are considered. Reasons mentioned by students to study rubric elements are being surprised by the supervisor judgement, having difficulty understanding, and wanting to know how to improve. Their cognitive processes reveal that they also try to understand how supervisors came to their judgement and to value their feedback. Our study underlines the importance of comparisons that students make when studying rubric feedback, as posited in Nicol’s theory of internal feedback generation. This eye-tracking study also reveals that although rubrics provide many sources of information for students to learn, not all information is considered by all students. This highlights the importance of making students and teachers aware of using all the information rubrics have to offer.

How students use rubrics: using process data from eye tracking
Presenting Author: Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Pablo Delgado, University of Sevilla, Spain; **Co-Author:**David Zamorano, Universidad de Deusto, Spain; **Co-Author:**Leire Pinedo, Universidad de Deusto, Spain; **Co-Author:**Alazne Fernández Ortube, University of Deusto, Spain; **Co-Author:**Lucía Barrenetxea-Mínguez, University of Deusto, Spain

Rubrics are used around the world with the purpose of providing clear assessment criteria and standards which further influence academic performance. However, our knowledge about how students use rubrics is limited. Additionally, we still need to enlarge our knowledge about how feedback influence the use of rubrics too. Our aim was to explore, using multimodal data, how students use rubrics when performing an activity while receiving four different types of feedback (control vs. process feedback vs. product feedback vs. feedback based on the rubric). In this presentation we will focus in the eye tracking data that we collected. We will explore four research questions and provide preliminary results in the extended abstract, but for EARLI 2023 the data analysis will be completed. Given that presenting the PLs ordered from highest (4) to lowest (1) favored students’ reading efforts on the highest, which, in turn, were the only associated to later task performance, and that this was not the case for the 1-4 order, our results suggest that when presenting rubrics prior to the task, ordering PL from highest to lowest could enhance students’ subsequent performance. On the contrary, if the instructional goal is that the students should pay attention to all levels, it is best to design the rubric with the highest performance level to the right.

Symposium

The potential of play for children's learning in uncertain times

Keywords: Cognitive Skills and Processes, Communication Skills, Competencies, Digital Literacy and Learning, Early Childhood Education, Gender Issues, Informal Learning, Mixed-method Research, Qualitative Methods, Social Aspects of Learning and Teaching, Teacher Professional Development, Teaching/Instructional Strategies, Tool Development
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland
Organiser: Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland
Discussant: Franziska Vogt, Switzerland

The present symposium fosters the importance of play in uncertain times. One uncertain aspect is the rapid development in the digitalization context. The way children play has changed over time (Edwards et al., 2013; Frost, 2012; Radesky & Christakis, 2016) together with the affordances, functions, and forms of contemporary toys. Not only toys have changed over time. Our everyday practice and many professions will shift, or many new professions will be invented because of the digitalisation and digital transformation. (Guided) play is a very important way to educating children for those uncertain times. Different forms of play can be distinguished (Wood, 2013). Play in early childhood education can be children's self-chosen and self-led play or more guided forms of play and games designed around specific goals. Practitioners seeking to foster play, for example when joining in as co-players, need to adjust the degree of guidance provided tactfully and intentionally, finding the right balance. This might require pedagogical frameworks rooted in actual practices, and which can help early educators navigate their playful engagements with children (Pyle et al., 2018). In the first paper the importance of children's play for learning is highlighted. In the second contribution the focus is placed on the guidance of the kindergarten educators in general, whereas in the third paper the potential of guided pretend play for exploring digital transformation through play is analysed. In the fourth paper play and technology are focused with an evaluation instrument for technology toys.

The relation of play and learning empirically studied and conceptualised
Presenting Author: Camilla Björklund, University of Gothenburg, Sweden; **Co-Author:**Ingrid Pramling-Samuelsson, University of Gothenburg, Sweden

Play is considered an important aspect of Early Childhood Education and Care. However, the relationship between play and learning is often taken for granted both in research and praxis. In this article, we study our own research group's empirical work over a 40-year period, and how we have used the concepts of play and learning. We observed that how the relation between play and learning has been conceptualised, have gone through changes during this period in a number of ways, in line with other research, influenced by policy, and theorised grounded in empirical studies towards what is called Developmental Pedagogy. Children's perspectives and teacher's sensitivity and responsiveness have been important features of the process of developing the preschool pedagogy in which play and learning are central. The relationship between play and learning are conceptualised differently, at the same time as the content (sometimes called curriculum in the English-speaking world) are equally important in the early as well as latest steps of this development in research.

Early educators navigating a spectrum of play facilitation – exploring how practices weave and shift
Presenting Author: Hanne Jensen, The LEGO Foundation, Denmark; **Co-Author:**Kathrine Jørgensen, The LEGO Foundation, Denmark

Research suggests that young children can learn through play in a range of pedagogical practices: from children's self-chosen and self-led play to more guided forms of play and games designed around specific goals. Importantly, facilitating children's engaged learning through play requires tact and intentionality as adults adjust the degree of guidance provided and even join children as co-players – often, practitioners find this a difficult balance to achieve and this is an issue resonating across countries and cultures, pointing to a need for pedagogical frameworks rooted in actual practices, and which can help early educators navigate their playful engagements with children. This paper explores how early educators in Denmark grew more competent at facilitating children's learning through play. Data derived from a study with professionals enrolled in a professional development module to strengthen their role repertoire in playful situations. The module consisted of 10 theme-based sessions, including on children's perspective and peer communities, design of play and learning environments, child- and adult-initiated play, and pedagogical positioning. As part of the study, focus participants were visited twice in their practice – first while they attended the module, and a second time 4-6 months after module completion. Drawing on field notes and interviews focused on their play-based practices, analyses revealed the rich interplay of participants' reflections on own practice and observed roles with children in playful situations. Findings on early educators' efforts to navigate working realities are discussed with reference to PD support to strengthen play-based practices.

The role of kindergarten educators in pretend play for future skills and digital transformation
Presenting Author: Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Franziska Vogt, St.Gallen University of Teacher Education, Switzerland

Previous research explores how children use digital technology during their pretend play (Arnott et al., 2020; Bird 2020). The role of the kindergarten educators has, however, not been researched widely. It can be assumed, that the guidance provided by early childhood educators plays a significant role in this process, as they join in the pretend play, model and expand the play to ensure creativity and understanding (Vogt, 2020). Guided play is very important for children's learning (Weisberg, Hirsh-Pasek, & Golinkoff, 2013). The review of Skene et al. (2022) shows the effectiveness of guided play for science and math-based learning. Vogt & Hollenstein (2022) show that children can explore processes of digital transformation during pretend play. Still, less is known about how kindergarten educators support the pretend play in such a way that learning about digital transformation is fostered. Specifically, the present paper focuses on the following research questions: (1) Which roles do kindergarten educators take on during guided pretend play? (2) In what way does the guidance of the kindergarten educator enable children to expand their pretend play? First results indicate that teachers have different roles during their guidance. For example, after they leading the situation they can switch in a passive role and children started leading the situation. The discussion will address the different roles of the kindergarten educators' guidance and how these influence the children's participation. The potential of guided pretend play for learning about digital transformation in the area of digital education will be discussed.

Play and technology enhanced toys in early childhood education: an evaluation instrument
Presenting Author: Maria Hatzigianni, University of West Attica, Greece; **Co-Author:**Anastasia Misirli, University of Patras, Greece; **Co-Author:**Vassilis Komis, University of Patras, Greece; **Co-Author:**Maria Dardanou, University of Tromsoe, Norway; **Co-Author:**Iro Voulgari, National and Kapodistrian University of Athens, Department of Early Childhood Education, Greece; **Co-Author:**Dimitra Bourha, University of West Attica, Greece; **Co-Author:**Christoforos Karachristos, University of Patras, Greece

This study aims at trialling a new evaluation instrument of technology-enhanced toys for children birth to eight years old by filling the gap of a scientifically constructed system. The terms used in early childhood literature to describe these toys and the form of play they instigate depend on the theoretical framework adopted. Scholars have coined new terms such as 'converged play' (Edwards, 2020), 'posthuman' or 'postdigital' play (Marsh, 2019) and many others. A new term 'technologically enhanced toys' [TETs] is proposed by this study. In line with the theoretical framework of digital materiality (Leonardi et al., 2019), this study examined toys that attempted to abolish the limits of materiality, facilitate synergies between the real and the virtual space and promote different extents of invention and imagination beyond physical matter. A pragmatic paradigm is adopted, following a mixed methodology (an evaluation instrument, statistics, content analysis). A large number of toys (n = 224) was selected from Amazon based on children's age (birth to eight years) and technical criteria (e.g., sensors, internet connectivity etc). Ethical consideration has been given to ensuring fair representation of toys from a wide range of sources to avoid the possibility of bias. The up-to-date evaluation of toys revealed: limited interactive characteristics, close-ended design, absence of opportunities for creativity and novelty, no criteria for inclusiveness. Findings from this study will significantly assist education stakeholders in their decision-making for trusting, investing, developing and advising on toys towards a play-based pedagogy.

Assessment and Evaluation, Learning and Social Interaction

Teacher-child interactions in early childcare: Conditions, associations and measurement approaches

Keywords: Classroom Assessment, Early Childhood Education, Quantitative Methods, Social Interaction, Teacher Professional Development, Writing/Literacy
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Franka Baron, University of Bern, Switzerland
Chairperson: Carolina Guedes, Faculty of Psychology and Educational Sciences, University of Porto, Porto, Portugal, Portugal
Discussant: Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

Warm, sensitive, and cognitively stimulating interactions are important for children's later skills (e.g., Mashburn et al., 2008). Several structural aspects have been shown to contribute to high-quality teacher-child interactions (e.g., Slot et al., 2015). However, most research is conducted with preschoolers, leaving a knowledge gap about the early onset of such links. Moreover, past research on teacher-child interaction in early childhood education and care (ECEC) has widely used the CLASS observational system, pointing to the need of exploring other accessible and psychometric sound measures. This symposium compiles empirical evidence from multiple perspectives aiming to investigate structural aspects that influence teacher-toddler interactions, examine the importance of the early onset of process quality for children's later development, and explore multiple ways to measure teacher-child quality of interactions in ECEC. Paper 1 focuses on domains of interaction quality and their associations with teachers' age, education, children's age composition, and group size in German toddler classrooms. Paper 2 investigates the associations between teachers' job satisfaction and in-service professional development, and teacher-toddler interaction quality in Portugal. Paper 3 examines how interaction quality in Finnish toddler classrooms influences children's emergent literacy skills in preschool. Paper 4 explores different measurements of interaction quality in preschool. The discussion will outline structural aspects that influence teacher-child interaction quality and highlight the importance of high process quality from an early, with important implications for pre- and in-service professional development programs. Furthermore, the discussion will give important insights into measurement approaches across ECEC, contributing to current knowledge in the field.

Domains of teacher-toddler interactions and associations with conditions in early childcare settings
Presenting Author: Franka Baron, University of Bern, Switzerland; **Co-Author:**Anja Linberg, German Youth Institute, Germany; **Co-Author:**Simone Lehrl, PH Weingarten, Germany; **Co-Author:**Dorothea Dornheim, University of Bamberg, Germany

This study examines domains of teacher-toddler interactions in early childcare settings and investigates their associations with structural characteristics. Ninety-five toddler classrooms located in Bavaria, Germany were observed and rated with CLASS Toddler (La Paro et al., 2012) and data on teachers and conditions within the childcare settings were assessed through self-report questionnaires. Confirmatory factor analyses and structural equation modeling were conducted using R. The results were in favor of a two-, instead of a one- or three-factor structure, which included the 'emotional and behavioral support' (EBS) and the 'engaged support for learning' (ESL) domains. The model showed a feasible fit: $\chi^2(19)=56.51$, p

Associations between job satisfaction, professional development, and educator-child interactions
Presenting Author: Carolina Guedes, Faculty of Psychology and Educational Sciences, University of Porto, Porto, Portugal, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal

Educator-child interactions are vital for children's development (Bronfenbrenner & Morris, 2006). Previous studies have suggested that educators' well-being and participation in professional development activities were associated with educator-child interaction quality in preschool (Egert et al., 2020; Penttinen et al., 2020). However, little is known about how educators' job satisfaction and participation in professional development activities are linked to educator-child interactions in toddler classrooms (Cassidy et al., 2017). The current longitudinal study aims to test the associations between educators' reported job satisfaction and frequency of in-service professional development activities, and educator-child interaction quality in toddler classrooms. Participants were 70 Portuguese leading educators and assistants working in 30 toddler classrooms. Educators and assistants reported on their job satisfaction and in-service professional development activities (Slot et al., 2015) with two questionnaires in the fall. Educator-child interactions were observed with the CLASS-Toddler (La Paro et al., 2012) in the winter. Results showed associations between job satisfaction and negative climate, educator sensitivity, behavior guidance and facilitation of learning and development. Staff with more frequent in-service professional development activities achieved higher ratings in engaged support for learning related dimensions of the CLASS-Toddler measure. These findings shed light on the importance of job satisfaction for warm, sensitive, and cognitive-stimulating interactions, and on the importance of providing educators and assistants with professional development activities to enhance their ability to engage toddlers in interactions that further support and challenge their learning and development.

Longitudinal association between teacher-child interaction quality and children's literacy skills
Presenting Author: Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

Teacher-child interaction quality has been shown to predict gains in the development of children's literacy skills in ECEC and in school, but only limited evidence exists for the early onset longitudinal associations. The aim of the present study was to investigate the association between the quality of early teacher-child interactions in toddler classrooms (age 2–3) and children's emerging academic skills later at the age of 5–6. Children's (n = 206) emerging literacy skills were assessed twice at the age of 2.5–3 and again at the age of 5.5–6. The quality of teacher-child interaction was evaluated in toddler classrooms (n = 41) using the CLASS-Toddler observation instrument. The analyses were conducted with longitudinal path models with the Complex option. The results indicated that after controlling for parental level of education, child gender and age and the previous level of investigated variables, the higher quality of engaged support for learning was related to higher phonological awareness at the age of 5.5 and on broader receptive vocabulary the age of 6. The results therefore imply that the quality of teacher-child interaction in ECEC toddler classrooms has longitudinal benefits in terms of supporting children's emerging literacy skills at the entry to pre-primary education. The results call for a need to address the characteristics of teacher support in detail within pre- and in-service training and especially put more effort on supporting the quality of cognitively stimulating learning interactions already in toddler classrooms.

Measuring Interaction Quality in ECEC: An Empirical Analyses of the CLASS Pre-K and the SSTEW
Presenting Author: Elisa Oppermann, University of Bamberg, Germany; **Co-Author:**Lars Burghardt, University of Bamberg, Germany; **Co-Author:**Julia Barenthien, University of Hamburg, Germany; **Co-Author:**Mirjam Steffensky, University of Hamburg, Germany; **Co-Author:**Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

The empirical research literature has demonstrated the immense potential of high-quality interactions in preschool settings for children's learning and development. Attention has thus grown around methodological approaches to measuring interaction quality in preschool. The present study compares the well-established CLASS Pre-K (Classroom Assessment Scoring System; Pianta et al., 2008) and the more recently developed SSTEW (Sustained Shared Thinking and Emotional Wellbeing Scale; Siraj-Blatchford et al., 2015). Conceptually, the two measures cover similar dimensions of interaction quality with a slightly different focus particularly in the operationalization of cognitively stimulating interactions. Empirically, findings show good psychometric properties of both scales. The similar pattern of quality ratings found across measures and the positive correlations between conceptually related dimensions indicate convergent validity of the scales. Implications for research are discussed.

Design choices in programmatic assessment: balancing between formative and summative
Keywords: Assessment Methods, Curriculum Development, Feedback, Higher Education
Presenting Author: Bas Agricola, HU University of Applied Sciences, Netherlands; **Co-Author:**Marlies de Vos, Open University the Netherlands, Netherlands; **Co-Author:**Tamara van Schilt-Mol, HAN, Netherlands; **Co-Author:**Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands

Assessment in higher education (HE) is often focused on concluding modules with one or more tests that students need to pass. As a result, both students and teachers are primarily concerned with the summative function of assessment: information from tests is used to make pass/fail decisions about students. In recent years, increasing attention has been paid to the formative function of assessment and focus has shifted towards how assessment can stimulate learning. However, this also leads to a search for balance between both functions of assessment. Programmatic assessment (PA) is an assessment concept in which their intertwining is embraced to strike a new balance. A growing number of higher education programmes has implemented PA. Although there is consensus about the theoretical principles that form the basis for the design of PA, programmes make various specific design choices based on these principles, fitting with their own context. This paper provides insight into the design choices that programmes make when implementing PA and into the considerations that play a role in making these design choices. Such an overview is important for research purposes because it creates a framework for investigating the effects of different design choices within PA.

Acceptance of simulation-based assessment formats in teacher education
Keywords: Assessment Methods, Competencies, Simulation-based Learning, Teacher Professional Development
Presenting Author: Christoph Vogelsang, Paderborn University, Germany; **Co-Author:**Jana Meier, University of Paderborn, Germany, Germany; **Co-Author:**Thomas Janzen, PLAZ Professional School - Paderborn University, Germany; **Co-Author:**Philipp Wotschel, Paderborn Centre for Educational Research and Teacher Education - PLAZ-Professional School - University of Paderborn, Germany

Following a comprehensive understanding of competence (Blömeke et al., 2015), which includes the dispositional level as well as situation-specific skills and observable action (performance), learning environments and assessment formats are needed in academic teacher education that enable the development and assessment of competencies related to practice. Simulation-based settings and formats, such as role-plays, are one possible method of simulating typical requirements of the profession under conditions that are as authentic as possible and allow “approximations of practice [that] include opportunities to rehearse and enact discrete components of complex practice in settings of reduced complexity” (Grossman et al., 2009a, S. 238). Such settings are also implemented more widely in other profession-related programs such as medicine (St. Pierre & Breuer, 2013). For teaching and practice purposes, such methods have also been developed for teacher training, but performance-based examination formats receive little attention in this regard, even though they are just as important for a holistic competence-oriented design of learning processes (Schaper, 2012). This article reports on the experiences and perceptions of (N=620) master's student teachers regarding role-play-based exercise and examination formats, which were collected in the course of an online survey. In addition, results are reported from interviews (N=16) that were conducted with student teachers who participated in role-play-based simulations. Student teachers perceive the relevance and authenticity of such examination formats especially high, but are sceptical about the evaluation and grading of such formats – unless they have participated in a simulation.

Assessing pre-service EFL teachers’ feedback performance in role-play-based simulations
Keywords: Assessment Methods, Higher Education, Pre-service Teachers, Simulation-based Learning
Presenting Author: Thomas Janzen, PLAZ Professional School - Paderborn University, Germany; **Co-Author:**Philipp Wotschel, Paderborn Centre for Educational Research and Teacher Education - PLAZ-Professional School - University of Paderborn, Germany; **Co-Author:**Jana Meier, University of Paderborn, Germany, Germany; **Co-Author:**Christoph Vogelsang, Paderborn University, Germany

Simulations involving role-plays with standardized patients have long been a corner stone of medical education, allowing aspiring medical personal to show their competence in an action-oriented way (Miller, 1990). In teacher education, such simulations could be a way to address the often-proclaimed gap between theory and practice, as these would allow pre-service EFL teachers to be assessed based on their performance rather than their declarative and procedural knowledge. Focussing on approximating one core practice of EFL teachers, such a simulation was developed to test pre-service EFL teachers’ feedback competence on written learner products (Grossman et al., 2009). This paper presents results from a pilot study (N=10) in which general feasibility and student acceptance were evaluated. Using student and expert interviews, as well as potential covariates such as feedback knowledge and general competence in the field of English didactics, the validity of the test will be explored. Preliminary results from the pilot study indicate that students generally have a positive attitude towards this new form of assessment as it allows them to demonstrate their abilities in a more action-oriented manner in an authentic, school-like situation. Based on these preliminary findings, a main study will be conducted for further validation.

Are Preschool Teachers Willing to Engage in Learning Situations?
Keywords: Assessment Methods, Attitudes and Beliefs, Early Childhood Education, Science and STEM
Presenting Author: Lukas Schmitt, RPTU Kaiserslautern-Landau, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany; **Co-Author:**Laura Venitz, University of Koblenz-Landau, Germany

Abstract
The importance of diagnostic and scaffolding activities for early science learning in preschool has been shown in previous studies consistently. However, the use of diagnostic and scaffolding techniques in everyday situations as well as in mathematics and science learning opportunities is scarce. Hitherto, there is no diagnostical instrument besides behavioral observations to assess preschool teachers’ willingness to engage in diagnostic and scaffolding activities in learning situations. Thus, the aim of the current study is the validation of a self-developed situation-based instrument. Participants were presented with 5 vignettes displaying learning situations in preschool and were asked to rate six items for each vignette on a four-point-Likert-scale. For our model, we proposed three underlying factors (Diagnosis, Scaffolding and Inactivity). The sample consisted of N=151 preschool teachers from kindergartens in South West Germany. The assumed 3-dimensional model yielded an acceptable fit. Multiple regression analyses showed that co-constructivist learning beliefs were positively associated with the willingness to engage in diagnostic and scaffolding activities, respectively. Besides, the more teachers valued experience, the more they were willing to engage in diagnostic activities. Preschool teachers’ age was positively correlated with the willingness to engage in scaffolding activities; however, it was not associated with the willingness to engage in diagnostic activities and inactivity. Results suggest that individual prerequisites of preschool teachers seem to predict the willingness to engage in diagnostic and scaffolding activities and therefore should be taken into account in future research.

What do workplace educators value about student performance?
Keywords: Assessment Methods, Higher Education, Qualitative Methods, Vocational Education and Apprenticeship Training
Presenting Author: Marlies de Vos, Open University the Netherlands, Netherlands; **Co-Author:**Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Cees van der Vleuten, Maastricht University, Netherlands; **Co-Author:**Elly de Bruijn, Hogeschool Utrecht / OU, Netherlands

Workplacement is a part of vocational education that helps prepare students for their future at work. Its assessment is complex since school often determines what is assessed, but this does not reflect what the workplace considers important about student performance. This paper approaches school and work as two activity systems with different people, rules and tools and with different assessment practices. Using the philosophy of inferentialism as a novel perspective, this paper aims to explore what workplace educators value about student performance. We analysed our interview data using a grounded theory approach. The findings show that workplace educators value different aspects of student performance that can be described along three frames: 1. a vocational frame focused on what it means to be a successful practitioner in a specific community of practice, 2. an educational frame focused on learning attitudes, visibility of learning and autonomy, 3. an expectation frame based on the workplace educator's expectations of the student related to their start at the workplace (e.g. prior experience and first impressions). Through the application of inferentialism this paper offers a new perspective on assessment that could be the starting point of reevaluating the assessment of workplace performance in vocational education and finding ways to establish a closer collaboration between the activity systems school and work.

Is it the clinical supervisor's role to support medical students' emotional challenges – if so when?
Keywords: Emotion and Affect, Higher Education, In-service Teachers, Qualitative Methods
Presenting Author: Linda Barman, KTH, Royal Institute of Technology, Sweden; **Co-Author:**Maria Weurlander, Stockholm University, Sweden; **Co-Author:**Henrik Lindqvist, Linköping University, Sweden; **Co-Author:**Robert Thornberg, Linköping University, Sweden; **Co-Author:**Annika Wernerson, Karolinska Institutet, Sweden

In this study, we report on clinical supervisors' views of their role and responsibilities to support medical students' emotional challenges during work-based education. Medical students spend significant time of their studies in healthcare with the purpose of learning and developing professional skills and approaches necessary as a practicing physician. Previous research show that students experience emotional challenges during work-based education that may affect their professional becoming, but that they seldom feel supported by clinical supervisors to cope with or process these situations. Based on interviews with 20 physicians with different medical specialties working in the Swedish healthcare, and missioned to supervise undergraduate students, we conducted a constructivist grounded theory analysis. The findings suggest that supervisors' awareness of students' challenges, their attitudes towards their profession and attribution of causes for students' emotional challenges influenced how they viewed their role and responsibilities to support students' emotional challenges during work-based training. Supervisors who did not perceive that their role entailed to support students' emotional distress, had no supporting strategies, whilst others used the education design to protect students from being exposed to emotional challenging situations. Supervisors who emphasised the importance for students to process emotional experiences from clinical work, reported limited opportunities to provide situation-near support but reflective seminars outside clinical practice may offer some reflection-on-action.

Pedagogic strategies of supervisors in health care placements
Keywords: Health-care Education, Mentoring and Coaching, Social Interaction, Teaching/Instructional Strategies
Presenting Author: Lieke Ceelen, Open University of the Netherlands, Netherlands; **Co-Author:**Anne Khaled, HAN University of Applied Sciences, Netherlands; **Co-Author:**Loek Nieuwenhuis, Open University of the Netherlands, Netherlands; **Co-Author:**Elly de Bruijn, Open University of the Netherlands, Netherlands

Supervising students at work is a valuable practice to contribute to the training of future colleagues in the profession. The focus of this study is to explore pedagogic strategies used by supervisors in the context of healthcare students' workplace learning. Pedagogic strategies include the interplay between reasons and actions (De Bruijn, 2012). In our previously published literature study we found supervisors to (1) demonstrate vocational activities, (2) entrust vocational activities, and (3) stimulate students' participation in the vocational community. We used these three perspectives on workplace pedagogy to empirically investigate the supervisors' pedagogic strategies in the contexts of seven healthcare placements. In these work settings, we observed the daily activities and interactions between supervisors and students. After the observation days, the supervisors were interviewed to find out their reasoning in relation to their actions. Findings reveal supervisors' pedagogic strategies, including their supportive actions and interventions and their pedagogic reasoning in the situated settings of three student-physiotherapists' and four student-nurses' placements. The study illustrates how supervisors are continuously challenged to balance the interests of the patient, the student, the supervisor's own interests and the interests of the school or organization. Our insights into pedagogic strategies provide opportunities to discuss and to promote the various manifestations of student support at the workplace.

Uncovering hidden Professional Learning Needs and Learning Preferences of Mentors in Flanders
Keywords: Mentoring and Coaching, Mixed-method Research, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Panayota Cotzaridis, KU LEUVEN, Belgium; **Co-Author:**Eline Vanassche, KU Leuven, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium

Mentoring has become an integral part of teacher education, as it enhances teachers' reflective practice as well as school professional development (Trevethan & Sandretto, 2017). However, researchers have thus far focused more on the role of teacher educators based in higher education (i.e. *university-based teacher educators*) and less on mentors in schools (i.e.*school-based teacher educators*) (e.g. Lunenberg et al., 2014). While both groups of teacher educators contribute significantly to teacher education, their professional development requires different approaches (Cochran-Smith, 2003) as they need specific answers to their learning needs (Kelchtermans et al., 2018). Taking a 'practice-based' viewpoint (Kelchtermans, 2013), I investigate the professional developmental needs that school-based teacher educators in Flanders (Belgium) encounter. It is therefore important to consider the national context when examining teacher education. A brief analysis of Flanders' teacher education policy illuminates further the significant role of mentors in the context of Flanders - currently faced with a growing teacher shortage. The study will therefore serve as a valuable resource for practitioners and policy makers in terms of knowing what mentors needs, sharing important information for trainers of mentors and supporting further research. The research analysis adopts a mixed-methods approach, reporting on survey (N = 67) and follow-up interview data (N = 13). This study is part of a large-scale international research of school-based teacher educators in Europe, making it a unique contribution to Flanders.

The decline of learning enjoyment and learning effort over primary and lower-secondary school
Keywords: Emotion and Affect, Motivation, Primary Education, Secondary Education
Presenting Author: Anna Hawrot, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Ilka Wolter, Leibniz Institute for Educational Trajectories (LIfBi), Germany

This study inquired into trajectories of learning enjoyment and learning effort over primary and lower-secondary school. It also verified if gender, migration background, and SES predicted their initial level and change. We used two independent large-scale panel samples with longitudinal data on (1) parent-reported student enjoyment and effort in Grades 1 to 3 (three measurement occasions) and (2) student-reported enjoyment and effort in Grades 3 to 10 (seven measurement occasions), over 9,500 observations in total. The data came from the German National Educational Panel Study. Parallel process curve-of-factor growth curve models estimated for each sample separately revealed a decline in learning enjoyment and learning effort over time. The size of the decline in the two characteristics was similar: 0.23-0.29 of *SD* between Grades 1 and 3; 0.39-0.43 of*SD* between Grades 3 and 10. Learning effort decreased gradually in both samples. Learning enjoyment decreased gradually in the first sample but showed a temporary increase just after the transition to lower-secondary school (between Grades 4 and 5) in the second sample. The results on group differences in the initial level and decline were mixed. We found some differences in the initial level of enjoyment and effort in favour of female students, students with a migration background, and students with high SES. The role of gender, migration background, and SES for the decline varied. The study provides further support for a decrease in school-related emotional and motivational functioning over primary and lower-secondary school.

Help me if you can I'm feeling down: Supporting emotion regulation and well-being in the classroom
Keywords: Emotion and Affect, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Well-being
Presenting Author: Matt Somerville, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Emily Midouhas, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Marcos Delprato, University of Sussex, United Kingdom

Children living in socioeconomically disadvantaged communities face a wide range of stressors that are different from those experienced by children from more advantaged homes. Research indicates that higher levels of well-being in children may act as a buffer against the negative effects of stress and adversities, and that supportive teacher behaviours may play a key role in promoting pupil's socio-emotional development and well-being. This paper presents the results of a naturalistic study of the associations between pupil perceptions of teacher support, emotion regulation and well-being in the primary classroom. The study was carried out in 31 classrooms across 8 primary schools situated in low socioeconomic neighbourhoods of New Zealand. In Phase 1, 508 pupils (M_{age} 9.9 years) completed questionnaires on wellbeing, emotion regulation and supportive teacher behaviours. Four classrooms were selected for Phase 2, which involved classroom observations of teacher support. We applied multilevel modelling to account for the hierarchical nature of the data and found that teacher support was a significant predictor of both emotion regulation and well-being, and that emotion regulation mediated the teacher support–wellbeing link. We also found a significant interaction between teacher support and school socio-economic status, indicating that teacher support was especially beneficial for pupils attending schools in the less disadvantaged communities of the sample. The observational data revealed that the classrooms rated as most supportive were characterised by autonomy-supportive teacher behaviours, clear expectations, and warm, low-conflict teacher-child relationships. The implications of these findings for practice, policy, and future research will be discussed.

Science students' burnout profiles, social identity and trust for teachers' faith in their abilities
Keywords: Burnout, Higher Education, Science and STEM, Well-being
Presenting Author: Liisa Myyry, University of Helsinki, Finland; **Co-Author:**Veera Kallunki, University of Helsinki, Finland

The well-being of students is a current topic in higher education, and it is related to how well students feel they fit in with their study community. Feeling the sense of belonging to other human beings is essential, as we are social animals. Students' sense of belonging to their study community in higher education is associated with students' engagement and happiness, and positive social identity improves well-being and protects against loneliness, but the social engagement requires the feelings of trust. We examined how study-related burnout, sense of belonging, social identity and trust for teachers are related, and measured them from 200 science students. We ran an LPA analysis and identified three burnout profiles: not exhausted, moderately exhausted and highly exhausted. The trust that teachers have faith in students' abilities and identification with degree programme students varied significantly according to the burnout profile, highly exhausted students showing lower levels of trust and social identity than not exhausted. The results indicate that both the importance of social identity and trust in teachers for higher education students should be scrutinized in further studies.

Utilisation of self-reflection-based feedback to support teaching and well-being in higher education
Keywords: Teacher Professional Development, Teaching Approaches, Tool Development, Well-being
Presenting Author: Telle Hailikari, Häme University of Applied Sciences, Finland; **Co-Author:**Siru Myllykoski-Laine, University of Turku, Finland; **Co-Author:**Anna Parpala, University of Helsinki, Finland; **Co-Author:**Liisa Postareff, HAMK University of Applied Sciences, Finland

Reflection has long-term effect on the teacher's learning-oriented teaching (e.g. Noben et al., 2021), which emphasizes interactive processes and pedagogical awareness (Postareff & Lindblom-Ylänne, 2008; Cao et al., 2018). Although reflection has been found to support teachers' well-being (Wosnitza et al., 2018), there are still few research-based tools to support higher education teaching and well-being. This study examines higher education teachers' experiences of a research-based self-reflection tool regarding teaching and well-being. A previously developed HowUTeach self-reflection tool was used (Parpala & Postareff, 2021) including statements measuring teaching processes and well-being, as well as written feedback developed for each scale. The participants (n=17) answered the HowUTeach survey, based on which they received written feedback on the different dimensions. The feedback described what the different dimensions of the survey measure and gave tips for developing teaching and well-being. After the survey, the participants took part in group interviews (a total of 6 including 2-3 teachers/interview). The interviews were analyzed using thematic analysis.The experiences evoked by using the self-reflection tool could be divided into three different themes: 1) reflection provides support for reflection on one's own teaching and well-being 2) reflection makes one think about the importance of the teaching context in teaching 3) joint discussion is needed to support self-reflection. The results show that self-reflection regarding teaching and well-being is especially useful if the teacher has already used reflection as part of their teaching, and if the teacher has the opportunity to discuss reflection with other teachers.

Development of an observation system for teacher-child interaction in lower primary school classes

Keywords: Primary Education, Social Aspects of Learning and Teaching, Teacher Effectiveness, Tool Development
Presenting Author:K.M. Starreveld, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Mathilde Overbeek, VU University Amsterdam, Netherlands; **Co-Author:**Agnes Willemen, VU University Amsterdam, Netherlands; **Co-Author:**Marian Bakermans-Kranenburg, ISPA - University Institute, Portugal

The importance of positive teacher-child interactions for children's development is well established. The Arnett Caregiver Interaction Scale (CIS; 1989) is a widely used measure of quality in caregiver-child interactions, yet it has serious psychometric and theoretical limitations. An adaptation of this scale, The Child Caregiver Interaction Scale (CCIS) (Carl, 2010), is a more valid and reliable measure for assessing group-interactions of caregivers and children in child care. Adapting it for use in primary schools may offer opportunities for measurement and teacher coaching. Here we describe the adaptation process of the Child Caregiver Interaction Scale for Primary schools (CCIS-P), present an overview of the preliminary findings regarding its psychometric properties look at associations with children's perceived quality of interaction with their teacher. As part of a larger study on teacher coaching, thirty-eight early primary school teachers were observed in their classrooms using the CCIS-P and one of their students completed a questionnaire regarding their appraisal of teacher support (Y-CATS; Mantzicopoulos & Neuharth-Pritchett, 2003). Results show that the CCIS-P demonstrates high internal consistency on the total scale (Cronbach's Alpha .82) and high inter-rater reliability on the domains (mean ICC .87 to .88) Preliminary results show positive correlations between child experienced autonomy in the relationship with the teacher and the Total CCIS-P score (r = .33; p = .05) and the Emotional domain (r = .39; p = .02). This study contributes to the understanding on how observation systems can be used to measure and improve teaching.

Impacts of Tablet Computer Use on the Quality of Teacher-Child Interactions
Keywords: Computer-assisted Learning, Early Childhood Education, Social Interaction, Video-based Learning
Presenting Author: Ueli Thomas Studhalter, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Jossen Priska, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Marco Seeli, University of Teacher Education of Lucerne, Switzerland; **Co-Author:**Annette Tettenborn, University of Teacher Education of Lucerne, Switzerland

The aim of the study was to examine the role of tablet computers in a specific learning scenario in preschool classes. The scenarios consisted in the teachers' accompaniment and support of children's block play. The teachers could use a tablet computer to support children's learning through visual feedback using short videos. For the children, the learning objective was to expand their knowledge about the stability of their block constructions. As part of an extensive field study, two teachers were videotaped while assisting children's play and learning. We performed a video analysis using MAXQDA software based on 8.7 hours of video footage. Herby, 486 teacher-child interactions were quantified to assess their quality. We wanted to examine how the quality of teacher-child interactions relates to conditions of use vs. non-use of tablet computer. Referring to the concept *sustained-shared thinking*, we define valuable interactions as those episodes that involve a deep, prolonged intellectual and content-specific exchange between the teacher and one or more children. To assess the quality of teacher-child interactions in such a way, we evaluate: (a) duration, (b) children's participation, and (c) teachers' scaffolding activities. Preliminary results suggest that the tablet-supported teacher-child interactions are of longer duration, while child participation differs partially compared to non-tablet interactions. The results are critically discussed considering technology-enhanced teaching and learning in early childhood education.

Decoding Prosociality: Understanding Classroom Based Experiences
Keywords: Peer Interaction, Qualitative Methods, Social Interaction, Well-being
Presenting Author: Aneeza Pervez, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Matt Somerville, IOE, UCL's Faculty of Education and Society, United Kingdom; **Co-Author:**Ed Baines, IOE, UCL's Faculty of Education and Society, United Kingdom

Objective: Although there is much research on prosociality, very little aims to understand children's perspectives on prosociality and the influence of school context. This study sought to explore ways in which children and teachers conceptualize prosociality in classroom settings. Design: semi-structured interviews and activity-based paired interviews were used to collect data. Paired interviews were used with children to counter response bias and power inequality inherent in semi-structured interviews. Moreover, a participatory design was used to promote reflexivity in children and combat a loss of interest. Methods: The sample of the study comprised 15 primary school teachers (2 male 13 female) and 15 Year 5 students (9 boys and 6 girls; age range 9 - 10 years; m = 9.28 years). Interviews with the children were divided into two parts; in the first half children were asked questions about their experiences. The second half was structured around a storytelling activity supported by visual cues. Interview transcripts were analysed using reflexive thematic analysis. Results: The analysis yielded three main themes; Conceptualization of prosociality (the essence of helping and kindness), Prosocial encounters in the classroom (helping, sharing and comforting in action) and Personal, social and relational structures influencing prosocial responding in classrooms (the role of teachers in promoting prosociality). Conclusion: This study highlights teachers' and children's understanding of prosociality in a structured environment and the impact classroom settings have on prosocial displays in children. The classroom ethos, as well as teacher's classroom strategies, are imperative in promoting positive interactions and prosociality in children.

Exploring student-staff's contribution to quality work in higher education
Keywords: Communities of Learners and/or Practice, Higher Education, Qualitative Methods, Social Aspects of Learning and Teaching
Presenting Author: Hannah Mülder, Faculty of Education, University of Oslo, NO, Norway; **Co-Author:**Carolina Borges Rau Steuernagel, Faculty of Medicine, University of Oslo, Norway; **Co-Author:**Rachelle Esterhazy, University of Oslo, Norway; **Co-Author:**Tone Dyrdal Solbrekke, Faculty of Education, University of Oslo, Norway

Recent initiatives for student-centred, collaborative, and interactive learning in higher education rely on the increased participation of student-staff (i.e. students employed by the university) to facilitate and support student learning. Implementing and further developing these initiatives requires continuous quality work and adaption. The concept of quality work comprises students' and staffs' activities and practices as they intend to improve, impact and define the quality of the education they are involved in. While interactions between and experiences by student-staff and participating students are explored in research, less is known about student-staffs' work surrounding teaching-learning situations. Quality work processes emerge from a combination of institutional structures, local practices and individual agency and influence teaching and learning in visible and invisible ways. We aim to characterise situations in which student-staff engage in quality work in the context of peer-mentors facilitating team-training activities for first-year medical students, aiming to develop collaborative skills. Using an ethnographic approach, we followed peer-mentors in preparatory courses, team building seminars and meetings with faculty, with participant observation and semi-structured interviews over a period of one year, combined with document analysis of educational material. Preliminary findings show that situations in which peer-mentors engage in quality work differ in purpose and structure being pre-set or emergent, who is participating, who in charge and what peer-mentors do. We thus aim to take a step towards developing the concept of quality work and gaining better empirical understanding of student-staffs' work and how to support it.

Assessment of divergent thinking through game based robotics

Keywords: Creativity/Divergent Thinking, Educational Technologies, In-service Teachers, Problem Solving
Presenting Author: Margarida Margarida Romero, Université Côte d'Azur, France

Problem solving through the use of game based robotics requires engaging in divergent and convergent thinking in order to create intermediate solutions. Divergent thinking is considered an important process in creativity research (Runco & Acar, 2012) and creative problem solving (Leroy et al. 2021). In this study, we focus on the analysis of divergent thinking (DT) in the CreaCube game based robotic task. We aim to evaluate DT in a situation of novelty (activity 1) and in a second instance of the task (activity) in which the participants are already familiar with the modular robots. We assess DT by adapting the Alternate Uses Test (AUT) (Guilford, 1967) operationalization of fluidity, flexibility and innovation in the context of a playful problem based activity with modular robotics played twice by 27 elementary education in-service teachers. Results show a higher fluidity (number of total figures built) in the second activity (A2), but a lower flexibility and innovation. Through the CreaCube task we expand the possibilities of assessing divergent thinking through “visuo-spatial constructive play objects” (VCPOs, Ness & Farenga, 2016) required in programming robots and STEM activities with technological components.

Gaming for environmental citizenship: A systematic literature review on behaviour change games
Keywords: Citizenship Education, Environmental Education, Game-based Learning, Sustainable Development
Presenting Author: Yiannis Georgiou, Cyprus University of Technology, Cyprus; **Co-Author:**Andreas Hadjichambis, Cyprus Center for Environmental Research & Education, Cyprus; **Co-Author:**Demetra Hadjichambi, Cyprus Center for Environmental Research & Education, Cyprus; **Co-Author:**Anastasia Adamou, Cyprus Center for Environmental Research & Education, Cyprus

As we are living amid an unprecedented environmental crisis, the need to cultivate more environmental citizens intensifies. Toward this direction, Behaviour Change Games (BGCs) have been argued as a viable venue to empower players’ Environmental Citizenship (EC). This review study examines whether empirical research in the field, covering the time span of the last fifteen years (2007-2021), provides evidence supporting the contribution of BCGs for EC. In total, 44 articles were reviewed, to shed light on the gaming elements and the persuasive strategies of the deployed BCGs, as well as on the EC actions facilitated by the BCGs and their impact on players’ EC competences. Our findings have pointed out that while BCGs seem to promote pro-environmental knowledge and attitudes, such an assertion is not fully warranted for pro-environmental behaviours. We reflect on our findings, and we provide future research directions to push forward the field of BCGs for EC.

Playing in the Museum. Influence of Students' Personal Epistemology on their Learning Experience.
Keywords: Critical Thinking, Game-based Learning, Knowledge Construction, Problem-based Learning
Presenting Author: Simon Morard, University of Geneva, Switzerland

This research investigates the subjectivity of a playful learning experience in a museum context. It focuses in particular on aspects related to the relationship to knowledge and the way students perceive their own play experience. Our work aims to model and study the playful learning experience, both from the point of view of the dimensions linked to play and to aspects relating to the relationship to knowledge (i.e. personal epistemology). Two digital games were designed to test our model, which identifies from a literature review, the main dimensions of a playful experience. This model is used as an analysis tool, completed by the study of audio and video traces collected during experimentation in the museum. The results allow us to identify how the players' personal epistemology is mobilized during their game experience, and how they appropriate the game as a particular learning experience.

Player types in digital learning systems - First results on the Gamification User Types Hexad Scale
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Game-based Learning, Motivation
Presenting Author: Simon Schultze, University of Teacher Education St. Gallen, Switzerland; **Co-Author:**Jan Hochweber, St. Gallen University of Teacher Education, Switzerland

Gamification is used in a variety of application contexts, including digital learning systems. However, different users prefer different gamification elements. The popular Gamification User Types Hexad model (Marczewski, 2015) distinguishes six player types. A corresponding instrument, the Hexad scale, was developed and empirically studied by Tondello et al. (2016, 2019), but not specifically for digital learning systems. In this study, students in German-speaking Switzerland/Liechtenstein from 18 classes in the most academically demanding school type worked on the Hexad scale and reported on their preferences for gamification in a newly developed digital learning system (lernnavi). Based on confirmatory factor analyses, the data are analyzed with respect to fit to the Hexad model, complemented by latent profile analyses of the Hexad subscales to identify different player profiles.

Focusing on Generic and Content-Specific Practices in Mathematics: A Meta-Analysis Spanning 50 Years
Keywords: Mathematics/Numeracy, Meta-analysis, Teacher Effectiveness, Teaching Approaches
Presenting Author: Charalambos Charalambous, University of Cyprus, Cyprus; **Co-Author:**Thekla Iakovou, University of Cyprus, Cyprus; **Co-Author:**Peng Peng, The University of Texas at Austin, United States

For years, scholars have been attending to either content-generic or content-specific teaching practices when trying to explain how teaching contributes to student learning in mathematics. Yet, during the past decade, there is increasing interest in attending to both, recognizing that both are needed for student learning. Despite this recognition, no meta-analysis that empirically examines this hypothesis seems to have been conducted, since most of the extant meta-analyses either attend to only one type of practice or, if they consider both, focus on proxies of those practices (e.g., student learning processes). Aiming to address this gap, the present meta-analysis drew on 175 studies conducted in mathematics over the past 50 years (1970-2020) to compare the contribution of content-generic and content-specific teaching practices to different types of student learning (mainly cognitive and affective). Toward this end, a content-generic framework (the Dynamic Model of Educational Effectiveness) and a content-specific framework (Mathematical Quality of Instruction) were utilized. Run using the “robumeta” package in *R,* the analysis showed both types of practices to contribute to student learning (cognitive and affective), with the content-specific practices having slightly higher effect sizes than those of the content-generic practices. Adding to a growing body of literature stressing the importance of attending to both types of practices, these results can have important implications for developing models to capture teaching quality, for exploring the effects of teaching quality on student learning, and for developing programs for teacher initial training and ongoing professional development.

Mathematics teacher educators’ perspective on teaching and collaboration in Chile
Keywords: Instructional Design, Mathematics/Numeracy, Pre-service Teachers, Synergies between Learning / Teaching and Research
Presenting Author: Paula Guerra, Universidad católica Silva henriquez, Chile; **Co-Author:**Helena Montenegro, Universidad de Chile, Chile; **Co-Author:**Flavio Guiñez, Universidad de Chile, Chile; **Co-Author:**Salome Martinez, Universidad de Chile, Chile; **Co-Author:**Constanza Ledermann, Universidad de Chile, Chile

The quality of preservice teacher education is relevant, and several studies have shown that teacher educators are crucial in this process. In Chile, an area of particular concern is mathematics teacher education due to low results in several evaluations. Although teaching is an individual task, research shows that collaboration is essential for educational improvement. In this context, the collaborative approach is relevant in teacher education. Design-based research

(DBR) is an approach that strengthens and improves teaching practices through collaboration between researchers and teacher educators.
This report will present results from the first and second years of four-year research. Nine mathematics teacher educators participate voluntarily. Data were collected through semi-structured interviews, and thematic analyses were conducted to identify patterns and recurring themes within the data. The preliminary analysis identified two main topics: ideas about teaching and collaborative practice among teacher educators. Participants express awareness of their role as a model about the first topic, but not all agree if they explicitly or implicitly model. Besides, the modeling process has a different emphasis. About the collaborative practice, teacher educators value this process. During the first year, a community was established among teacher educators and the research team, as DBR proposed, to redesign a math task. About this process, they highlight the development of flexibility in their classes, a focus on math, an exchange of ideas, and the improvement of their class. Participants also identified aspects that facilitate and difficult collaboration among teacher educators. Theoretical and practical implications will be discussed.

Multi-criterion noticing in mathematics education - A vignette-based study
Keywords: Assessment Methods, Competencies, Mathematics/Numeracy, Pre-service Teachers
Presenting Author: Sebastian Kuntze, Ludwigsburg University of Education, Germany; **Co-Author:**Marita Friesen, University of Education Heidelberg, Germany; **Co-Author:**Jens Krummenauer, University of Education Ludwigsburg, Germany

The complexity of mathematics classroom situations often requires mathematics teachers to notice and analyse aspects of the situation with respect to multiple criteria which can be meaningful for supporting the students' learning. Such so-called multi-criterion noticing requirements are likely to come with high cognitive load for the teacher, in particular for less experienced pre-service teachers. For multi-criterion noticing, teachers need multi-criterion awareness as well as corresponding professional knowledge in the relevant domains. Despite its importance for mathematics teacher expertise, studies approaching multi-criterion noticing in systematic ways are still scarce. Consequently, this study examines pre-service teachers' analyses of a classroom vignette, which had been designed to require noticing related to four different criteria which are relevant for the students' learning and understanding. The criteria were related to different mathematics education theory elements. The study explores the teachers' competence related to multi-criterion noticing and aims to find out whether the pre-service teachers' multi-criterion noticing can be fostered through an intervention focused in the relevant criterion knowledge elements. The findings include evidence on pre-service teachers' growth in multi-criterion noticing. Moreover, the empirical results also provide insight into pre-service teachers' difficulties, pointing to the complexity of multi-criterion noticing.

Student teachers' attitudes predict self-efficacy for teaching low-achieving students in mathematics
Keywords: At-risk Students, Attitudes and Beliefs, Mathematics/Numeracy, Self-efficacy
Presenting Author: Freya Winterle, University of Vienna, Austria; **Co-Author:**Nele Kampa, University of Vienna, Austria

Fostering mathematical abilities of all students in a heterogeneous setting can be viewed as a crucial part of school education. Inadequate basic mathematical abilities may hinder individual's participation in society. In order to adequately support every student, teachers need to provide differentiated instruction that fits varying needs and ability levels. Teachers' self-efficacy is an essential factor of their professional competence as well as for positive learning outcomes. Teachers' self-efficacy and positive attitudes towards education in STEM classrooms have been shown to be positively correlated. We investigate how student teachers attitudes towards teaching low-achieving students in mathematics and causal attributions regarding this student group are linked with their specific self-efficacy for teaching this group of students. Our sample consists of students in teacher training in Germany and Austria (N=188). By applying a structural equation model, we found a significant relation between student teachers' attitudes towards teaching low-achieving students in mathematics and their specific self-efficacy for teaching low-achieving students in mathematics (β =.26, p

The digital home learning environment of toddlers
Keywords: Digital Literacy and Learning, Early Childhood Education, Environmental Education, Parental Involvement in Learning
Presenting Author: Sarah K Schröter, Otto-Friedrich University of Bamberg, Germany; **Co-Author:**Elisa Oppermann, University of Bamberg, Germany; **Co-Author:**Franziska Cohen, University of Education Freiburg, Germany; **Co-Author:**Luisa Prokupek, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Sabine Blaurock, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

Children's home learning environment (HLE) has received much attention over the past decade. Studies confirm the high impact of the HLE on children's learning outcomes, particularly on their language and numeracy skills (e.g. Anders et al. 2012; Sénéchal & LeFevre 2002). However, the HLE is changing as information communication technology (ICT) increasingly becomes an integral part of children's lives and, consequently, of the HLE. There is little empirical evidence on the impact of ICT use on the HLE of children. Some authors worry that ICT use may replace non-digital educational activities in children's HLE (e.g. Vilhelmson et al. 2018). Therefore, the present study investigates a possible relationship between children's HLE and their ICT contact and analyses potential factors influencing the digital HLE of children, for instance, parental ICT skills and beliefs. We analysed survey data from 209 participants with children between 6 to 18 months. Results revealed a positive relationship between the frequency of parent-child activities and active media use with the child (r=0.16*), while controlling for the child's age, the sum of people under 18 in the same household, gender, the highest degree of the participating parent, and family income. It appears that children experience either a rich home learning environment where parents frequently provide joint non-digital activities with complementary ICT use, or a relatively poor home learning environment with fewer non-digital activities and less ICT use.

Supporting children`s numeracy development in families: A digital intervention study
Keywords: Digital Literacy and Learning, Early Childhood Education, Educational Technologies, Game-based Learning
Presenting Author: Anna Mues, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Efsun Birtwistle, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Astrid Wirth, Ludwig-Maximilians-Universität München, Germany; **Co-Author:**Tina Schiele, Ludwig-Maximilians-Universität-München, Germany; **Co-Author:**Frank Niklas, Ludwig-Maximilians-Universität (LMU), Germany

Early numeracy competencies are of great importance for children´s later academic achievement. In addition to family characteristics, the home numeracy environment (HNE) plays a key role for children´s development. Here, digital interventions with learning apps on tablets offer the potential to approach families in a low-threshold manner and to support them regardless of their background.
In a field experiment, we investigated whether the provision of specific mathematical learning apps for kindergarten children and parental information about the HNE improves the quality of children´s numeracy competencies and the HNE. Children´s numeracy competencies were measured in two cohorts (N_1 = 190 children; M_{1age}= 63.6 months; SD_1 = 4.4; N_2 = 310; M_{2age}= 59.36; months; SD_2=3.94) at t1 and about six months later at t2. Parents were surveyed about demographic information and the HNE. Between t1 and t2, N_1= 65 and N_2 = 91 of the participating families received tablet computers with specific mathematical learning apps and parental information for a period of 5.5 months.
Our analyses showed no intervention effect for the quality of the HNE. However, group comparisons and regression analysis with the exact app usage times

showed significantly greater mathematical competency gains for children from intervention families even when controlling for child and family characteristics. The study demonstrates that pedagogically valuable learning apps can support children's development of numeracy competencies already at preschool age, however we need to think about further ideas how to reach the parents more adequately in order to increase the quality of the HNE.

Framework of parental restrictive mediation for using digital technologies at home
Keywords: Competencies, Digital Literacy and Learning, Parental Involvement in Learning, Primary Education
Presenting Author: Marit Puusepp, University of Tartu, Estonia; **Co-Author:**Margus Pedaste, University of Tartu, Estonia

Digital technology is widely used for achieving educational learning outcomes. However, research shows that access to digital technologies also results in their use for entertainment purposes. Therefore, parental restrictive mediation, in terms of rules and restrictions, is often applied to regulate technology use at home. However, not much is known about the different forms of restrictive mediation. The aim of this study is to propose a framework of parental restrictive mediation to describe the different categories of restrictions applied to regulate students' digital technology use.We collected data from students (n = 847; grades 3, 6, and 9) and their parents (n = 709) about their understanding of the rules and restrictions applied at home for using digital devices, platforms, content, and internet. We used inductive content analysis of open-ended questions to develop a framework of parental restrictive mediation. The proposed framework consists of four main categories (devices, platforms, content, and internet) and six sub-categories with a total of 39 different variables. Application of the framework revealed that it enables researchers to specify the variety of rules and their alteration through grades in basic school. The results showed that the most detailed rules at home concerned device use (e.g., time-restriction rules for smartphones) and that all restrictions were reduced with students' age. In future studies, analysis of how different restrictions may predict students' digital competence or academic learning outcomes could inform parents on how to set rules in a more meaningful way.

App-based Support for Parental Self-Efficacy in the First 1,000 Days: A Randomised Control Trial
Keywords: Early Childhood Education, Educational Technologies, Informal Learning, Self-efficacy
Presenting Author: Laura Outhwaite, University College London, IOE, United Kingdom

Parental self-efficacy is key for guiding parents' interactions with their child and is an important target for early intervention. This study reports a pilot randomised control trial (RCT) of a parenting application (app) with 79 parents of children aged 0-6 months in the UK. The app includes 1,026 daily age-appropriate activities across eight areas of child development, using resources accessible at home. While controlling for pre-test scores, parents who used the parenting app (Treatment Group) had significantly higher parental self-efficacy, after the 4-week intervention period, compared to the Active Control Group. Partial correlation analyses indicated that higher frequency of self-reported use of the parenting app was associated with greater parental self-efficacy outcomes. This evidence establishes proof of concept that parenting apps can have significant benefits on parental self-efficacy in early childhood. Limitations to the interpretation and generalisation of the findings, as well as directions for future research are discussed.

How adults with and without deafness process idioms: Direct retrieval or compositional analysis?
Keywords: Cognitive Skills and Processes, Comprehension of Text and Graphics, Inclusive Education, Special Education
Presenting Author: Inmaculada Fajardo, Department of Developmental and Educational Psychology/Reading Research Unit, Spain; **Co-Author:**Nadina Gómez-Merino, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Marta Vergara, Department of Developmental and Educational Psychology/Reading Research Unit, Spain; **Co-Author:**Antonio Ferrer, Department of Developmental and Educational Psychology/Reading Research Unit, Spain

Little is known about how individuals with deafness process some kind of figurative language like idioms whose meaning could be directly retrieved from memory when they are very familiar (as opposed to the compositional analysis of each individual idiom word). Direct retrieval could benefit readers who rely more in direct lexical access like people with prelingual deafness (Belanguer & Rayner, 2015). This proposal describes an ongoing study in which 24 adults with and without prelingual deafness read familiar and literally plausible idioms (break the ice) embedded in literal vs. figurative context. Idiom's congruency was also manipulated by including a non-related word at the end of the idiom (target word: ice/pulp). Participants eye movements on the target and post-target regions were monitored. Results showed a main effect of group for the target and posttarget areas with hearing participants showing shorter fixation times than participants with deafness. We also observed a facilitative idiomacity effect for both groups in the post-target area which was fixated shorter when it was preceded by idiomatic than by literal contexts. The incongruency effect in the target region (higher fixation times in the incongruent words) was significant for both groups in the literal context condition but not in the idiom condition. Altogether, these results suggest that both groups relied more on direct retrieval of idioms than on the compositional analysis. Nonetheless, when the context induces a literal interpretation, participants were able to change to an idiom compositional analysis (word by word) as shown by slower reading times.

Formative assessment in inclusive mathematics education in secondary schools: A systematic review
Keywords: Classroom Assessment, Inclusive Education, Mathematics/Numeracy, Secondary Education
Presenting Author: Fynn Töllner, Leuphana University of Lueneburg, Germany; **Presenting Author:**Kyra Renftel, Leuphana University Lueneburg, Germany; **Co-Author:**Poldi Kuhl, Leuphana Universität Lüneburg, Germany; **Co-Author:**Michael Besser, Leuphana Universität Lüneburg, Germany

Formative assessment can be used to put individualisation in place. When it comes to inclusive teaching in secondary school mathematics education, little is known about how to design and implement such a formative assessment. This paper addresses this research gap by conducting a systematic review on formative assessment for an inclusive mathematics education in secondary schools. For this purpose, we searched selected literature databases and identified 16 relevant articles. 14 of these 16 articles were from the United States, one from Switzerland, and one from Austria. They were published between 1990 and 2020. The identified publications include (systematic) reviews as well as quantitative, qualitative and non-empirical work. The systematic analysis of these publications was done with respect to formative assessment in general as well as its both main components, namely diagnostics and feedback. The analysis indicates, that in terms of formative assessment in general, teachers should be supported with information on how to deal with their students' diagnosed mistakes. While diagnosing achievement it should be considered, that students with different conditions differ in their preferred approach to a subject matter and the mistakes they make. While giving feedback, students with mathematical disabilities benefit from a graphical representation of their performance development, as this can help to motivate them. After presenting the main results, we will discuss limitations and implications of the conducted review. We will put special emphasis on the meaning of the results for the future implementation of formative assessment practices in inclusive mathematic teaching at (German) secondary schools.

Interconnectedness between students' self-efficacy in self-regulation and strengths
Keywords: Quantitative Methods, Self-efficacy, Self-regulated Learning and Behaviour, Special Education
Presenting Author: Minna Ikävalko, University of Eastern Finland, Finland; **Co-Author:**Erkko Sointu, University of Eastern Finland, Finland; **Co-Author:**Jaana

Viljaranta, University of Eastern Finland, Finland; **Co-Author:**Matthew Lambert, University of Nebraska-Lincoln, United States

Students' self-perceptions of own abilities to regulate and assess behaviours, emotions and thinking have been seen to strongly influence students' educational and psychosocial development. To investigate self-perceptions more in depth, we need to recognise the interpretations (e.g., doubts and confidence) students hold about their accomplishments in learning situations. We examined 9–16-year-old students' (N= 599) self-perceptions from the viewpoints of the sources of self-efficacy in self-regulation and behavioural and emotional strengths. Independent sample *t*-tests were used to examine whether students' age or received pedagogical support played a role in their self-perceptions of abilities and strengths. Pearson's correlation coefficients were used to examine whether these two viewpoints are related to each other. First, we found that primary school students perceived their sources of self-efficacy in self-regulation and strengths more positively than lower secondary school students. However, previous experiences of stress and anxiety in task situations did not differ between the school levels. Second, among primary school, pedagogical support did not play a significant role in how students perceived their abilities and strengths, whereas in lower secondary school, significant differences in several measured areas were found. Third, we found that the sources of self-efficacy in self-regulation and strengths were related in both primary and lower secondary school settings. The results indicate that students interpret learning situations differently in relation to age, and in lower secondary school in relation to pedagogical support. Additionally, results revealed that the connection between the sources of self-efficacy in self-regulation and strengths can be found empirically.

Effects of different learning environments on students' socio-scientific decision-making.
Keywords: Instructional Design, Learning Strategies, Science Education, Teaching/Instructional Strategies
Presenting Author: Maria Tsapali, University of Bristol, United Kingdom; **Co-Author:**Michelle Ellefson, University of Cambridge, United Kingdom

An ongoing debate within educational and psychological circles is the effectiveness of constructivist teaching methods over direct instruction. This study, through two supplementary examples, explores the effects of three different learning environments (explicit instruction, guided discovery and unguided discovery) on primary school students' socio-scientific decision-making. Experiment 1 allows a comparison between three learning conditions so as to identify which one produces better learning outcomes for students, while Experiment 2 provides depth and context in the question under study by capturing the reasons behind the differences of the three learning conditions. Experiment 1 adopts an experimental pre-test post-test design and classroom-based interventions with a sample of 190 11-year-old students from four primary schools in Greece. The results show that explicit instruction and guided discovery were significantly more effective than unguided discovery. When taking into account achievement level, though, only explicit instruction closed the achievement gap, while guided discovery favoured high-achieving students. Experiment 2 employs one-to-one think-aloud tasks with 30 students to capture their reasoning while they are engaging in socio-scientific decision-making. The results show that students in the Explicit instruction tended to pay more attention to the process they were following and listed the next steps, as well as they provided more explanations on their rationale when making a decision. Taken together, the results of the two experiments suggest that explicit instruction is the most effective learning environment to introduce socio-scientific decision-making in mix-level primary classrooms.

Robotics and programming in primary education: a teacher-led classroom intervention.
Keywords: Computational Thinking, Primary Education, Science and STEM, Teacher Efficacy
Presenting Author: Amy Hughes, Cardiff University, United Kingdom; **Co-Author:**Sarah Gerson, Cardiff University, United Kingdom; **Co-Author:**Johanna van Schaik, Radboud University Nijmegen, Netherlands

Recent advances in tangible technologies (e.g., educational robotics) have enabled the introduction of programming and computational thinking concepts in early-childhood classrooms. Simultaneously, research continues to illustrate the benefits of introducing these ideas as early as possible once children begin formal schooling. This study aimed to implement a 6-week robotics intervention within primary school classrooms. We then investigated the impact of this curriculum on children's skill development and teachers' self-efficacy. In total, 430 children (aged 4 – 7 years) and 13 teachers across 7 primary schools participated in this study. In a pre-test post-test design, schools were assigned to one of three conditions: control (i.e., No intervention), classroom intervention (Intervention), or classroom intervention plus teacher training (Intervention+). Several pupil measures were taken pre and post-intervention. These included assessments of programming (including algorithm construction, prediction and debugging), visual perspective taking, sequencing and executive functioning. Teacher attitude and self-efficacy measures were also collected throughout the study. Data analysis is ongoing; however, we aim to explore whether there were improvements in pupils' abilities pre and post-intervention and whether these improvements differ across the three conditions. Multilevel modelling methods will allow us to control for group factors (i.e., school attended and year group) that may influence outcomes at the individual level. When exploring improvements in programming (specifically algorithm construction), preliminary findings suggest that improvements between the three conditions did not differ significantly. However, it appears that age effects are present, with older children improving more than younger children.

Quality and equity in computational thinking education: the relationship with teachers' practices
Keywords: Achievement, Computational Thinking, Secondary Education, Teacher Effectiveness
Presenting Author: Sara Monteyne, KU Leuven - Centre for educational effectiveness and evaluation, Belgium; **Co-Author:**Charlotte Struyve, KU Leuven - Centre for educational effectiveness and evaluation, Belgium; **Co-Author:**Johan van Braak, Ghent University, Belgium; **Co-Author:**Koen Aesaert, K.U.Leuven, Belgium

The aim of this study is to investigate whether teachers' classroom practices (i.e., the extent to which teachers focus on teaching computational thinking skills in class) have the potential to foster student achievement in computational thinking and whether these practices can reduce differences in student computational thinking achievement according to students' background characteristics. A regression analysis with a two-level design was conducted on country specific data of Germany from the International Computer and Information Literacy study (ICILS) 2018. The results indicate that students who are regularly given the opportunity to practice computational thinking skills in the classroom have a higher score on the computational thinking scale. However, in the sample of German schools, these classroom practices do not seem to have the potential to reduce achievement gaps between students.

Associations between Creativity & Computational Thinking in Primary School: Computational Creativity
Keywords: Assessment Methods, Competencies, Computational Thinking, Creativity/Divergent Thinking
Presenting Author: Ann-Kathrin Jaggy, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Katerina Tsarava, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Manuel Ninaus, University of Graz, Institute of Psychology, Austria; **Co-Author:**Mathias Benedek, University of Graz, Institute of Psychology, Austria; **Co-Author:**Korbinian Moeller, Loughborough University, Mathematics Education Centre, United Kingdom

Computational thinking (CT) has been considered an important 21st century STEM competence, that is crucial for present and future generations to meet the demands of the future digital world. Equally important to solving problems is creativity, i.e. the ability to provide innovative solutions. Both CT and creativity are

built upon cognitive thinking processes that contribute to knowledge construction and are involved in problem-solving. However, little is known about their association. The aim of the present study is to build a robust basis for future research on how domain-general creativity and CT are related and to investigate the extent to which domain-general creativity and CT transfer to creativity in the CT context (Computational Creativity). *N*=136 primary school children participated in the cross-sectional study. Standardized tests were used to assess various facets of computational thinking and domain-general creativity. Additionally, a newly developed measurement instrument for the assessment of creativity within a CT-context (i.e., Computational Creativity) was used. The results of the preliminary analyses confirm a positive relationship between Computational Thinking and individual facets of domain-general creativity (r=.25 - .47). Further, the multiple regression analyses revealed that computational thinking is an important factor for (the divergent aspect of) computational creativity (β = .24 - .41; p < .05). Domain-general creativity partly predicted computational creativity in third and fourth graders (β = .20 -.23; p < .05), thus also not consistent across all assessed facets nor across grade levels. The results are discussed in terms of a potentially promising approach for future STEAM education.

Student Self-Assessment and Feedback in Singapore Primary Schools: Engaging Teachers and Students
Keywords: Assessment Methods, Classroom Assessment, Feedback, Teaching/Instructional Strategies
Presenting Author: Hwei Ming Wong, National Institute of Education/Nanyang Technological University, Singapore, Singapore

The Singapore Ministry of Education (2009) has been promoting the use of assessment and feedback to enhance students' learning, as seen in national policies such as the Primary Education Review and Implementation Holistic Assessment (PERI HA) initiative.
The present study examined primary school teachers' implementation of student self-assessment through their teacher learning communities, types of teacher-student feedbacks and benefits of student self-assessment from teachers' and students' perspectives. A total of 13 teachers and their 318 students in four primary schools participated in this study. The teachers attended a series of workshops, aimed at equipping them with skills and knowledge about student self-assessment and feedback. The teachers also participated in focus group discussions (FGDs). Their students participated in a questionnaire and five students from each teacher's class were also randomly selected to participate in FGDs to share their perceptions and experiences of self-assessment and feedback. We will discuss the findings from this study and share recommendations on moving forward assessment and feedback practices in schools.

Feedback in Singapore Classrooms: Findings on Assessment, Knowledge and Interactions Across 15 Years
Keywords: Assessment Methods, Classroom Assessment, Feedback, Teaching/Instructional Strategies
Presenting Author: Dennis Kwek, National Institute of Education/Nanyang Technological University, Singapore, Singapore

The paper provides insight into the nature of teaching and learning in Singapore primary and secondary classrooms over the past 15 years, with a particular focus on the relationships between feedback, epistemic knowledge and interactional structures. Since the introduction of Thinking Schools, Learning Nation (1997) and Teach Less, Learn More (2005) educational policies into the Singapore education system, classroom pedagogies have changed in direct, and indirect, responses to these policies and other sociocultural forces impacting the education system. The CORE Research Programme (CORE) began in 2004 with the purpose of providing a social science research evidence base to document, measure and monitor the pedagogical shifts in primary and secondary classrooms across a range of subject domains in Singapore schools. The paper will focus on assessment and feedback practices of teachers in these classrooms and subject domains, examining the changes in these practices, how they have been shaped by shifts in epistemic knowledge foci and interactional structures, and why tensions continue to persist in the school system for assessment and feedback reforms.

Differences between assessor and assessee outcomes in peer assessment: A systematic review.
Keywords: Assessment Methods, Classroom Assessment, Feedback, Peer Interaction
Presenting Author: David Zamorano, Universidad de Deusto, Spain; **Co-Author:**Maryam Alqassab, Universidad de Las Palmas de Gran Canaria, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain

The peer assessment research has focused on (1) one role (assessor or assessee) or (2) peer assessment as a whole. However, to better understand how students learn from peer assessment, it is necessary to acknowledge the differences between the two roles, assessor and assessee, to support learners in each role. The present study aims to investigate the existing evidence about the differences between the assessor's and assessee's cognitive and non-cognitive outcomes of peer assessment. A systematic literature review was conducted, searching ERIC and PsycINFO (ProQuest) databases, using eight different terms related to peer assessment (e.g., peer feedback). We found 25 studies that met the inclusion criteria. The studies selected had to (1) be conducted in a formal educational setting (primary, secondary, and higher education), (2) carry out fieldwork with a sample (experiments, quasi-experiments, response to questionnaires, interviews), (3) be written in English (4) and report differences in assessor or assessee cognitive or non-cognitive outcomes. Preliminary results shows that 68% (17) studies report differences on cognitive and 32% (8) on non-cognitive outcomes. More than half of the studies focused on cognitive outcomes point towards higher cognitive outcomes for the assessors (eg. learning, performance and writing hability). Meanwhile, mixed results are reported on the studies focused on non cognitive outcomes. Further analysis of the differences between assessors and assessees cognitive and non cognitive outcomes will be reported. Implications of the study fundings on how to consider the roles of assessor and assessee when implementing peer assessment in classroom settings will be discussed.

Teachers stimulating self-regulated learning via co-regulated formative assessment practice
Keywords: Classroom Assessment, Secondary Education, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Marijke Veugen, Wageningen University and Research Centre, Netherlands; **Co-Author:**Judith Gulikers, Wageningen University, Netherlands; **Co-Author:**Perry den Brok, Wageningen University & Research, Netherlands

Many teachers want to stimulate students to self-regulate their learning by applying formative assessment (FA) in the classroom. While the interaction between teacher and student are key in the FA process, not many research has been done yet in how teachers co-regulate the FA process to stimulate self-regulated learning (SRL) of students. In this study the main question was: How do teachers plan and implement (co-regulated) FA activities and what (matched) FA behaviour did students show? The FA cycle was used as framework to describe the FA process in five phases: 1. Clarifying expectations, 2. Eliciting student responses, 3. Analysing and interpreting responses, 4. Communicating about responses and 5. Taking follow-up actions: Adjusting teaching and learning. In total fourteen teachers planned and implemented co-regulated FA activities to stimulate students' SRL. Results showed that teachers implemented more FA activities to stimulate SRL than they planned. Results also showed what co-regulated FA activities looked like for each of the five phases of the FA cycle. With these results teachers and researchers are better able to recognize and implement co-regulated FA practice to stimulate students' SRL.

Impact of a Media Literacy Intervention on Primary School Pupils' Ability to Recognize Fake News
Keywords: Citizenship Education, Critical Thinking, Primary Education, Science and STEM
Presenting Author: Genevieve Allaire-Duquette, Université de Sherbrooke, Canada; **Co-Author:**Abdelkrim Hasni, Université de Sherbrooke, Canada; **Co-Author:**Josée Nadia Drouin, Agence Science-Presse, Canada; **Co-Author:**Anne Gaignaire, Le Curieux, Canada; **Co-Author:**Audrey Groleau, Université du Québec à Trois-Rivières, Canada; **Co-Author:**Jean-Philippe Ayotte-Beaudet, Université de Sherbrooke, Canada

Few studies have explored children's experience with fake news. Those who have done so measured their ability to identify fake news and report that the percentage of primary school pupils recognizing fake news is alarming low. However, the effect of educational interventions remains poorly documented. The aim of this study is to explore the impact of a media literacy intervention on primary school pupils' ability to recognize fake news, on their fake news self-efficacy, and on their views of science news. To fulfill our objective, we will use a pretest–posttest design to compare fake news self-efficacy and views of science news in a sample of 200 pupils from 9-12 y.o. The posttest will also include a fake news identification task. Following the analysis of the data from the pretest-posttest questionnaires, contrasted cases will be further explored through qualitative research interviews that will address real-life use of fake news identification skills, likelihood of sharing fake news, perceived importance of fake news identification skills and news media consumption habits. Data collection is underway. We expect that fake news identification capabilities should be significantly greater than what is reported in descriptive studies (4-35%). We also expect fake news self-efficacy and views of science news to increase significantly. During the presentation, results will be discussed to propose guidelines for the design and implementation of intervention strategies that can effectively fight the proliferation of incorrect information online.

Friendship as political virtue: a project of citizenship education with middle school children
Keywords: Citizenship Education, Ethics, Qualitative Methods, Secondary Education
Presenting Author: Rosi Bombieri, University of Verona, Italy; **Co-Author:**Luigina Mortari, University of Verona, Italy; **Co-Author:**Marco Ubbiali, University of Verona, Italy

The contribute presents "The MelArete project", which is structured in: a) an educative pathway aimed at involving middle school children in reflecting and dialoguing on political virtues, i.e. the ones which give form to an engaged citizenship, and b) a qualitative research on the realized educative activities aimed at rigorously evaluating their effectiveness in fostering the children's ethical flourishing. The project can be defined as an "educative" research and not only "educational", because it is designed in order to offer good experiences to the participants and precisely these educative experiences become the source of the data collection. We will present the theoretical framework of the project, the design of the educative pathway and the heuristic process that involved 52 children of a middle school in the North of Italy. The presentation will focus on the activities concerning the virtue of friendship, that, according to Aristotle, is the main political virtue, and on the definitions that the participants gave to it. These definitions were analyzed following a methodological crossbreeding between the phenomenological method (Husserl, 2012) and the grounded theory (Glaser & Strauss, 1967). Findings, which show the richness of the children's ethical thinking, highlight how the children conceptualize and experience friendship.

Implementing VaKE in Science Education in different age groups
Keywords: Citizenship Education, Instructional Design, Knowledge Construction, Morality and Moral Development
Presenting Author: Panagiota Christodoulou, University of Western Macedonia, Greece; **Co-Author:**Dimitris Pnevmatikos, University of Western Macedonia, Greece; **Co-Author:**Georgios Malandrakis, Aristotle University of Thessaloniki, Greece; **Co-Author:**Evmorfia Garyfallogianni, University of Western Macedonia, Greece; **Co-Author:**Pantelis Kizos, University of Western Macedonia, Greece

It is argued that some instructional designs are suitable for some age groups but not others. The paper addresses whether V*a*KE as an instructional approach could be equally efficient in primary and tertiary education. Three implementations of V*a*KE in science education will be presented; one at the level of primary and two at the tertiary education. The main research question of each instruction was whether implementing V*a*KE could promote both values education and sustainability education. The first was in teaching science education. A V*a*KE dilemma was addressed in a class of 81 elementary school students. The dilemma discussion aimed to promote the concept of nanotechnology and lasted 5 weeks. The second dilemma was addressed in a class of 15 University students. The dilemma discussion aimed, again, to promote the concept of nanotechnology and sustainability and lasted three weeks. The third V*a*KE dilemma discussion was addressed in a class of 27 university students. The dilemma discussion aimed to promote the water footprint understanding and lasted 3 weeks. Comparisons showed significant improvements in conceptual understanding and sensitivity to environmental issues and the connection between values and science or sustainability education. Similarities and differences between the instruction with V*a*KE in elementary and tertiary education are discussed.

Covid-19 pandemic as an opportunity for shaping civic identity among youth.
Keywords: Citizenship Education, Pandemic, Parental Involvement in Learning, Qualitative Methods
Presenting Author: Lars Birger Davan, OsloMet, Norway

March, April, and May 2020 represent disrupting events, followed by serious restrictions on people's lives, in Norway, as well as in many other countries in the world. The global Covid-19 pandemic had a significant impact on education, work life and spare time. Norwegian adolescents were called to give up personal freedoms and to stay home to limit the spread of the virus. Our study aims to find out how young people's civic identity was affected during the pandemic. Through interviews with forty adolescents aged 14-15, our study finds that economic, cultural, and emotional resources in the family are significant factors for establishing and maintaining a civic identity among adolescents. By giving up personal freedom, many young people experienced unique constructs of civic identity, where civic participation goes beyond specific political aims, some see that personal sacrifice of freedom is of the greater good for the whole society and humanity, while others are frustrated for losing their civic life, yet others are feeling lost having little understanding of the context of their loss.

Increasing task-oriented reading skills of lower comprehenders on inferential questions
Keywords: Comprehension of Text and Graphics, Computer-assisted Learning, Primary Education, Reading
Presenting Author: Ruth Villalon, University of Cantabria, Spain; **Co-Author:**Marian Serrano-Mendizábal, University of Valencia / Interdisciplinary Research

Structure for Reading (ERI Lectura), Spain; **Co-Author:**Ángeles Melero, University of Cantabria, Spain; **Co-Author:**Belén Izquierdo-Magaldi, University of Cantabria, Spain

Students usually read texts to answer questions, but many of them struggle to answer the inferential ones. Literature supports strategy instruction to improve low-comprehenders' skills; however, answering questions involves self-regulation strategies that go beyond those needed to understand a text. Although many computer-based interventions have focused on teaching strategies to foster lower-skilled text comprehension, the role of strategy instruction in task-oriented reading has not been examined. In this study we used an intelligent tutoring system based on strategy instruction to improve below-average comprehenders' task-oriented reading skills. We explored its efficacy in both, textbase and situation model levels of comprehension, comparing it with training based on question-answering practice. Results showed that although just practicing question answering may be enough to improve text-based scores, strategy instruction seems to be necessary to improve low comprehender students' skills to answer situation model questions.

Implementation of professional development trajectories for reading instruction.

Aim. The aim of the current study was to examine the implementation quality of two professional development (PD) programs focused on reading instruction. One difference between these programs lies in the space for teacher agency, which may affect implementation quality. We examined whether the PD programs complied with characteristics of effective PD and effective reading instruction. Methodology. Two coding schemes and a questionnaire were developed to investigate three levels of implementation quality, namely the transfer of program content from the teacher educator to the teachers (delivery), how teachers perceived PD (receipt), and the extent to which teachers applied the content of PD in teaching practice (enactment). Findings. Regarding delivery, findings indicate that more characteristics of effective PD were visible in the high-agency PD than in the low-agency PD. For instance, more powerful and concrete practical examples were used in the high-agency PD program. Furthermore, in the high-agency PD, more attention was paid to effective instruction on reading motivation and comprehension. No differences between the PD programs were found in attention for decoding skills and vocabulary. Data of receipt and enactment are currently being analyzed and will be presented at the conference. Theoretical and Educational Significance. The instruments that were developed in the present study may be used more widely to investigate the implementation of PD programs. Additionally, the results of the current study provide more insight into the role of teacher agency in the implementation of PD.

Development of self-regulation searching processes while answering text-based pre-questions
Keywords: Goal Orientations, Primary Education, Reading, Self-regulated Learning and Behaviour
Presenting Author: Noemi Skrobiszewska, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Marian Serrano-Mendizábal, University of Valencia / Interdisciplinary Research Structure for Reading (ERI Lectura), Spain; **Co-Author:**Eduardo Vidal-Abarca, Universidad de Valencia, Spain; **Co-Author:**Paul van den Broek, Leiden University, Netherlands

In task-oriented reading situations, as answering a question, the task gives some clues about the relevance of the information in the text. Some questions give more explicit cues as word overlap between the question and the text (shallow questions) and others are not as explicit and require to make inferences. Research shows that skilled readers adapt their reading processes to different level questions but less is known about younger readers. In this study, we examined how readers of different ages adapt their reading processes in order to answer shallow and testing pre-questions. Our results indicate that readers as young as 4^{th} graders self-regulate their reading behavior, like older readers, adapting it to the question level except for the search of relevant information, in which they seem to struggle.

Effects of the reading self-concept in relation to multilingualism
Keywords: Bilingual Education, Competencies, Reading, Self-concept
Presenting Author: Daria Ferencik-Lehmkuhl, University of Cologne, Germany; **Co-Author:**Michael Schurig, TU Dortmund University, Germany; **Co-Author:**Nils Jaekel, University of Oulu, Finland; **Co-Author:**Sandra Schwinning, University of Wuppertal, Germany

The academic self-concept is one of the most thoroughly studied educational-psychological variables. It is empirically well established that the relationship between academic self-concept and achievement is reciprocal (i.e., mutually reinforcing; Marsh et al., 2005). This also applies to the reading self-concept as a part of the verbal self-concept and reading literacy (Goy et al., 2017). But too little is known about the effects of the reading self-concept in relation to performance in different subjects and multilingualism. In our study with fifth grade students (N = 3152) from 31 higher secondary schools (Gymnasium) in the state of North-Rhine Westphalia, Germany, we address the explorative question of the potential variance of the effects of reading self-concept on performance in German, English and mathematics by multilingualism while also considering the role of students' background, i.e., sex, and cultural capital.Results showed that the reading self-concept has a relevant positive influence on the abilities in German, English and Mathematics in the fifth grade of the higher secondary school track. Multilingualism on the other hand showed negative effects in German and Math. Both findings fit well within the national research canon.

The Perception and Effect of Autonomy Support from Artificial Intelligence
Keywords: Artificial Intelligence, Educational Technologies, Motivation, Self-determination
Presenting Author: Juming Jiang, The University of Hong Kong, Hong Kong; **Co-Author:**Ayumi Tanaka, Doshisha University, Japan

This study examined how students perceive autonomy support from Artificial Intelligence (AI) and whether its effect differs from that of autonomy support from humans. It was furthermore investigated whether the use of face photographs improved how students perceive autonomy support from AI. A total of 156 Japanese undergraduates made voice calls in English to human partners or humans who pretended to be AI. Results indicated that students perceived their partners as autonomy-supportive even when they believed that their partners were AI, but they were significantly lower than those who thought another human supported them. Moreover, presenting face photographs improved perceived autonomy support and its effect on needs satisfaction and motivation to speak English. The results revealed both the potential and limitations of using AI to support autonomy in an education setting.

Doctoral Students' Language Preference and Motivation for Publication in Japan
Keywords: Doctoral Education, Higher Education, Motivation, Quantitative Methods
Presenting Author: Cheng Wenjuan, Hiroshima University, Japan

English is adopted as a *lingua franca* by non-native English speakers for academic purposes. Several studies have investigated the numerous reasons why non-native English speakers choose to publish in English; some researchers who preferred to publish in English were more motivated by the need to be recognized and rewarded for their work. However, little is known regarding the language choices of doctoral students for publication. This study aimed to investigate

doctoral students' language preferences and their motivation to publish in a preferred language. Data from a public university in Japan were collected using a questionnaire. This paper offers novel insights into doctoral students' strategic language choice for scholarly output based on local, institutional, and international motivations. Moreover, it discusses the relationship between doctoral students' language choices and motivations. The study contributes to our understanding of degree student experiences, second language academics' motivations, and support for doctoral students' academic publishing.

Associations between perfectionistic profiles and motivational profiles
Keywords: Goal Orientations, Motivation, Quantitative Methods, Well-being
Presenting Author: Antti Pulkka, National Defence University, Finland; **Co-Author:**Heta Tuominen, University of Eastern Finland, Finland; **Co-Author:**Markku Niemivirta, University of Eastern Finland, Finland

In this study we focused on the associations between perfectionism and achievement goal orientations. The aim was to examine what kinds of profiles of perfectionistic tendencies and achievement goal orientations could be identified among university students (n=173), and how these profiles were associated with each other.We identified four perfectionistic profiles: concerned (relatively low standards, high concerns; 12.7 %), non-perfectionist (low standards, relatively low concerns; 24.9 %), perfectionist (relatively high standards and concerns; 28.3%), and ambitious (relatively high standards, low concerns; 34.1 %). Further, four achievement goal orientation profiles were identified: avoidance-oriented (focus on performance-avoidance and work-avoidance; 6.9%), performance-oriented (focus on performance orientations; 32.4%), disengaged (no clear focus on any orientation; 26%), and mastery-oriented (focus on mastery-orientations; 34.7%). The connections between perfectionistic profiles and achievement goal orientation profiles showed that it was typical for the concerned students to hold either the avoidance-oriented or the performance-oriented motivational profile, and for the ambitious to hold the mastery-oriented profile. Then again, it was untypical for the concerned to have the mastery-oriented profile and for the ambitious it was untypical to have the performance-oriented profile.It seems that a focus on concerns is related to more maladaptive patterns of achievement-related goals, when compared to a focus on high strivings without concerns.

How digital mathematics curricula can affect performance: A focus on motivational features
Keywords: Educational Technologies, Mathematics/Numeracy, Motivation, Secondary Education
Presenting Author: Margaret Bowman, Miami University, United States; **Co-Author:**Kui Xie, The Ohio State University, United States

Motivation for mathematics, a predictor of performance, often declines during middle school. To improve performance, we need to influence motivation. This study examines how digital mathematics curriculum that incorporates specific features – authenticity, interactivity, and ease of use – may influence the motivational factors utility value and expectancies, which may lead to greater performance. Quantitative measures were gathered in two ways: through surveys to determine students' perceptions of a specific digital mathematics curriculum, their utility value beliefs about mathematics, and their expectations of success in mathematics; and through post-test measures to determine mathematical performance on a test of application knowledge. Using path analysis, the researcher found that authentic and easy to use curriculum is related to students' utility value and expectations of success, and that higher expectations of success predict higher performance on assessments of application knowledge. This study contributes to the literature by highlighting the importance of utility value and expectancy interventions through the use of digital mathematics curricula.

(De)motivating teaching styles in higher education – validation of the circumplex model
Keywords: Higher Education, Motivation, Self-determination, Teaching Approaches
Presenting Author: Aleksandra Huic, Faculty of Humanities and Social Sciences, University of Zagreb, Croatia; **Co-Author:**Nina Pavlin-Bernardic, Faculty of Humanities and Social Sciences, Croatia; **Co-Author:**Vesna Vlahovic-Stetic, Faculty of Humanities and Social Sciences, University of Zagreb, Croatia

A new circumplex model of teacher (de)motivating styles (Aelterman et al., 2019) distinguishes not only between autonomy supportive and controlling behaviors which lead to basic need support/thwarting in students, but between the level of direction in teaching/learning. The latter are described by two new styles - structure and chaos. However, investigations of this new model are still rare, especially in the context of higher education. This study extends previous literature by validating the Croatian translation of the Situation-in-Schools Questionnaire – Higher education (SIS-HE) which operationalizes the above model. We conducted two studies. In the first, qualitative, study, 2 focus groups were conducted with a total of 17 university teachers with the goal of translation and adaptation of the questionnaire. In the second, quantitative study, 130 university teachers participated in an online survey and filled out the Croatian version of the SIS-HE Questionnaire, the Psychologically Controlling Teaching Questionnaire, part of the Teacher as a Social Context Questionnaire and the Approaches to Teaching Questionnaire. Findings from the qualitative study suggest situational vignettes on which the SIS-HE is based are suitable for the Croatian higher education context and have adequate face validity and clarity. Results of the quantitative study confirm the expected internal structure, as well as the convergent and discriminant validity of the questionnaire. Multidimensional scaling analysis confirmed the assumed circularity of the model. Findings have both theoretical and practical implications.

Using a Person-Centered Approach to Study Motivating and Demotivating Teaching Styles
Keywords: Engagement, Higher Education, Motivation, Self-determination
Presenting Author: Lennia Matos, Pontifical Catholic University of Peru, Peru; **Co-Author:**Rafael Gargurevich, Pontificia Universidad Católica del Perú, Peru; **Co-Author:**Dora Herrera, Pontificia Universidad Católica del Perú, Peru; **Co-Author:**Mordechai Benita, Ben-Gurion University of the Negev, Israel; **Co-Author:**Johnmarshall Reeve, Australian Catholic University, Australia

According to Self-determination theory, students' basic psychological needs (autonomy, competence, and relatedness) are essential for wellbeing, engagement, and optimal development and functioning. Social contexts can promote or thwart these needs. In order to analyze group difference effects on students' need-satisfaction, need-frustration, engagement, and disengagement, a person-centered approach (cluster analysis) was used to generate combinations of perceived motivating (autonomy-support/structure) and demotivating (control/chaos) teaching styles. The sample was composed by 420 university students from Peru. The best fit of the data was a four-cluster solution. The supportive-style was related to only positive outcomes while the thwartive-style was related to the negative ones. The demanding-style and the neglectful-style were related to moderate or low levels of positive and negative outcomes. These findings show the predictive power of each distinct perceived teaching style.

Finding the balance: Can generating predictions promote conceptual change in intuitive physics?
Keywords: Conceptual Change, Eye Tracking, Learning Strategies, Misconceptions
Presenting Author: Elfriede Diestel, DIPF Frankfurt, Germany; **Co-Author:**Maria Theobald, DIPF Frankfurt, Germany; **Co-Author:**Garvin Brod, DIPF Frankfurt, Germany

Generating (incorrect) predictions before seeing the correct outcome is hypothesized to facilitate the revision of misconceptions because it induces a meaningful

cognitive conflict in learners. In line with this hypothesis, Theobald and Brod (2021) found that incorrect predictions evoked surprise, which was associated with successful revision of a misconception about water displacement. The aim of this study, which will be performed in 2023, is to replicate and extend these findings using a more complex task. Here, children between the ages of six and eleven learn about torque via a balance scale task (Siegler, 1976). While water displacement depends on only one factor (the object's size), in the balance task, two factors (weight and distance) determine in which direction the scale tips or balances. The study follows a between-subject pretest-learning phase-posttest-transfer test design. In a computerized task, children see a balance scale (fulcrum with an arm that can rotate around it) with varying amounts of weights (1–4) placed at varying distances from the fulcrum (1–4). In some of the trials, the common misconception (only weight determines balance) leads to the correct solution while in the other trials, the misconception leads to the incorrect solution. Children state their expectations about which side of the scale goes down (left/right) or whether the scale stays balanced either before seeing the correct answer (prediction condition) or after (postdictioncondition). We hypothesize that generating predictions facilitates conceptual change in children even during a more complex task.

Using eye-tracking measures to predict novice learners' Python program reading performance
Keywords: Eye Tracking, Learning Analytics, Mixed-method Research, Science and STEM
Presenting Author: Meng-Jung Tsai, National Taiwan Normal University, Taiwan; **Co-Author:**Dai-Rung Li, National Taiwan Normal University, Taiwan; **Co-Author:**Po-Fen Hsu, National Taiwan Normal University, Taiwan; **Co-Author:**Chung-Yuan Hsu, National Pingtung University of Science and Technology, Taiwan; **Co-Author:**Guo-Li Chiou, National Taiwan Normal University, Taiwan

This study explored novice learners' information processing in Python program reading. 60 university novice programming learners served as the sample of this study. Tobii 4C, RealGaze 2.0 and WEDA 2.0 were used to track and analyze each participant's eye movement collected in a Python reading test. A post-task interview was also conducted to understand the difficulties faced during the reading. We conducted data analyses in several stages. First, eye-tracking indices, scan paths and heat maps were observed for each participant. Second, logistic regression analyses were performed to examine the models using eye-tracking measures to predict reading performances. Finally, independent *t* tests, scan paths and lag sequential analyses (LSA) were conducted to examine and profile the visual attention patterns for the correct- and incorrect-response groups. The results indicated that students' reading performance can be significantly predicted by eye-tracking measures in each reading task, with a prediction rate above 0.6 for correct-response predictions and ranged from 0.8 to 0.9 for incorrect-response predictions. It is worth noting that saccadic measures were included in all models. Specifically, participants with longer saccadic length in critical-relevant areas and shorter saccadic length in irrelevant areas were more likely to respond incorrectly in the reading tasks. Additionally, the correct-response group paid more attention on variables than the incorrect-response group. Different visual behavior characteristics were revealed for both groups. These results imply that novice learners may have difficulties in tracking values of variables and identifying critical elements in Python programs. The difficulties are reconfirmed by the interview data.

Using gaze-cued think-aloud to elicit teachers' professional vision of classroom management
Keywords: Classroom Management, Eye Tracking, Teacher Professional Development, Video-based Learning
Presenting Author: Rebekka Stahnke, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Sigrid Blomeke, University of Oslo, Norway

Professional vision of classroom management is an important aspect of teacher expertise and describes their ability to notice relevant events, interpret these events and decide on possible next strategies. Learning more about the cognitive processes of expert and novice teachers could help to develop ways for fostering teacher professional vision. However, accessing teachers' cognition while they use these abilities can be methodologically challenging. One promising approach is eliciting and analyzing think-aloud data.We used a gaze-cued think-aloud method to compare nineteen novice and twenty expert teachers' professional vision of classroom management (displayed in video clips). Think-aloud data was transcribed and coded with regard to events noticed, processes display as well as the content of analysis. Results revealed characteristics of expertise both in terms of the frequencies of noticed events or suggested courses of action and patterns of event analysis: experts noticed more events than novices, they also talked more about student learning and the teachers monitoring. Their analysis of events showed a higher proportion of idea units addressing how the teachers' behavior or the context can be adapted appropriately. The think-aloud method used enabled us to gain insights into teachers' professional vision. It supported teachers in expressing their comprehensive thoughts. However, the unlimited time as well as the retrospective report might entail some disadvantages as teachers may express thoughts that did only occur to them during a second watching of the video clips. Despite these limitations, think-aloud methods can facilitate insights into teachers' cognitive processes while observing classroom management events.

The role of prior knowledge in playing a game incorporating self-explanation: An eye-tracking study
Keywords: Computer-assisted Learning, E-learning/ Online Learning, Eye Tracking, Game-based Learning
Presenting Author: Guo-Li Chiou, National Taiwan Normal University, Taiwan; **Co-Author:**Chung-Yuan Hsu, National Pingtung University of Science and Technology, Taiwan; **Co-Author:**Meng-Jung Tsai, National Taiwan Normal University, Taiwan

The purpose of this study was to explore how students interacted with self-explanation prompts in a computer game that was designed to enhance their conceptual understanding by using eye-tracking techniques. This study adopted a pretest-posttest design, and the participants (43 fourth graders) were randomly assigned to either the experimental or the control group. While the experimental group played the game with self-explanation prompts, the control group played the version without self-explanation. An eye tracker was used to record both groups' eye movements while playing the games. The results indicate that engaging in self-explanation had a significantly positive effect on the posttest score only for the participants with the lower pretest score. Moreover, for the experimental group, the results of eye-movement analyses show that the participants with the higher level of pretest score made more visual transitions between the self-explanation prompts and relevant game components. In other words, how the participants reacted to the self-explanation prompts varied with their prior knowledge. Game designers are suggested to address this issue when incorporating instructional features into a computer game.

How to signal animations for learners with different prior knowledge levels: an eye-tracking study
Keywords: Comprehension of Text and Graphics, Eye Tracking, Multimedia Learning, Video-based Learning
Presenting Author: Killyam Forge, University of Toulouse, CLLE, France; **Co-Author:**Julie Lemarié, University of Toulouse, CLLE, France; **Co-Author:**Jean-Michel Boucheix, University of Dijon, LEAD-CNRS, France; **Co-Author:**Pierre-Vincent Paubel, University of Toulouse, CLLE, France

The inconsistent results in the scientific literature on the signaling effect in learning from educational animations makes necessary a better understanding of the boundary conditions of signaling effectiveness. Some moderators of the signaling effect are related to the characteristics of the learner (e.g., level of prior knowledge) and some concern the signals' properties (e.g., quantity, accessibility, relevance). This eye-tracking study aims to investigate the joint effects of prior knowledge and the signal's level of accessibility on learning performance (comprehension, inference and transfer) and cognitive load of learners studying from an entirely visual animation about the piano mechanism (Boucheix & Lowe, 2010). The results will improve our understanding of the conditions of effectiveness of the signaling effect in learning from dynamic content, in order to provide recommendations to teachers and instructional designers on how to facilitate student learning by effectively incorporating signals into their instructional animations.

Using AI in educational apps to individually support students: Opportunities and challenges
Keywords: Artificial Intelligence, At-risk Students, Computer-assisted Learning, Eye Tracking
Presenting Author: Maike Schindler, Universität zu Köln/ University of Cologne, Germany; **Presenting Author:**Achim J. Lilienthal, TU Munich, Germany

In this theoretical paper, we elaborate on the potential of using Artificial Intelligence (AI) for smart educational apps that can identify student strategies and their individual needs of support, and support students individually and adaptively in their learning. To illustrate this, we will present different projects in mathematics education where AI is being used, partially in combination with eye tracking, in order to identify student needs and to support them. We illustrate how the use of AI in educational apps can have an added value in school practice, especially when resources such as teachers' time to support students are limited. Here, AI can help identifying student strategies, their strengths and needs of support and help providing adaptive and individual support. We will elaborate on the opportunities and the shortcomings of AI, and about possibilities to deal with challenges in the development and use of smart educational apps.

Quality Teacher Education in the context of the Sustainable Development Goals
Keywords: Higher Education, Pre-service Teachers, Qualitative Methods, Sustainable Development
Presenting Author: Sunet Grobler, University of Innsbruck - Institute for Teacher Education and School Research, Austria

In 2015, the United Nations (UN) developed the 17 Sustainable Development Goals (SDGs) with a focus on the people, planet, prosperity, peace and partnership (UN, 2015; UNESCAP, 2019). The fourth SDG is labelled as *quality education,* and with this goal, the UN aims to *"ensure inclusive and equitable quality education and promote lifelong learning opportunities for all"* (UN, 2015, p. 19). SDG4, as *quality education,* lays the foundation for cultivating a sense of sustainability in pre-service teachers since education contributes significantly to reaching the SDGs (Nazar et al., 2018; Thangeda et al., 2016). However, there is ambiguity in the meanings of the involved concepts. This study explores the quantitative and qualitative margins of SDG4 since it significantly transforms education for sustainability (Ferrer-Estévez & Chalmeta, 2021; UNESCO, 2017). Therefore, a systematic qualitative investigation was executed to gain global interpretations of the concepts such as *quality education* and *sustainability*. Investigation into how SDG4 is promoted in different contexts also transpired. Reflecting on the data from policy documents, stakeholder interviews and focus groups during an SDG4 webinar, this paper introduces emerging themes. The holistic context approach is necessary for a sustainable future while focusing on aspects such as the self, people´s needs, values, and balance between values, aspirations and reality. It also shows the importance of education quality (or effectiveness) for sustainability. By integrating intermediate theories, this study suggests ways in which teacher education and the promotion of SDGs can cultivate a sense of sustainability in pre-service teachers beyond the level of qualification.

Development of young children in China: Comparing parent report and direct assessment longitudinally
Keywords: Assessment Methods, Early Childhood Education, Educational Policy, Sustainable Development
Presenting Author: Zeyi Li, The University of Hong Kong, Hong Kong; **Co-Author:**Stephanie Wing Yan Chan, The University of Hong Kong, Hong Kong; **Co-Author:**Nirmala Rao, The University of Hong Kong, Hong Kong

Sustainable Development Goal (SDG) Target 4.2 states that by 2030, ensure that all girls and boys have access to quality early childhood development, care and pre-primary education so that they are ready for primary education. Progress towards the target is evaluated using two indicators. SDG Target Indicator 4.2.1 measures the “proportion of children aged 24 to 59 months who are developmentally on track in Health, Learning, and Psychosocial well-being.” SDG Target Indicator 4.2.2 focuses on the “participation rate in organized learning.” A parent report measure, ECDI2030, was developed by UNICEF to determine children’s “developmentally on track” status and measure progress towards SDG Target 4.2.1. Earlier studies compared results from ECDI2030 with those from a corresponding direct assessment measure, the Early Childhood Development Assessment Scale (ECDAS) and found a moderate- to high- correlation, and similar factor structure between the two measures. This study further examined the stability of correlations between ECDI2030 and ECDAS using a longitudinal design. Participants were three- to six-year-olds in Beijing and Hebei Province, China, and their parents. Children’s development was assessed by ECDAS on two occasions, 12 months apart, and parents completed the ECDI2030 concurrently. Results from both measures were associated with child age, gender, urbanicity, and socio-economic status. However, parent report results showed less variability and discrimination of developmental competencies than direct assessment, and this pattern was exacerbated as children matured. Both measures indicated different rates of development across the three domains. Factors contributing to associations between parent reports and direct assessment are discussed.

Local and Regional Influences When Developing K-12 Climate Change Education Policy
Keywords: Educational Policy, Environmental Education, Qualitative Methods, Sustainable Development
Presenting Author: Laurel Kruke, University of Southern California, United States; **Co-Author:**Gale Sinatra, University of Southern California, United States; **Co-Author:**Julie Marsh, University of Southern California, United States

Environmental and climate change education is inconsistently integrated into classrooms around the world, with some countries incorporating it into national education standards, and others leaving the decisions up to individual districts. These national or regional conversations often begin because of natural disasters or other public discourse about current or future quality of life for a country’s citizens. This poster presentation showcases Los Angeles Unified School District’s Climate Literacy resolution as an example of a policy passed at a local level to show support for climate change education efforts in the second largest school district in the United States. Through a qualitative analysis of semi-structured interviews with key contributors to the development and adoption process, this study shows that local climate change impacts influenced the timing and positive reception this policy received. Findings also indicate there is still confusion, even from supportive leadership, about the definition of climate literacy as a subject. More education around the definition of climate literacy, an emphasis on broad policy efforts (in addition to individual actions), and crafting rhetoric around local and regional climate change impacts can improve the uptake of climate change education in education systems.

Curriculum, transfer, equity. What research can(‘t) tell us.
Keywords: Cognitive Skills and Processes, Curriculum Development, Educational Attainment, School Effectiveness
Presenting Author: Daniel Muijs, Queen's University Belfast, United Kingdom

While traditionally much of the focus in teacher effectiveness research has been on process (how do we teach), there has recently been increasing interest in the content (what do we teach). In particular, the concept of a knowledge rich curriculum has been touted as a solution for a number of equity issues in education. In this paper we will explore whether claims in favour of a knowledge curriculum and even for particular content are actually supported by evidence from educational effectiveness research, programme evaluations and cognitive science. A systematic review methodology was used to interrogate the literature in this area. A systematic review methodology was used to interrogate the literature in this area. Findings suggest that while evidence provides arguments for the structure of curriculum and the importance of knowledge, they do not, as sometimes stated, provide any justification for the actual content of that curriculum.

The cultural correlates of learning poverty: An ecological analysis across 45 countries Long-term
Keywords: Achievement, Attitudes and Beliefs, Reading, Writing/Literacy
Presenting Author: Ronnel Bornasal King, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Jiajing Li, The University of Macau, Macao; **Co-Author:**Shing On Leung, The University of Macau, Macao

Learning poverty is a critical social problem that has drawn considerable attention in recent years. However, past studies on learning poverty have mostly focused on the role of economic factors. Few studies have explored how cultural values are associated with learning poverty. To address this gap, we examined whether national cultural values (i.e., power distance, individualism, masculinity, uncertainty avoidance, long-term orientation, and indulgence) were associated with learning poverty in 45 countries after accounting for the roles of economic factors, gender, and duration of compulsory education. Results indicated that out of the six cultural values, long-term orientation was negatively associated with learning poverty but power distance was positively associated with it. The

findings of this study extend the literature on learning poverty by emphasizing the cultural correlates of learning poverty.

How do all these big concepts of a sustainable planet have the power to change my practice?
Keywords: Cooperative/Collaborative Learning, Early Childhood Education, Environmental Education, In-service Teachers
Presenting Author: Torhild Høydalsvik, Volda University College, Norway; **Co-Author:**Jan Vikane, Volda University College, Norway

Education for Sustainability is motivated by a need for an education that empowers children of all ages with knowledge, skills, values, and attitudes to address the global challenges we are facing (Chen & Liu, 2020). We are interested in how the teachers work with these challenges as their professional development. Our title 'How do all these big concepts of a sustainable planet have the power to change my practice'? It is a sigh og heart from a person who have found it best to do it small and simple in her early childhood education´s teacher practice. Powerlessness and despair are easy to fall into when the United Nation´s goals are made of big concepts, difficult to translate to daily life.We have collected data from 26 part-time students combining practising as teachers in early childhood education (ECE) in Norway. We chose a mixed methods design with three different data set, first as descriptive statistics, and other data by qualitative research analysis method: Stepwise-Deductive Induction (Tjora, 2018) developing concepts and models and reduce complexity. We found that the capacity to educate for sustainable development must be strengthened by developing teachers' expertise and awareness about professional development for teachers in service. Further we found a weak connection between the expressed the concept sustainable development and the teachers´ didactic developmental projects´ content for the children. We are working on how to tie together a higher motivation with focus on the teachers´ opportunities by strengthen their practical action competence.

Disagreement as a value in education for democracy: Patterns of classroom talk and teacher beliefs
Keywords: Attitudes and Beliefs, Citizenship Education, In-service Teachers, Primary Education
Presenting Author: Andreas Reichelt Lind, OsloMet - Oslo Metropolitan University, Norway

This roundtable presentation explores the different ways that disagreement is valued by primary school teachers in Norwegian primary school classrooms. The emergent patterns will be discussed in relation to the goal of educating for democracy. The study builds on transcriptions of recorded sequences from classroom lessons where disagreement is made a topic by the teachers, as well as interviews of teachers where the role of disagreement for critical thinking was thematized. Preliminary results indicate that the teachers attribute extrinsic value to disagreement. In the classroom talk, however, it tends to be unclear for what purpose or which intrinsic value(s). When group tasks are presented, on the other hand, they tend to be oriented towards reaching consensus. It is the valuation of disagreement in relation to education for democracy, as well as the discrepancy between valuing disagreement but aiming for consensus in practice, I want to address during this roundtable discussion.

Culture of Democracy in the Changing Landscape of Higher Education in the USA
Keywords: Citizenship Education, Critical Thinking, Higher Education, Inclusive Education
Presenting Author: Sandra Bass, UC Berkeley, United States; **Presenting Author:**Thomas Schnaubelt, Stanford University, United States; **Presenting Author:**Anna Mahoney, Tulane University, United States; **Presenting Author:**Agnieszka Nance, Tulane University, United States; **Presenting Author:**Ryan McBride, Tulane University, United States

In the changing landscape of American higher education, universities and colleges are struggling to articulate the importance of civic education and to implement practices contributing to the development of a civic identity. A fundamental responsibility of higher education is now in question as universities look to revive civic education and initiate new programs to re-establish their role in supporting democracy. This proposed (workshop/roundtable) will focus on several research-based approaches from different institutions in the USA, rooted in a shared desire for educating for effective citizenry. For the purpose of this presentation, we will focus on our shared framework for the development of a healthy civic identity, comprised of the following commitments: Commitment to the Values, Practices and Institutions of Liberal Democracy; Focused Commitment(s) to an Issue(s), Commitment to Integrity; Communitarian Mindset and five building blocks: Capacity to Engage Constructively Across Difference; Democratic Knowledge, Habits, and Skills; Knowledge of Social Change Frameworks and Tools, Deep Content Knowledge, and Resilient Mind, Body and Spirit. The presenters will share their programmatic initiatives on individual campuses with particular attention to efforts where student outcomes in these areas have been rigorously assessed in ways that can be replicated. Scholars will share work related to an individual core commitment or building block, or contributions that interrogate the relationship between two or more dimensions.

School at the museum: non formal education and teachers' professional development
Keywords: Citizenship Education, Mixed-method Research, Researcher Education, Teacher Professional Development
Presenting Author: Laura Landi, Università di Modena e Reggio Emilia, Italy; **Co-Author:**Chiara Bertolini, Università degli studi di Modena e Reggio Emilia - Department of Education adn Human Sciences, Italy; **Co-Author:**Lucia Scipione, University of Modena and Reggio Emilia, Italy; **Co-Author:**Chiara Pelliciari, Musei civici di Reggio Emilia, Italy; **Co-Author:**Riccardo Campanini, Musei civici di Reggio Emilia, Italy; **Co-Author:**Alessandra Landini, Istituto Comprensivo Manzoni, Italy; **Co-Author:**Agnese Vezzani, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy; **Co-Author:**Mariangela Scarpini, Unimore (University of Modena and Reggio Emilia), Italy

The pandemic and the sudden need for spacing has forced institutions to react creatively and plan new ways for distance learning. In Reggio Emilia all primary and middle schools of one educational institution took turns in spending a week at the local museum. This unexpected encounter between formal and non-formal education provided fertile ground for creating new awareness, innovating teaching methodologies and researching professional development possibilities. To exploit this opportunity the school and the museum involved university researchers. This experience was transformed from an emergency measure into an educational opportunity: for the students, who were able to learn in an immersive environment with a dynamic, inclusive and interdisciplinary approach; for the teachers, who designed and delivered lessons together with the museum staff, and for the museum educators, who rethought their educational offer. The CERIID (UNIMORE) research group has observed, monitored and described the educational offer of the Museum. It has collected data on all three actors involved. The experience has proved particularly useful as a venue for teachers' professional development. Data were collected through observation, and focus group. We intend to present our results in terms of changes in beliefs, teaching methodologies, observational abilities and awareness of students' competencies. We aim at opening a dialogue to investigate the possibility of mutuating educational format from non-formal education to foster teachers' reflexive processes based on cultural transposition (Mellone, 2018).

The interplay between task characteristics and quality of student dialogue in citizenship education
Keywords: Argumentation, Citizenship Education, Reasoning, Secondary Education
Presenting Author: Monika Waldis, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Manuel Hubacher, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Liliane Wenger, University of Applied Sciences and Arts Northwestern Switzerland

FHNW, Switzerland; **Co-Author:**Acelya Aydin, University of Applied Sciences and Arts Northwestern Switzerland FHNW, Switzerland

An important component of contemporary citizenship is the ability to form one's own opinion about matters concerning justice and the public interest. This includes the ability to process multiple information, acknowledge own and others' needs and interests, and to draw factual and value-related decisions. According to literature, stimulating dialogue in classroom teaching may foster student's ability to argue about factual and value-related matters. Moderate controversial topics and an argumentation strategy training contribute to enhance the quality of student dialogue in citizenship education. This study investigates how task characteristics intervene with the quality of student dialogue in citizenship education. Coding instruments such as the discourse quality index (Steenbergen et al. 2003) and a grid investigating transactivity (Gronostay, 2019) prove to be of diagnostic relevance for student's civic reasoning ability. The interplay between task settings and prompts (e.g. controversy, complexity, different perspectives and value-based references) and its specific links to the discourse quality of classroom debates will be further elaborated and discussed.

Workshop
Teaching and Teacher Education

Portrait methodology: a valuable tool to stimulate teacher identity reflection and development

Keywords: Mentoring and Coaching, Qualitative Methods, Self-concept, Teacher Professional Development
Interest group: SIG 11 - Teaching and Teacher Education

Join this workshop if you are interested in a very effective, non-traditional, and dialogic way to encourage teachers to reflect on their teaching experiences and to explore teacher identity development. I will present the findings of and reflections on a completed doctoral research carried out on four novice English teachers and the development of their sense of teacher identity throughout their first year of teaching, whilst engaging in *portrait methodology.* Portrait methodology is a qualitative and narrative research method that sets out to explore the realities of participants' perspectives on their lived experiences through in-depth interviews and aims to capture the essence of these perspectives and experiences in a written portrait, which is consequently used as a reflection tool. It is among the emerging narrative approaches to promote creative ways to trigger deep reflection and stimulate identity development with professionals. In this workshop I will share my research journey as a portrait methodologist: from my rationale for using this approach to the implications of conducting portrait methodology. I will interactively discuss with you the dilemmatic moments during the research process and which methodological choice would fit this approach most. This interactive session will vary in work forms, from sharing the theory behind portrait methodology to active engagement and reflective discussion on conducting this approach. This all with the intention to increase your understanding of how portrait methodology contributes to teacher identity reflection and development.

A new tool for exploring scientific work and writing in the face of Digitization

Keywords: Critical Thinking, Digital Literacy and Learning, Tool Development, Writing/Literacy
Interest group: SIG 12 - Writing

Please bring your own device if you are attending this ICT demonstration.There is a mushrooming of tools that support almost all aspects of scientific thinking and writing. Tasks such as writing, thinking, communicating, planning, project management, organizing, researching, text evaluation, reading, and summarizing are increasingly supported digitally and intertwined. As such, computers become essentially co-authors of academic texts. Furthermore, advances in computer science and computer linguistics make these tools knowledgeable of aspects such as language and, more recently, content. However, rarely are these tools known to instructors or students, or openly accessible. Additionally, it is difficult to keep track of not only ongoing developments but also the disappearance of respective tools. This also poses challenges to both the usage of such tools and how to teach their use. In response, we have created an openly accessible platform that facilitates the testing and teaching of a selection of such tools. In this presentation we will demonstrate a prototype of the platform, explain its rationale and intended pedagogy.

Numbers, Brains, Development and Education: Progress, Challenges and Promise

Keywords: Cognitive Development, Early Childhood Education, Educational Neuroscience, Mathematics/Numeracy
Interest group:
Chairperson: Eleni Kyza, Cyprus University of Technology, Cyprus

In recent years, cognitive, developmental, and educational psychologists have made great strides towards a better understanding of how children develop numerical and mathematical skills and understanding from an early age onwards. In addition, cognitive neuroscientists have used a variety of non-invasive neuroimaging tools to better understand the neural correlates of the development of numerical and mathematical skills. In this talk I will review these contributions to our understanding of children's developing numerical and mathematical abilities and understanding. I will discuss what we have learnt about the foundations underlying numerical and mathematical abilities. I will focus on how children's developing understanding of numerical symbols (e.g., number words and Arabic numerals) serves as a critical foundation for later mathematical abilities and how the learning of numerical symbols shapes the developing brain. Furthermore, I will consider not only how this recent can be applied to educational contexts but als what we learn from those contexts can inform behavioral and brain-imaging research on the development of mathematical cognition. Relatedly, I will consider barriers to successful translation of research and the dialog between research and educational practice. Finally, I will discuss the importance of taking an inclusive, global approach to research into children's development of numerical and mathematical skills that goes beyond the study of White Educated Industrialized, Rich, and Democratic (WEIRD) populations.

Together for learning: Understanding the ecosystem of collaborative learning

Keywords: Cooperative/Collaborative Learning, Higher Education, Learning Analytics, Problem Solving
Interest group: SIG 04 - Higher Education
Chairperson: Armin Weinberger, Saarland University, Germany

More than ever before, collaboration and dialogue have become means to address major challenges we are currently facing - pandemic, conflict, humanitarian crises. At the macro societal level but also at the micro-level of workplaces and classrooms, knowing how to collaborate and how to solve problems together is paramount. Yet, while the value of working and learning together with others is widely acknowledged, meaningful and productive collaboration remains difficult to accomplish, gauge and guide.In this keynote, I will reflect on the complexity of the collaborative learning process and what it implies for researching these processes from an ecological perspective using new analytics techniques.Outcomes of collaborative learning have been examined extensively through scaled assessments and sociocultural studies continue to reveal new knowledge about the dialogical nature of collaborative learning. Yet remaining are questions about how individual cognitions are joined into productive interaction, how collaboration dynamics are shaped or what drives collaboration when difficulties occur.Against this backdrop, and taking departure in empirical research on small group collaboration in higher education contexts, I will discuss (i) the need for examining the collaborative process as an interrelated set of actions, people and resources – the ecosystem of collaborative learning, (ii) individual and collective factors salient to collaborative learning, and (iii) the multimodal nature of in-situ collaboration. Further, I will elaborate on how digital technologies and data-based analytic techniques offer new opportunities to examine some of the 'black-boxed' aspects of collaborative learning.This presentation will also consider the challenges of researching collaborative learning processes. First, I will address methodological challenges, primarily focusing on the pitfalls of reductionistic interpretation and the need for methodological triangulation. Second, I discuss a combined empirical and conceptual challenge; as digital traces of collaboration are disclosed through new digital technologies and analytical techniques, the question of what constitutes collaboration becomes highly relevant. I will conclude by exploring the implications of examining the ecosystem of collaborative learning for how we are framing education to prepare a young generation to jointly engage with present and future hardships.

Learning to Master Writing: Coping with the Cognitive Demands of Writing Processes

Keywords: Cognitive Development, Cognitive Skills and Processes, Self-regulated Learning and Behaviour, Writing/Literacy
Interest group: SIG 12 - Writing
Chairperson: Rui Alexandre Alves, University of Porto, Portugal

Writing, as a component of literacy, offers possibilities for independent personal development. It allows individuals to acquire knowledge and culture, and corollary to better comprehend the surrounding world and therefore to emancipate from instrumented ideology (Nussbaum, 2012). However, mastering writing requires long and explicit instructions. International and national assessments demonstrate that composing texts remains a challenge for students: more than half of primary and secondary students do not meet the expected proficiency levels in writing (Jiménez, 2018). Designing instructions that foster learning to write is therefore essential.Writing instructions that are the more efficient rely on development of self-regulation skills (e.g., Graham et al., 2012). Why are such techniques so efficient? In this keynote, I will adopt a cognitive perspective to explain why efficient management of the writing processes is central for skilled writing.Writing involves many cognitive processes that make heavy demands on working memory. Thus, a common claim in writing research since the 1980s is that writers are cognitively overloaded (Flower & Hayes, 1981). Obviously, this is particularly the case for young students learning to write. However, this also occurs in skilled writers who exhibit high cognitive effort when composing texts. One goal to reach is therefore to minimize the demands that writing places on working memory on the one hand to allow fluent processing (Olive, 2014), and on the second hand for allowing interactions between writing processes in working memory. Such interactions have been shown to be fundamental for efficient and fluent writing (McCutchen, 1988, 2000). In that frame, I will first describe how working memory intervenes during writing. Second, I will address how novice and skilled writers regulate writing processes. Finally, I will describe how executive functions contribute to such regulation (Olive, 2021, 2022; Limpo & Olive, 2021).

Session E 1

23 August 2023 12:00 - 13:30
HELEXPO_CC
Invited Symposium

Current issues in measuring and modeling motivational outcomes international large-scale assessments

Keywords: Achievement, Large-scale Assessment, Motivation, Primary Education, Quantitative Methods, Self-concept, Self-efficacy, Teacher Effectiveness
Interest group:
Chairperson: Ioulia Televantou, European University Cyprus, Cyprus
Organiser: Rolf Strietholt, Germany
Discussant: Christoph Niepel, University of Luxembourg, Luxembourg

The main purpose of international comparative assessments is to measure educational outcomes and compare them within and across countries. This invited symposium focuses on motivational outcomes and uses from the IEA-study (International Association for the Evaluation of Educational Achievement) TIMSS (Trends in International Mathematics and Science Study) data to investigate issues related to the measurement of motivational outcomes and variation in these outcomes. The papers deal with the attitude-achievement paradox, the immigrant paradox, method factors in mixed worded motivational scales, and correlations between various motivational scales. The IEA awards outstanding research papers that use IEA data. Each of the four papers is co-authored by an recent IEA awardee.

Associations between motivation, engaging teaching and math performance in TIMSS 2015
Presenting Author: Michalis Michaelides, University of Cyprus, Cyprus; **Co-Author:**Militsa Ivanova, Department of Psychology, University of Cyprus, Cyprus

Student motivation is a multifaceted construct with empirically supported associations with educational outcomes. The current study used latent variable methodology to examine the factor structure of the engaging teaching and motivational constructs in the fourth- and eighth-grade USA student context questionnaires of the 2015 Trends in International Mathematics and Science Study (TIMSS). Measurement models revealed adequate fit of correlated factors for self-concept, enjoyment, and importance and usefulness of learning mathematics, after controlling for negative wording. Self-concept was the strongest predictor of achievement in both grades; importance and usefulness beliefs had a weak relationship with eighth-grade performance. Engaging teaching and enjoyment were positively associated; accounting for self-concept, the effect of engaging teaching on TIMSS performance was negative and mediated by enjoyment. The results suggest that a multifaceted conceptualization of motivation is needed in studies of student achievement. The strong effect of student self-concept on performance should be acknowledged in educational reforms.

Motivational Outcomes and Immigration Background: Studying the “Immigrant Paradox” using TIMSS
Presenting Author: Ioulia Televantou, European University Cyprus, Cyprus; **Co-Author:**Andrés Christiansen, International Association for the Evaluation of Educational Achievement (IEA), Netherlands; **Co-Author:**Ingrid Gogolin, University of Hamburg, Germany; **Co-Author:**Rolf Strietholt, IEA Hamburg, Germany

Recent immigrant students have better motivational outcomes (e.g., educational aspirations, educational expectations) than native individuals and later immigrants, despite the considerable barriers they face when moving to another country; this trend is commonly referred to as the “immigrant paradox”. Using cross-national data from TIMSS 2019 on grade four students’ self-concept we show that, given the same level of achievement, recent immigrants have higher self-concept than their native peers and later immigrants. This finding remains robust after adjustments for socio-economic status, and, it is detected using data from different educational systems present in the database. However, for some countries, it isn’t shown. Further research is needed before conclusions are reached as to why this paradox may occur.

Exploring the Paradoxical Relation Between Achievement and Self-beliefs: A Country-level Trend Study
Presenting Author: Rolf Strietholt, IEA Hamburg, Germany; **Co-Author:**Mojca Rozman, International Association for the Evaluation of Educational Achievement (IEA), Germany; **Co-Author:**Maximiliano Romero, International Association for the Evaluation of Educational Achievement (IEA), Germany

The positive relationship between the achievement of students and their academic self-concept has been replicated in several studies at student level. At country level, this relationship is negative, and this finding, also repeatedly replicated, is often referred to as the attitude-achievement paradox. A limitation of previous research is that the so-called paradox has only been studied with cross-sectional data. In this study, we investigate the achievement-attitude paradox

with longitudinal trend data from several cycles of TIMSS. The cross-sectionally observed negative correlations vanished in longitudinal analyses. These findings were consistent across grades, subjects, and attitudinal constructs. Our results suggest that the paradox is probably just a spurious correlation due to unobserved time-invariant country-specific characteristics, such as a culture-specific response style.

The method factor in mixed-worded scales: Relationships between scales and with student performance
Presenting Author: Stefan Johansson, University of Gothenburg, Sweden; **Co-Author:**Rolf Strietholt, IEA Hamburg, Germany

Mixed-worded scales require a more careful reading and answering process than scales with only one type of wording. Accordingly, the use of mixed scales is intended to increase data quality. Nevertheless, studies repeatedly find a non-intended method factor for negatively worded items. In the present study, we investigate the relationship between such method factors of different scales and examine whether they are correlated with student performance. Our empirical analysis is based on responses to mixed-worded items on students' self-concepts in math, science, and reading in TIMSS and PIRLS 2011. Using data from 37 countries we observed that a bi-factor models with a general factor for academic self-concept and a nested method factors for the reverse worded items better fit the data than the unidimensional models. The method factors of the measurement models for academic self-concept in reading, math, and science correlate with each other. In further analyses, we found that the method factors are associated with reading performance but not with math and science achievement. This result suggests that reading ability is an important determinant of data quality from surveys in a school context.

Session E 2

23 August 2023 12:00 - 13:30
AUTH_CH
Invited Symposium

Meet the EARLI Editors

Keywords: Higher Education, Qualitative Methods, Quantitative Methods, Writing/Literacy
Interest group:
Chairperson: Rui Alexandre Alves, University of Porto, Portugal
Discussant: Rui Alexandre Alves, University of Porto, Portugal

EARLI publishes three peer-reviewed journals: Learning and Instruction, Educational Research Review and the newest open access journal Frontline Learning Research. Additionally, the EARLI book series, New Perspectives on Learning and Instruction is designed to communicate the high-quality research on learning and instruction to a broader audience of researchers and post-graduate students in education and psychology. EARLI members are fully encouraged to submit their current research on the association's journals.
The meet the editors symposium aims to inform the EARLI members about the specific aims of each journal, how to select the right journal to publish your research and they will advise you on how to make successful submissions to the journals. This is an audience-initiated session and participants are invited to raise any question or issue they feel pertinent.

Learning and Instruction
Presenting Author: Gert Rijlaarsdam, University of Amsterdam, Netherlands

Learning and Instruction is an international, multi-disciplinary, peer-refereed journal. The journal provides a platform for the publication for the most advanced scientific research in the areas of **learning**, **development**, **instruction** and **teaching**. It welcomes original empirical investigations. The papers may represent a variety of theoretical perspectives and methodological approaches. They may refer to any age level, from infants to adults and to a diversity of learning and instructional settings, from laboratory experiments to field studies, and from large-scale quantitative studies to case studies. The major criteria in the review and the selection process concern the significance of the contribution to the area of learning and instruction, and the rigor of the study. Studies may contribute to general areas of learning and instruction or to specific domains of learning.

Educational Research Review
Presenting Author: Hans Gruber, University of Regensburg, Germany

Educational Research Review is an international peer-reviewed journal aimed at researchers and various agencies interested to review studies in education and instruction at any level. The journal welcomes different types of systematic review-studies, theoretical contributions and shorter forum - papers but does not publish original empirical investigations.

Frontline Learning Research
Presenting Author: Nina Bonderup Dohn, University of Southern Denmark, Denmark

EARLI decided to found a new journal in order to open more publishing opportunities for high level manuscripts. The particular aim was to explore open access publishing and emphasize innovative and risk-taking research in the field of learning and instruction. Frontline Learning Research (FLR) is an open-access electronic-only journal that publishes articles on issues and trends occurring internationally in research on learning and educational sciences. FLR is a forum for multidisciplinary research on learning and learning environments and it aims at enhancing new theoretical and methodological approaches in learning sciences. FLR also welcomes commentaries aimed at triggering discussion about important theoretical and methodological questions about the published articles. During this session we will discuss the guidelines more deeply and help participants to recognize what features make manuscripts innovative and risk-taking.

New Perspectives on Learning and Instruction
Presenting Author: Isabel Raemdonck, Université Catholique de Louvain, Belgium

New Perspectives on Learning and Instruction is the international, multidisciplinary book series of EARLI and is published by Routledge.
The aim of the series is to present to the scholarly community high quality, theoretically-driven research on a specific theme in the domain of learning and instruction. Books that are published in the series are innovative, attempting to forge new conceptions of the field. Originality, scientific merit, and significance for the field are what guide the series. Both edited collections and sole-authored texts that meet these criteria are considered for publication.
The focus of the Book Series is on European work, however, contributions from non-European researchers and non-members of the European Association for Research in Learning and Instruction are invited. The series is designed to appeal to a wide audience of researchers and post-graduate students in education and psychology.
Latest Book: Dialogues between Northern and Eastern Europe on the Development of Inclusion: Theoretical and Practical Perspectives
Edited by Natallia Bahdanovich Hanssen, Sven-Erik Hansén, Kristina Ström (2021).

Session E 3

23 August 2023 12:00 - 13:30
UOM_R08
Symposium
Teaching and Teacher Education

Teachers' and school staff members' agency, expertise and ties to colleagues

Keywords: Inclusive Education, Informal Learning, Mathematics/Numeracy, Migrant / Refugee and Minority students, Peer Interaction, Secondary Education, Social Aspects of Learning and Teaching, Social Interaction, Teacher Professional Development, Teaching Approaches
Interest group: SIG 14 - Learning and Professional Development
Chairperson: Tuire Palonen, University of Turku, Finland

Organiser: Tuire Palonen, University of Turku, Finland
Discussant: Michael Goller, University of Kassel, Germany

The symposium focuses on the dynamics between teachers' agency, expertise and social relationships. How teachers mobilize their relational agency; how resources, ideas, advice and knowledge flow within school communities? Teachers exercise agency by adopting, adapting or challenging existing practices according to their own understanding of what is desirable and possible. We aim to elaborate school staff members' agency through professional and relational lenses. Professional agency is seen influencing at work practices (e.g., developing, decision making, pedagogical) and identity (re)negotiation. Relational agency encompasses teachers' ties with others. Teacher expertise consist of knowledge and skills needed in providing optimal support for students' learning. Teacher expertise develops in practice and within professional networks. Expertise development includes continuous improvement but also arrested development. The network perspective allows simultaneously focus on the overall social structure of a school, and on the expertise and resources exchanged through interactions. Several methodologies and data gathering instruments are employed: surveys, online logs, interviews and Social Network Analysis (SNA). We aim to study how school staff members differ in professional agency (Study 1)? How teachers are involved with students, their families, school colleagues and specialists (relational agency, Study 2). Connections between teacher agency and social relationships are explored (Study 3), and how teachers' content knowledge relates to the resources reached out through social relationships (Study4). Three of the studies in the symposium refer to challenges with migration and one study is related to mathematic teachers. Data for the symposium is collected in four countries, in 14 schools.

School staff members' professional agency in Finland, Scotland, and Sweden – a comparative study
Presenting Author:Päivi Hökkä, University of Tampere, Finland; **Co-Author:**Katja Vähäsantanen, Häme University of Applied Sciences, Finland; **Co-Author:**Eija Räikkönen, University of Jyväskylä, Finland

Professional agency has been widely addressed in investigations of learning and work, especially within educational organizations. Most of the studies in educational contexts have been small-scale and qualitative in nature, and the comparative research designs have been scarce. Furthermore, the research has mainly focused on teachers' work and ignored other professionals within educations fields. Thus, this study aims to compare school staff's professional agency in three countries (Finland, Scotland, and Sweden) and to understand the factors that are related to their professional agency. We understand professional agency through behavioural lenses and rely on subject-centered socio-cultural approach that emphasize professional agency as influencing at work and identity (re)negotiation.
We collected electronically survey data from 407 informants by utilizing the short version of professional agency measure (PAM) that consisted of nine items assessing three validated dimensions of professional agency (Influencing at work, Participation at work, and Negotiating professional identity). The questionnaire also covered participants' background information. In analysing the data, we utilized structural equation modelling. This study confirms the structure of professional agency among the staff across the three countries. We will also examine the differences in the staff's professional agency across the three countries considering their national contexts. Finally, we will examine how gender, age, professional post, and work contract are connected to professional agency.

Teachers' relational agency within professional networks for supporting migrant students
Presenting Author: Natasa Pantic, University of Edinburgh, United Kingdom; **Co-Author:**Marc Sarazin, University of Edinburgh, United Kingdom; **Co-Author:**Thibault Coppe, University of Groningen, Netherlands; **Co-Author:**Didem Oral, University of Stockholm, Sweden; **Co-Author:**Eveliina Manninen, University of Jyväskylä, Finland

This study examines teachers' relational agency – working flexibly with school colleagues and other professionals – as a mechanism for mobilising resources to support migrant students' integration in schools. We consider how collaboration networks of teachers and other school staff shape inclusive practices for supporting migrant students. Data on teachers' relational agency was collected via online logs and complemented with interview and social network data from staff surveys in 7 schools in Finland, Scotland and Sweden. This study employed a mixed-method design combining qualitative analysis of interviews and online logs, stochastic actor oriented statistical models, and innovative data visualisations. The study's focus on relational agency allows us to illuminate the mutually formative influence of agency and structures by examining how expertise and resources are exchanged through interactions in which teachers and other actors reach out to other actors within the school community and beyond to mobilise support for migrant students. We interpret these interactions in terms of their alignment to the principles of inclusive pedagogy – a distinctive way of thinking about supporting migrant students within educational provision that is ordinarily available to all students.

Teacher agency and ties to colleagues. A Survey study from two Finnish schools.
Presenting Author: Tuire Palonen, University of Turku, Finland; **Co-Author:**Eveliina Manninen, University of Jyväskylä, Finland; **Co-Author:**Päivi Hökkä, University of Tampere, Finland

The aim of this study was to explore school staff members' social ties, both for instrumental (information seeking, collaboration, migrate student support) and expressive (emotional support and inspiration giving) network dimensions and whether teachers' agency, understood as a capacity to respond critically to problematic situations, is related to these ties. The participants (N=111) coming from two school communities in Finland were teachers, principals and other professionals, working for various pupil support tasks. Data were collected along two different questionnaires designed to measure social relations (Social Network Analysis, SNA survey) and teacher agency. For agency, a 9-item PAM scale sum variable was employed. Regarding social ties SNA analysis revealed a similar tie distribution in both school communities, emphasis being expectedly in instrumental ties. Further, statistically significant positive correlation was found for teacher agency and all other network dimensions, except emotional support seeking. Work role, analysed by t-test between the teachers and staff members in the pupil support tasks, indicated differences in collaboration (outgoing ties $t=-2,182$, (106); $p< 0.05$ and incoming ties $t=-2,072$; (39,881), $p< 0.05$), migrate students' support (incoming ties $t=-2,331$ (47,414); $p< 0.05$) and agency ($t=-2,040$, (104); $p< 0.05$) so that teachers' values were lower for each variable. The results showed expectedly highest connection between instrumental ties and teacher agency. Social network analysis can contribute to teacher expertise studies by showing how teachers' informal relationships support their professional development and how teacher agency is seen from social relationships' perspective.

Can mathematics teachers' pedagogical content knowledge predict their professional influence?
Presenting Author: Monika Grigaliuniene, Vytautas Magnus University, Lithuania; **Co-Author:**Erno Lehtinen, University of Turku, Finland

The aim of this study was to investigate possible connections between the length of teachers' professional career, their professional status within the social network of colleagues (advice size), and their pedagogical content knowledge. Advice size value refers to how typically colleagues' ask pedagogical advice from the person. The participants were 39 mathematics teachers from seven Lithuanian secondary schools. Data were collected by a questionnaire designed to measure pedagogical content knowledge ($\alpha= .832$) and by a social network analysis rating. Data analysis revealed a statistically significant moderate positive correlation between years of professional activity and advice size (0.437), moderate negative correlation (-0.424) between pedagogical content knowledge and advice size, and no significant correlation between years of professional activity and pedagogical content knowledge. Contrary to the assumption, teachers' advice size value was negatively correlated with teachers' pedagogical content knowledge. Cluster analysis resulted in four clusters which showed that teachers with short career had highest pedagogical content knowledge, but other teachers do not ask their advice. Teachers with long careers and high advice size were divided in two clusters, one with low and one with high pedagogical content knowledge.

Symposium
Teaching and Teacher Education

Teaching and Learning Economics with Visual Representations

Keywords: Citizenship Education, Competencies, Comprehension of Text and Graphics, Knowledge Construction, Qualitative Methods, Quantitative Methods, Secondary Education, Social Sciences and Humanities, Teaching/Instructional Strategies
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Malte Ring, University of Tübingen, Germany
Organiser: Malte Ring, University of Tübingen, Germany
Discussant: Stefanie Findeisen, University of Konstanz, Germany

Visual representations are a central tool in teaching and learning domain knowledge. In economic education, visual representations represent abstract – often mathematical – principles, such as the relationship between supply and demand and their role in pricing. Although regularly used in teaching economics in secondary and higher education, their use does not necessarily promote a more thorough understanding of the underlying domain model (or principle). With the overarching aim to better understand the prerequisites of successfully teaching and learning with visual representations in economics, we explore the relationship between visual representations and conceptual understanding. In this symposium, we combine different empirical methodological approaches to analyze how (well) learners deal with visual representations and how the format of the representations influences conceptual understanding. In the first presentation, results are presented of a graph competence test with a focus on what makes graph questions difficult. In the second presentation, qualitative results are presented focusing on the connection between economic understanding of pricing with the help of a diagram. Presentation three discusses how different visual representations of pricing affect the teaching-learning practices in the classroom and thus what learning is made possible. The final presentation discusses how models used in social studies teaching can help students grasp the complexity and changeability in economic issues and systems. The first presentation focuses on the assessment of students' abilities in higher education whereas the other three presentations analyze learning processes in secondary education. All presentations discuss how teaching and learning with visual representations in economics can be successfull.

What Makes Graph Tasks Difficult in Economics? Results from a Graph Competence Assessment Study
Presenting Author: Malte Ring, University of Tübingen, Germany; **Co-Author:**Luis Oberrauch, University of Tuebingen, Germany

Economists use graphs to present and analyze relationships, for example in the supply and demand model. The ability to understand and work with these graphs is at the core of economic thinking and is also one of the central challenges for novices in the field. So far, researchers have mainly analyzed the effect of adding graphs to lectures and the effect of certain graph formats on conceptual understanding. In contrast, this research project aims to model graph competence as domain-specific procedural knowledge. To measure graph competence, we first defined six subcomponents in a theoretical framework: reading, interpreting, choosing the right graph to display a relationship, using the graph in an example, identifying errors in a graph, and evaluating the underlying model assumptions. For each of these subcomponents, we developed items for three types of graphs: the supply and demand model, cost curves and indifference curves. The instrument was administered as an online survey at multiple higher education institutions in south-western Germany with students of different academic disciplines. Using item response theory (IRT) with a sample of 579 students, we find that the instrument is suited to measure graph competence and that the items capture a broad range of ability levels. For the symposium we focus on what tasks were particularly difficult for learners and discuss several pedagogical implications for teaching and learning with visual representations in economic education.

Effects of the representation of economic models with graphs on learners' ability to think in models
Presenting Author: Jana Doris Franke, University of Education Freiburg, Germany, Germany; **Co-Author:**Franziska Birke, Institute for vocational training and economic education, Germany

Graphs as a visualization of mathematical modelling of economic models are used in many ways in economic education, for example, to show systematic relationships of a model or as an analysis tool. It is yet unclear to which extent learners can deal with graphs as a representation of an economic model and what effects the representation of an economic model using a graph has on the learners' ability to think in models. Due to the empirically proven subject specificity and contextuality of graphical understanding, the broad research findings from the field of science and mathematics cannot be unconditionally applied to economic education. To better understand the challenges and the process of learning with graphs, we interviewed learners in secondary education. Specifically, we focused on the ability of students to think in economic models using the example of pricing and its visual representation through the price-quantity graph (Marshall`s graph). Preliminary results show both challenges and difficulties of learners in using the price-quantity graph as well as some effects of the representation on model comprehension. Based on the results of the evaluations, implications of graphs as a challenge and consequences for economic education will be discussed.

Representing or affording? Visual representations in economics teaching as an agent in the classroom
Presenting Author: Ann-Sofie Jägerskog, Stockholm University, Sweden

In economics teaching, supply/demand graphs are frequently used as a visual tool to help students understand the complex relationships involved in pricing. Previous studies have investigated students' understanding of graphs, identifying several challenges related to learning economics through graphs. What has not been investigated further is how visual representations used in teaching economics affect the teaching practice established in the classroom and thus what learning is afforded. This empirical study aims at doing just that. In a series of three lessons, four upper secondary classes were introduced to economics and pricing. Two classes had lessons based on traditional supply/demand graphs and two on a causal loop diagram. The introductory lecture as well as small group discussions were transcribed and analysed to identify teachers' and students' communicative actions during this lesson and goals driving them. Based on this analysis, conclusions were drawn concerning the relationship between teaching practices established and what visual representation was used in teaching. Results suggest that the teaching practices established in causal loop diagram-based classrooms could be characterised as epistemic practices, where discussing and learning about pricing was the main object. In contrast, teaching practices established in graph-based classrooms were characterized by a focus on the visual representation as such and the logics behind it, rather than discussing the inner workings of the causal relationships involved in pricing. The study has educational and theoretical significance in terms of practical implications for teaching and discussions concerning what is afforded through different visual representations of the same subject content.

Visualising complexity and changeability - critical aspects of teaching visual models in economics
Presenting Author: Malin Tväråna, Uppsala University, Sweden, Sweden; **Co-Author:**Ann-Sofie Jägerskog, Stockholm University, Sweden; **Co-Author:**Mattias Björklund, Stockholm University, Sweden; **Co-Author:**Sara Carlberg, n/a, Sweden; **Co-Author:**Patrik Gottfridsson, n/a, Sweden; **Co-Author:**Therese Juthberg, n/a, Sweden; **Co-Author:**Robert Kenndal, n/a, Sweden; **Co-Author:**Marie Losciale, n/a, Sweden; **Co-Author:**Jenny Rosengren, n/a, Sweden; **Co-Author:**Per Sahlstrom, n/a, Sweden; **Co-Author:**max Strandberg, Stockholm University, Sweden

The aim of this presentation is to discuss how models used in social studies teaching can help students grasp the complexity and changeability in economic issues and systems in the context of social science education (SSE). Models are often used in SSE teaching to help students grasp complexity and changeability. However, students often find models difficult to understand and there is a risk that seemingly fixed models do not offer an understanding of the changeability in societal issues. The project investigates students' conceptions of two different models that are commonly used in SSE (one flowchart and one plot diagram) and what aspects that need to be discerned in order for students to reason in a qualified way about the content illustrated. Results from a phenomenographic analysis of 21 group discussions (with students from both compulsory and upper secondary school) show that the critical aspects identified in part can be understood as model and content specific, but in part as model generic. By comparing the critical aspects for the two different models, it is evident that in order to read both models, aspects pertaining to structure, casual expansion, and human agency are important.

Teaching and Teacher Education

Team teaching, a promising strategy? Empirical insights from Norway, South-Africa, and Flanders

Keywords: In-service Teachers, Pre-service Teachers, Social Aspects of Learning and Teaching, Teacher Effectiveness, Teacher Efficacy, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Hanne Tack, Ghent University, Belgium
Chairperson: Ruben Vanderlinde, Ghent University, Belgium
Organiser: Hanne Tack, Ghent University, Belgium
Organiser: Mathea Simons, University of Antwerp, Belgium
Discussant: Elke Struyf, University of Antwerp, Belgium

The international research literature on team teaching offers an overall positive appraisal of team teaching for both teachers and learners (Baeten & Simons, 2014; 2016; Fluijt et al., 2016; Schmulian & Coetzee, 2019; Solheim, 2019; Walsh, 2020). Team teaching – a collaborative teaching model, also referred to with synonyms such as co-teaching and collaborative teaching – concerns “two or more teachers in some level of collaboration in the planning, teaching and/or evaluation of a course” (Baeten & Simons, 2014, p. 93). Team teaching could address challenges such as the growing heterogeneity of the student population, high attrition rates of beginning teachers, educational reforms and innovations. Despite its promising character, scant empirical evidence has been published with convincing data on team teachings’ effectiveness. This symposium focusses on advancing insights in team teaching and its effectiveness, by presenting four different and complementary perspectives from three countries. In so doing, we aim to contribute to the international state-of-the-art on team teaching theory, by presenting (1) a large-scale cross-sectional survey study on team teaching in Flanders, (2) a mixed-methods study on the role of shared responsibility as a predictor of student achievement during team teaching in Norway, (3) the development and validation of the learners’ team teaching perception questionnaire in South Africa and Flanders, and (4) a study on the preference of South African undergraduate students for specific team teaching models. Based on the insights from the different perspectives, the discussion aims to settle a first international agenda for research, policy, and practice on team teaching.

A state-of-the-art on team teaching practices in Flanders: Results of a large-scale survey study
Presenting Author: Aron Decuyper, Ghent University, Belgium; **Presenting Author:**Dries De Weerdt, University of Antwerp, Belgium; **Presenting Author:**Dries Mariën, University of Antwerp, Belgium; **Co-Author:**Hanne Tack, Ghent University, Belgium; **Co-Author:**Mieke Meirsschaut, mieke.meirsschaut@arteveldehs.be, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Elke Struyf, University of Antwerp, Belgium

Team teaching is a promising strategy where teachers are collaboratively engaging in teaching activities. Based on the level of collaboration between the teachers, five team teaching models are distinguished in the literature (i.e., the observation model, the coaching model, the assistant teaching model, the equal status model, and the teaming model). Despite its promising character as a teaching strategy, like most other European countries, a state-of-the-art on team teaching practices in Flanders is still lacking. To address this gap, this study presents the results of a large-scale cross-sectional survey study completed. As such, the research question is: “*How is team teaching implemented in Flanders?”.* A total of 656 teachers experienced with team teaching from 86 schools completed the questionnaire. The findings show that when it concerns the use of the models of team teaching, most teachers report they use a mix of team teaching models (n=195; 33%). Also, the assistant teaching model – where one teacher assists the *“responsible”* classroom teacher – is a quite common practice (n=149; 25%). However, large, and significant differences were found for the level of education on the use of team teaching (with medium and large effect sizes). These, and other important relations related to the implementation of team teaching will be presented. Based on this survey study, measurement instruments are developed and validated to further grasp team teaching practices. In so doing, the utilization potential of both our findings and the developed instruments is high and evident.

Shared responsibility between team teachers predicts student achievement – A Norwegian study
Presenting Author: Aslaug Fodstad Gourvennec, University of Stavanger, Norway; **Presenting Author:**Oddny Judith Solheim, The Norwegian Reading Centre, Norway; **Co-Author:**Per Henning Uppstad, Norwegian Reading Center, Norway; **Co-Author:**Erin McTigue, Fakultet for utdanningsvitenskap og humaniora Nasjonalt senter for leseopplæring og leseforsking, Norway

Shared responsibility between teachers is regarded as a prerequisite to successful co-teaching/team teaching. However, few studies have investigated whether shared responsibility between teachers actually leads to improved student achievement. This mixed methods study investigates shared responsibility in a sample of 148 classrooms where two general educators worked collaboratively in literacy instruction through first and second grade. First, we analyzed whether the degree of shared responsibility between the two teachers for planning, enacting and evaluating literacy instruction predicted student reading when controlling for pre-reading skills at baseline. Second, we carried out in-depth individual interviews with six collaborative teacher dyads purposefully selected from high- and low-performing classrooms to investigate what characterized their sharing of responsibility. The results show that shared responsibility significantly predicts student reading achievement. Further, the interviews reveal a surface level collaboration between co-teachers in low-performing classes, yet a more profound level of collaboration with influence on key teaching decisions in high-performing classes.

Measuring learners’ perceptions of a team-taught learning environment: Development and validation
Presenting Author: Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Stephen Coetzee, University of Pretoria, South Africa; **Co-Author:**Marlies Baeten, KU Leuven, Belgium; **Co-Author:**Astrid Schmulian, University of Pretoria, South Africa

Team teaching is a teaching model in which teachers work collaboratively in the preparation, teaching and evaluation of a course. Literature suggests that team teaching potentially provides rich and varied lessons, increased support and learning gains. However, team teaching could possibly also cause some confusion. To support the implementation of team teaching, stakeholders (teachers and policy makers) require an instrument that offers learners insights to support their decision making. We describe the development and validation of an easy-to-use questionnaire to explore learners’ perceptions of team teaching. The questionnaire was developed and validated in four stages: an extensive literature review (1) resulted in a preliminary version of the questionnaire (2) containing advantages and disadvantages for learners of team teaching. Next, a pilot study (3) was conducted, followed by a validation study (4) based on confirmatory factor analysis in two different learning environments of secondary education (Belgium, n=229 pupils) and higher education (South Africa, n=350 students). The final questionnaire comprises 16 items and four factors and appears to be valid, internally consistent, and reliable.

To Team or Not to Team: Undergraduate Students’ Perspectives of Two Teachers Simultaneously in Class
Presenting Author: Stephen Coetzee, University of Pretoria, South Africa; **Presenting Author:**Astrid Schmulian, University of Pretoria, South Africa

We report on a study that explored undergraduate accounting students’ experience of team teaching. In particular, we explored the students’ (n = 350) perspectives of the relative advantages and disadvantages of teaming, as a form of team teaching, in contrast to the more widely adopted equal status model of team teaching. The results suggest that the students assessed the teaming and equal status models of team teaching positively. They were, however, statistically significantly more positive about the advantages of the teaming model (M = 3.52) compared to the equal status model (M = 3.12) ($F = 3.321$, $p = 0.000$). A larger majority of the students (n = 275, 79%) indicated a stronger preference for the teaming model, as compared to the equal status model. The teaming model provided students with classes that, from their perspective, were more interesting, aided their understanding, and provided them with faster and more individualized support than the equal status model. In adopting the teaming model, teachers should, however, consider sources of possible confusion and intimidation.

Symposium
Cognitive Science

Interventions for multiplicative reasoning: Advocating an early start and attention to transfer

Keywords: Cognitive Development, Conceptual Change, Early Childhood Education, Mathematics/Numeracy, Primary Education, Teaching/Instructional Strategies
Interest group: SIG 03 - Conceptual Change
Chairperson: Xenia Vamvakoussi, University of Ioannina, Greece
Organiser: Wim Van Dooren, KU LEUVEN, Belgium
Organiser: Xenia Vamvakoussi, University of Ioannina, Greece
Discussant: Andreas Obersteiner, Technical University of Munich, Germany

This symposium presents intervention studies aiming at stimulating multiplicative and proportional reasoning competences in primary and pre-primary students. Multiplicative and proportional reasoning are notoriously difficult for students to develop and to exhibit in out-of-school settings. This seemingly contrasts with evidence that precursors of such competences are present and develop at a much earlier age than traditionally assumed. Three papers show that fostering such competencies ais feasible considerably earlier than is currently the case in instruction. Christou and Kandyli show that a minimal intervention via a game-based activity promoted kindergarten children's ability to solve measurement division problems. Pitta and Vamvakoussi designed activities to support kindergarten children's multiplicative reasoning for discrete and continuous quantities in parallel that promoted substantially their problem-solving competences in non-instructed tasks. Vanluydt, Verschaffel, and Van Dooren developed improved second graders' quantitative reasoning and solutions of missing-value proportional problems, as well as relevant vocabulary. On the other hand, Määttä and colleagues are concerned with students' ability to engage in multiplicative reasoning without guidance. They compared an intervention aiming at fostering fifth graders' tendency to spontaneously discern multiplicative relations in everyday situations with one that promoted fraction knowledge valued in school contexts; they found that the first led to more transferable Knowledge. The four studies not only indicate that it is feasible and fruitful to invest on early stimulation of multiplicative and proportional reasoning competences; and to facilitate related knowledge transfer, they also point at the instructional design principles that learning environments can build on.

Early understanding of measurement division: the effects of a minimal intervention via game activity
Presenting Author: Konstantinos Christou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Anastasia Kandyli, University of Western Macedonia, Greece

We present part of an ongoing design research study aiming at developing activities that promote multiplicative reasoning in early instruction. Specifically, we report on the effects of a game-based activity on children's ability to solving problems pertaining to measurement division (i.e., dividing a quantity into an unknown number of equal groups of a measured quantity), deemed the most challenging aspect of division, particularly for young children. The participants (14 kindergarten children, age 4-6) were pre- and post-tested via individual task-based interviews. They participated in a whole-class activity (approx. 1 hour long) during which they played a game that elicited thinking about equal-grouping. Specifically, the teacher called a number and the children formed equal groups with the size of this number. The participants counted the size of each group, and the number of groups and reported their findings. At the end of each round, the children were asked to make comparisons with the previous one in order to notice the relationships between the size and the number of the groups. The results showed that this minimal intervention improved children's ability to solve measurement division problems. The children employed distribution as well as equal-grouping strategies. In addition, some children also verbalized a fundamental principle of division ("more groups, smaller size") reflecting the inverse proportional relationship between the divisor and the quotient. These results indicate that quite advanced multiplicative reasoning abilities can be fostered in the early years, using learning environments that are challenging, motivational and focused on deep mathematical structures.

Fostering early multiplicative reasoning: An ongoing design research study
Presenting Author:GEORGIA PITTA, University of Ioannina, Greece, Greece; **Co-Author:**Xenia Vamvakoussi, University of Ioannina, Greece

We present part of an ongoing design research study aiming at developing a program of activities to support early multiplicative reasoning. The three pillars of the program are a) addressing various multiplicative situations for discrete and continuous quantities in parallel, b) providing experiences with three fundamental multiplicative operations (iterating a quantity, equi-partitioning, and measurement), and c) introducing vocabulary for multiples and submultiples. Points (a) and (c) are typically not pursued in early math instruction. We developed three story-based activities. The first introduces terms for multiples and submultiples based on multiplicative comparison. In the second, children solve missing value proportional problems. The third focuses on multiplicative change using "fraction machines". We implemented these activities with 22 kindergarten children (9 and 13 children in their first and second kindergarten year, respectively). The children were pre- and post-tested with tasks different than the intervention tasks. Our research questions were whether these activities would be within the reach of pre-primary children; and whether they would promote their multiplicative competences. During the intervention, we found that all children engaged with the activities, but most of the younger ones needed substantial support. The older children gradually needed less support, adopted the intended strategies, and invented new ones. After the intervention, the older children as well as two of the younger ones improved substantially their multiplicative reasoning competences in terms of problem solving, for discrete as well as continuous quantities. These results indicate that quite advanced multiplicative reasoning competences can be fostered earlier than typically assumed.

Stimulating the early development of proportional reasoning: An intervention with second graders
Presenting Author: Wim Van Dooren, KU Leuven, Belgium; **Co-Author:**Elien Vanluydt, KU Leuven - University of Leuven, Belgium; **Co-Author:**Laure De Keyser, KU Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium

Children, but also adults often suffer from difficulties in (learning to) reason proportionally. However, research increasingly shows that the emergence of proportional reasoning abilities starts rather early, several years before it is typically introduced in school. Only a few attempts have been made to stimulate this early emerging ability. The current study aimed to stimulate proportional reasoning in second graders. An intervention was developed with a focus on quantitative reasoning and at promoting different strategies to solve missing-value proportional problems. The effectiveness was tested in a pretest-intervention-posttest study with a control group (n=139). A large effect of the intervention was seen on children's proportional reasoning abilities in fair-sharing situations. A small transfer effect was found to word-problem solving, and a moderate effect on the proportional vocabulary that was part of the intervention.

Adaptive or routine expertise in promoting spontaneous focusing on multiplicative relations
Presenting Author: Jake McMullen, University of Turku, Finland; **Co-Author:**Saku Määttä, University of Turku, Finland; **Co-Author:**Antti Koskinen, University of Tampere, Finland, Finland; **Co-Author:**Hilma Halme, University of Turku, Finland; **Co-Author:**Kristian Kiili, Tampere University, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Finland

A major goal of mathematics education is the use of mathematical knowledge in everyday life. However, many students fail to spontaneously use their existing mathematical knowledge in situations that are not explicitly mathematical, including everyday situations. Within students'' existing mathematical competences a tendency of spontaneous focusing on multiplicative relations (SFOR) has been identified as an indicator of a tendency to spontaneously use multiplicative relations in non-explicitly mathematical situations. Individual differences in SFOR and fraction knowledge have been found to predict each other's development.

The present quasi-experimental classroom intervention study aims to compare the effectiveness of two interventions at promoting 5^{th} grade students' (n = 306) SFOR tendency. The Spot-the-relations intervention is expected to promote adaptive expertise, in the intervention students engage in non-routine tasks that are conceptually rich, require meaning-making and allow for multiple interpretations by practicing recognizing and describing multiplicative relations in everyday situations. The Number-line-estimation intervention is expected to promote more routine expertise, in this intervention students' fraction conceptual knowledge is targeted. Results indicate that the Spot-the-Relations intervention more strongly supported students' ability to recognize and describe multiplicative relations, while the Number-line-estimation intervention more strongly supported students' routine fraction conceptual knowledge. While both interventions led to improvements in SFOR tendency, the Spot-the-Relations intervention led to significantly larger improvements than the Number-line-estimation intervention. These results confirm previous theoretical arguments that learning environments that support adaptive expertise will lead to more readily transferable

knowledge, in this case, using multiplicative relations in everyday situations.

Discussant: Jo Van Herwegen, United Kingdom

Uncertain times need creative and collective endeavors. The International Science and Evidence Based Education Assessment (ISEEA) by the UNESCO Mahatma Gandhi Institute of Education for Peace and Sustainable Development (MGIEP) set out to answer two urgent questions: a) Are education systems still serving the right purpose? and b) How can education systems adapt themselves to address the pressing challenges we face today? The first-of-its-kind assessment of education systems, the ISEEA report brought together multi-disciplinary expertise to provide a scientifically robust and evidence-based assessment to inform education policymaking at all levels and scales. The full report 'Reimagining Education', with a Summary for Decision Makers (SDM), was launched in March 2022. This symposium will present and further discuss the main findings and implications of the ISEEA for education practice and policy. The first presentation will discuss the background and approach undertaken by ISEEA to answer the two questions above and the key findings. The second presentation will discuss the research gaps as revealed by the ISEEA that resulted in a transdisciplinary global research agenda for education. One of the most important findings of the ISEEA was the urgent need to establish the science-policy interface in education to strengthen the science-policy nexus. The third presentation will highlight the features of data and evidence required to mandate policy interventions in education practices. The final presentation will discuss the emerging and critical role of technology and AI in both driving and implementing large-scale education transformation both in learning and assessment.

The International Science and Evidence based Education (ISEE) Assessment: aims and findings
Presenting Author: Nandini Chatterjee Singh, UNESCO Mahatma Gandhi Institute of Education for Peace and Sustainable Development, India; **Co-Author:**Nienke van Atteveldt, Vrije Universiteit Amsterdam, Netherlands

The UNESCO Mahatma Gandhi Institute of Education for Peace and Sustainable Development (MGIEP) embarked on the ambitious International Science and Evidence Based Education (ISEE) Assessment in 2019, and in spite of the challenges presented by the COVID-19 pandemic, has since commendably convened over 300 scientists and experts from 45 countries from diverse disciplines. The findings presented in ISEEA report will undoubtedly pave the way for policy and decision making for future education systems since the world now needs, more than ever, visions for a future that must be more sustainable, resilient, socially just and fair. This first presentation will discuss the background and approach undertaken by ISEEA and its key findings.

A global research agenda for evidence-based education
Presenting Author: Grégoire Borst, Université Paris Cité - CNRS, France

How to improve social presence and decrease orchestration load in hybrid learning environments?

Keywords: Computer-supported Collaborative Learning, E-learning/ Online Learning, Educational Technologies, Emotion and Affect, Engagement, Learning Analytics, Social Aspects of Learning and Teaching, Teaching/Instructional Strategies
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Jan Elen, KU LEUVEN, Belgium
Organiser: Annelies Raes, KU LEUVEN, Belgium
Discussant: Gaëlle Molinari, Switzerland

Hybrid learning environments are defined as an unbounded multi-dimensional fluidity, allowing learners and teachers to move freely between physical, social and organizational spaces, while maintaining their connection with a shared educational endeavor. Although hybridity creates possibilities, it also creates challenges. Regarding the student perspective, previous research has indicated the need for social presence. Previous research mainly focused on comparing onsite and remote student experiences during lectures, yet this symposium also presents recent work on collaborative learning in hybrid classrooms (see

Buseyne et al.). The study of Hauk and Gröschner compares student experiences during whole-group discussion and small-group work in a hybrid classroom. Regarding the teacher perspective, systematic reviews have revealed the challenging role of the teacher. Teachers need to engage in multiple tasks under multiple constraints within their everyday classroom teaching situations which is defined as classroom orchestration. In line with that concept, orchestration load seeks to capture the attentive load teachers encounter when regulating multiple activities and learning processes in real-time. Research focussing on the role of the teacher in the hybrid context is limited, yet this symposium includes ongoing research on that topic. The paper of Kaliisa and Damsa illustrates the use of learning analytics techniques to support teachers' design role in hybrid environments, improving the connections between online and face-to-face activities. Finally Ortega-Arranz et al. investigate the factors influencing teachers' orchestration load. The symposium will be chaired by Jan Elen (KU Leuven) and Gaëlle Molinari (University of Geneva & UniDistance) will provide an overall discussion.

Optimal experience in a hybrid computer-supported collaborative learning setting
Presenting Author: Siem Buseyne, Faculty of Psychology and Educational Sciences, Centre for Instructional Psychology and Technology, KU Leuven Kulak, Belgium; Itec, imec research group at KU Leuven, Imec; CIREL, Centre Interuniversitaire de Recherche en Education de Lille, France, France; **Co-Author:**Celine Vens, KU LEUVEN, Belgium; **Co-Author:**Thierry Danquigny, Université de Lille, France; **Co-Author:**Fien Depaepe, KU Leuven, Belgium; **Co-Author:**Jean Heutte, Université de Lille, France; **Co-Author:**Annelies Raes, KU Leuven, Belgium

More often than ever, universities are shifting towards hybrid forms of learning, not only for lectures but also for other instructional methods, such as collaborative forms of learning. Past research has mainly focused on students' cognitive and motivational factors in hybrid learning settings during lectures. Previous research did not reveal significant differences regarding the cognitive results, yet, significant results were found regarding the affective variables, i.e. stating that students attending a course remotely are generally less engaged compared to students attending the course on-campus. Research investigating collaborative learning in a hybrid setting is however limited. In the current study, students' teamwork experiences during collaborative hybrid learning are investigated. More specifically, this study presents quantitative results on the effect of the learning delivery mode (on-campus vs. remote) on (a) students' team flow experience during a hybrid collaborative learning task and (b) students' individual flow experience and (c) learning gain during the entire hybrid course. Significant results were found between the delivery mode and students' team flow experience, in favor of students participating on-campus. Similarly, significant results were found regarding students' individual flow experience, again in favor of students attending the course on-campus, though only for one of the individual flow aspects. No significant differences were found between students' learning gain based on the delivery mode.

Supporting teachers in hybrid learning environments: The role of learning analytics
Presenting Author: Rogers Kaliisa, University of Oslo, Faculty of Education, Norway; **Co-Author:**Crina Damsa, University of Oslo, Norway

Teachers often struggle to design and guide students in hybrid learning environments. The aim of this contribution is to illustrate the potential of learning analytics (LA) in supporting teachers' learning design roles (e.g., planning and revising learning activities) in hybrid lenvironments. Using data from 7 asynchronous online discussions in a hybrid bachelor's course, we analyzed student interactions (N=34) and the content of the weekly online discussions using social network analysis (SNA) and automated discourse analysis. SNA metrics identified different sub-groups of students (e.g., most active vs. least active), while the content analysis of the discussion forum posts provided a nuanced view of the main concepts used by the students. Based on these findings and in collaboration with teachers, we designed a LA dashboard (Canvas discussion analytics dashboard [CADA]) that visualizes the participation, social interactions, concepts, and the sentiment attached to students' online discussion posts on a need-to-know basis. We evaluated CADA using 10 in-depth interviews with university teachers who used it practice. The findings showed that CADA provided teachers with an easier-to-understand visual representation of large amounts of student information (e.g., misconceptions about a topic) during online discussions. This information enabled teachers to monitor the quality of the online discourse, which they leveraged to make minimal learning design changes and to customize face-to-face classroom activities. While some teachers expressed a need for CADA to include actionable insights, the results underline the potential of LA in supporting teachers' learning design roles in hybrid learning environments.

Teacher's and Students' Perception of Hybrid Classrooms in Secondary School Education
Presenting Author: Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Dennis Hauk, Friedrich Schiller University Jena, Germany

Due to COVID-19-related school closures, distance and blended learning courses have become relevant educational settings to provide students with flexible modes of participation. In this study, we investigate students' engagement and teacher's motivational support in a blended synchronous learning environment, called a hybrid classroom, in which onsite students (sitting in a real-life, face-to-face classroom) and remote students (connected online to the classroom via video conferencing tools) are taught simultaneously. Therefore, we videotaped four hybrid classroom lessons in two classes (N = 38 students) during one week in Spring 2021 and assessed students' perception through a questionnaire at the end of each lesson. A teacher's interview provided post-hoc reflections upon students' engagement in hybrid classroom settings. Quantitative findings show no differences between onsite and remote-students perception during whole-group discussion. In small-group work, however, onsite students perceived a significant higher agentic and behavioral engagement than the online connected remote-students. The teacher perceived particularly engaging offsite students in whole-class discussions as challenging. Implications are discussed regarding the role of teacher's attention, support, and scaffolding in hybrid classrooms.

Teacher orchestration load while designing and implementing hybrid collaborative activities
Presenting Author: Alejandro Ortega-Arranz, Universidad de Valladolid, Spain; **Co-Author:**Alejandra Martínez Monés, Universidad de Valladolid, Spain; **Co-Author:**Ishari Amarasinghe, Universitat Pompeu Fabra, Spain; **Co-Author:**Yannis Dimitriadis, Universidad de Valladolid, Spain; **Co-Author:**Davinia Hernandez-Leo, Universitat Pompeu Fabra, Spain

The flexibility provided by hybrid learning models has attracted the attention of educational providers, such as Higher Education institutions. Hybrid settings are usually understood as those that involve onsite (i.e., in the classroom) and remote (e.g., in a different classroom, at home) students simultaneously under the instruction of the same teacher. However, designing and conducting lessons is likely to increase the teachers' orchestration load, while the difficulties to set up proper interactions among the onsite and remote students may become a considerable obstacle for implementing collaborative activities. Some tools have been proposed to help tackle these challenges, but there is a need to better understand the factors that influence teachers' orchestration load while using these tools for designing and conducting collaborative activities. This paper outlines a study carried out in a hybrid classroom in which a Jigsaw collaborative pattern was implemented with the Engageli software. The study involved 2 teachers and 67 students enrolled in a subject of a computer science undergraduate course. Preliminary results show that teachers reported a medium-to-high orchestration load for implementing and setting up the collaborative activity in the hybrid classroom. Among the factors that contributed most to such load, teachers highlighted the creation and management of groups and the creation of collaborative documents, given the rather high complexity of a jigsaw activity.

Motivational, Social and Affective Processes

Student Academic Emotions and Interest in Classroom and in Computerised Learning Environments

Keywords: Anxiety and Stress, Argumentation, Artificial Intelligence, Cognitive Skills and Processes, Computer-assisted Learning, Educational Technologies, Emotion and Affect, Interest, Motivation, Secondary Education, Self-efficacy
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Maria Psyridou, University of Jyväskylä, Finland

Do Individual and Contextual Determinants Affect the Development of Emotions? Growth Curve Models.

Keywords: Emotion and Affect, Motivation, Secondary Education, Self-efficacy
Presenting Author: Simon Meyer, University of Erlangen-Nuremberg, Germany; **Co-Author:**Juliane Schlesier, University of Oldenburg, Germany; **Co-Author:**Michaela Gläser-Zikuda, University of Erlangen-Nürnberg, Institute for Educational Science, Germany

Previous studies regarding the transition from primary to secondary school focused mainly on disparities relating to students' regional, socio-economic, and ethnic backgrounds, while affective factors, such as achievement emotions, have been less researched in this context. Especially systematic longitudinal studies that consider individual and contextual determinants on the development of achievement emotions are lacking. Based on prior cross-sectional studies, it is reasonable to assume that higher values of school-related self-efficacy as well as higher levels of intrinsic motivation among early secondary students positively influence the development of positive achievement emotions and prevent students from having negative achievement emotions. Thus, the purpose of the present longitudinal study is to analyze the influence of individual factors (school-related self-efficacy, motivation) as well as environmental determinants on class level (instructional quality, autonomy support) on the development of students' enjoyment and boredom after transition to secondary school. The longitudinal study was conducted from the beginning of 5^{th} grade to the beginning of 6^{th} grade (three measuring points) and included $N = 638$ students (84.9% female) with an average age of $M = 10.19$ (SD = .45). First results of multilevel growth curve models indicate that the decrease in students' enjoyment in the course of the first year of secondary school can be particularly explained by the decline of students' self-efficacy. The increase of students' boredom, on the other side, is particularly induced by their perceived teachers' instructional quality. The theoretical and educational implications will be discussed at the conference.

Individual Differences as Determinants of Boredom and Shame in Socio-Emotional Conflict Situations
Keywords: Anxiety and Stress, Artificial Intelligence, Cognitive Skills and Processes, Emotion and Affect
Presenting Author: Lara Chehayeb, German Research Center for Artificial Intelligence (DFKI), Germany; **Co-Author:**Dimitra Tsovaltzi, DFKI (German Research Center for Artificial Intelligence) / Saarland University, Germany; **Co-Author:**Patrick Gebhard, German Research Center for Artificial Intelligence (DFKI), Germany

Performance tasks in groups like learning in current competitive classroom situations often give rise to socio-emotional conflicts that are grounded in uncertainty and are not easily altered. Besides anger, perceived conflicts may result in shame, or boredom. Boredom is a major factor in learning settings leading to poor academic performance and drop-outs . Individual differences may determine the experience of conflict situations. They influence the ability to regulate one's own emotions in a given situation. Our aim is to inform the development of learner-centered support for effective performance experiences. We investigate the influence of individual differences, social identity, the way we relate to others, and self-consciousness, our proneness to social comparison on emotional regulation, cognitive appraisal of threat, and boredom in conflict situations. Therefore, we conducted an online experiment in a virtual setting (N = 57). To control socio-emotional and cognitive conflict, we created a conflict situation by using a socially interactive agent which shames participants. We tested a moderated mediation model. Results showed that self-consciousness (moderator) moderated the effect of social identity (predictor) on cognitive appraisal of threat (mediator), which then mediated the effect of social identity on boredom (outcome).

Automatically Detecting Affect in Computerized Learning Environments: A Systematic Literature Review
Keywords: Artificial Intelligence, Computer-assisted Learning, Educational Technologies, Emotion and Affect
Presenting Author: Maria Cutumisu, University of Alberta, Canada; **Co-Author:**Lydia González Esparza, The University of Alberta, Canada; **Co-Author:**Minghao Cai, University of Alberta, Canada; **Co-Author:**Iñaki Palestino Díaz, Tecnologico de Monterrey (ITESM), Mexico; **Co-Author:**Genaro Rebolledo Méndez, Tecnologico de Monterrey (ITESM), Mexico; **Co-Author:**Carrie Demmans Epp, University of Alberta, Canada

Affect detection is increasingly viewed as an essential component of computerized learning systems aiming to improve learner outcomes by adapting to learner affect. However, it is not clear what methodologies, emotions of interest, and type of experiments have been reported in the literature. This systematic review analyzes 36 peer-reviewed publications to ascertain how learning-centered affect is automatically detected and analyzed via affect-sensitive computational systems in educational settings. One author reviewed the publications and another author reviewed 15% of these publications, reaching an inter-rater reliability Kappa coefficient of 0.98. Evidence from the reviewed articles shows that most studies (1) were published in the last four years; (2) mainly used facial expressions to detect affect; (3) identified engagement, boredom, frustration, and confusion as the most frequent affective states in learning settings; and (4) used supervised machine learning algorithms to classify learner emotions. The current review aims to ascertain the degree to which educational computational systems can automatically recognize or respond to users' affective states. Moreover, the review aims to investigate whether affect-sensitive interfaces facilitate HCI in terms of enjoyment and effectiveness (e.g., learning gains).This research provides recommendations on how to address several gaps in the literature, including the need to develop: (1) more methodological approaches, both theory- and data-driven, for capturing and analyzing affect; (2) adaptive intelligent educational interfaces that use affective and behavioral states to provide a better learning experience; and (3) affective datasets to improve existing machine learning affect-detecting models.

Maintaining interest: Contrasting the effects of triggered situational and individual interest
Keywords: Argumentation, Computer-assisted Learning, Interest, Secondary Education
Presenting Author: Thorben Jansen, Leibniz-Institut für die Pädagogik der Naturwissenschaften und Mathematik, Germany; **Co-Author:**Lars Höft, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Luca Bahr, Leibniz Institute for Science and Mathematics Education (IPN), Germany

Interest is crucial for a meaningful and sustained engagement with complex tasks, especially in settings offering a high degree of autonomy, like digital learning environments (DLEs). According to the Four-Phase Model of Interest Development (Hidi & Renninger, 2006), interest may develop from a fleeting situational (triggered situational (TSI) and maintained situational interest (MSI)) into a more stable individual interest, both sharing the same psychological state of interest experience (IE). Accordingly, IE depends, on one side, on external factors and collative variables and is, hence, highly unstable and occasion-specific. On the other side, IE can be self-generated due to existing knowledge and individual interest, resulting in a cross-situational component. Studies systematically disentangling the occasion-specific and cross-situational components of IE can unravel the effects of temporary external factors and individual interest in related domains on the development of situational interest (SI). Therefore, we conducted an experimental study ($N = 955$) within a DLE and applied latent state-trait analysis to scrutinize the effects of occasion-specific and cross-situational components of IE on the change of MSI across two complex tasks. In addition, we controlled for domain-specific individual interest (DII) to disentangle the effects of TSI and DII. Results revealed that initial MSI and the occasion-specific component of TSI predicted the change in MSI. However, the effect of the cross-situational component of TSI was moderate but insignificant. Likewise, the total effect of DII diminished. Findings underscore the importance of repeatedly triggering students' interest via characteristics of the DLE.

High-Stakes And High Goals: How Two Learning Goals can be Achieved When Studying Worked Examples
Keywords: Cognitive Skills and Processes, Example-based Learning, Higher Education, Instructional Design

Presenting Author: Nina Udvardi-Lakos, University of Freiburg, Germany; **Co-Author:**Marlene Weirich, Pädagogische Hochschule Freiburg, Germany; **Co-Author:**Julia Asbrand, Humboldt-University Berlin, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany

The use of worked examples can support initial acquisition of cognitive skills. Worked examples in complex domains (e.g., argumentation) often show the skill application in an exemplifying domain. Although learners' focus should remain on the skill and the exemplifying domain is less important, learners need to understand the content knowledge to benefit from worked examples. We examined whether asking students to focus on both content knowledge and skills by using a high-stakes exemplifying domain would allow learners to acquire both skill and content knowledge simultaneously, or whether high-stakes content distracts from and impedes learning the skill. In a training study with $N = 234$ students, we used example-based learning materials. We included an exemplifying domain associated either with high or low stakes for participants, by using content knowledge either relevant or irrelevant for course outcomes. We assessed cognitive load associated with the learning materials, declarative knowledge about the skills, and skill application in argumentation tasks. Incorporating high-stakes content knowledge in the worked examples did not hamper learning outcomes compared to a condition using a low-stakes exemplifying domain, where the high-stakes content knowledge was taught afterwards. Having two simultaneous learning goals (skill and content knowledge) did not increase cognitive load associated with the learning materials. The results suggest that worked examples can be used to integrate and foster both skills and content knowledge when these are associated with high stakes for learners. This finding suggests that worked examples can support two simultaneous learning goals.

Designing professional education for adaptive expertise: case study results

Keywords: Competencies, Higher Education, Instructional Design, Teacher Professional Development

Presenting Author: Loek Nieuwenhuis, HAN University of Applied Sciences, Netherlands; **Co-Author:**Lia Fluit, Radboud University Medical Center, Netherlands; **Co-Author:**Wietske Kuijer-Siebelink, HAN University of Applied Sciences, Netherlands; **Co-Author:**Carla Oonk, Wageningen University, Netherlands; **Co-Author:**Petra Swennenhuis, Fontys University of Applied Sciences, Netherlands; **Co-Author:**Anne Khaled, Hogeschool Utrecht (University of Applied Sciences Utrecht) and HAN UAS, Netherlands

Educational developers are looking for (evidence-based) ways to stimulate adaptive expertise development. Work-based programs should combine traditional novice-expert model with open and ill-structured workplace problems. Lehtinen, Hakkarainen and Palonen (2014) built a learning theory for the professions in times of rapid change. Professional education should support learning to solve complex and ill-structured workplace problems in order to prepare students for future work. Hatano and Inagaki (1986) discern routine expertise en adaptive expertise: routine expertise is the execution of high quality procedures in order to act efficiently and accurately. Adaptive expertise is the power to develop new solutions for professional problems or even new problem solving methods. According to Spiro et al. (2018) adaptivity is trainable by developing a growth mindset instead of a fixed mindset. In the paper we present the results of 11 case studies, executed in 2022. The aim is developing a program theory through realist evaluation of educational practices. In a realist approach theory development and practice-based research go hand-in-hand (Pawson & Tilly, 1997; Pawson et al., 2005). A consortium of 5 regular universities and 6 universities of applied sciences cooperate to evaluate work-based, open-end educational programs enhancing adaptive expertise. We examined the local design theory in use for educating professional students in ill-structured, work based problem contexts. Case studies are based on document analysis, interview sessions with course designers, educators (teachers and practitioners) and students involved. Self-,perception scales on adaptive expertise are administered to the students at the start and the end of the courses.

An analysis of instructional methods in higher education: Differences by course and discipline.

Keywords: Higher Education, Instructional Design, Quantitative Methods, Teaching/Instructional Strategies

Presenting Author: Javier Fernández, Universidad de Leon, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Carlos Rodríguez-Hernández, Institute for the Future of Education, Tecnológico de Monterrey, Mexico; **Co-Author:**Juan Fraile, Universidad Francisco de Vitoria, Spain

Instructional methods are a key area of research in Higher Education. Importantly, most of the studies in the area use convenience samples and/or do not compare the methods across disciplines, which limits the generalizability of the results. To offer a more complete analysis, that we can considered representative, this study explores the instructional methods reported in Spanish universities using a nationwide sample of syllabi. We created a database including all subjects from public universities in the country (N = 78,094) and subtracted a subsample of 1,693 syllabi for analysis. Our results analyzed the type of instructional methods used and the most common instructional profile. Additionally, we looked for differences by academic year and discipline. Our findings showed that university teaching is still led by master classes, especially in the early years. Methods such as portfolios or project-based learning, on the contrary, were more used in later years. We also found differences among disciplines, as social sciences tend to use less master classes and more debate and students' presentations. This study allows us to detect areas of improvement in university teaching, providing valuable information for universities and educators who aim to redesign their instructional methods.

Students' disciplinary values navigation through troubled pasts and contemporary resistances

Keywords: Attitudes and Beliefs, Higher Education, Instructional Design, Science and STEM

Presenting Author: Sugat Dabholkar, GSE-Rutgers University, United States; **Presenting Author:**Julia Gouvea, Tufts University, United States; **Co-Author:**Lawrence Uricchio, Tufts University, United States

Interpreting what is valued in a disciplinary domain and how that aligns or contradicts with personally held values is an important part of disciplinary learning because it can shape students' sense of belonging as well as their current and future participation in the discipline. Our study aims to understand students' disciplinary values navigation in an undergraduate computational biology course. Findings suggest that the resources provided about troubled disciplinary pasts and contemporary resistances in the discipline of computational biology supported students' navigation of disciplinary values in connection with their prior lived experiences, sense-making about disciplinary concepts and practices, critical considerations of power and privilege, and their own participation in the disciplinary domain. This work contributes 1) empirical examples of disciplinary values navigation as a process that includes students' interpretation of the multiplicity of values within a discipline and their consideration of how they and others might reshape those values through their disciplinary participation, and 2) understandings of how science learning spaces can be designed for students to critically navigate disciplinary values.

Preparing teachers for differentiating their instruction: A meta-analysis and a multiple-case study

Keywords: In-service Teachers, Inquiry Learning, Science Education, Teacher Professional Development

Presenting Author: Rebecca Kahmann, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Mienke Droop, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Ard Lazonder, Radboud University, Netherlands

Since elementary school children highly differ in their science domain knowledge and skills, differentiated instruction can be a promising instructional approach to respond to these individual differences. Teachers are open for differentiated instruction, but need support to implement it, possibly in the form of professional

development programs (PD programs). Inquiry-based science lessons might be a particularly inviting context to implement differentiated instruction because of the flexibility in the level of guidance. The aim of the current paper is twofold. First, we provide an overview on the effects of PD programs on teachers' implementation of differentiated instruction and students' learning outcomes, so far. Second, we inventory which aspects of differentiated instruction teachers already implement inquiry-based science lessons and in which aspects they might benefit from professional development. For the first aim, we conducted a meta-analysis of 27 studies that tested the effects of PD programs on teachers' differentiation practices and student learning. The results showed that PD programs increased teachers' implementation of differentiated instruction, but had no significant mean effect on students' learning outcomes. For the second aim, we conducted a multiple-case study. Specifically, we interviewed and observed 10 elementary school teachers for an inquiry-based science lesson. Preliminary results show that while the teachers already applied differentiated instruction to some degree, they could still benefit from PD programs regarding some aspects, like monitoring children's skills and knowledge. Outcomes of these two studies will inform the design of a PD program on differentiated instruction in the context of inquiry-based science education.

Teacher programs for differentiated instruction: a review study
Keywords: Inclusive Education, Secondary Education, Teacher Professional Development, Teaching Approaches
Presenting Author: Berber Langelaan, Hogeschool van Amsterdam, Netherlands; **Co-Author:**Ron Oostdam, University of Amsterdam, Netherlands; **Co-Author:**Lisa Gaikhorst, University of Amsterdam, Netherlands; **Co-Author:**Wouter Smets, Karel de Grote University college, Belgium

To gain more insight into the organization of effective teacher training for DI, a systematic qualitative review study was conducted of 29 peer-reviewed articles from 2010-2020. The articles reported on interventions (teacher training programs) targeted at improving teachers' competence for tailoring the diverse learning needs of their students. This review identified the relevant DI content characteristics, explored the extent to which DI learning interventions work (or do not work), and explored how environmental circumstances, such as school context and teacher characteristics, interplay with the interventions' effects.Differentiated instruction (DI) is an approach to teaching aimed at meeting student differences. DI is considered an important but complex teaching competence. Therefore, training (future) teachers for DI is important, and the development and redesign of teacher education curricula are desirable. The findings indicate that to be relevant and effective, a DI program is ideally longitudinal and comprehensive, and addresses attitudes, knowledge, and skills. Attitudinal change is considered a prerequisite for effectively applying DI and the importance of a facilitative intervention context is emphasized. With respect to program characteristics; active learning, collaborative practice and reflective practice support positive outcomes. The findings underscore the relevance of attention to DI learning for both preservice and inservice teachers.

Differentiated students or differentiated instruction?
Keywords: Inclusive Education, Special Education, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author:Sérgio Gaitas, ISPA-Instituto Universitário / CIE - ISPA (Center for Research in Education), Portugal

Differentiated instruction (DI) is a widely addressed concept and has been proposed as an approach to address student diversity and develop inclusive educational systems. DI is considered a flexible approach to teaching that offers adequate challenges and appropriate scaffolding to all students in the context of heterogeneous classrooms. However, despite DI being a well-known approach, recent reviews have drawn attention to the misconceptions around the concept, from individualization to the teaching of specific groups of students. Considering the worldwide misconceptions and the limited studies describing the teachers' daily practices of DI, this study aimed to characterise teaching practices under the concept of DI. Thirty-nine teachers self-reported a DI strategy that they usually develop. The main findings suggest that the teachers' reported practices are based on an ability streaming approach or directed to students with disabilities and are typically mobilized when students cannot do the same activity as the other pupils. These results revealed major discrepancies between the practice and the intended goal of DI. In fact, what is being enacted in the name of DI has become ambiguous.

Can differentiated instruction support students' socio-emotional variables?
Keywords: Inclusive Education, Self-concept, Social Interaction, Well-being
Presenting Author: Marcela Gerardina Pozas Guajardo, Profesional School of Education, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Verena Letzel, University of Trier, Germany

In consideration of the substantial increase in students' learning demands, teachers are urged to address student heterogeneity in their daily teaching practice by means of differentiated instruction (DI). The practice of DI, as a vehicle to achieve inclusive education, not only aims to support all students' academic learning but also foster their social and emotional development. However, current research in the field of DI has mostly been limited to an examination of its effects on students' achievement outcomes. Consequently, the potential impact of DI on students' socio-emotional outcomes has, up until now, received very little attention. In order to address this gap in the research, the current study sought to investigate the effects of DI on students' emotional well-being, social inclusion and academic self-concept. Survey participants in this study included 602 lower secondary school students from 25 inclusive and regular classes in secondary schools in Mexico. Following multilevel analyses, surprisingly, the results have indicated that students' rating of their teachers' DI practice was not positively associated with their emotional well-being, social inclusion and academic self-concept. A further t-test for dependent samples demonstrated that students perceive their teachers' DI practice to be quite seldom.

Session E 12

Learning and Instructional Technology, Motivational, Social and Affective Processes

Student and Teacher Growth Mindsets

Keywords: Emotion and Affect, Engagement, Large-scale Assessment, Mindsets, Motivation, Multimedia Learning, Primary Education, Quantitative Methods, Video-based Learning, Writing/Literacy
Interest group: SIG 06 - Instructional Design, SIG 08 - Motivation and Emotion
Chairperson: Debra Myhill, University of Exeter, United Kingdom

The rich gets richer: Growth mindsets matter more in affluent contexts
Keywords: Engagement, Large-scale Assessment, Mindsets, Motivation
Presenting Author: Ronnel Bornasal King, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Faming Wang, The Univerisity of Hong Kong, Hong Kong; **Co-Author:**Shing On Leung, The University of Macau, Macao; **Co-Author:**Andrew Elliot, University of Rochester, United States

There is a heated debate about how socio-economic contexts interact with growth mindsets in predicting learning-related outcomes. However, past studies were beset by the small sample size and mostly focused on family SES. In this study, we adopted a large nationally representative sample to explore how family SES, school SES, and country affluence moderated the effect of students' growth mindset on academic achievement, intrinsic motivation, and academic engagement. Multilevel moderated analyses were conducted to analyze the Programme for International Student Assessment (PISA) 2018 database with 612,004 students from 80 countries. Results indicated that having a growth mindset was positively associated with academic achievement, intrinsic motivation, and academic engagement. Meanwhile, the effect of growth mindset on academic achievement, intrinsic motivation, and academic engagement was moderated by socio-economic contexts. Students from affluent families, schools, and countries benefited more from the growth mindset. This study shows the "rich gets richer" phenomenon and highlights the importance of considering the interplay between socio-economic contexts and growth mindset in understanding academic achievement, intrinsic motivation, and academic engagement.

The effects of growth mindset and emotions on L2 writing performance

Keywords: Emotion and Affect, Mindsets, Quantitative Methods, Writing/Literacy
Presenting Author:JIAHUAN ZHANG, The University of Hong Kong, China; **Co-Author:**Choo Mui Cheong, The University of Hong Kong, Hong Kong; **Co-Author:**Yuan Yao, The Hong Kong Polytechnic University, Hong Kong; **Co-Author:**Xinhua Zhu, The Hong Kong Polytechnic University, Hong Kong

Growth mindset (GM), defined as an individual's perception that intelligence is malleable, has caught increasing attention in educational research. GM often leads to positive learning emotions and facilitates learning in many contexts. Several studies have investigated the relationship between GM and learning emotions in second language (L2) contexts, with limited discussion in L2 writing that entails more effort than other language learning domains. Additionally, writers with different writing proficiency levels showed different impacts of writing mindset and emotions on writing performance separately, but these two have not been researched together thus far. Therefore, taking a step further, this study investigated the effects of growth mindset and L2 writing emotions (enjoyment and anxiety) on L2 writing performance. Participants were 589 Chinese twelfth-graders who were learning English as their L2 in mainland China. Results showed that GM was positively associated with enjoyment and negatively with anxiety. When examining GM-emotions relationships as per writing proficiency levels (high, middle, low), there were intriguing group differences. There was an indirect positive path from GM to writing performance via anxiety in the middle-level group; and an indirect positive path via enjoyment in the low-level group. Findings suggested that the endorsement of GM can effectively modulate writing emotions, which further enhances writing performance. Pedagogical implications include fostering GM and proliferation of social-emotional learning are discussed.

How growth mindsets induced by a pedagogical agent can foster learning in primary school
Keywords: Mindsets, Multimedia Learning, Primary Education, Video-based Learning
Presenting Author: Konstantinos Michos, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Sascha Schneider, University of Zurich, Switzerland; **Co-Author:**Kate Xu, Open Universiteit Nederland, Netherlands

Studies have shown that an induction of a growth mindset has a positive effect on learning performance, intrinsic motivation, lowered perceived difficulty, and mental effort. This study investigates whether the presence of a pedagogical agent in digital learning media can boost this effect for primary school students. This was investigated using a learning video on the topic "deep sea" with a total of 149 primary school pupils randomly assigned to the four experimental conditions of a 2 (growth mindset vs. fixed mindset induction) x 2 (pedagogical agent vs. no pedagogical agent) factorial design. The results show that (a) the group with an induced growth mindset achieved better learning performance and reported lower perceived difficulty than the group with an induced fixed mindset, (b) the presence of the pedagogical agent led to higher scores in intrinsic motivation, lower scores in perceived difficulty, and more mental more mental effort, and (c) the positive effects of an induced growth mindset on learning performance and perceived difficulty was increased with a pedagogical agent. These results suggest the use of pedagogical agents to effectively incorporate a growth mindset induction into primary school students' learning activities.

Examining a 'throughline' in research-based curricula by researcher-student collaborative inquiries
Keywords: Curriculum Development, Higher Education, Inquiry Learning, Qualitative Methods
Presenting Author: Tracy Zou, The Chinese University of Hong Kong, Hong Kong; **Co-Author:**Tom Barry, University of Bath, United Kingdom; **Co-Author:**Ka Sing Yu, The University of Hong Kong, Hong Kong; **Co-Author:**Jetty C. Y. Lee, The University of Hong Kong, Hong Kong; **Co-Author:**King L. Chow, The Hong Kong University of Science and Technology, Hong Kong; **Co-Author:**Lily Y. Y. Leung, The Chinese University of Hong Kong, Hong Kong

A research-based curriculum prepares students for dealing with unforeseen problems in an uncertain world. Scholars increasingly advocate for a connected curriculum embedding a 'throughline' that develops students' inquiry capacity gradually throughout their years of study. However, implementing such a connected curriculum is challenging. This multiple-case study examined how the research-based curriculum was perceived by teachers and experienced by students in three science and one interdisciplinary undergraduate programmes. Data were collected from documents, teacher and student interviews, and researcher-student collaborative analyses. The findings identified a 'throughline' conceptualised differently by teachers and students. Students viewed mentoring, peer support, and opportunities outside of the curriculum as part of the 'throughline', whilst faculty members focused more on the formal curriculum. The implications are to develop a holistic view of the curriculum with formal and informal support to students.

Unraveling research competence for professionals: a concept analysis based on a systematic review.
Keywords: Competencies, Curriculum Development, Higher Education, Synergies between Learning / Teaching and Research
Presenting Author: Lisette Munneke, Utrecht University of Applied Sciences, Netherlands; **Co-Author:**Pieter Schilder, HU University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Belinda Ommering, Utrecht University of Applied Sciences, Netherlands; **Co-Author:**Daan Andriessen, Utrecht Univesity of Applied Sciences, Netherlands

As a result of ambiguity in defining research competence for professional contexts, implementing research competence in curricula within higher professional education (HPE) is challenging. This might hinder the motivation of upcoming professionals to use research competence in their daily practices, while this is important to deal with the growing complexity in these practices. Therefore, in this contribution the variety of interpretations of the concept of research competence for professional contexts is reviewed to come to a clear and unambiguous definition of the concept which helps to shape and implement research more effectively in curricula of HPE. With help of the Conceptual Analysis Method, we identified the terms used for the phenomenon of professionals doing research in and for their own practices. Following this, we analyzed the definitions given in different domains and communities of research. Findings indicate a distinction in a holistic and analytic approach, with little to no attention regarding possible differences between the research competence needed in professional contexts and more academic contexts. Based on these results we propose a holistic definition grasping the core ideas of this competence. The professional with research competence should be able to 1) recognize and acknowledge where adequate actionable knowledge is lacking in the professional context, 2) make substantiated decisions on how to deal with these knowledge gaps, 3) answer research questions in a systematic manner with a rigor that is appropriate within the given context, and 4) make the results useful for specific professional situations in dialogue with stakeholders.

Co-creation and student-staff partnership in higher education. A scoping review
Keywords: Cooperative/Collaborative Learning, Curriculum Development, Engagement, Higher Education
Presenting Author: Maren Omland, Oslo Metropolitan University, Norway; **Presenting Author:**Frederick A. Reiersen, Oslo Metropolitan University, Norway; **Presenting Author:**Anja Amundrud, University of Oslo, Norway; **Co-Author:**Hege Hermansen, Oslo Metropolitan University, Norway; **Co-Author:**Magnus Hontvedt, University of South East Norway, Norway

In this paper, we conduct a review of existing research on the involvement of students in the development of teaching and learning in higher education. Such student-staff collaboration is referred to here as *co-creation*. Several studies suggest that co-creation in higher education has several potential benefits, such as reduced dropout, increased academic performance, increased student engagement and improved equity. Co-creation can also be a tool for supporting student agency and well-being in times characterized by uncertainty, political turmoil and environmental crisis. By engaging students as agentic partners in their own

educational trajectories, we can create opportunities for students to shape teaching and learning in higher education and increase their sense of belonging. However, the existing literature demonstrates a considerable variety in how co-creation is conceptualized and enacted. This review systematizes this knowledge and examines factors that may encourage or discourse co-creation activities in higher education. Based on systematic searches in the data bases Scopus, Web of Science and Eric, we identified 180 articles that fit our inclusion criteria. We examine how co-creation is conceptualized and operationalized, the advantages and challenges associated with co-creation, and key recommendations for implementing co-creation activities in higher education. The analysis is currently ongoing, but preliminary findings suggest that co-creation activities can foster student engagement and agency and lead to higher retention rates and increased student performance. However, little research describes successful approaches for how best to implement such activities, and there are few theoretically based explanations on how and why such activities may be successful.

Preparing students for peer-led education and their outcomes: A systematic literature review
Keywords: Higher Education, Meta-analysis, Teaching Approaches, Teaching/Instructional Strategies
Presenting Author: Marieke Thurlings, Eindhoven University of Technology, Netherlands; **Co-Author:**Gerdienke Reijmers, Universiteit Utrecht, Netherlands; **Co-Author:**Karline Timmers, Universiteit van Amsterdam, Netherlands; **Co-Author:**Jan van der Veen, Eindhoven School of Education, Netherlands; **Co-Author:**Pieter de Bordes, Universiteit Utrecht, Netherlands

To prepare students to peer-lead education, they need to be trained. This systematic literature review aims to describe training programs for peer-leading students and evaluate outcomes for these students. It also aims to evaluate learning outcomes for students that participate in the peer-led education. Finally, it aims to evaluate beliefs of the teaching staff that is involved, on the training programs and the peer-led education. Based on an extensive search and eligibility criteria, 86 studies were included. Preliminary findings show that both groups of students are satisfied and have positive learning outcomes. Studies are mostly of descriptive nature. This calls for collaboration between educationalists, educational researchers, and those developing and evaluating training students for peer-led education.

A Systematic Review on Erroneous Examples
Keywords: Example-based Learning, Instructional Design, Learning Approaches, Meta-analysis
Presenting Author: Marc Rodemer, University of Duisburg-Essen, Germany; **Co-Author:**Sonja Dieterich, University of Duisburg-Essen, Germany; **Co-Author:**Stefan Rumann, University of Duisburg-Essen, Germany

Erroneous examples as a particular form of worked examples emphasize wrong answers or solution steps in instruction. We present a systematic literature review summarizing empirical evidence concerning the effectiveness of erroneous examples on learning. Overall, 25 out of 36 studies report positive effects on learning outcomes. While most studies appeared in mathematics or medicine, only few other domains are reported. Conditions for the effectiveness of erroneous examples are different prompts in the learning material or types of feedback that are influenced by prior knowledge and cognitive load. Our review calls for more systematic research on the educational conditions under which erroneous examples are beneficial for learning.

Correct or erroneous examples first? Effects of the order of different example types on learning
Keywords: Example-based Learning, Instructional Design, Misconceptions, Problem Solving
Presenting Author: Lukas Wesenberg, Chemnitz University of Technology, Institute for Media Research, Germany; **Co-Author:**Felix Krieglstein, Chemnitz University of Technology, Germany; **Co-Author:**Sebastian Jansen, Chemnitz University of Technology, Faculty of Humanities, Institute for Media Research, Germany; **Co-Author:**Günter Daniel Rey, Chemnitz University of Technology, Germany; **Co-Author:**Maik Beege, University of Education Freiburg, Germany; **Co-Author:**Sascha Schneider, University of Zurich, Institute of Education, Germany

Correct but also erroneous worked examples are both frequently used instructional methods to foster students' learning performance, especially in problem-solving. However, no study has yet examined how the order of these example types affects learning. While the expertise reversal effect would suggest presenting correct examples first, the productive failure approach hypothesizes the reversed order to be learning-facilitating. In addition, the congruency of subsequent exemplified problems was tested as a moderator. For example, with arithmetic tasks, congruent problems target exactly the same calculation while incongruent problems refer to different calculations. To test the (conflicting) hypotheses, 83 university students were assigned to one of the four conditions in a 2 (correct vs. erroneous example first) × 2 (same vs. different exemplified problems) between-subject design. Although no main or interaction effects were found regarding students' learning performance, mediational analysis offered support for the expertise reversal effect, as it indicated that there is an indirect effect of order via mental load on learning. Presenting correct examples first and erroneous examples second resulted in a lower mental load, which in turn was associated with better learning performance. These findings offer first insights into the question of how the presentation order of different example types impacts learning and provide practical recommendations for the design of educational media.

Students' navigation in an open-ended project addressing democracy and citizenship
Keywords: Citizenship Education, Inquiry Learning, Peer Interaction, Problem-based Learning
Presenting Author: Anniken Furberg, University of Oslo, Norway; **Co-Author:**Sigrid Ernstsen, Department of Teacher Education and School Research, University of Oslo, Norway; **Co-Author:**Kari Anne Rødnes, University of Oslo, Norway

In this study, we investigate how a class of upper secondary school students navigated in an open-ended project addressing democracy and citizenship. This setting involved a complex theme, self-organized inquiry, peer collaboration, making of products and the use of various sources with little scaffolding from teachers and disciplinary norms. We take a sociocultural approach to explore how the students made sense of the theme, how they regulated their work process and how they related to each other socially during their engagement. We analyse video recordings of all classroom interactions from the project, including an analytical focus on the products that the students made. Our results show that the students in their sensemaking looked up information and inspiration using the internet where they mainly relied on online encyclopedia sources and image-based social networks. To solve the assignment, they were concerned with distributing tasks, coping facts and images, and decorating their product contributions. Furthermore, the students related to each other by gathering in social groups where they negotiated and included each other's contributions and opinions. In addition, they made products that highlighted their class relations. We argue that the way the students navigated in the project is valuable, as they encountered opportunities to practice democratic principles. However, our study clarify the important role of the teacher in supporting students in their sensemaking, work processes and relational work as they engage in complex projects.

Effects of Prior Instruction and Feedback on Students' Learning
Keywords: Example-based Learning, Feedback, Instructional Design, Learning Strategies
Presenting Author: Salome Wagner, University of Tübingen, Germany; **Co-Author:**Leonie Sibley, University of Tübingen, Germany; **Co-Author:**David Weiler, University of Tübingen, Germany; **Co-Author:**Jan-Philipp Burde, University of Tübingen, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany

Instruction and feedback are powerful strategies to enhance learning. However, it is still unclear whether combining instruction and feedback aids learning. We conducted three online experiments (N_1 = 439, N_2 = 310, N_3 = 166) investigating potential interaction effects of prior instruction and feedback. In Experiment 1 and 2, we crossed two factors: prior instruction (direct vs. control) and feedback (yes vs. no). In Experiment 1, we replicated previous findings, as the combination of instruction and feedback did not lead to additive effects and the effectiveness of instruction was significantly reduced once feedback was provided. This interaction could be explained by the level of arousal, particularly for low-performers. In Experiment 2, we could not replicate this effect with more elaborative feedback. Instead, we found a differential pattern, that is a main effect of prior instruction on far transfer and a main effect of feedback on near transfer. In Experiment 3, we investigated whether the sequence (feedback à instruction vs. instruction à feedback) affected the findings. Results demonstrated that the sequence in which the strategies were provided did not matter. Together, our findings refute the belief that combining direct instruction and feedback provides additional support for learning.

Cooperative Learning in the classroom - A mixed methods study on the quality of implementation
Keywords: Cooperative/Collaborative Learning, In-service Teachers, Mixed-method Research, Teaching Approaches
Presenting Author: Vanessa A. Völlinger, Justus-Liebig-Universität Giessen, Germany; **Co-Author:**Katja Adl-Amini, TU Darmstadt, Germany; **Co-Author:**Agnes Eckart, Justus-Liebig-University Giessen, Germany

The positive effects of cooperative learning (CL) have been extensively documented. Thereby the question of how teachers implement CL methods is not trivial, as designing CL sequences places complex demands on teachers and the quality of implementation is supposed to be significantly related to the effectiveness of the methods. The present study used an explanatory mixed-methods design with sequential phases (quantitative-qualitative). An observation scale including indicators of the basic elements of CL as well as interviews and the analysis by thematical coding were used to analyse and explain the implementation of CL in 30 German classrooms. The quality of the observed CL lessons was rather low. Even the two most important elements of group goals and individual accountability, were only implemented in 17% of the lessons observed. Results of the qualitative analysis show a thematic pattern with differences between teachers with high and low implementation fidelity concerning the perception of the social learning and the responsibility for success of CL.

Solitary Practice and Band Rehearsals: Design and Strategy Use Regarding the Professional Level
Keywords: Cooperative/Collaborative Learning, Developmental Processes, Learning Strategies, Mixed-method Research
Presenting Author: Simon Schmidt, Universität Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany

Previous research on music practice mostly focused on individual practice. In particular, deliberate practice showed to be a reliable determinant of music performance. Much less is known about the importance of collective (deliberate) practice. A mixed method study is reported which addresses the interplay of individual and collective practice in a sample of N = 67 members of pop music bands. Both forms of practice and their relation were assessed with a questionnaire and with a semi-structured interview. Practice patterns of participants at two professional levels of musicians (semi-professionals, professionals) were investigated in order to trace differences with regard to the use of strategies and the appearance of deliberate practice in both practice contexts. Results indicate that professionals, compared to semi-professionals, invest more time in individual practice and work more goal-driven in collective practice. The use of individual and collective practice strategies does not clearly differ in terms of professional level. Individual and collective practice seem to be interrelated. In the discussion, the role of inter-individual relations in group processes is elaborated. Conclusions are drawn about the development of expert music performance in general.

Exploring the Enactment of Open-Schooling Projects and their Impact on Students' Self-Determination
Keywords: Communities of Learners and/or Practice, Qualitative Methods, Science Education, Self-determination

Open Schooling (OS) is a promising approach in fostering the interaction and collaboration among schools and external stakeholders and in facilitating students' learning through their active engagement in OS projects. This study aims at exploring how OS was employed by schools during an academic school year and whether students' engagement in OS projects impacted their self-determination. 40 schools, 80 teachers affiliated with these schools, and 330 students participated in this study. OS project reports that were created by each participating school and students' completed questionnaires served as the study's data, which were analyzed both qualitatively and quantitatively. Five pathways emerged from the analyses depicting the actions and emerged outputs associated with the school projects. The pathways differentiated in terms of either the sequence of actions and deriving outcomes followed during the planning phase of the projects or the presence/absence of stakeholders' contribution in specific actions/outputs. Only students whose project followed a specific pathway appeared to have developed their self-determination significantly. The findings can contribute towards improving the methodology of the European-funded project that the present study was conducted in the context of which, and for making informed recommendations for future relevant initiatives.

Fostering students' autonomous motivation with a societal impact project
Keywords: Cooperative/Collaborative Learning, Higher Education, Motivation, Self-determination
Presenting Author: Yuanyuan Zhu, Maastricht University, FHML, Dept. of Educational Research and Development, Netherlands; **Co-Author:**Diana Dolmans, Maastricht University, Netherlands; **Co-Author:**Rashmi Kusurkar, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Leo Koehler, Maastricht Uiversity, Faculty of Health, Medicine and Life Sciences, Netherlands; **Co-Author:**Latifa Abidi, Maastricht Uiversity, Faculty of Health, Medicine and Life Sciences, Netherlands; **Co-Author:**Hans Savelberg, Maastricht Uiversity, Faculty of Health, Medicine and Life Sciences, Netherlands

Background: Autonomous motivation (AM) is crucial for university students since it is positively related to higher academic performances[1], intention to continue studies[2], and improved well-being[3]. Self-determination theory poses that learning environments with characteristics that support basic psychological needs facilitate AM. We created a so-called societal impact project with basic psychological needs supportive elements such as freedom to choose projects, coach and group support, and creative presentations. This study investigated the effect of the project on students' AM for their study programmes and explored their experience in the project.Methods: Students voluntarily registered in either a control or an intervention group. Control-group students followed their regular programme, intervention-group students participated in an extracurricular societal impact project next to the regular programme. All students filled out a survey in the beginning and the end of the project, measuring their basic psychological needs, AM, enjoyment and usefulness of their study programme, and well-being. Focus groups were conducted with intervention-group students at the end of the project. Results: 1) Although there was no significant difference of students' scores of the variables between the two groups at the end, intervention-group students rated their study programme significantly more enjoyable, interesting, and valuable; 2) Students' AM and well-being were significantly lower as compared to the beginning of the project in both groups; 3) Intervention-group students

linked the project experience with the basic psychological needs and described it helpful to see the value of their study and showed willingness to continue the project. Key words: Motivation, Self-determination, Curriculum development

Perfectionism and Resilience: The role of Gender
Keywords: Attitudes and Beliefs, Emotion and Affect, Gender Issues, Resilience
Presenting Author: Athina Voulgari, Aristotle University of Thessaloniki, Greece; **Co-Author:**Susana Panteliadou, Aristotle University of Thessaloniki, Greece

Perfectionism is a multidimensional concept that has been examined as a personality trait and more recently in the context of social interaction. Perfectionism as a disposition consists of constant striving for perfection (which shows ambivalent relationships with maladjustment and in some cases can be adaptive) and constant concerns with mistakes and doubts about actions (which is maladaptive). Perfectionistic self-presentation is steadily related with maladjustment. Perfectionism as a personality trait and resilience have been co-examined in college students, showing that resilience can minimize the negative consequences of perfectionism on mental health dimensions and adjustment. Few studies have examined the relationships between the two constructs (perfectionism and resilience) and their dimensions in adolescent population. Moreover, no study examined possible relationships between perfectionistic self-presentation and resilience. The current study examines the relationship between perfectionism and resilience in adolescents. 119 students (11-15 years old) from schools of Thessaloniki completed questionnaires regarding perfectionism as a disposition, perfectionistic self-presentation and resilience. Perfectionism as a personality trait predicted perfectionistic self-presentation, as hypothesized. Significant gender differences where observed, the predictive value was far more powerful for girls than for boys. Perfectionism as a disposition predicted to a greater extent than perfectionistic self-presentation resilience, mostly the ability for emotional regulation. Gender differences were again observed. Boys and girls had similar scores regarding perfectionism, but boys had higher regarding resilience. Moreover, perfectionistic self-promotion predicted negatively resilience for girls, not for boys. The findings are discussed in the context of understanding challenges faced by adolescents nowadays, taking gender into account.

Primary-school students' motivational profiles and their connections with gender and achievement
Keywords: Achievement, Developmental Processes, Motivation, Primary Education
Presenting Author: Anna Rawlings, University of Jyväskylä, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland

The present study aimed to identify among Finnish primary-school students (N = 1995) motivational profiles of task-avoidant and task-focused behaviours, and examine over three years their stability, development, and relationships with gender and arithmetic achievement. Students completed self-report questionnaires mapping their task-avoidance, challenge-enjoyment, competence-displaying, and fear of failure in the 2^{nd}, 3^{rd}, and 4^{th} grades. Time-constrained arithmetic tests administered each year were used as an indicator of achievement. Two-step cluster analysis was used to identify motivational-response profiles for each time point. Profile stability and change were examined with configural frequency analysis, the relationship between profile membership and gender with cross-tabulations, and the effects of profile membership on test achievement with one-way ANOVAs. Four motivational-response profiles were identified: *Adjusted* (high challenge-enjoyment, low task-avoidance, competence-displaying, and fear of failure); *Disinterested* (low challenge-enjoyment, high task-avoidance); *Worried* (high fear of failure, decreasing challenge-enjoyment, increasing task-avoidance); and *Competitive* (high competence-displaying, low levels of other variables). Regarding stability, 33.3% of participants remained in the same profile throughout, and a further 8.3% moved to another profile after t1, then remaining there for t2 and t3. Girls were over- and boys underrepresented in the Worried profile, and boys were over- and girls underrepresented in the Competitive profile. Overall, Adjusted students achieved better in the arithmetic test than others, and Competitive students better than Worried and Indifferent students. The findings suggest that an understanding of different motivational-response profiles and their dynamics, antecedents, and outcomes may be important for providing students with support suited to their individual needs.

How Aware Are Teachers Towards Math-gender Stereotype Reinforcing Behavior? A Video Experiment
Keywords: Attitudes and Beliefs, Gender Issues, In-service Teachers, Quantitative Methods
Presenting Author: Anna-Sophia Dersch, Justus-Liebig-Universität Gießen, Germany; **Co-Author:**Anke Heyder, Ruhr-University Bochum, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany

Implicit and explicit stereotypes of girls having inherently lower math abilities remain prevalent among society and also teachers as powerful socializers. Such beliefs negatively influence female representation in math. A majority of female students report math-gender stereotypes – also expressed by teachers. Here, we researched teachers' awareness towards teacher behavior that reinforces math-gender stereotypes (*math-gender stereotype reinforcing behavior;* MGSRB). We staged and filmed four math lesson videos with a model teacher expressing implicit to explicit MGSRB. In an online experiment, we randomly assigned 289 participating teachers to a *male* or *female* model teacher expressing MGSRB and instructed them to evaluate their teaching behavior. Very few teachers were aware towards implicit MGSRB, most were aware towards explicit MGSRB. Teachers were more aware towards the male model teachers' MGSRB than towards the female model teacher's MGSRB, $F(1, 272) = 23.06$ $p < .001$, $\eta^2 = .078$. Model-observer gender-similarity improved awareness, $F(1,272) = 4.97$, $p = .027$, $\eta^2 = .018$. Awareness was weakly correlated with explicit math-gender stereotypes. The findings call for teacher trainings improving teachers' awareness towards MGSRB.

Why do they pursue a major in math and science?: Female preservice teachers' perspective
Keywords: Gender Issues, Pre-service Teachers, Qualitative Methods, Science and STEM
Presenting Author: Gamze İnan, Boğaziçi University, Faculty of Education, Turkiye; **Co-Author:**İrfan Erdoğan, Bogazici University, Turkiye

To better understand gender disparity in education and promote equal representation of females in mathematics and science careers, it would be helpful to investigate how women who have already chosen a teaching major in these fields perceive their own earlier school years. That is, examining how they made their choices, how their choices were influenced by gender stereotypes in these fields, and how their views would affect their future students' career choices deserve attention. In this qualitative study, we examined the experiences of female preservice teachers from the fields of mathematics and science, focused to understand how they chose their major, and how they perceived the role of gender in education in these fields. In-depth semi-structured interviews lasting approximately 45 minutes were conducted, transcribed verbatim, and thematically analyzed with qualitative analysis software. The study showed that female preservice teachers choose careers based on their earlier experiences in math and science classrooms.

Inclusive school cultures and digital school development processes in Austria in times of COVID-19.
Keywords: Digital Literacy and Learning, Mixed-method Research, Pandemic, Primary Education
Presenting Author: Ricarda Derler, University of Graz, Austria; **Presenting Author:**Melina Tinnacher, University of Graz, Austria; **Co-Author:**Heike Wendt, University of Graz, Austria

The COVID-19 pandemic left autonomous schools in Austria to respond individually to common challenges. The In-DIG-developments project (University of Graz, Austria) investigated the impact and changes caused by COVID-19 in primary and secondary schools in Styria (Austria) with a particular focus on inclusive and digital educational settings. The study was conducted in a mixed methods design with a quantitative survey for students, teachers, principals and parents, followed by interviews. This contribution focuses on pandemic related school development and therefore surveys of primary school principals (n=18) and interviews with principals of small schools (n=8) have been taken into account. Results show that all primary schools in Styria were provided differently with personal and digital resources. A multivariate regression showed that primary schools without inclusion classes advanced significantly more in the area of digitization compared to schools with inclusion classes or small schools. Negative effects on student well-being and subject learning were significantly less of a concern for principals of small schools than for principals of regular primary schools. Small schools were significantly more likely to provide services for students with special needs or in need of support and paid more attention to educational equity in distance learning. The contribution of this study is to identify which indicators support a digitization process in inclusive school culture in Austria's primary schools on different levels of school development.

Differential Effects of COVID-19 School Closures on Students' Achievement
Keywords: Achievement, Quantitative Methods, School Effectiveness, Secondary Education
Presenting Author: Tim Fütterer, University of Tübingen, Germany; **Co-Author:**Tony Tan, University of Oslo, Norway; **Co-Author:**Rolf Vegar Olsen, University of Oslo, Norway; **Co-Author:**Astrid Marie Jorde Sandsør, University of Oslo, Norway; **Co-Author:**Sigrid Blömeke, University of Oslo, Norway

School closures resultant from the COVID-19 pandemic represented a sudden and unexpected disruption of students' learning (Thorn & Vincent-Lancrin, 2021). Findings from previous studies suggest that school closures may have had a negative effect on student achievement, especially for students with low socioeconomic status (SES; Hammerstein et al., 2021). Although these findings appeared robust as many studies examined large samples and employed methods enabling causal inferences (e.g., difference-in-difference [DiD]; Engzell et al., 2021), many studies contained weaknesses in their underlying data. For instance, convenience samples were used (e.g., Clark et al., 2021), data were not representative (e.g., Kuhfeld et al., 2020), or data were obtained from survey methods such as web-based surveys result in distorted samples and/or low response rates (e.g., van der Velde et al., 2021). Moreover, studies were limited to a selected number of countries and detailed insights into differential effects are scarce (e.g., only self-reported proxies of students' socioeconomic status [SES], lack of information about student's migration background). We gain insight into such differential effects of COVID-19 school closures on students' reading and math learning progression by using longitudinal data of more than *N*=369.000 Year 8 and 9 Norwegian students. Preliminary findings fromDiD analyses indicate that differences of students' learning progression during COVID-19 to previous cohorts are negligible. Students with higher SES and students who do have an immigrant status were less affected than students with lower SES or a nonimmigrant status (0.11

Educational interventions for improving literacy to Greek primary school students during COVID-19
Keywords: At-risk Students, Pandemic, Primary Education, Writing/Literacy
Presenting Author: Styliani Tsesmeli, University of Patras, Department of Educational Studies and Social Work, Greece; **Co-Author:**Ioanna Skarmoutsou, University of Patras, Department of Educational Studies and Social Work, Greece

AbstractThe aim of the study was to assess a scientifically based educational intervention of literacy designed to support the inclusion of children with literacy difficulties (i.e., poor readers/spellers). The study was implemented in regular primary school classes in Greece before and during the COVID-19 pandemic. Participants were 72 students following third and fourth grade of two primary schools, who were divided into two intervention and two control groups. All students were assessed via standardized and non-standardized tests of intelligence, literacy and language tasks before the pandemic. The intervention took place via e-learning in the school classroom of the two experimental groups and included a pre-test, an educational program and a post-test. The experimental material comprised of complex words which pose particular difficulties to children in terms of spelling and meaning and their improvement assists considerably their vocabulary and reading comprehension. The results showed that the systematic exercise of the word structure increased significantly students' spelling and semantic performance which is essential for their subsequent academic progress. These findings underline the importance and the feasibility of implementing scientifically based educational interventions in inclusive education during COVID-19 pandemic. Theoretical and practical issues concerning the implementation of hybrid models of educational interventions and the transition to online learning are also discussed.

"Silent voices" in COVID-19: Students' experiences of wellbeing, learning, social relationships
Keywords: Anxiety and Stress, At-risk Students, Pandemic, Social Interaction
Presenting Author: Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Venla Panula, University of Jyväskylä, Finland; **Co-Author:**Noona Kiuru, University of Jyväskylä, Finland; **Co-Author:**Sanni Pöysä, University of Jyväskylä, Finland; **Co-Author:**Niina Junttila, University of Turku, Finland; **Co-Author:**Matilda Sorkkila, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

The present study examined students' experiences of well-being, learning, and social relationships during the COVID-19 pandemic. The data were collected via online questionnaires from 443 students (Mage = 17 years) living in Finland in spring 2022. The questionnaires included structured and open-ended questions. The cluster analysis was conducted, and six clusters were found: 1) students with increased well-being and eased learning (5%); 2) students with no big changes in well-being, learning, and experiences of loneliness (30%); 3) students with decreased well-being, increased loneliness, and more difficulties in learning (42%); 4) students with decreased well-being and more difficulties experienced in learning, but no big change in loneliness (13%); 5) students with decreased well-being and increased loneliness but no big change in learning (7%), and 6) students with decreased loneliness (3%). The findings indicated diversity in ways how students experienced the COVID-19 pandemic and related distance learning. The further analyses were conducted to examine the extent to which the clusters would differ with respect to students' reports of background factors, mood, loneliness, study burnout, and resilience. In addition, students' answers to open-ended questions were analyzed in each cluster. The findings provided important knowledge concerning how students have experienced the COVID-19 pandemic and related distance learning. These experiences are important to consider in any attempts to renew education.

How long does it take pupils to acquire Proficiency in English?
Keywords: Bilingual Education, Educational Policy, L1/Standard Language Acquisition, Migrant / Refugee and Minority students
Presenting Author: Steve Strand, University of Oxford, United Kingdom; **Co-Author:**Ariel Lindorff, University of Oxford, United Kingdom

This paper asks a central question for educators and policymakers: how long does it take for pupils new to English to acquire proficiency in English? This study reports on 5,453 EAL pupils who entered Reception class at age 4/5 in Wales between 2009 and 2011. We tracked these pupils over their subsequent six years in primary school (through Y1 to Y6). Every January the Proficiency in English (PIE) of the pupils was recorded by their teachers on a five-point scale, ranging from A (New to English) through to E (Fluent). We asked how long does it take for a majority (at least 50%) of pupils to make any specified transition? For pupils who entered Reception at A (New to English) over half (59%) had transitioned to B (Early Acquisition) by Y2,and over half (51%) had transitioned to C (Developing Competence) by Y4. However only one-third (31%) had transitioned to D/E (Competent/Fluent) by the end of Y6. Overall, by the end of Y6, nearly all (96%) transitioned to B (Early Acquisition), and over three-quarters (78%) transitioned to C (Developing Competence) but only around one-third (31%) transitioned to D/E (Competent/Fluent). This indicates that the majority of pupils starting Reception class New to English took more than six years to be rated as Competent/Fluent. This has significant implications for school funding in England, which provides targeted funding to EAL pupils for a three-year period after they join school, less than half the minimum suggested by our data for gaining academic proficiency.

Effects of feedback on writing: Differences between students with and without migration backgrounds
Keywords: Feedback, Migrant / Refugee and Minority students, Secondary Education, Writing/Literacy
Presenting Author: Nora Müller, Westfälische Wilhelms-Universität Münster, Germany; **Co-Author:**Vera Busse, Westfälische Wilhelms-Universität Münster, Germany; **Co-Author:**Till Utesch, Westfälische Wilhelms-Universität Münster, Germany

Although process-oriented writing instruction with feedback can support multilingual writers in particular, little is known about these practices and their influence on text quality. Therefore, this paper provides insights into writing and feedback practices and analyzes how these practices can account for writing differences, considering migration-related multilingualism and other background characteristics. Data from our sample of middle and lower-track secondary school students in Year 9 (N = 208; n = 106 students had a migration background) suggest that most of these students write texts in German class weekly; but they receive text feedback less often. Regarding frequency and quality of feedback, we found no differences in perception between students' groups. Results from regression analyses show that perceived general feedback quality (based on effective feedback criteria) and *feed forward* (i.e., specific advice on text development) predict a significant amount of the variance in text quality, while feedback frequency does not improve the model. Our findings underline the relevance of feedback for text quality, albeit it can be discussed to what extent feedback quality is more important than feedback quantity. Additional simple slope analyses show that students with migration backgrounds do not benefit from *feed forward*, when controlling for other background characteristics. While students with migration backgrounds particularly rely on feedback to support their writing, the *feed forward* presumably needs to be better adapted to their needs to be effective.

Hoping for linguistic diversity in academic writing
Keywords: Higher Education, Migrant / Refugee and Minority students, Multicultural Education, Writing/Literacy
Presenting Author: Ana Costa, University of Lisbon, Linguistics Center and Polytechnic Institute of Setúbal, Portugal

Migration within Portuguese-speaking countries in the last decades brought to the Portuguese higher education system students speaking and writing diverse intra-linguistic varieties, such as Brazilian Portuguese (BP) or different varieties from African countries (Angola, Cape Verde, or Guinea). Students from non-European regions perceive their own linguistic variety as a source of failure in writing and assessment contexts. The main goal of this study is to describe the linguistic and academic writing profile of 1st-year students from Portuguese-speaking countries in undergraduate courses at a higher education institution in Portugal. A linguistic and discourse analysis of writing essays provides evidence-based knowledge of students' writing strengths and weaknesses. The results highlight that problems affecting academic writing are independent of linguistic variety. Since it is not linguistic variation the main cause for inadequacy in academic essays, we hope these results will help teachers become more open to students' diversity in their scientific communication and empower all students with linguistic self-confidence.

Literacy and literacy didactics in the context of migration: A systematic literature review
Keywords: Bilingual Education, Migrant / Refugee and Minority students, Multicultural Education, Writing/Literacy
Presenting Author: Olga Kostoula, Private University of Education, Diocese Linz, Austria; **Co-Author:**Nicole Kronberger, Institute of Education and Psychology, Austria

Literacy and literacy didactics in the context of migration: A systematic literature review Migration movements increase globally and include notably forced migrants many of them children at school age. In educational contexts, migration entails cultural, emotional and language related disruptions that impact on learning behaviour. It is usually in connection with unvoluntary migration that the issue of emergent bilingualism gains attention as concepts and methods to teach linguistically divers and educationally heterogeneous classes lag behind contemporary demographic and educational developments. An issue of particular importance in this regard is the development of literacy. Literacy involves both linguistic and cognitive skills and represents a key construct for educational practice when learners bring with them experiences from different education systems or disruptions of their educational trajectories.The linguistic components of literacy are most obvious because they pertain to language understanding and speech production skills. Less is known about the cognitive components and their development in bi- or multilingual environments. The literature appears scattered across disciplines and this holds more true with regard to the question of how literacy relates to multilingualism. As a result, syntheses connecting the theoretical foundations of the concept to educational practice are scarce. The paper addresses these gaps following three steps: First, it reports the results of a systematic literature review on the concept of literacy in connection with migration and emergent bilingualism. Second, it categorises findings according to their cognitive and educational implications with particular consideration of multilingualism and third, it derives recommendations for further research.

How does seductive details combine with animated pictures influence students' learning?
Keywords: Comprehension of Text and Graphics, Educational Technologies, Instructional Design, Multimedia Learning
Presenting Author: Tiphaine Colliot, CeRCA UMR7295 Université de poitiers, France; **Co-Author:**Jean-Michel Boucheix, University of Dijon, LEAD-CNRS, France

The purpose of this study was to test the effects of static pictures versus animated pictures on students' performance in a paper-folding task in a naturalistic environment. This study also assessed the effects of seductive details on students' achievement. Seventy-two 2^{nd}-3^{rd} grade children participated in the present study. Results showed that animated pictures significantly improved students' performance and reduced the time spent to perform the task. No difference was obtained regarding students' perception of the easiness of the task. Moreover, results demonstrated no effects of seductive details on students' achievement. Seductive details even significantly decreased students' interest in the task.

Mapping processing and comprehension in learning from video combining trace and recall data.
Keywords: Comprehension of Text and Graphics, Computer-assisted Learning, Multimedia Learning, Video-based Learning
Presenting Author: Marijn Gijsen, University of Antwerp, Belgium; **Co-Author:**David Gijbels, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium

Up until now, empirical studies investigating learning from video have mainly compared the processing that occurs to the processing of (digital) texts. Less studies have focussed on how students differ in their processing of videos and how these differences relate to differences in learning outcomes, with most of this research relying on the use of self-report instruments such as retrospective annotations. This study aims at extending the current research on learning from video by combining quantitative measures in the form of trace-data with qualitative data from a cued-retrospective recall to map differences in cognitive levels of processing while learning from video and link those differences to learning outcomes in the form of a multi-layered post-test. Thirty-seven higher education students participated in our study. Results suggest that students using deeper levels of processing spent more time in sequences indicative of key information and processed both details and key information in a deeper way. Students in the surface condition spent more time in sequences containing details and factual knowledge while also repeating these sequences more. Students using deeper levels of processing scored higher on the amount and coherence of idea-units they recalled from the video. In conclusion, the use of multiple data sources and multi-layered post-tests is a crucial step in the further development of research on learning from video and more importantly our understanding of how to adequately measure students' cognitive processing in learning from videos.

Effects of Design Decisions of Educational Video Games on Learning and Students' Thoughts
Keywords: Comprehension of Text and Graphics, Game-based Learning, Multimedia Learning, Video-based Learning
Presenting Author: Ercan TOP, Bolu Abant Izzet Baysal University, Turkiye; **Co-Author:**Emre GÜNEL, Abant İzzet Baysal University, Turkiye

This study aimed to determine the students' opinions about the methods and techniques applied in developing an educational game for vocabulary teaching. Therefore, a mixed methodology was chosen to investigate all factors thoroughly. The researchers developed the game using the RPG Maker engine. The game's familiar and exciting environment map was based on a small town where the students live. Also, the characters were based on the students' real-life teachers. In addition, a series of puzzles, quests, and minigames were created to make the game fun and challenging. “Popping name tags” were used to teach words to create incidental vocabulary learning. Ninety-six students studying at a public secondary school comprise the study's sample. The students were given the achievement test developed by the researcher, and 18 were interviewed. The experimental group's post-test success and the experimental group's retention were higher than the control group's. The interviews of the students support the findings and show the success of designing the game according to the students' real life.

A test of a cinematographic principle in learning a first aid procedure from video
Keywords: Comprehension of Text and Graphics, Eye Tracking, Instructional Design, Multimedia Learning
Presenting Author: Jean-Michel Boucheix, University of Dijon, LEAD-CNRS, France; **Co-Author:**Martin Merkt, Deutsches Institut für Erwachsenenbildung, Germany; **Co-Author:**Julie Perrin, University of Dijon, LEAD-CNRS, France; **Co-Author:**Joanna Duval, University of Dijon, LEAD-CNRS, France; **Co-Author:**Alexandre Benoist, Biomedical Engineering and Innovation Direction, CESITECH, William Morey Hospital, Chalon sur Saone, France; **Co-Author:**Stéphane Argon, University of Dijon, LEAD-CNRS, France; **Co-Author:**Stéphanie Javelier, Anesthesia Department, CESITECH, William Morey Hospital, Chalon sur Saone, France

The design of educational videos according to cinematographic principles may affect their potential effectiveness for learning. In previous experiments, we studied the effect of film continuity in learning a medical hand procedure in nurse training. We tested the effect of violating the 180° rule which states that the camera should stay on the same side of an imaginary 180° axis when an ongoing event is filmed. In a pre-post experiment, nurses' students were assigned to two groups that learnt a Cardio-Pulmonary Resuscitation (CPR) procedure from a video with continuous (respecting the 180° rule) versus discontinuous (violating 180° rule) camera viewpoint changes. Results showed that learners with lower prior knowledge were harmed by discontinuity, compared to continuity. Because nurse participants generally had high prior knowledge, the new present study has two goals (i) replicate the experiment and confirm the previous results with more novice learners (ii) explore the underlying cognitive processes using an eye tracking investigation during the learning phase. Fifty-six University students (not in health domain) were assigned to two groups that learnt the same CPR procedure from a video with continuous versus discontinuous camera viewpoint changes, and were eye tracked. Learners were more disoriented in the discontinuous condition than in the continuous condition, indicating that violating the 180° rule tasked the participants with mapping the spatial references in the adjacent shots. However, these additional task demands did not negatively affect learning outcomes.

Entrepreneurship in school education: policy directions and pedagogical considerations
Keywords: Competencies, Primary Education, Secondary Education, Teaching/Instructional Strategies
Presenting Author: Sofia Boutsiouki, University of Macedonia, Greece; **Co-Author:**Nikolaos Mouratoglou, European Schoolnet, Belgium

Entrepreneurship is as an important activity for modern countries due to its multifaceted economic and social impact. For this reason, it is promoted as an attractive career option for young people, while countries are expected to focus on introducing entrepreneurship in their educational systems. In this context, the current presentation discusses the development of the EU policy regarding the inclusion of entrepreneurship education in the European policy agenda and the creation of an entrepreneurship education ecosystem. It also analyses the EU efforts to encourage national education systems to foster entrepreneurial learning with a special focus on initiatives fostering entrepreneurship in school education. Moreover, the presentation discusses the findings of a survey that was conducted by European Schoolnet aiming at collecting school staff's views on innovation and entrepreneurship competences. The survey was open on School Education Gateway from January until March 2022 and attracted 121 respondents from 33 countries, 79% of whom were teachers or school leaders. The results suggest that both competences are integrated in the school curricula through cross-curricular approaches and other school activities, while approximately eight out of ten respondents indicate that both competences should be given more emphasis at school level. Additionally, participants report their views concerning the supportive resources (e.g., teaching materials, networks, professional development) and teaching practices (e.g., simulations, outdoor learning) which seem to be effective in teaching innovation and entrepreneurship competences.

A Delphi Study at secondary schools to identify entrepreneurship education norms
Keywords: Competencies, Curriculum Development, Economics of Education, Secondary Education
Presenting Author: Sultan Goksen-Olgun, Maastricht University School of Business and Economics, Netherlands; **Co-Author:**Wim Groot, Maastricht University, Netherlands; **Co-Author:**Ingrid Wakkee, Amsterdam University of Applied Science, Netherlands; **Co-Author:**Richard Martina, Amsterdam University of Applied Science, Netherlands

According to the European policy agenda, promoting entrepreneurship is an essential societal task that cannot be started early enough. Education plays an important role here, as entrepreneurship can be taught. This has led to tremendous growth in the provision of entrepreneurship in various levels of education, including secondary education, in recent decades. Despite the growth in entrepreneurship offerings, little attention has been paid in the literature to educational programs and widely accepted standards in entrepreneurship targeting high school students. The primary purpose of this study is to examine what entrepreneurship in secondary education, according to teachers, should include in terms of knowledge, attitudes, skills, and reflections. To this end, a Delphi survey was conducted among stakeholders in entrepreneurship education in the Netherlands. The results were used for all characteristics to compile a top three deemed necessary when providing entrepreneurship in secondary education. Based on these results, these competencies were cataloged into frameworks in the entrepreneurship literature.

Roles in teacher teams within higher education: a review
Keywords: Educational Policy, Higher Education, Synergies between Learning / Teaching and Research, Teacher Professional Development
Presenting Author: Belinda Ommering, Utrecht University of Applied Sciences, Netherlands; **Presenting Author:**mieke koeslag-kreunen, Hogeschool Utrecht (University of Applied Sciences Utrecht), Netherlands

High-quality higher education requires versatility of teaching staff. Existing literature refers to long lists of tasks, but these overviews assume teachers to be individual all-rounders. It also ignores the fact that working contexts of teachers are diverse. Such traditional perspectives do not align with today's urge for teachers to be flexible and adaptable and do not support sharing responsibilities in teacher teams. This scoping review identifies teacher roles and their combinations, while also considering the different contexts in which teachers might be working. Analyses on the detected empirical and peer reviewed studies present a range of teacher roles (e.g., instructor, leader, researcher, developer) that appear in various contexts (e.g., universities, practices, online and class room settings). Combinations of roles and contexts were also found (e.g, sharing leadership roles, blending online and class room teaching). Our worldwide and multidisciplinary scoping review provides an innovative perspective compared to existing overviews that focus on individual practice, single roles, fragmented tasks and neglect combinations or contexts. Moreover, it presents modern role descriptions that can promote agility, professional development and collaboration in teams. These contemporary role descriptions reflect the various professional aspects of working in higher education and may even potentially attract, retain, recognize and value new and diverse educational talent.

Double First-Class Initiative : An application of performance-based funding at a Chinese university
Keywords: Educational Policy, Higher Education, Qualitative Methods, Teacher Effectiveness
Presenting Author: Iat Fei Lam, The Chinese University of Hong Kong (CUHK), Hong Kong; **Co-Author:**Manhong Lai, The Chinese University of Hong Kong, Hong Kong

With the ascendency of New Public Management, performance-based funding systems (PBFS) have become widespread in many countries. The intended and unintended consequences of PBFS have been widely discussed in previous studies. This study uses qualitative methods to investigate the implementation of internal PBFS and its impact on a university in China. We conducted in-depth interviews at a sample university which is a Double First-Class university with serval First-Class disciplines. Twelve academics in three different situation disciplines were interviewed. First, the structure of the internal PBFS is almost the same as the directive of the Double First-Class Initiative, and the motivation for implementing the internal PBFS is accountability and efficiency instead of excellence. Second, academics must change their publishing strategy and sacrifice their time on teaching to achieve better performance in the evaluation. Third, most academics feel burnout and loneliness due to the enormous pressure of publishing.

How did School Quality Develop During COVID-19 – Analyses on Educational Inequality
Keywords: Pandemic, Quantitative Methods, School Effectiveness, Teaching/Instructional Strategies
Presenting Author: Christoph Helm, Johannes Kepler University Linz, Austria; **Co-Author:**Stephan Gerhard Huber, PH Zug, Switzerland

Since the sudden occurrence of the pandemic caught most schools unprepared, it is reasonable to assume that the switch to distance learning was accompanied by losses in school quality as well as instructional quality. Empirical research has not yet examined whether and to what extent school quality suffered because of the school closures, and whether socially distressed schools suffered greater declines in quality. In the present study, we analyze these questions based on teacher reports from a trinational study in Germany, Austria, and Switzerland (N=1.241). Our findings show that socially disadvantaged schools did suffer more form the pandemic, i.e., the had higher losses in educational quality.

The Writing-Reading Nexus: Authors and Their Audiences
Keywords: Communities of Learners and/or Practice, Comprehension of Text and Graphics, Social Interaction, Writing/Literacy
Presenting Author: Nancy Nelson, Louisiana State University, United States; **Co-Author:**Kim Skinner, Louisiana State University,, United States; **Co-Author:**Estanislado Barrera, Louisiana State University, United States

Writing-reading relations, which are at the core of written communication, deserve their central role in writing research. This paper reviews research into four major ways in which writing and reading are connected in academic writing. For the "constructing meaning connection," the focus is on cognitive research into reading and writing, which since the 1970s has examined the constructive nature of both processes and has countered portrayal of reading as the inverse of writing, or vice versa. For the "intertextual connection," attention is on studies into transformations that are made when writers compose their own texts from one other source text, as in summarizing, translating, or critiquing, as well as when they perform discourse synthesis from multiple extant texts by organizing, selecting, and connecting content. For the "knowledge resources connection," emphasis is on relations between reading and writing abilities and on the application of various kinds of knowledge. And, for the "social and cultural connection," the review addresses research into audience influences on writing, citations of other authors, collaborative writing, response to writing, and author-oriented reading. The international bodies of work that are summarized, which come from different disciplines and are associated with different traditions and epistemologies, can be viewed as an ongoing collaborative quest to understand these four kinds of relations that are so important in communication through written language.

Measuring discovery through writing
Keywords: Cognitive Skills and Processes, Conceptual Change, Knowledge Construction, Writing/Literacy
Presenting Author: David Galbraith, University of Southampton, United Kingdom; **Co-Author:**Amy Peters, University of Southampton, United Kingdom; **Co-Author:**Sophie Hall, University of Southampton, United Kingdom; **Co-Author:**Veerle Baaijen, CLCG University of Groningen, Netherlands

Despite the general agreement that writing leads to the development of understanding, there is scant research assessing how writing affects writers' subjective state of understanding. In this presentation, we describe our attempt to develop a multi-item scale capable of distinguishing between subjective understanding and organization and we assess its psychometric properties. Exploratory factor analysis of 165 students' ratings of 12 knowledge statements about one of 6

randomly selected topics indicated that a two-factor solution fitted the ratings best. We labelled these factors *Understanding* and *Organisation*. Results of two studies recently carried out using this scale show that: (i) Subjective ratings on these two factors correlate significantly with objective measures of students' knowledge; (ii) Consistent with previous research on illusion of explanatory depth (Keil, 2006), participants show *decreases* in their knowledge ratings after being asked to summarise a text; (iii) Consistent with previous research into more expository writing (Galbraith & Baaijen, 2018), participants show *increases* in subjective knowledge after writing argumentative texts, though this increase is only statistically significant for the organisation measure. We conclude that the new scale is a reliable method for distinguishing between different components of writers' subjective knowledge and argue that this provides a more sensitive measure of subjective knowledge than the single-item rating scales used in previous research.

Research Writing as a Tool for Doctoral Students' and Early Career Researchers' Development
Keywords: Doctoral Education, Higher Education, Knowledge Construction, Writing/Literacy
Presenting Author: Montserrat Castelló, Ramon Llull University, Spain

Writing is crucial to research and also to researchers' careers. In their doctoral programs, students preparing to be researchers are already pressured to write abundantly. However, many report frequent struggles in writing, which vary in their nature as well as causes and consequences. Students typically receive little support for dealing with these struggles with writing, which, if sustained, can undermine their well-being and interest. Difficulties with writing have affected doctoral students' motivation to persist and have been associated with drop-out risk. This paper reviews the growing number of investigations into the challenges that academic writing presents to individuals preparing to be researchers and also to individuals who are new to their careers as researchers in academia. It also reviews attempts to support graduate students' (and their supervisors') writing. We discuss writing processes and difficulties from a sociocultural perspective and provide effective resources and tools to promote novice researchers' writing development.

Investigating teacher learning? A scoping review on the Interconnected Model of Professional Growth
Keywords: In-service Teachers, Qualitative Methods, Quantitative Methods, Teacher Professional Development
Presenting Author: Elisa Calcagni, Friedrich Schiller Unitersity Jena, Germany; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Jan van Driel, The University of Melbourne, Australia; **Co-Author:**Hilary Hollingsworth, Australian Council for Educational Research (ACER), Australia

In this scoping review, we address the question of how teacher learning can be investigated and illustrated in a comprehensive way. For this, we refer to the Interconnected Model of Professional Growth (IMPG) by Clarke and Hollingsworth (2002), one of the most cited models in the field. The model emphasises the idiosyncratic way in which teachers' learning processes unfold. The review examines ways that the IMPG has been adopted or adapted in educational research since its initial publication and how it has informed the field to understand and investigate the complex nature of teacher learning. A scoping review employing citation tracking resulted in a final sample of 54 papers that made intensive use of the IMPG to study teacher learning. We found that, as intended, the IMPG is used as an interrogatory, analytic and design tool, in a rich variety of contexts, and in conjunction with different methodological and theoretical frameworks. Furthermore, three patterns of use in empirical research were identified, whereby papers varied with regards to whether and how they actually considered individual learning trajectories. The review identified how some central aspects of the IMPG were reinforced in the ways it was used in the studies examined, whereas other aspects were challenged. Ultimately, the review has provoked consideration of further ideas related to the model's potential use, specifically, to study teacher learning in group learning contexts and by individual teachers to examine and understand their own professional learning and growth.

Supporting & sharing practitioner learning on a global scale through locally-contextualised inquiry
Keywords: Communities of Learners and/or Practice, Digital Literacy and Learning, Inquiry Learning, Teacher Professional Development
Presenting Author: Alison Twiner, Hughes Hall, University of Cambridge, United Kingdom; **Presenting Author:**Sara Hennessy, University of Cambridge, United Kingdom; **Co-Author:**Patrick Carmichael, University of Cambridge, United Kingdom; **Co-Author:**Peter Dudley, University of Cambridge, United Kingdom; **Co-Author:**Ying Ji, University of Cambridge, United Kingdom

Practitioner inquiry is an established approach, and known to be a powerful factor when implemented as a supportive mechanism for professional learning and school improvement. The evidence base underpinning educational policy and practice, however, is largely informed by research conducted by those outside of practice - by academic researchers - with practitioner voices and expertise largely absent. Our work seeks to shift this balance. We will report on the development of a global community of practitioner-researchers and publication platform for educational-practice knowledge. We will outline our own research approach around this development – through design-based research – as well as the inquiry approaches utilised by practitioners submitting their work to the digital publication platform. Through case study exemplars, such as evidencing practitioners' local instantiations of research lesson study, we will illustrate the processes and outcomes of practitioner agency: how these make a difference for their own practice and for their students' learning. We share analysis across interview, focus group and survey data as well as practitioner reports submitted to the publication platform. Drawing across the data sources we evidence the potential benefits and widening ripples of such systematic inquiry and global, openly-accessible sharing - for practitioners, researchers, policymakers and learners - toward a goal of rigorous, practitioner-authored evidence influencing practice and policy.

The impact of Research Lesson Study on teacher learning patterns
Keywords: In-service Teachers, Inquiry Learning, Learning Strategies, Teacher Professional Development
Presenting Author: Maria Vrikki, University of Nicosia, Cyprus; **Co-Author:**Leonidas Kyriakides, University of Cyprus, Cyprus; **Co-Author:**Jan Vermunt, Eindhoven University of Technology, Netherlands; **Co-Author:**Chrissavgi Triantafillou, National and Kapodistrian University of Athens, Greece; **Co-Author:**Panayiotis Antoniou, University of Cyprus, Cyprus; **Co-Author:**Efi Paparistodemou, Cyprus Pedagogical Institute, Cyprus; **Co-Author:**Maria Anastasou, University of Cyprus, Cyprus

Although Lesson Study (LS) integrates many of the characteristics of effective professional development, empirical evidence of its association to teacher learning is still scarce. We aim to examine how teachers' participation in LS affects their own learning patterns, which refer to a set of learning activities, beliefs and motivations about teaching and learning. We also aim to examine how different types of support offered to LS groups in the form of an advisor in the subject matter and a facilitator of the LS process, can affect teachers' learning patterns. To examine these aims, we conducted a two-phase study in Cyprus and Greece that was part of a larger EU project. In Phase I, we aimed to validate the *Inventory of Teacher Learning*, which was translated into Greek and measures three different types of teacher learning patterns: meaning-oriented learning, application-oriented learning and problematic learning. Having administered the questionnaire to 253 secondary school teachers, we used confirmatory factor analysis and found that a three-factor model had a good fit to our data, despite a high correlation between meaning-oriented and application-oriented learning. Phase II concerns an intervention study with two experimental groups that conduct LS, but with different types of support, and a control group that was not introduced to LS. Regression analyses from Phase II will determine whether teachers' participation in LS has an effect on their learning and whether the type of support plays a role. The outcomes of the study have theoretical, methodological and educational significance.

Supporting Secondary Mathematics Coaches' Learning Through One-on-One Meta-coaching
Keywords: In-service Teachers, Mathematics/Numeracy, Mentoring and Coaching, Teacher Professional Development
Presenting Author: Hilda Borko, Stanford University, United States; **Co-Author:**Marsha Ing, University of California, United States; **Co-Author:**Michael Jarry-Shore, Boise State University, United States; **Co-Author:**Thomas Smith, Vanderbilt University, United States

“Responsive coaching” (Dozier, 2006) uses individual teachers’ needs to guide the coaching process. Similarly, responsive meta-coaching tailors support to individual coaches’ needs. This study explored a meta-coaching program in which a more experienced and accomplished coach supported coaches to become more effective in their work with teachers to improve their mathematical instructional practices and create more equitable learning experiences for all students. We use a case study methodology to examine the meta-coaching relationship between one meta-coach and one coach as that coach worked with four middle school mathematics teachers in a set of individual coaching cycles over a two-year period. Data include audio-recordings of interviews with the meta-coach and coach at the beginning and end of each year, field notes and artifacts from the lessons, student responses to surveys about their experience in the lesson, and audio-recordings of planning and reflection meetings. Preliminary findings suggest three major themes: the meta-coach tailored their work with the coach; the coach perceived their work with the meta-coach to be useful with all four teachers; and the meta-coach and coach found it useful to have multiple artifacts of practice, particularly for enabling conversations about equity. This research extends the literature on coaching by demonstrating that, like responsive coaching, responsive meta-coaching can be an effective way to support coaches in their work with teachers. It also suggests that the theoretical concepts used to describe the preparation of professional development facilitators (Prediger et al., 2019) are applicable to the preparation of coaches.

Fostering Robust, Ecologically-Valid and Sustainable Approaches to Self-Regulated Learning in Schools

Keywords: In-service Teachers, Lifelong Learning, Metacognition, Primary Education, Quantitative Methods, School Leadership, Self-regulated Learning and Behaviour, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Christian Brandmo, University of Oslo, Norway

Effects of in-service teacher training on professional competences in self-regulated learning
Keywords: Lifelong Learning, Quantitative Methods, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Carmen Nadja Hirt, University of Zurich, Switzerland; **Co-Author:**Tabea Daria Eberli, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Johannes Jud, University of Zurich, Switzerland; **Co-Author:**Amina Rosenthal, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Yves Karlen, University of Zurich, Switzerland

Developing teachers' professional competences in self-regulated learning (SRL) is essential for increasing SRL implementation in class. Previous evaluations of such teacher training focused mainly on the effects on teachers' promotion practices. Building on the integrative model of teachers' professional competences in SRL (Karlen et al., 2020), training should go beyond and thus focus on developing teachers' competences as self-regulated learners and agents of SRL. The present study analyzes the effects of multi-day teacher training in SRL on teachers' competences (1) as self-regulated learners and (2) as agents of SRL. The intervention study with a pre-post and control group design surveyed $N = 54$ teachers ($n_{EG} = 31$; $n_{CG} = 23$) with an average professional experience of 16.48 years ($SD = 10.13$). Teachers were 61.1% female and on average $M = 34.56$ years ($SD = 8.95$) old. Self-report and knowledge tests were used to assess teachers' own SRL competences, their competences as agents of SRL, and their SRL instructional practices. Mixed ANOVAs were used to examine possible interaction effects (time*group). Results indicate effects on teachers’ beliefs and some of their motivational competences as agents of SRL and self-regulated learners but not on their knowledge. A discussion on how teacher training in SRL must be designed to show the desired effects is needed. Initial further analyses show a benefit for teachers with lower level of knowledge at t1 regarding their PCK-SRL development. The results suggest that there is probably no "one size fits all" in the field of teacher training in SRL.

Relating Teacher Views of Self-Regulated Learning with Classroom Practices and Students’ SRL
Keywords: Metacognition, Self-regulated Learning and Behaviour, Teacher Professional Development, Teaching Approaches
Presenting Author: Nancy Perry, University of British Columbia, Canada; **Co-Author:**Marissa Hall, The University of British Columbia, Canada; **Co-Author:**Xinke Wan, University of British Columbia, Canada; **Co-Author:**Martin Dammert, The University of British Columbia, Canada; **Co-Author:**Hazel Ryan Sheehan, The University of British Columbia, Canada; **Co-Author:**Lynda Hutchinson, King's University College at the University of Western Ontario, Canada

Research indicates capacities for self-regulating learning (i.e., being metacognitive, motivated for learning, and strategic) are assets for *all* students (i.e., linked to achievement and other indicators of success in school). Recognizing this relationship, researchers are turning their attention to supporting teachers to support SRL in their classrooms. Attempts to achieve uniformity in implementing supports for SRL can prove frustrating because teachers come to projects with varying beliefs, amounts of interest, and expertise about SRL. Also, their response to SRL innovations likely depends how innovations “fit” with their teaching and learning context. Our participatory approach to research positions teachers as co-learners, *with* researchers, studying how to support SRL in classrooms. In this poster we present data from a year-long collaboration with 12 5^{th} grade teachers. We articulate differences in teachers’ beliefs and understandings about SRL and ask: (a) how are these differences reflected in the SRL promoting practices they employ in their classrooms; and (b) how do aspects of students’ self-reported SRL (affect, motivation, strategy use) relate to the contexts they are in? Our analyses point to four groups of teachers, differentiated on the basis of views about SRL, different patterns of SRL practices across these groups, and differences among students’ self-reported affect, motivation for learning and strategies used across these contexts. In general, findings offer insights about how to collaboratively build robust (ecologically valid and sustainable) SRL innovations with teachers in schools that are customized for their students.

Professionalizing teachers on SRL: School counselors’ perspectives on barriers and opportunities
Keywords: In-service Teachers, School Leadership, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Lies Backers, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

The implementation of self-regulated learning (SRL) in primary and secondary schools is complex and requires a sustainable long-term development of the complete school. To support school leaders and their team of teachers to implement SRL, a two-year school-wide professionalization program was designed in collaboration with an in-service teacher professionalization organization. School counselors working as in-service teacher trainers in this organization support the school leaders with the school-wide implementation. This study focuses on the perspective of the school counselors and more specifically on the opportunities, the challenges, and barriers they experience during professionalizing school teams on SRL implementation. Two-monthly focus group with the counselors were executed to gain more insight in their perspectives. Five focus groups with all school counselors already took place; five more are planned during the currently ongoing in-service teacher professionalization. Thematic analysis is used to analyze the qualitative data gathered during the focus groups. Preliminary results show that school counselors themselves hold misconceptions about SRL and lack confidence to work with SRL theory. Besides a lot of challenges, school counselors mentioned also opportunities. The presentation will present more detailed results as well as implications for practice and further research.

A multi-site video study exploring self-regulation strategies to foster 21st century skills
Keywords: Metacognition, Primary Education, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies
Presenting Author: Therese Hopfenbeck, University of Melbourne, Australia; **Co-Author:**Samantha-Kaye Johnston, The University of Oxford, United Kingdom;

Co-Author: Joshua McGrane, The University of Melbourne, United Kingdom; **Co-Author:**Juliet Scott-Barrett, University of Oxford, United Kingdom; **Co-Author:**Tracey Denton-Calabrese, University of Oxford, United Kingdom

Over the last four decades, teachers and researchers have increasingly focused upon how best to support students to become self-regulated learners, as self-regulation is viewed as a key skill in enhancing 21st century attributes such as creativity. Self-regulated learners are proactive, they set goals, they are good at managing their time, and use strategies which are adapted to the tasks they are supposed to solve. In a complex world of uncertainty, teaching self-regulation can be seen as equipping students with the ability to grow and learn *after* they leave school. The current study investigated how 22 primary school teachers facilitated students' development of self-regulation, aimed at facilitating student creativity, in nine countries, in 19 primary school classrooms. Video data (n = 46 videos) from each classroom were remotely collected during the pandemic in 2021. Teachers and students were interviewed about their experiences of self-regulation strategies within the classroom and how these related to the development of creativity skills. Through reflexive thematic analysis, three researchers analysed the videos of the classrooms and interviews, and categorised practices related to the use of self-regulation strategies to foster creativity. The findings demonstrated that teachers employed a range of self-regulatory strategies, including goal setting, planning and time management across the different classrooms. Importantly, teachers considered student's individual differences while implementing these strategies. Based on these findings, we discuss the importance of this study for supporting more responsive classroom practices as well facilitating more diverse and achievable classroom-based research across international borders.

A New Measure for Assessing Teacher Education Students' Peer Feedback Beliefs
Keywords: Attitudes and Beliefs, Feedback, Peer Interaction, Pre-service Teachers
Presenting Author: Marit Puusepp, University of Tartu, Estonia; **Co-Author:**Pihel Hunt, University of Tartu, Estonia; **Co-Author:**Gerli Silm, University of Tartu, Estonia

To date, there are few instruments available for the quantitative study of students' peer feedback beliefs and existing questionnaires cover some, but not all, of the relevant aspects found in literature. The aim of the study was to create a unified peer feedback beliefs questionnaire and validate it on a sample of pre-service teachers. Cognitive interviewing (n = 7) was used for the preliminary validation of the instrument. Confirmatory factor analysis (n = 196) was performed for further validation, resulting in a peer feedback beliefs model with six constructs: importance of peer feedback skills; quality of given peer feedback; quality of received peer feedback; usefulness of peer feedback implementation; peer feedback competence; and coping with emotions. Discriminant and convergent validity of the instrument were evidenced by low factor correlations and high AVE values respectively. Internal reliability according to Mcdonald's omega was also deemed acceptable. The surveyed students rated different peer feedback aspects highly, but distinctly: e.g., students believed they provide higher quality feedback than they receive. The questionnaire could be used to assess teacher education students' peer feedback beliefs and to improve instruction in teacher education.

Noticing, awareness, modes of cognition: An integrated model for teachers' professional d evelopment
Keywords: Classroom Management, Cognitive Skills and Processes, Feedback, Teacher Professional Development
Presenting Author: Els Boshuizen, Open University of the Netherlands, Netherlands; **Co-Author:**Charlotte Eliza Wolff, University of Iceland - School of Education, Iceland; **Co-Author:**Karel Kreijns, Open University of the Netherlands, Netherlands; **Co-Author:**Dorothy Duchatelet, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands

A dominant conceptual framework for the description and interpretation of teacher behaviour is the theory of professional vision. The theory includes the concept of noticing – the act of perceiving and identifying classroom situations and student behaviours that reveal potential problems that directly or indirectly might hamper student learning. However, this theoretical framework leaves many open questions, such as: What is the relationship with expertise development and which cognitive processes play a role? And how can teachers learn to handle the multiplicity of fast and slow pace of classroom events taking place simultaneously? In this poster we extend the framework of teacher professional vision by combining Endsley's theory of situation awareness with Eraut's theory of modes of cognition, which discriminates between fast and slow cognition, and brief and long events. Eraut described how the experienced professional navigates the interaction between different kinds of events in relation to speed of perception, and how cognition can constrain in- and on-action reflection, and thus learning through practical experience. Understanding teachers' modes of cognition amidst classroom complexity helps clarify the influence of experience in relation to the development of the fluid, flexible, intuitive scripts and routines that underly teachers' professional vision. Our poster presents a model integrating these perspectives and discusses implications for teacher learning, particularly the potential for enhancing teachers' noticing and situational awareness in the classroom, i.e., the interpretative expertise of professional vision.

A scoping review of research on reduced grading
Keywords: Assessment Methods, Classroom Assessment, Educational Policy, Feedback
Presenting Author: Dan-Anders Normann, Norwegian University of Science and Technology (NTNU), Norway; **Co-Author:**Lise Vikan Sandvik, Norwegian University of Science and Technology (NTNU), Norway; **Co-Author:**Henning Fjørtoft, Norwegian University of Science and Technology (NTNU), Norway

There is considerable interest in changing grading practices to ameliorate their perceived negative impacts on student learning and motivation. Therefore, reducing the role of grades in assessment is becoming popular in various contexts. We conducted a scoping review of 21 peer-reviewed studies that explored the reduced use of grades. Using qualitative content analysis and a theory of action framework to investigate the rationales for going gradeless, we analyzed data to identify changes in assessment practices and to explore how such changes were perceived by teachers and/or students. Six key factors were identified: contextual conditions (e.g., policy changes leading to reduced grading), rationales (e.g., improving psychological or socio-relational dimensions), changes in assessment practices (e.g., moving from grades to pass/fail), conditions for successful implementation (e.g., challenging assessment beliefs), impact on student learning (e.g., improving well-being or impacting student attitudes), and stakeholder concerns (e.g., negatively impacting study habits). Furthermore, although teachers perceived the benefits of going gradeless, students' views were divided. We suggest that building a theory of action approach could help support practitioners in understanding contextual needs, exploring existing assumptions about grading, developing an appropriate action strategy, and evaluating the outcomes of going gradeless.

Students' feedback engagement, feedback perceptions and individual characteristics
Keywords: Engagement, Feedback, Higher Education, Quantitative Methods
Presenting Author: Mona Bassleer, Ghent University, Belgium; **Co-Author:**Nicolas Dirix, Ghent University, Belgium; **Co-Author:**Stijn Schelfhout, Ghent University, Belgium; **Co-Author:**Wouter Duyck, Ghent University, Belgium

Feedback engagement of the feedback receiver is a necessary prerequisite for feedback to be effective in the learning process. However, empirical research that focuses on the use of feedback by students is understudied. In addition, little is known about the potential influencing roles of student feedback perceptions and student characteristics in the relation between feedback and students' feedback engagement. The present study aims to test the relations between received feedback on study orientation, and intentional and behavioral feedback engagement, while also taking student feedback perceptions and student characteristics (i.e., self-control and test anxiety) into account. We use a within subjects-design with self-reported data from first-year university students across the academic years 2021-2022 and 2022-2023. At this moment, we have a sample size of $N = 223$ for the academic year 2021-2022. For the academic year 2022-2023, the data collection is still ongoing. Preliminary results show that received feedback on study orientation has an indirect effect on behavioral feedback engagement and is mediated by intentional feedback engagement. Also, student feedback perceptions, self-control, and test anxiety indirectly influence behavioral feedback engagement, again mediated by intentional feedback engagement. Our findings suggest that interventions should pay attention to students' intentions to engage with feedback. In doing so, especially focusing on the improvement of students' perceptions of feedback (i.e., perceived fairness, usefulness, and acceptance) can add value in supporting students' feedback engagement.

Revealing teachers' conceptualizations of student identity and development: A connection to practice
Keywords: Feedback, Secondary Education, Social Aspects of Learning and Teaching, Teaching/Instructional Strategies
Presenting Author: Emily Gonzalez, University of Southern California, Rossier School of Education, United States; **Co-Author:**Christina Kundrak, University of Southern California, United States; **Co-Author:**Mary Helen Immordino-Yang, University of Southern California, United States

The present study empirically investigates how U.S. urban secondary teachers, identified by their administration as highly skilled, talk about their students' development of academically relevant social-emotional capacities. Independent observers rated 40 high-performing U.S. urban public secondary teachers' classroom practices during a 50-minute observation using a validated framework measuring support for deep learning. Participating teachers were then invited for a separate lab-based interview in which they were prompted to provide feedback to 6 pseudo-randomly sampled students from their classroom. We found that teachers who were rated more highly in their classroom practice more frequently discussed their students' identity development ($r(38)=0.34$, $p=0.03$). Furthermore, we found that teachers who more frequently discussed the themes of students' identity ($r(38)=0.36$, $p=0.02$) and self-esteem ($r(38)=0.39$, $p=0.01$) showed overall greater complexity in the open-ended feedback they provided to their students. In addition to the theme of student identity, teachers who were ranked in the highest quartile of classroom practices tended to consider students' broader dispositional and developmental growth, while teachers ranked in the bottom quartile of classroom practices tended to consider instrumental and behavioral factors. Results indicate that high-quality teaching likely requires a broader and developmentally oriented understanding of students' social-emotional and academic capacities, underscoring the importance of developing teachers' deep knowledge of student development rather than focus solely on instrumental practices.

How do groups learn in a virtual space? Didactic and social implications of breakout rooms
Keywords: Computer-supported Collaborative Learning, Cooperative/Collaborative Learning, Mixed-method Research, Pandemic
Presenting Author: Sabrina Gerth, University College of Teacher Education Tyrol, Austria; **Co-Author:**Mario Vötsch, University College of Teacher Education Tyrol, Austria; **Co-Author:**Anja Steiner, University College of Teacher Education Tyrol, Austria; **Co-Author:**Gerlinde Schwabl, University College of Teacher Education Tyrol, Austria

We explore the didactic and social dimensions of collaborative learning in virtual group rooms. Breakout rooms are defined as social arrangements including interaction processes that may promote learning effects under certain conditions. In the first survey, we asked nineteen students of a master's program in vocational education to evaluate the learning environment in breakout rooms. Afterwards, the same students were interviewed in groups to follow-up on their responses in the survey. They were asked about general conditions and characteristics of breakout rooms as virtual learning environments. In a second survey, we are planning to ask master students in primary school education about their learning experiences in breakout rooms. We will then compare the results of both groups to generalize their implications about teaching and learning contexts. So far, our results highlight the influence of factors such as time constraints, work assignments, group size and group composition on collaborative learning in breakout rooms. Consequently, virtual spaces require a reflective use of instructional methods and clearly structured work assignments. The role of the lecturer in a virtual space seems to focus on preparing the learning-settings (e.g., preparation and moderation of the learning process) and ensuring an output of the learning phase. We conclude by summarizing implications and suggestions that can be transferred into other virtual or analog learning environments.

A Digitally Enhanced Primary School Mathematic Classroom – A Case-Study
Keywords: Computer-assisted Learning, Computer-supported Collaborative Learning, Primary Education, Qualitative Methods
Presenting Author: Frauke Kesting, SCRIPT, Luxembourg; **Co-Author:**Catalina Lomos, LISER - Luxembourg Institute for Socio Economic Research, Luxembourg; **Co-Author:**Sibel Telli, Canakkale Onsekiz Mart University (COMU), Turkiye; **Co-Author:**Undine Seineke, Luxembourg Institute of Socio-Economic Research (LISER), Luxembourg

This qualitative case study, using video-based research complemented with teacher interviews and focus group, examines teacher and students' classroom experiences during one digitally enhanced mathematic lesson in primary education in Luxembourg. With this study, we aimed to observe the teacher's role, classroom interactions and the lesson structure and explore three research questions: 1) What is the teacher's role in a lesson where a digital learning platform for mathematics has been integrated? 2) What are the teaching strategies used and the lesson structure? 3) What are the classroom interactions (teacher-student, student-student) in a digitally enhanced lesson? The nineteen students in the last grade of primary education were in the video-recorded lesson. Their teacher is an experienced teacher, working in close collaboration with other four teachers teaching at the same grade level in the school. The setting was that students work individually with the digital learning platform in one math lesson, managed and organized as a usual math lesson by their teacher. For the focus group and interviews, all five teachers in that school who teach the same class level, including the teacher of the filmed classroom, participated in a focus group and individual interviews. The results showed that, the digitally enhanced classroom allowed for the transition from the teacher-centred lesson to a more self-regulated student learning, and supported peer-learning interactions, while shifting teacher's role towards a facilitator of learning. We will discuss these findings also in light of teachers' reports on the challenges digital learning integration raises in their professional practice.

The influence of collaborative hybrid learning on students' competence development and interaction
Keywords: Competencies, Cooperative/Collaborative Learning, Health-care Education, Social Interaction
Presenting Author: Sari Pramila-Savukoski, University of Oulu, Finland; **Co-Author:**Raila Kärnä, University of Oulu, Finland, Finland; **Co-Author:**Heli-Maria Kuivila, University of Oulu, Finland, Finland; **Co-Author:**Ashlee Oikarainen, University of Oulu, Finland, Finland; **Co-Author:**Tiina Susanna Törmänen,

University of Oulu, Finland; **Co-Author:**Jonna Juntunen, University of Oulu, Finland, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Kristina Mikkonen, University of Oulu, Finland, Finland

Education in health sciences prepares future experts for society with competence in evidence-based health care, leadership and collaboration. Recent changes in education and its transformation to more digital have brought up challenges. Hybrid learning, that enables to participate in teaching both face-to-face and remotely, has challenged educators to develop teaching competence and students to develop their health science competence. There has been little research on collaborative learning in hybrid learning environments. The aim of this study was to evaluate the influence of collaborative hybrid learning on health sciences students' competence development and collaborative interaction. Hybrid collaborative learning was observed from four small groups of health science undergraduate students (n=17) in a university using video recordings during the three- lesson. Observational data on health science competence and verbal interactions during collaboration were analysed using coding-and-counting methods, and the results were described using percentages, frequencies, and descriptive examples. The results showed that health science students' competence development was strongly reflected in their collaborative interactions, where they demonstrated analytical thinking, problem solving, collaboration, communication and technological skills. Students effectively used collaborative work time to complete tasks, with cognitive interaction observed in 85% of the data and socio-emotional interaction in 53% of the data. The results show how competence and interactions are constructed in hybrid collaborative learning and show, that hybrid collaborative learning support students' competence development if digital environments are adequately resourced and well-organized. Further multifaceted research need to be conducted to examine effect of hybrid learning in health sciences competence development.

International partnership in cooperation for democratic values in primary education
Keywords: Citizenship Education, Cooperative/Collaborative Learning, Curriculum Development, Primary Education
Presenting Author: Natalia Demeshkant, Pedagogical University of Krakow, Poland; **Co-Author:**Stefanie Schnebel, University of Education Weingarten, Germany; **Co-Author:**Katarzyna Potyrala, Pedagogical University of Cracow, Poland; **Co-Author:**Mareike Brehmer, University of Agder, Norway; **Co-Author:**Hilke Rapp, PH Weingarten, Germany; **Co-Author:**Aslaug Kristiansen, University of Agder, Norway; **Co-Author:**Inger Marie Dalehefte, University of Agder, Norway; **Co-Author:**kristin endresen-maharaj, University of Agder, Norway; **Co-Author:**Georg Kristoffer Fjalsett, University of Agder, Norway; **Co-Author:**Marion Visotschnig, Pädagogische Hochschule Weingarten, Germany

The study presents preliminary results after the first edition of the Erasmus+ project Values in democracy education - enhancing competencies and beliefs of teacher students (VALIDE). Three universities (University of Weingarten, Germany, University of Agder, Norway and Pedagogical University of Krakow, Poland) are cooperating in the project. As a result of the project a study trans-national student collaboration program "Democracy Values Education in Primary schools" was designed. Students enrolled in the course were encouraged to get involved in exchange and preparation for their stay abroad with students from partner universities. The study research question: Which are the motives and aims teacher students express while joining the tri-national exchange program focussing on democratic values and value education? The study materials were Polish and German students (n=14) interviews after completing the first edition of the project exchange program. Analysis of the data suggested several narratives from the findings. The first focuses on the student's motives and expectations regarding international cooperation. The analysis shows that the students are expected to enter into international professional relationships and experience the educational teacher training process abroad in the project-partners countries. The second aspect of the analysis considers students' experiences of working together with students or other people from abroad. Here the analysis shows that students evaluated their international cooperation experience as an opportunity to learn about different points of view on social and educational issues. In a conclusion, we can state that effective teacher education for diversity and democracy needs partners from outside the own cultural community.

The socio-materiality of learning through Minecraft education during the pandemic: a case study
Keywords: Computer-supported Collaborative Learning, Pandemic, Qualitative Methods, Social Interaction
Presenting Author: Giuseppe Ritella, University of Campania Luigi Vanvitelli, Italy; **Co-Author:**Ivana Lorusso, University of Foggia, Italy; **Co-Author:**Maria Beatrice Ligorio, University of Bari, Italy

The present paper presents the results of a case study involving 50 students aged between nine and ten years, who participated in a multi-year educational activity based on the pedagogical use of Minecraft. Theoretically, the paper is based on previous research conceptualizing and empirically operationalizing the complexity of socio-material relations in the context of making-based activities, which includes both the creation of material objects in makerspaces and the construction of virtual buildings and objects. The collected dataset includes 1) two questionnaires, 2) video recordings of students' presentations of their virtual worlds, 2) group interviews, and 3) screen recordings of the educationally relevant gameplay of a sample of students. The data analysis involved the qualitative content analysis of the interviews and of the open-ended questions of questionnaires; as well as the video analysis of the screen recordings of the students' activity in the virtual world and of the presentation of the virtual worlds. The analysis of the quantitative data deriving from the questionnaires was carried out by means of descriptive statistical analysis. The findings shows that 1) complex socio-material configurations of participation were orchestrated in real time with relative independence by the students; 2) different clusters of interconnections emerge between the students' perception of educational activities in Minecraft and their experiences related to the pandemic, as well as between learning through play and extra-curricular life. Finally, during the interviews, several students discuss how they have reconsidered some beliefs and stereotypes concerning online gaming and STEM disciplines.

Back to the Future: Cooperation as a Forgotten Art During the Pandemic
Keywords: Cooperative/Collaborative Learning, Pandemic, Qualitative Methods, Religiosity and Spirituality
Presenting Author: Petra Juen, Institut für Praktische Theologie, Fachbereich Religionspädagogik, - didaktik und Katechetik, Austria

We are in a time of many uncertainties: the ecological crisis, the war in Europe, the Covid 19 pandemic since 2020. These and many other factors contribute to social insecurity. Educational institutions such as schools, but also universities are reflecting their teaching. In my contribution, I would like to address the following questions: · To what extent can cooperation be a path of hope in uncertain times? · How does teaching change in uncertain times? · Who and what supports inclusion and exclusion of “hard to reach” students during uncertain times?I will address these questions from a religious education perspective in the Austrian context. My qualitative-empirical dissertation study, which deals with the challenges, opportunities, and limits of interreligious and interdenominational cooperation before 2020 serve as the data basis. Furthermore, qualitative interviews with teachers are currently conducted to enlarge the perspective.In Austria, the situation of religious education is unique in Europe. A total of 16 recognized religions and religious communities can provide confessional religious education at schools. Since school year 2021/22 ‘ethics’ has been introduced nationwide as a compulsory subject at secondary level in addition to the subjects of religious education. The examination of a cooperation before, during and ‘after’ the pandemic allows a development of possible implications for the training of religious education teachers. In addition, the contribution raises questions about the quality and quantity of teaching in uncertain times, touches the conversion to online-teaching-formats and discusses the remains of it.

Pilot Study for the Validation of the Number Sense Brief for the Brazilian Context

Keywords: Assessment Methods, Early Childhood Education, Learning and Developmental Difficulties, Mathematics/Numeracy
Presenting Author: Luciana Vellinho Corso, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil; **Co-Author:**Fabiana de Miranda Rocha Luna, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**Amanda Oliveira Meggiato, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**RAQUEL WEBER, Universidade Federal do Rio Grande do Sul, Brazil

This study aimed to present a pilot study, conducted with an adapted version of an American instrument, the Number Sense Brief (NSB), that evaluates the number sense skills in Brazilian children in their last year of Early Childhood Education and first year of Primary Education. The sample consisted of 84 students from public schools in the State of Rio Grande do Sul, who were evaluated with the NSB, TEMA-3 and the Columbia Mental Maturity Scale – 3. Participants also provided data on their socioeconomic status via a questionnaire. Different analyses were performed to evidence psychometric characteristics of the instrument, mainly: confirmatory factor analysis, Cronbach's alpha (α), and Spearman's correlation. The results confirmed that the adapted version of the instrument has three factors, as the original version, which indicates validity, while also having expressed satisfactory reliability indexes and data on the performance of the participants. The new version of the instrument is considered adequate and functional for the new context, with the potential to support the evaluation of number sense.

The Development of Early Numeracy as a Predictor of Math Skills in Primary School
Keywords: Classroom Assessment, Mathematics/Numeracy, Pandemic, Primary Education
Presenting Author: Veronique Dierkx, University Utrecht, Netherlands; **Co-Author:**Bernadette van de Rijt, University Utrecht, Netherlands; **Co-Author:**Sietske van Viersen, University Utrecht, Netherlands

The mathematical abilities of primary school children in the Netherlands have been declining in recent years and results have decreased even more during the pandemic. Although we know that early numeracy (EN) is one of the strongest predictors of children's mathematical abilities, little is known about EN development beyond kindergarten and its predictive value for math skills in the later grades of primary school. Therefore, we studied 1251 children's EN skills across six timepoints between Kindergarten and the end of Grade 1, as well as their general math abilities in the middle grades of primary school. We also considered parental education level and migration background as well as COVID-related school closure as potential predictors impacting on EN development. Using latent growth modeling we found that EN developed linearly throughout between Kindergarten and the end of first grade and that lower parental education levels, parental migration background as more COVID-related school closures negatively affected initial levels and growth rates in EN. Moreover, the EN development significantly predicted math scores in the mid grades of primary education. The importance of assessing EN at an early stage is indicated by our findings, as it allows for early intervention which can alter children's developmental trajectories and positively affect their later math abilities.

The relation between primary school students' adaptive number knowledge and proportional reasoning
Keywords: Mathematics/Numeracy, Primary Education, Reasoning, Simulation-based Learning
Presenting Author: Salla Pehkonen, University of Jyväskylä, Finland; **Co-Author:**Antti Lehtinen, University of Jyvaskyla, Finland; **Co-Author:**Pasi Nieminen, University of Jyväskylä, Finland; **Co-Author:**Markus Hähkiöniemi, University of Jyväskylä, Finland

Balance scale tasks have been widely used to study students' proportional reasoning. However, there is a lack of knowledge of what mathematical skills contribute to the recognition of proportionality in these tasks. Adaptive number knowledge can be reasonably assumed to one be one such skill. Therefore, we studied primary school (2^{nd}, 4^{th}, and 6^{th} grade) students' adaptive number knowledge and if it helps to solve a scientific problem where recognition of mathematical relations is relevant. We used a test with open tasks where students were instructed to produce as many solutions as possible to study students' adaptive number knowledge. In addition, students participated in an intervention where they tried to form a balance rule and solve balance scale tasks in a digital learning environment. There was a relation between students' adaptive number knowledge and their use of proportionality. The students with higher adaptive number knowledge were more likely able to make proportional observations and adaptively use them in different situations. Whereas the students with lower adaptive number knowledge made mostly non-proportional observations when solving balance scale tasks.

Coding in elementary school mathematics lessons? That works!
Keywords: Computational Thinking, Mathematics/Numeracy, Primary Education, Problem Solving
Presenting Author: Jens Dennhard, University of Education Heidelberg, Germany; **Co-Author:**Saskia Schreiter, University of Education Heidelberg, Germany

The teaching of competencies in the context of digitization is already a central goal in primary education. These include informatics competencies, which can, due to the numerous interfaces between mathematics and computer science, be taught in an integrated way in mathematics classes. The research project presented here involves the planning, conception, and empirical evaluation of interdisciplinary learning environments for coding in primary mathematics education (grades 3/4). For this purpose, mathematical topics with algorithmic structures, such as number sequences, are identified from the primary education curriculum and integrated into an age-appropriate digital coding environment. The block-based visual programming language NEPO is used, which is freely available through the online editor Open Roberta Lab (https://lab.open-roberta.org). The learning environments are developed in a design research approach in iterative circles. Based on existing mathematical and computer science didactic theory and research, prototype learning environments are developed, repeatedly empirically tested, and continuously refined by analyzing screen and audio recordings of children's programming processes. The goal is to develop learning environments for coding at the primary level that are practicable and easy to use in mathematics classes.

6-year-olds' different ways of reasoning about a larger collection of items
Keywords: Early Childhood Education, Mathematics/Numeracy, Primary Education, Reasoning
Presenting Author: Anna-Lena Ekdahl, Jönköping University, Sweden

Children develop an understanding of numbers by, for instance, counting items in smaller or larger sets. When a larger set is placed in a regular arrangement (for example, in rows) subitizing or counting can be used to quantify a subset, and thereby determine the size of the larger set. It becomes more challenging when the items are placed in an irregular arrangement. The aim of this study is to answer the question: How do 6-year-olds estimate and reason about how to determine a quantity of a larger set in an irregular arrangement? In this study, 130 Swedish 6-year-olds were asked: *How many cubes do you think there are on the tray? How could you find out*? looking at a tray with 47 randomly arranged wooden cubes. In the analysis, students' answers were summarized. Codes, inductively sprung from the data, were used to describe students' reasoning. The analysis shows that around half of the students made a reasonable estimation of the number of cubes. In 2/3 of the observations, single-unit counting was in focus in students' reasoning when determining the size of the set of cubes. Whereas in 1/3 of the observations, decomposing the whole collection into subsets, either of the same size (e.g., groups of five) or different size, was in focus in their reasoning. Hence, the study reveals different ways in which 6-years-olds reason about estimating or determining the size of an uncountable set. Based on this, implications for how to teach quantification and estimation are discussed.

Developmental trajectories of initial abilities of children according to socioeconomic status
Keywords: Cognitive Skills and Processes, Mathematics/Numeracy, Primary Education, Reading
Presenting Author: María Victoria Velasco, Pontificia Universidad Católica de Chile, Chile

Executive functions and reading and mathematical skills are fundamental to developing in the social environment. However, not all children have the same conditions for developing these skills; one condition that defines important differences is socioeconomic status (SES). It has been observed that children with a low-SES have a lower development of the skills above. The present study investigates the initial developmental trajectories of these skills to investigate the impact of education on learning. A group of 161 children of different SES was evaluated in language, mathematics, and executive function performance. Parallel trajectories were observed in the case of language and mathematics, and a compensatory trajectory in the case of the development of executive functions. This indicates that, although education has a similar impact on both groups in the case of language and mathematics, the initial differences remain over time. The need to investigate the role of executive functions and the impact of their trajectory is discussed. The need to generate public policies in this regard is raised.

A Participatory Workshop Exploring Institutional Gatekeeping in Doctoral Programme Admissions

Keywords: Doctoral Education, Higher Education, Inclusive Education, Researcher Education
Interest group: SIG 24 - Researcher Education and Careers

Prior to making formal applications, potential doctoral students often send academics, programme directors or programme officers informal approaches. Academics often make snap judgements about these inquiries, but, in deciding how to respond, they effectively become gatekeepers to the academic profession. For prospective doctoral applicants, particularly from marginalised social groups and Global South countries, the application process is often challenging to navigate. Previous studies on doctoral recruitment inequalities have focused on formal admissions (Posselt, 2014; Francis et al., 2021; Miller et al., 2019). It is equally vital to understand the pre-application side of admissions (NERC, 2021). Addressing pre-application communications – and the issues therein – is a neglected area of practice in doctoral education. This participatory workshop is underpinned by a research project at the University of Warwick which investigates this area. The workshop is aimed at key stakeholders across doctoral education, including supervisors, doctoral programme directors and programme officers, and those who are working on doctoral education as a research field and/or policy area. The workshop objectives are (i) to map the roles of various stakeholders in the pre-application stage, (ii) to collectively refine understandings of this aspect of doctoral admissions, and (iii) to consider potential channels of action that could ameliorate some of the inequalities that emerge in this stage of doctoral admissions.

Mining Digital Learning Data in Education: A Step-by-Step-Guide Using WordPress

Keywords: Artificial Intelligence, E-learning/ Online Learning, Educational Technologies, Learning Analytics
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.
Digital learning platforms can present content in many manners and engage students in learning tasks. At the same time, they provide various types of information about student learning by applying Learning Analytics (LA) and Machine Learning (ML; Zhai et al., 2020). Mining educational data includes, for example, the learning behavior of learners by collecting log files about the time-accurate use of each learning resource (Fischer et al., 2020). Conclusions can be drawn from these log files using methods from the field of LA and ML (e.g., Gobert et al., 2013). For this reason, the question arises of how educational researchers can mine data for LA and ML usage to improve teaching-learning processes. In this ICT demonstration, we present an approach to constructing web-based learning platforms for persons without or with little expertise in computer science. Based on the content management system WordPress, we show how to design a web-based learning platform and develop a community-build learning platform together with the participants of the ICT demonstration. Researchers will be enabled to collect log files providing a comprehensive data source for investigating students' learning behavior. The preliminary considerations, prerequisites, implementation, design, and data collection with a self-constructed digital learning platform will be demonstrated and discussed.

We concretized this approach with our own learning platform, which was tested through data collection with 580 learners from the 9^{th} and 10^{th} class and a total of 493,511 data points in science learning.

HELEXPO_CC
Invited Symposium

Investigating technology integration in learning activities through the lens of the ICAP model

Keywords: Assessment Methods, Competencies, Digital Literacy and Learning, Educational Technologies, Emotion and Affect, Higher Education, Instructional Design, Large-scale Assessment, Learning Approaches, Meta-analysis, Quantitative Methods, Teacher Professional Development
Interest group: SIG 06 - Instructional Design
Chairperson: Dominik Petko, University of Zurich, Switzerland
Organiser: Alberto Cattaneo, Switzerland
Discussant: Paolo Raviolo, Italy

Digital technologies are often integrated in education to support teaching and learning processes and foster learning outcomes, including knowledge acquisition and competence development. However, the way technology is used by teachers and students in education is determinant for the learning outcomes. According to the interactive, constructive, active and passive (ICAP) model, the cognitive processes underpinning learning become increasingly elaborated from passive to interactive learning activities. Thus, the ICAP model can help to measure and better understand the concept of quality of technology integration in teaching and learning activities. The four studies composing this symposium elaborate from different perspectives on important aspects of applying the ICAP model in the context of technology-enhanced teaching and learning, like the measurement of technology integration, the relationships between learning activities and learning outcomes, and the recommendations on how to effectively use technology in classrooms.The first paper illustrates the results of a systematic review of meta-analyses to compare the effects of technology and non-technology supported learning activities on students' learning. The second paper examines the differences in the frequency of technology integration across qualitatively different learning activities between vocational and general education and depending on the subject matter. The third contribution investigates the effects of different technology-enhanced learning activity on students' outcomes. Finally, the fourth paper explores how technology-related professional development affects high-quality technology-enhanced teaching. The discussant will provide a critical perspective on the application of ICAP model on technology-supported learning activities.

Learning Activities in Technology-enhanced Learning: A Systematic Review of Meta-Analyses
Presenting Author: Michael Sailer, LMU Munich, Germany

The ICAP model postulates that learning activities are an approximation of certain cognitive processes. Further, based on the model, effects of technology-enhanced learning are mediated by the learning activity that is facilitated by technology. In this systematic review of meta-analyses, we examined effects of instruction with versus without digital technology in higher education while considering students' learning activities in the technology and nontechnology conditions. We included N = 29 eligible effects from N = 17 meta-analyses in our systematic review. Our results showed that when digital technology instruction was used as a substitute for nontechnology instruction, there was no significant change in students' learning. However, when the technology provided learning-activity-specific support, learning was fostered. Further, when digital technologies offered more advanced learning activities, we observed a positive impact on students' learning. Our results support the hypothesis that effects of technology-enhanced learning are mediated by the learning activity that is facilitated by technology. Hence, digital technologies can have positive effects on learning in higher education when they incorporate learning-activity-specific support or they offer more advanced learning activities to learners. Further, our results emphasize the crucial role of investigating learning activities from experimental conditions in meta-analyses on technology-enhanced learning in addition to specific technological features.

Integration of Technology in Interactive, Constructive, Active and Passive Learning Activities
Presenting Author: Chiara Antonietti, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland

Since previous research investigating the use of technology in school has focused mainly on the frequency of digital tools used by teachers and students, there is a lack of data about the quality of technology integration in education. With this paper, we aim to investigate how technologies are integrated in teaching and learning activities that entail different levels of learners' cognitive engagement. We developed the 12-item ICAP Technology Scale (ICAP-TS) to measure the quality of technology integration and tested differences between teaching profiles on a sample of 2248 upper secondary teachers (vocational and general education) to investigate the effect of school type and (taught) subjects. Results revealed that teachers use technology to present information and knowledge to students more frequently than to allow them to use technology in an active, constructive, and interactive way. Comparison between teaching profiles also revealed that vocational teachers use technology more frequently than general teachers. In general education schools, the constructive and active use of technology is more frequently reported by teachers teaching humanities and language subjects than science and technology subjects. Our results provide information on how frequently technologies are integrated in upper-secondary schools for different purposes.

Exploring Technology-enhanced Learning Activities in Higher Education and their Effects on Students
Presenting Author: Christina Wekerle, University of Augsburg, Germany

Technology-enhanced university teaching is considered to have great potential to promote learning, especially when instructors stimulate high-quality learning activities such as constructive and interactive learning activities instead of active and passive learning activities (ICAP; Chi & Wylie, 2014). Due to a lack of empirical studies in authentic, technology-enhanced instructional settings, we investigated the cognitive and affectivemotivational effects of these learning activity modes in authentic, technology-enhanced higher education courses with a sample of 87 higher education teachers and 3820 students in 170 university courses. The results highlight the importance of technology-enhanced interactive learning activities for students' knowledge gain and the potential negative consequences of passive learning activities for affective-motivational outcomes. However, the superiority of constructive and interactive learning activities compared to passive and active learning activities for cognitive and affective-motivational outcomes was not supported by the findings. Instead, the findings point to potential differential effects of the individual learning activities within one activity mode.

How to Promote High-Quality Technology-Enhanced Teaching Through Teacher Professional Development?
Presenting Author: Tim Fütterer, University of Tübingen, Germany

The effectiveness of technology in teaching depends on the quality of how teachers implement it. Professional development (PD) is a promising approach to promote teachers' knowledge (e.g., technological pedagogical knowledge [TPK]) and skills (e.g., planning and conducting lessons) that are necessary to be able to integrate technology into teaching in a high-quality way. However, up to now, insights into the importance of teachers' cognitive (e.g., technological [TK], pedagogical-psychological [PK] knowledge) and motivational (e.g., self-efficacy) prerequisites, different PD approaches (e.g., integrative vs. transformative), as well their interplay for PD effectiveness are missing. We used data from N = 255 teachers who participated in a three-month PD program to promote their TPK and skills to conduct high-quality technology-enhanced teaching. We randomly assigned teachers to a TPKintegrative (utilizing the Replacement, Amplification, and Transformation [RAT] framework) or a TPK-transformative (utilizing the ICAP framework) PD intervention. We assessed teachers' TK, PK, TPK, self-efficacy and teaching quality at three measurement points (pretest, posttest, follow-up). Findings from baseline latent change models indicated that both PD interventions did not change teachers' tested TPK but increased their self-efficacy in the short and in long term. Regarding TPK, teachers with less PK and regarding selfefficacy teachers with more TK at the pretest benefited more in both PD interventions while teaching quality increased in the long term. Teachers in the TPK-transformative PD intervention with higher TK particularly benefited in the short and long term. Results can help to design effective and differentiated PD programs to prepare teachers for highquality technology-enhanced teaching.

Invited Symposium
Culture, Morality, Religion and Education

Religions and worldviews in education providing hope of social sustainability

Keywords: Attitudes and Beliefs, Cultural Diversity in School, Curriculum Development, Digital Literacy and Learning, Environmental Education, Ethics, Morality and Moral Development, Religiosity and Spirituality, Social Aspects of Learning and Teaching, Sustainable Development, Well-being

Interest group: SIG 19 - Religions and Worldviews in Education
Chairperson: Martin Ubani, University of Eastern Finland, Finland
Organiser: Martin Ubani, University of Eastern Finland, Finland
Organiser: Alexander Unser, TU Dortmund University, Germany
Organiser: Sarah Delling, University Siegen, Germany
Discussant: VASILIKI MITROPOULOU, Greece

This symposium discusses through fresh studies how education about religions and worldviews can contribute in the promotion of social sustainability. Arguably, the purpose and mission of education is to ensure that all students can benefit from learning so that they are able to 'participate fully in public, community and economic life' (NLG 1996). Many times in political documents and policy recommendations education is portrayed as the principal answer to many challenges (Niemi 2021). Poverty, the in-equal distribution of resources, is one of the 'wicked' and 'persistent' problems of humankind and includes, for instance, physical, psychological, social and also educational consequences (Comber 2015). It is usually agreed that the concept 'sustainable development' includes bio-physical/environmental, economic, and social sustainability (Vallance, Perkins & Dixon 2011; Dillard, Dujon & Brennan 2013). The emergence of 'social sustainability' in public consciousness can be traced to the UN General Assembly (1983) that aimed for initiatives that lead 'to the achievement of common and mutually supportive objectives which take account of the interrelationships between people, resources, environment and development'. We argue that education about religions and worldviews can contribute in the promotion of social sustainability. According to Jenkins the 'transition toward sustainability requires engagement with the religious symbols that shape a global moral consciousness'. As religions have significantly shaped the cultural roots of sustainability problems we need to critique and reform the elements of religion that contribute to unsustainable worldviews (Jenkins 2008) in education and research. With these 4 presentations we wish to further this process.

Theologies, Religion and Literacy: Towards Socially Sustainable Religious Education?
Presenting Author: Martin Ubani, University of Eastern Finland, Finland

With this theoretical presentation I discuss the question of the place of religious literacy in the social sustainable development framework. The presentation first discusses the concept of literacy and argues how the spreading of literacy in societies has included aspects related to, on the one hand, worldview and value development and, on the other hand, individual social empowerment and grander socio-cultural change, and how these aspects should also present standards for religious literacy today. Social sustainability has been attributed elements such as inclusivity, impartiality, meaning making and also cohesion of 'textures' of society through common values, mutual understanding and shared cultural memory. The presentation maintains that religious literacy as a critical skill is essential for promoting socially sustainable development that not only acknowledges the role of religion in, for instance, society and culture (i.e., to be able to 'read', to be literate) but also involves the knowledge, skills and attitudes related to religion in public exchange (i.e., to be able to act literate). Finally, the presentation concludes with implications for religious education in public schools.

A digital response-tool to grasp personal orientations underlying sustainability conflicts
Presenting Author: Stefan Altmeyer, Johannes Gutenberg University Mainz, Germany

While there is a broad consensus that education in general as well as religious education should contribute to the goals of education for sustainable development (ESD), it remains largely unexplored how it should achieve the intended goals. This becomes even more critical as empirical studies have repeatedly shown that the goals of education for ecological sustainability are as indispensable as they are difficult to achieve. In particular, the discrepancy between sustainability awareness and everyday actions seems to be particularly large and strongly dependent on personal factors. Against this background, the paper argues that the evaluation of everyday sustainability conflicts should be considered; it aims to show how underlying personal orientations can be identified and educationally addressed. The main attention will be on the so-called "poplar dilemma tool", a digital response-tool that focuses on an everyday sustainability dilemma and its evaluation. Being developed and tested in an empirical study among more than 1,100 secondary school students in Germany and Austria, the use of this instrument allows for the identification of five types of personal orientations, each of which is characterized by a typical evaluation pattern. The paper concludes that the poplar dilemma is applicable to educational practice as classroom tool, to develop teaching programmes that can deal with personal predispositions in an appropriate and differentiating manner.

Diversity as an Element of Social Cohesion – the Findings of an Empirical Research
Presenting Author: Eszter Kodacsy-Simon, Lutheran Theological University in Budapest, Hungary; **Co-Author:**Etelka Seres-Busi, Lutheran Theological University in Budapest, Hungary

The issue of fragmentation is a clearly visible and observable phenomenon in Hungary that can be seen in a number of issues emerging in our society. For several decades, the role of church schools and their processes of value transmission have also come to the fore from time to time, both as a legitimation dilemma from outside and as an identity dilemma from within.From time to time, the voice of students is also explored, but there is an under-representation of studies and research on the school experiences of students in church schools.Present exploratory research interviewed 37 students from church schools with different backgrounds. In our analysis, we will discuss1. the ways in which certain concepts (society, nation, community) appear in students' responses, and the associations they make to these concepts;2. how they interpret concepts (for example power, responsibility, norms) that determine both public discourse and social perception, and how they make this "tangible" in relation to school stories;3. which elements (re-creating and reinterpreting traditions, rules, shaping personal beliefs, etc.) and prosocial values they identify as personal resources that can later promote their integration and participation in society and help achieve social cohesion.In the analysis the aspect of "diversity" emerged as a core concept among the codes, mentioned by students as a factor activating their personal resources, for example in dealing with life issues or shaping their own worldview and beliefs. The presentation will show the connections between the core concept, the meanings students give to it, and the barriers students perceive.

Existential Resilience and Well-being, Hope and Meaning: Cultivating Existential Sustainability
Presenting Author: Arniika Kuusisto, University of Helsinki, Finland

This paper approaches existential resilience and well-being, education for hope and meaning, through arguing for cultivating of existential sustainability in education. The topic is approached both through theoretical and conceptual literature and empirical extracts from data constructed by young children (N=42; ages 3-8) through digital audio-visual tools, on what they find personally important and valuable. Resilience can be seen "at the heart of existentialism", "opening new roads for multidisciplinary research on existential resilience" (Vos 2015). Through existential perspective to resilience and well-being, it is here examined as an existential query to coping with difficult life situations (ibid.), finding hope and meaning. At present, the pandemic, climate crisis, and global turmoil have contributed to many children's existential anxiety. Their coping is critically linked with the support, or lack thereof, for resilience resources (Koirikivi et al, 2021)—with potential implications into worldview education.

Session F 3

23 August 2023 14:45 - 16:15
UOM_R08
Symposium
Teaching and Teacher Education

Examining the Validity of Standardized Approaches to Measuring Teaching Quality

Keywords: Assessment Methods, In-service Teachers, Quantitative Methods, School Effectiveness, Social Aspects of Learning and Teaching, Teacher Effectiveness, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Mark WHite, University of Oslo, Norway
Discussant: Anna-Katharina Praetorius, University of Zurich, Switzerland

Measuring teaching quality is highly complex. Variation in instructional practices across time, students, content, and other features must be accounted for in the measurement of teaching quality. Further, common tools for measuring teaching quality rely on students' ability to self-report on their own experiences, or on raters' ability to carefully observe and interpret instructional practice according to rubric guidelines. This variability in the object of measurement (i.e., instruction) and the filtering of measurement through individual reporters creates challenges in trying to measure and study teaching quality. These (and other) challenges create the need to carefully study the validity of different approaches to measuring teaching quality. This symposium does exactly that. The first paper uses survey measures of teaching quality to examine the context sensitivity of measures, illuminating differences in the measurement of teaching quality between in-person and distance learning. The second paper shows that survey measures do not always capture their intended constructs and different measures of teaching quality do not always agree, raising questions about how to triangulate teaching quality across sources. The third paper looks at the impact of training teachers to observe teaching quality, showing positive impacts of such training, but raising questions about whether even trained teachers can discriminate across different dimensions of teaching quality. The last paper introduces an approach to explore the robustness of study conclusions to the observed levels of rater error. Across these studies, we see the validity of measures of teaching quality being investigated, often with mixed results.

Students' Perceptions of Teaching Quality in In-person Classrooms and Distance Education
Presenting Author: Ann-Kathrin Jaekel, University of Tuebingen, Germany; **Co-Author:**Richard Goellner, University of Tuebingen, Germany

The importance of teaching quality for student learning has been widely studied. However, empirical models focus on school-based in-person teaching. Studies focused on comparing students' perceptions across learning environments could not draw clear comparisons due to several other influencing factors. Therefore, it is unclear whether students perceive learning in in-person and in distance environments differently and if teaching quality dimensions are differently associated with students' learning outcomes. This study addresses this gap in research and compares students' perceived teaching quality in both learning settings as well as the associations with students' motivation. Specifically, we investigated whether and to what extent student perceptions of different quality dimensions (monitoring, support, and challenging tasks) result in an invariant measurement of teaching quality for the two learning settings. In addition, we tested for differences in the mean values and associations between students perceived teaching quality and their learning motivation. Therefore, we used data of two large studies assessing teaching quality before and during the school closures in 2019 and 2020. The results showed that the used scales were comparable across learning settings. Thereby, challenging tasks were perceived to be more pronounced for distance education than for in-person education, whereas monitoring and support showed higher mean values for in-person learning. A similar pattern was found for associations with students' motivation: The correlations for challenging tasks with students' motivation were higher in distance learning than in in-person teaching and learning. These results show the exceptional role of the provision of challenging tasks in distance education settings.

Student Perceptions as Indicator of Teaching Quality: A Report from Nordic Classrooms
Presenting Author: Berglind Gisladottir, University of Iceland School of Education, Iceland; **Co-Author:**Michael Tengberg, Karlstad University, Sweden; **Co-Author:**Astrid Roe, University of Oslo, Faculty of Education, Norway; **Co-Author:**Anders Stig Christensen, UCL University College, Denmark, Denmark

This study investigates student perceptions as indicator of teaching quality in lower secondary classrooms. It draws on survey data from Denmark, Finland, Iceland, Norway, and Sweden, targeting the students' evaluations of instructional practices in language arts, mathematics, and social science. The aim of the study is both to compare patterns of instructional practices across countries and subjects, and to explore validity aspects of student responses as indicator of teaching quality.Nearly 2,000 students in the five Nordic countries responded to the Tripod Survey in three different subjects. The survey contains 38 items, expected to measure seven different domains of instruction. Descriptive statistics, factor analyses, ICC, and Pearson correlations were combined in the study. Findings reveal mainly converging response patterns in the five countries, although a few significant differences appear, suggesting country-specific traits of the instruction. Students in the Nordic countries generally rate their teachers as caring and attentive, but less prone to share responsibility for planning classroom activities with the students. In line with previous research, however, the seven-factor structure of Tripod is only weakly supported by fit values.Alternative structures of the data are explored and discussed, including a three-factor model and a bifactor model. Bivariate analyses suggest that aggregated survey estimates of teaching quality are only weakly related to aggregated estimates from classroom observations, but that a few domain-specific estimates, such as classroom management, relate strongly between surveys and observations.

Classroom Observation Ratings of Teaching Quality – An Investigation of a Teacher Training
Presenting Author: Tosca Daltoè, University of Tübingen, Germany; **Co-Author:**Julia Maier, University of Tübingen, Germany; **Co-Author:**Evelin Ruth-Herbein, University of Tübingen, Germany; **Co-Author:**Richard Goellner, University of Tuebingen, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany; **Co-Author:**Benjamin Caspar Fauth, University of Tübingen, Germany

Classroom observation is widely used to provide feedback on teaching quality. However, observing and assessing teaching quality is challenging even for experienced teachers. For this reason, rater trainings using classroom videos to represent teaching practice aim to prepare teachers in providing satisfactory observation ratings of teaching quality. In the context of a rater training for a newly developed classroom observation form (Fauth et al., 2022) we investigated the psychometric quality of observation ratings of teaching quality in classroom videos in two studies. In Study 1, $N = 10$ teachers were trained in rating teaching quality using the observation form. The teachers rated classroom videos of the TALIS video study over the course of the training. We investigated interrater agreement and interrater reliability of the resulting teaching quality ratings. Results indicated mostly satisfactory teaching quality ratings after the rater training with clear differences between the items, depending on the teaching quality aspect assessed. Study 2 was conducted with the same sample of teachers after the rater training. Teachers rated 34 classroom videos of the Pythagoras study. We investigated construct validity of the resulting teaching quality ratings. Results provide evidence for convergent validity but limited discriminant validity of the observation ratings. We discuss the results and limitations of the present investigation, taking into account current considerations on validity arguments for classroom observation systems.

Evaluating the Robustness of Observational Studies' Results to Rater Error with a Linking Data Set
Presenting Author: Mark WHite, University of Oslo, Norway

Rater error is a serious threat to conclusions from observational research on teaching quality. This is especially true for cross-country research where raters are often nested within countries, making it difficult to use standard approaches for examining rater agreement. This paper introduces a new approach to examine rater error in cases where raters are nested within country. This approach focuses on incorporating uncertainty due to rater error into study conclusions, allowing for an examination of how robust study conclusions are to rater error. The approach creates a linking data set by "master scoring" a set of videos from each country. The linking data set is used to calibrate a hierarchical rater model that nests raters as items within observation rubric dimension scores. The hierarchical rater model is then applied to the full data set to estimate scores that are adjusted for rater effects or the model is embedded within a larger model to examine research questions. I demonstrate an application of this approach to the LISA Nordic data set, which collected videos of 390 lessons across the five Nordic countries. This application shows the importance of accounting for rater error.

Session F 4

23 August 2023 14:45 - 16:15

Symposium
Instructional Design

Bringing journal writing, learning by explaining, peer-tutoring in a dialogue

Keywords: Cognitive Skills and Processes, Metacognition, Peer Interaction, Self-regulated Learning and Behaviour, Teaching/Instructional Strategies, Writing/Literacy
Interest group: SIG 10 - Social Interaction in Learning and Instruction, SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Ai Miyamoto, University of Freiburg, Germany
Organiser: Ai Miyamoto, University of Freiburg, Germany

Discussant: Vincent Hoogerheide, Utrecht University, Netherlands

Journal writing, learning by explaining, and peer tutoring are all established learning methods for facilitating students' generative learning. The aim of this symposium is to introduce different generative learning methods and discuss similarities and differences in their effectiveness on students' learning strategy use and comprehension. The first presenter investigates the effectiveness of journal writing on learning strategy use and comprehension, with a particular focus on the effects of prompts as instructional support, among teacher university students in Germany. The second presenter examines the effectiveness of journal writing on students' learning strategy use and comprehension among secondary school students in Germany. His study focuses on the role of medium (oral vs. written) in addition to prompts in influencing the effectiveness of journal writing. The third presenter also investigates the role of medium (oral vs. written) and prompts in the effectiveness of learning by explaining on secondary school students' learning strategy use and comprehension. The fourth presenter examines the effectiveness of peer tutoring on students' learning strategy use and comprehension among high school students in Japan. All presenters conducted field experiments in a classroom setting. We will discuss similarities and differences in the effectiveness of different generative learning methods. This symposium is relevant to educational researchers and practitioners as it provides important and practical insights into how different kinds of generative learning activities can be effectively implemented in the classroom in order to foster students' learning processes and outcomes.

Digital journal writing: Cognitive, but not metacognitive prompts enhance comprehension and transfer
Presenting Author: Veit Kubik, University of Würzburg, Germany; **Co-Author:**Markus H. Hefter, Bielefeld University, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany; **Co-Author:**Kirsten Berthold, University of Bielefeld, Germany

Journal writing is an effective generative learning activity when prompts are provided as instructional support. In this experimental field study, we tested the effectiveness of cognitive and metacognitive prompts to elicit participants' strategy use and in turn to enhance their comprehension after 1 week in an authentic educational setting of a digital university lecture. Student teachers ($N = 97$) watched a university lecture about *Piaget and his Theory of Cognitive Development* and were subsequently instructed to write a learning journal using a digital learning environment. Following the opportunity to revise their learning journals, students received a posttest after 1 week. The preliminary results showed that the prompts fostered the application of the targeted cognitive and metacognitive learning strategies. Importantly, we observed a main effect of prompt type on the learning outcome, indicating that prompts supported student teachers' self-regulated learning. More specifically, contrast analyses showed that cognitive prompts, but not metacognitive prompts, enhanced comprehension despite the opportunity to revise learning journals (Nückles et al., 2009). The benefit of cognitive prompts was mediated by the frequency of participants' use of elaboration strategies, however, not by organization strategies and students' perceptions of germane cognitive load. One possible reason that metacognitive prompts were not instructionally effective may be the additional affordances that come with self-regulated learning in digital, unsupervised environments at home as compared to in the traditional, lab-based setting. Complementary support measures are needed to make metacognitive prompts effective in digital learning environments, such as informed training and example-based video instructions.

Writing or speaking? The role of medium in the effectiveness of learning journals
Presenting Author: Florian Luft, University of Freiburg, Germany; **Co-Author:**Ai Miyamoto, University of Freiburg, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany

Journal writing is an established learning method to facilitate the effective use of cognitive and metacognitive learning strategies and subsequent learning outcomes. In addition, recent studies suggest that similar learning processes and outcomes may be also possible in the medium of oral speech. Thus, the aim of the present study is to investigate the role of the medium (written vs. oral) in the effectiveness of learning journals on students' learning strategy use and learning outcomes. In our randomized controlled field experiment, secondary school students ($N = 163$) first watched a video lecture on a psychological topic and were then randomly assigned to experimental conditions in which they made a learning journal entry either in a written or oral format, or restudied the learned material. Students in the experimental groups then revised their learning journals using the transcribed texts, while the restudy group kept reading the texts. All students took a knowledge test after one day and after seven days. The results showed that spoken learning journals led to significantly higher learning outcomes than written learning journals in the post-test and follow-up test. The mediation analyses further revealed that the effect of the medium on learning outcomes was explained by the use of cognitive and metacognitive strategies. Our findings suggest that students benefit more from spoken learning journals than written learning journals because of more cognitive and metacognitive strategies they use while learning, possibly due to the lower production and formulation cost of oral speech compared to the act of writing.

The role of prompts and medium in the effects of learning by explaining on students' comprehension
Presenting Author: Ai Miyamoto, University of Freiburg, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany

Learning by explaining is an effective learning method to facilitate students' generative learning. In this experiment, we investigated the differential effects of the medium of explaining (written vs. oral) and instructional support (i.e., prompts) on students' learning outcomes. Secondary school students in south Germany first watched an instructional video and learned about a psychological theory (cognitive load theory). They were randomly assigned to either experimental conditions in which students produced an explanation to a fictitious peer in a written or oral format (with or without prompts) or restudied the learned material. Afterward, students in experimental conditions had a chance to revise their explanations, while students in a control condition continued to restudy the learned material. All students took a knowledge test after one day (post-test) and seven days (followed-up test). The preliminary results showed no main effect of experimental conditions on students' conceptual and transfer knowledge in both post-test and follow-up tests while controlling for students' prior knowledge and school grades. However, there was a marginally significant main effect of the medium, indicating that students who produced oral explanations showed higher conceptual and transfer knowledge compared to students who produced written explanations. There was no main effect of prompts. One possible reason for the superiority of oral explanations over written explanations could be the higher feeling of social presence for the oral conditions, which triggers more generative and elaborative processes during explaining. Another possibility is the higher extraneous load in the written than the oral condition.

Effects of a high school peer-tutoring program on students' understanding and learning strategy use
Presenting Author: Tatsushi Fukaya, Hiroshima University, Japan

Peer-tutoring might promote not only deeper comprehension of subjects, but also everyday use of effective learning strategies. The purpose of this study was to develop an effective peer-tutoring program and evaluate its effects. 320 public high school students participated in the program which consisted of lectures and actual peer-tutoring. The program consisted of four hours of classes (50 min. x 4). The first class was an introduction to effective tutoring. In the second class, the first tutoring activity was conducted with scaffoldings to improve the quality of tutoring. In the third class, students were asked to reflect on the first lesson. In the fourth class, we conducted the second tutoring activity, with less scaffolding than in the first tutoring. Before and after the program, a questionnaire survey was administered that included a test to understand the content covered in the first tutoring activity and questions about learning strategies. For the learning strategy, delayed measurements were also conducted 2 months after the program. The results of the analysis showed that comprehension scores for the subject contents increased from pre- to post-tutoring. The post-measurement was taken approximately one month after the first tutoring session, suggesting that tutoring promoted a deeper understanding of students. In addition, the use of learning strategies such as checking one's own understanding by giving explanations improved from pre- to post-tutoring, and this improvement was maintained in the delayed measurement taken two months after the program.

Symposium
Higher Education

Challenging the narrow definitions of diverse students' sense of belonging in higher education

Keywords: Educational Attainment, Higher Education, Inclusive Education, Migrant / Refugee and Minority students, Mixed-method Research, Peer Interaction, Pre-service Teachers, Sustainable Development

Interest group: SIG 04 - Higher Education
Chairperson: Pieter van Lamoen, Erasmus University Rotterdam, the Netherlands, Netherlands
Organiser: Aike Dias-Broens, Erasmus University Rotterdam, Netherlands
Discussant: Kim Ouwehand, Erasmus University Rotterdam, Netherlands

Evidence suggests that developing a sense of belonging is positively related to emotional wellbeing, academic motivation and success in higher education. With the massification of higher education and the diversification of the student population, it is essential to challenge the existing narrow definitions of sense of belonging. In this symposium, we will challenge these definitions from multiple viewpoints. In presentation 1, the body of literature about the conceptualizations and measurements of sense of belonging in higher education will be discussed. This includes a discussion on how and if these (narrow) conceptualizations and measures take students' ethnicity and generation status in higher education into account. Afterwards, three studies will be presented where the (narrow) definitions of sense of belonging are challenged by discussing results based on empirical research with higher education students. In presentation 2, first year undergraduate students' understanding of their own belonging needs - and how this connects to subsequent levels of belonging - is investigated through a mixed methods action research study across two English universities. Furthermore, presentation 3 also focuses on the first year experience and zooms in on the sense of belonging of an often underrepresented group of students, namely mature first-generation students, who follow a teacher education program. Finally, in the 4th presentation, the perspective and experience of students who feel a low sense of belonging and decide to drop out early is discussed.

A systematic literature review about the sense of belonging of diverse students in higher education
Presenting Author: Aike Dias-Broens, Erasmus University Rotterdam, Netherlands; **Co-Author:**Marieke Meeuwisse, Erasmus University Rotterdam, Netherlands; **Co-Author:**Sabne Severiens, Erasmus University Rotterdam, Netherlands

Sense of belonging in higher education plays an important role in the academic attainment of students in higher education. It is worrisome that first-generation students and ethnic minority students feel a lower sense of belonging in higher education compared to their peers. Therefore, in this systematic review we investigated 1) how the sense of belonging of students in higher education is conceptualised and measured, and 2) how these conceptualizations and measures differ in studies based on students' ethnicity and generation status in higher education. The systematic review included 150 quantitative, qualitative and mixed method articles published between 2000 and 2021. The quality of the included articles was appraised and the articles were analysed through an integrative approach. Results revealed the following concerns: 1) the used conceptualizations were extensive and varied greatly, and this concern was also found in the measures as 52 different measures for sense of belonging in higher education were used, 2) multiple conceptualizations from (diverse) students in qualitative studies were not included in conceptualizations in quantitative studies, 3) there was a misalignment between the conceptualizations and measures used, and 4) there was missing psychometric investigation into the validity and measurement invariance of sense of belonging for (diverse) student populations in higher education. These results are important and can be used to determine a more fitting conceptualization and measure of sense of belonging for a diverse student population in higher education.

An action research approach to challenging narrow conceptions of belonging amongst students
Presenting Author: David Gilani, Middlesex University, United Kingdom

An ever-expanding body of research and practice within higher education has seen increased provision of opportunities to help students build belonging. This is not without purpose, given the close links between belonging and student outcomes - e.g. continuation rates. This research argues for and explores a missing element: helping students to understand their individual belonging needs, challenge narrow definitions and subsequently act to build authentic belonging. This is especially important, given repeated research suggesting that it is students from disadvantaged backgrounds who tend to have lower levels of belonging. Based on a sample of approximately 80 new undergraduate students from two English Higher Education institutions, this mixed-methods approach investigates how two different types of workshops – one focused on study skills and another on the topic of belonging – can help students to understand their own needs. Quantitative aspects of the research focus on how belonging levels change across students' first year of study using the Yorke belonging scale, whilst the qualitative parts of the research centre around students' contributions to a longitudinal online diary.Results will centre around the extent to which workshop interventions enhance first year undergraduate students' understanding of their own belonging needs and eventual levels of actualised belonging, as well as the actions students take to build authentic belonging.

Mature student belonging in teacher education: we're fine because you don't feel you are by yourself
Presenting Author: Karina Ryan, Mary Immaculate College, Ireland

This paper will share access practitioner insights on the theme of belonging in higher education. These insights form part of a larger collaborative research project with mature first-generation students participating on an initial teacher education programme. Evidence strongly suggests that mature students often struggle with belonging as they transition into higher education. These struggles with belonging are particularly apparent amongst under-represented groups in teacher education in Ireland where teaching is predominantly a middle-class profession. While the theme of belonging arose frequently throughout the study, belonging did not emerge as an unproblematic concept or one that is easily defined or universally achievable. Instead, belonging, as experienced by the participants, was complex, protracted, and primarily relational in nature. As the year progressed, the participants grew in confidence and found ways of experiencing belonging and student teacher identities. They also drew heavily on and, contributed in turn, to the peer group support which was an important part of this alternative belonging experience. The findings suggest that, for mature ITE students a sense of belonging, which aligns with and even celebrates their mature and first-generation entrant identities, can be greatly enhanced through supports collaboratively developed and delivered within a framework of care.

Student sense of belonging and early dropout – how are they related?
Presenting Author: Claudia Gomes, Rotterdam University of Applied Sciences, Netherlands

Although higher education has become more accessible and inclusive for students of all social, cultural and educational backgrounds, not all students reach their academic goal. Belonging is critical to first-year student success and persistence in higher education. In the freshman year students make the transition to higher education and need to find a new sense of belonging. The foundation for sense of belonging is laid in the freshman year and plays an important part in the academic outcome of first year students, especially in the liminal phase of the transition and in the student's ability to integrate into the life of the institution. Student sense of belonging is related to early drop out in the propaedeutic year. The aim of the study was to gain a better understanding of the underlying factors of student sense of belonging and how these relate to early drop out. Students were recruited to participate in an online quantitative survey (N = 1745). The findings suggest that quality of relationships with peers, staff, and identification with the institution play an important role in students' sense of belonging and early drop out.

Symposium
Educational Policy and Systems

Research on predictors of grade retention in Europe: State of the art

Keywords: At-risk Students, Attitudes and Beliefs, Developmental Processes, Educational Policy, Meta-analysis, Parents' Beliefs and Affect, Primary Education, Secondary Education, Teaching/Instructional Strategies
Interest group: SIG 18 - Educational Effectiveness and Improvement
Chairperson: Mieke Goos, Belgium
Discussant: Barbara Belfi, Maastricht University School of Business and Economics, Netherlands

A lot of research has been done on grade retention, in many countries around the world, showing this practice to be non-effective and highly unfair, tackling low-

SES students, ethnic minority students, and disabled students in particular (Goos et al., 2021; Valbuena et al., 2020). Much less is known about predictors of grade retention at the parent, teacher, class and school team level. Which characteristics increase students' risk of being retained in grade? Which types of teachers apply grade retention more often? Our symposium tries to answer these questions, via a literature review and 3 empirical studies conducted in Luxembourg, Belgium, and Portugal (see Table 1). Our symposium closes with a discussion linking our results to educational policy and practice. Table 1*Descriptive characteristics of the 4 symposium studies* Study Country Data Method 1 Europe / Literature review 2 Luxembourg Data of the Luxembourgish Ministry of Education Empirical study (multilevel regression analysis) 3 Belgium SiBO longitudinal study Empirical study (multilevel regression analysis) 4 Portugal Data of Madeira primary schools Empirical study (path analysis) References Goos, M., Pipa, J., & Peixoto, F. (2021). Effects of grade retention policies: A literature review of empirical studies applying causal inference. *Journal of Economic Surveys, 35*(2), 408-451. doi: 10.1111/joes.12406

Do parental educational aspirations protect against grade retention?
Presenting Author: Florian Klapproth, Medical School Berlin, Germany; **Co-Author:**Fabian Meissner, Medical School Berlin, Germany; **Co-Author:**Antoine Fischbach, Luxembourg Centre for Educational Testing, Luxembourg

Based on longitudinal data from 38,176 students enrolled in Luxembourgish secondary schools, we examined whether parental educational aspirations are negatively related to students' likelihood of retention in grade 8. Moreover, we investigated whether this relationship is moderated by parents' immigration status. By using 2-level logistic regression analysis, we could show that parental educational aspirations are indeed a significant predictor of students' likelihood of being retained in grade 8, even when students' achievement (represented by grade point average) and students' secondary school track are controlled for. Students whose parents had high educational aspirations were less prone for grade retention than students whose parents had low educational aspirations. A moderation effect of parents' immigration status was not found. The results obtained are discussed with regard to the importance of family background for educational success.

Which teacher, class and school characteristics predict Flemish teachers' grade retention beliefs?
Presenting Author: Mieke Goos, KULeuven + UCLL, Belgium; **Co-Author:**Elke Londers, UCLL, Belgium

This study aims to unravel which teacher, class and school characteristics are related to Flemish primary school teachers' grade retention beliefs. For this purpose, data from 857 teachers, 109 principals, and 3885 students from 121 Flemish primary schools were used. Two-level linear regression analysis was used to detect characteristics predicting teachers' beliefs about the effectiveness of grade retention. Flemish primary school teachers, on average, appeared to have rather positive beliefs about grade retention effectiveness. Grade, teaching in a multiple-age-class, class math achievement heterogeneity, and school team grade retention beliefs seemed to matter in this regard, demonstrating the importance of both personal professional experiences and teachers' immediate environment in shaping their beliefs.

Are teacher beliefs about interventions promoting student success related with grade retention?
Presenting Author: Natalie de Nóbrega dos Santos, ISPA-Instituto Universitário, Portugal; **Co-Author:**Vera Monteiro, ISPA- Istituto Universitário, Portugal

A complex and multifaceted belief system influences teachers' professional practices. The present study sought to understand primary school teachers' beliefs about the effectiveness and difficulty of implementing various interventions, including grade retention, to promote the academic success of struggling second-grade students. Additionally, we sought to understand the relationship between these beliefs and teachers' grade retention practices. Two hundred seventy-three primary school teachers from the Region of Madeira, Portugal, completed an online questionnaire designed for this purpose. The results indicated that teachers consider grade retention to be ineffective, compared to other interventions, but still moderately helpful in preventing school failure. Individual instruction, smaller class sizes and differentiated instruction were considered the more effective interventions. Teachers also found grade retention easier to implement than family involvement and psycho-pedagogical support. A path analysis indicated that teachers who believed more in the effectiveness of grade retention and one-on-one instruction and considered it more challenging to promote social-emotional skills retained more students the last time they taught second grade. The results suggest the importance of developing pedagogical differentiation strategies, promoting socio-emotional skills and supporting family involvement, during teachers' initial training and career, that is, three interventions that will have a greater possibility of reducing the use of grade retention and promoting school success among struggling students.

The predictors of grade retention in Europe: A systematic review
Presenting Author: Joana Pipa, ISPA - Instituto Universitário | Center for Research in Education, Portugal; **Co-Author:**Sérgio Gaitas, ISPA-Instituto Universitário / CIE - ISPA (Center for Research in Education), Portugal; **Co-Author:**Francisco Peixoto, ISPA - Instituto Universitário | Center for Research in Education, Portugal

Research on grade retention has a long tradition and remains a hot topic in educational research and practice, especially given the debate around the complexity of its effects. In addition, studies have revealed that grade retention does not affect students equally, showing the existence of several factors predicting the likelihood of grade retention. However, a systematic approach summarizing the literature regarding the predictors of grade retention is still missing. This study aims to summarize the research findings of recent European studies investigating the predictors of retention in grades K-12. More specifically, this study aims to identify factors at the student, teacher, classroom, school and region/country level that have an impact on students' grade retention status. Based on our search strategy and selection criteria, 32 studies were identified. Overall, our findings indicate that students' characteristics have been examined most often, demonstrating their predictive value for grade retention. These findings suggest the need for changing the paradigm of studying grade retention predictors only in the light of student characteristics, to explore the contribution of other factors, such as teaching practices and classroom and school organization. Changing this paradigm would strongly contribute to changing grade retention policies and practices.

Symposium
Teaching and Teacher Education

Teacher interventions on learning interaction in the classroom

Keywords: Classroom Management, Engagement, In-service Teachers, Pre-service Teachers, Primary Education, Teacher Professional Development, Teaching/Instructional Strategies, Well-being
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland
Organiser: Sigrun K. Ertesvag, University of Stavanger, Norway
Discussant: Pamela Sammons (Greet), University of Oxford, United Kingdom

A substantial body of evidence exists on the importance of learning interactions between teachers and students in promoting students' engagement and learning. Learning interactions holds the most promise for intervention efforts seeking to improve student engagement and learning because, unlike many individual and family factors, they are malleable and open to improvement by the school community. Accordingly, there is a need for research-based initiatives to develop learning interactions both in teacher training and in schools to provide a career-long focus on the development and improvement of learning interactions. This symposium presents initiatives to support teacher students' and teachers' development of learning interaction skills in Norway, Finland, and Sweden. The first paper investigates students' understandings and expressions of learning interaction from their first practice period, the first year of teacher education. Knowledge about teacher students' early understandings and expressions of learning interactions is important to better understand and support teacher students' development of learning interaction in teacher education and future interventions. The second paper presents a model for prospective

teachers' systematic development of learning interaction skills. This innovative approach to teacher training addresses the development of learning interactions in practice periods throughout the teacher training. The third and fourth papers present two initiatives to develop teachers' didactic learning interaction (third paper) and generic learning interactions (fourth paper). Taken together the four papers illustrate how pre- and in-service training can support teachers' career-long development of learning interaction. The studies also address the role of systematic observation in interventions to improve learning interactions.

Beginning teacher students' understandings and expressions of classroom management
Presenting Author: Karin Street, Western Norway University of Applied Sciences, Norway; **Co-Author:**Sigrun K. Ertesvag, University of Stavanger, Norway; **Co-Author:**Siv Måseidvåg Gamlem, Volda University College, Norway; **Co-Author:**Linda Moen Rebni, Western Norway University of Applied Sciences, Norway; **Co-Author:**Randi M. Sølvik, Universty of Stavanger, Norway; **Co-Author:**Grete Sørensen Vaaland, University of Stavanger, Norway

Although classroom management is seen as central to supporting students' learning and development, little is known regarding teacher students' initial and developing classroom management during teacher education. Expanding our knowledge of this is important to inform teacher education practice and prepare teacher students for their professional role. In this study, we included texts (understandings) and self-recorded videos (expressions) from 19 Norwegian teacher students' first practice placement during their first year of teacher education, to investigate their early understandings and expressions of classroom management. Students demonstrated awareness of emotional support and classroom organisation principles of learning interactions, while there was less evidence of students' competence in instructional support. Furthermore, there was an emphasis on aspects of learning interactions that can be planned for and controlled, rather than aspects that place high situational demands and which may require situation-specific classroom management skills. This study is a first step in establishing knowledge regarding teacher students' developing classroom management competencies, to design research-informed learning processes for teacher students in teacher education and future interventions. It is important to carefully consider the progression of teacher students' developing classroom competencies in teacher education courses, building on established skills as well as supporting progress on new ones, to support teacher students' teaching self-efficacy and classroom management competencies.

Enhancing interaction and assessment skills with intervention program in teacher training in Finland
Presenting Author: Sanni Pöysä, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

This study examined teacher students' experiences of utilizing a research-based intervention program as a part of their pedagogical studies. The intervention program was created to enhance pre- and in-service teachers' awareness of dynamics of classroom interactions and increase their opportunities to provide formative assessment. The participants of the present study were 15 teacher students who participated on the intervention program during one academic year as a part of their studies. The data for the present study were collected by transcribing the group discussions that students had at the end of the academic year, and the data were analyzed with the conventional content analysis. The results showed, for example, that teacher students experienced that the tasks related to the intervention program enhanced their teacher identity. Particularly important were the discussions with respect to different themes targeted within the program. Overall, the results suggested that this intervention program can enhance teacher students' interaction and assessment skills in teacher training.

Leadership for learning – improving teaching among Swedish in-service teachers
Presenting Author: Marcus Samuelsson, Department of Behavioural science and learning, Sweden; **Co-Author:**Anja Thorsten, Department of Behavioural Sciences and Learning, Sweden

Two researchers and eight teachers participated in a collaborative research project, *Leadership for learning*, to improve in-service teachers' skills and abilities for teaching. A main aspect of the project was an intervention focusing on how teachers could plan, carry out and follow up their teaching. In relation to the intervention, an observation protocol was created consisting of three focus areas: Instructions and tasks, Task focus, and Thinking and responding. Each area was divided into two - five indicators. The researchers were responsible for the intervention and the co-researching teachers were trained to conduct the observations before and after the intervention. In all, the co-researchers observed 35 teachers when they taught, representing different school subjects. The co-researchers scored each lesson based on the degree the teachers had fulfilled each indicator in the three areas, using a four-graded scale. The pre- and post-observations were analysed in two steps. Firstly, the observed teachers were separated into three groups based on the scoring; X: 1.1-2.0, Y: 2.1-3.0 and Z: 3.1-4.0. Secondly, pre-, and post-observation were compared. Based on this, it was found that 29 of 35 teachers had changed their way of teaching in a positive direction, also that 5 of 35 had changed it in a negative direction and that 1 of 35 had not changed at all. A statistical analyse of the scores in the per- and post-observation showed that group X and Y did significant progress. The intervention seemed to have helped the teachers improve their *leadership for learning*.

Teacher stress and learning interaction quality as predictors of improvement in student engagement
Presenting Author: Sigrun K. Ertesvag, University of Stavanger, Norway; **Co-Author:**Grete Sørensen Vaaland, University of Stavanger, Norway

Adopting a person-centered approach, the present study investigates how variables of teacher stress and learning interactions co-occur within teachers. Further, how these profiles of stress and TLI predict change in students' engagement in a one-year video-based individual teacher coaching intervention. Learning interactions (TLI) are interactions between teachers and students that are central drivers for student learning and development. TLI can be organized into three domains: teachers' emotional support, classroom organization, and instructional support. The intervention is implemented in the school year 2022-2023 and aims to improve teachers' TLI skills and students' engagement in upper secondary schools.The sample consists of 99 teachers and 1400 students in 99 classrooms participating in a cluster randomized control trial designed to evaluate the effects of the intervention on, among other things, student engagement. This paper uses the baseline (spring/fall 2022) and post-test (spring 2023) student, observer, and teacher reports. Applying Latent profile analysis (LPA) four baseline profiles were identified and characterized by 1) Low level of stress – medium level of teacher-student TLI compared to the other profiles, 2) Medium stress - medium TLI 3) High Stress- low TLI quality 4) Medium stress - high TLI quality. Multilevel analyses will be applied to investigate how profiles of stress and TLI predict change in individual students' engagement (Spring 2023). Knowledge of for whom and under which conditions an intervention is effective, allows interventions to be more targeted and indicate for whom and how interventions may be particularly useful to improve teacher-student TLI and student engagement.

Cognitive Science, Learning and Instructional Technology

Critical evaluation of evidence and sources when learning from multiple documents

Keywords: Attitudes and Beliefs, Cognitive Skills and Processes, Comprehension of Text and Graphics, Critical Thinking, E-learning/ Online Learning, Metacognition, Pre-service Teachers, Problem Solving, Reading
Interest group: SIG 02 - Comprehension of Text and Graphics
Chairperson: Marc Stadtler, Germany
Organiser: Marc Stadtler, Germany
Discussant: Clark Chinn, Rutgers University, United States

Learning from multiple authentic documents on the Internet has become a widespread task. Due to the open publication principle of this medium, however, individuals have to critically evaluate the validity of what they read. In so doing, individuals may make first-hand evaluations, thus critically questioning the quality of the evidence that is presented to support a claim. Second-hand evaluations, in contrast, involve that readers critically evaluate the trustworthiness of the sources at hand. A better understanding of how first- and second hand evaluations skills unfold across the lifespan and how these skills can be fostered is urgently needed. Against this backdrop, the goal of this symposium is to present four empirical studies that center on the selection, integration, and evaluation of sources and evidence including the promotion of this skill. Presentation 1 studies how learners from late primary school to young adulthood evaluate sources

and evidence in a web-based assessment tool. Using a longitudinal design, Presentation 2 examines the contribution of epistemic beliefs on pre-service teachers' selection and integration of different types of evidence. Presentation 3 studies secondary students' source evaluations as a function of strategic and metacognitive scaffolds. Finally, presentation 4 reports on the effects of a strategy training aiming at fostering secondary students' critical evaluation strategies in an out-of-school lab day. A joint discussion will be stimulated by a renowned discussant. Expected scientific and educational outcomes are a better understanding of the skills of evaluating sources and evidence and evidence-based interventions that effectively promote these skills.

Credibility Evaluation Profiles of Students Representing Primary and Secondary Education
Presenting Author: Riikka Anttonen, Tampere University, Finland, Finland; **Co-Author:**Laura Kanniainen, Tampere University, Finland; **Co-Author:**Carita Kiili, Tampere University, Finland

This study examined the structure of credibility evaluation of online texts and credibility evaluation profiles among 738 students (51% girls) from different levels of education. Students' credibility evaluations were measured in a web-based task. In this task, 140 fourth graders, 200 sixth graders, 205 eighth graders and 193 students from general and vocational upper secondary education evaluated the credibility of four online texts. Two of the online texts were more credible (a popular science text and a science newspaper article) and two less credible (a personal blog text and a commercial text). Students read one text at a time and evaluated the author's expertise, the authors' benevolence, and the quality of the evidence with a six-point scale. Based on the confirmatory factor analysis, students' credibility evaluations reflected the source texts (first-order factors) and required two latent skills (second-order factors): confirming the more credible texts and questioning the less credible texts. This factor structure was similar across the four participating grade levels. The latent profile analysis identified four credibility evaluation profiles: (1) critical evaluators (n = 144), (2) emerging evaluators (n = 204), (3) hesitant evaluators (n = 271), and (4) trusting evaluators (n = 119). Findings showed that the number of critical evaluators increased among older students: 8% of fourth graders, 22% of sixth graders, 32% of eighth graders and 38% of students from general and vocational upper secondary education were critical evaluators. This indicates that there is still room for improvement across all grade levels.

How do pre-service teachers use multiple documents depending on their epistemic perspectives?
Presenting Author: Martin Greisel, University of Augsburg, Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany

Teachers need to process multiple documents containing different kinds of knowledge (i.e., experiential knowledge, scientific knowledge, and local contextual knowledge) to solve teaching problems they are confronted with. How they integrate these types of knowledge is assumed to depend on their epistemic perspective. Therefore, we examined the extent to which their epistemic perspective (absolutist, multiplistic, evaluativist) predicts how they use documents with different types of knowledge (experiential knowledge: Whatsapp chat and internet forum; scientific knowledge: journal article and handbook chapter; contextual knowledge: expert report on one student and teachers' report about the class) when they solve a pedagogical problem. This was presented as a video vignette of collaborative learning. Our results showed that an absolutist perspective did not predict how frequently a document was used (all $\beta \leq |.10|$, $p \geq .09$). However, a multiplistic perspective was detrimental to the use of scientific documents (journal article: $\beta = -.14$, $p = .021$; handbook chapter: $\beta = -.22$, p

Scaffolding Students' Source Trustworthiness Evaluation
Presenting Author: Danna Tal Savir, University of Haifa, Israel; **Co-Author:**Sarit Barzilai, University of Haifa, Israel; **Co-Author:**Fayez Abed, University of Haifa, Faculty of Education, Israel; **Co-Author:**Shiri Mor-Hagani, University of Haifa, Faculty of Education, Israel

In a "post-truth" era, students require more than ever the capabilities of evaluating source trustworthiness in order to decide whether to believe the information that they read online. Therefore, there is a need to develop instructional approaches for promoting source evaluation. The aim of our study was to advance the understanding of how epistemic scaffolds contribute to the development of students' source evaluation performance. In a quasi-experimental study with 137 9th grade students, we examined the contribution of learning with a strategic epistemic scaffold, which included a digital tool for mapping sources, claims, and evidence from multiple documents, and a meta-epistemic scaffold, which involved collaborative development of class lists of evaluation criteria, to students' capabilities to use source evaluation to select documents and to draw conclusions. Students who learned with the document mapping scaffold increasingly used sourcing criteria to justify their document evaluations and became more likely to consider source trustworthiness as they weighed claims and drew conclusions. The meta-epistemic criteria discussions enhanced the effects of document mapping by leading to greater metacognitive knowledge about source trustworthiness evaluation criteria and to greater vigilance against unreliable sources. The scaffolds had no significant impact on the amount of documents that students' used in their essays. These results demonstrate that learning with a strategic document mapping scaffold can foster source trustworthiness evaluation even without explicit meta-epistemic discussions of evaluation criteria. However, supplementing mapping with meta-epistemic criteria discussions can lead to greater metacognitive growth and thus support more robust source evaluation.

Can 5G radiation kill birds? Promoting the use of evaluation strategies against misinformation
Presenting Author: Philipp Marten, Ruhr University Bochum, Germany; **Co-Author:**Sandra Aßmann, Ruhr-University Bochum, Institute of Educational Sciences, Germany; **Co-Author:**Marc Stadtler, Ruhr-University Bochum, Institute of Educational Science, Germany

When learning online, a wide variety of content is easily available. Yet, Internet users must evaluate the veracity of what they read, a task that adolescents often neglect. Therefore, the aim of the present study was to test the effectiveness of a newly developed strategy training aiming at the promotion of two evaluation strategies, sourcing and corroboration, using authentic Internet materials. The training was compared to a control group that received a declarative knowledge training on the topic of misinformation of about the same length. Data were collected from 196 7^{th} and 8^{th} graders who participated with their classes in an out-of-school science lab day. Classes were assigned randomly to either the strategy training or the knowledge training. Data were collected at three points of measurement (before, immediately after, and three-four weeks after the training). Analyses controlled for individual difference variables reading proficiency, self-reported prior knowledge, topic interest, and socioeconomic background. As expected, the strategy training group outperformed controls in terms of discriminating between sources of higher and lower trustworthiness, debunking false statements, and knowledge of evaluation strategies in the short and medium term. Instructors may readily implement the theoretically founded and empirically validated training materials that are published as Open Educational Resources. Future research, however, should examine ways of increasing the magnitude of effect sizes, which were only small to moderate in the present study. This could even enhance the potential of this training approach in terms of equipping adolescents with the skills necessary in the information age.

STEM learning experiences as boundary objects? The Hong Kong case
Keywords: Curriculum Development, Science and STEM, Science Education, Secondary Education
Presenting Author: Ka Lok Cheng, The University of Hong Kong, Hong Kong

STEM curriculums should function as boundary objects that bridge different disciplinary perspectives. However, there is currently insufficient invested effort regarding how boundary-crossing could be realised in the curriculum artefacts. Thus, this work serves to supplement the related dialogues in interdisciplinary

STEM education. Specifically, the current study aims to understand whether dialogues between perspectives were supported by the STEM-related elements in the official junior science curriculum documents and the textbooks accordingly written in Hong Kong. Content analysis was carried out under the guidance of analytical constructs that pay attention to the identification, coordination, reflection, and transformation of perspectives. The study shows that the curriculum artefacts could support the identification and coordination of different disciplinary perspectives to a certain extent, like the description of the nature of the subject and the inclusion of learning activities that might serve as boundary objects. Nevertheless, there are insufficient opportunities for the students to reflect on their own perspectives and develop mechanisms for working and functioning at the boundaries. This study could serve as a stimulus for further academic dialogues and guidance for revising official curriculums and textbooks to allow students to be better equipped to deploy interdisciplinary strategies to resolve problems in uncertain times.

Towards Defining, Assessing and Modelling Competency Levels in the Field of Stoichiometry
Keywords: Competencies, Feedback, Problem Solving, Science Education
Presenting Author: Krause Alexander, Gottfried Wilhelm Leibniz Universität Hannover, Germany; **Co-Author:**Andreas Nehring, Gottfried Wilhelm Leibniz Universität Hannover, Germany

Stoichiometry is a particular difficulty in learning chemistry for learners worldwide. Various studies have already been conducted on the difficulties and their causes, the necessary prerequisites as well as possible learning supports in stoichiometry. Competency-based approaches that allow to determine learners' level of competency based on assessment are still rare in this field. We developed a competency model in the field of stoichiometry describing four competency levels (“StoiCoLe-model”). Learners have high stoichiometric competencies if basic knowledge, stoichiometric equations and reaction equations can be interconnected and applied to solve complex stoichiometric problems. We developed a test consisting of 40 items that assesses the defined competencies and administered it in a sample of 79 mainly first-year students from various chemistry courses. Our results indicate adequate psychometric properties and provide confirming evidence for three of four levels. We discuss these findings with regard to possible alternative competency levels and to fostering learning and teaching in stoichiometry.

Designing Social Justice Oriented Science Curricula Towards Consequential Learning
Keywords: Curriculum Development, Science and STEM, Science Education, Secondary Education
Presenting Author: Ravit Duncan, Rutgers University, United States; **Co-Author:**Edna Tan, UNC Greensboro, United States; **Co-Author:**Rishi Krishnamoorthy, PSU, United States; **Co-Author:**Tasha Austin, Buffalo State College, United States; **Co-Author:**Frieda Reischman, Concord, United States; **Co-Author:**Sugat Dabholkar, GSE-Rutgers University, United States; **Co-Author:**Ti'Era D. Worsley, University of South Carolina-Greensboro, United States; **Co-Author:**Megumi Asada, Rutgers University, United States

Supporting minoritized students' participation in a science classroom requires designing with expansive notions of what counts as doing and learning science. Additionally, prior work on equitable participation in STEM learning contexts has demonstrated that disrupting settled, and powered participation structures can support expansive epistemic agency. Building on this work, we designed a middle-school biology unit about stress to address the topic of body systems and their interactions, while also challenging the boundaries of disciplined science, and promoting social change making through consequential learning. We identified three core axiological commitments that shaped the design of the unit - a) challenging and expanding disciplined science by entangling body and environment, b) politicizing “environment” and relating injustices across local and national contexts, and c) supporting social change making at the structural level through allied political struggle. We present how these commitments were operationalized in the unit design and how that supported marginalized students' consequential learning in a science classroom. Our work contributes to understanding ways to design for justice-oriented learning in a science classroom.

Space for All: A Multinational Survey of Astronomy Education
Keywords: Curriculum Development, Informal Learning, Science and STEM, Science Education
Presenting Author: Christine Hirst Bernhardt, University of Maryland, College Park, United States; **Co-Author:**Janelle M. Bailey, Temple University, United States

Astronomy is one of the oldest sciences in human history; space sciences seek to answer the biggest questions, and encompass technologies that directly impact humanity. Space content can naturally integrate into existing subjects and leverage students' innate curiosities and interests, which is critical now as we adapt learning for digital natives. Astronomy can be a “gateway” to inspire further STEM learning. In 2021, a study of 53 nations found astronomy present in 100% of national curricula, and made recommendations for professional development and further research (Salimpour et al., 2021). The present study provides qualitative context for those recommendations and establishes a foundation on which to ground further work with educators. Surveys were collected from participants in 21 countries other than the USA based on their involvement with astronomy education efforts, and 6 were selected to participate in semi-structured interviews. Initial results favor informal astronomy learning over mandated content. Partnerships with universities and community-based efforts such as telescope loan programs provide promising opportunities as the primary roles of astronomy education in these countries. Results also highlight the national influence of space programs and involvement with the global space economy as well as restrictive curricula upon access to astronomy education. Participants from every represented nation expressed frustration at the lack of professional development for teachers. Future studies should focus on the impact of formal and informal collaborations, and provide quality materials for teachers to integrate astronomy into their courses.

Resilience trajectories despite IPV experiences and the influence of protective factors
Keywords: Anxiety and Stress, At-risk Students, Resilience, Self-determination
Presenting Author: Dilan Aksoy, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Céline Favre, PH FHNW, Institut Forschung und Entwicklung, IFE, Switzerland; **Co-Author:**Celeste Simões, University of Lisbon, Faculty of Human Kinetics, Portugal; **Co-Author:**Petra Sidler, School of Education, FHNW, Switzerland

Countless studies have shown that parental violence can severely impair children's development. Meta-analyses show a strong association between parental violence and psychopathological consequences as well as impaired socio-emotional development. Interparental violence (IPV) is the most commonly observed form of violence in adolescence and is associated with psychopathological consequences, future violent behavior, and delinquency. Despite these serious consequences and the high prevalence (35-49%) of IPV experiences in the USA and Europe, there are few analyses that focus on person-centered models and consider psychological IPV. Therefore, this study examines the following question: What are the resilience trajectories of youth with IPV experiences, how stable are they, and what protective factors that can be addressed in school and sociodemographic variables predict group membership? Using a sample of 879 (T1; August 2020) and 770 (T2; July 2021) adolescent Swiss students aged 11.74 (*SD*= .64) and 13.77 (*SD*= .53), respectively, we conducted a Latent Transition Analysis and analyzed profile affiliation using multinomial logistic regression analysis. Results show that there are four time-invariant IPV-resilience trajectories, with the non-resilience profiles being the most stable profiles over time. Socio-demographic variables and parental physical violence as well as protective factors showed significant prediction of profile membership.

Resilience in adolescence over time: A Three-Wave Latent Transition Analysis on Violence-Resilience
Keywords: Anxiety and Stress, At-risk Students, Resilience, Self-determination
Presenting Author: Wassilis Kassis, School of Education, FHNW, Switzerland; **Co-Author:**Céline Anne Favre, School of Education, FHNW, Switzerland; **Co-Author:**Dilan Aksoy, School of Education, FHNW, Switzerland

Internationally, about 25% of all children experience physical abuse by their parents. Despite the numerous odds, there are adolescents who have experienced even the most serious forms of physical abuse by their parents escape the vicious family violence cycle. In this study, we analyzed longitudinally over two years and three waves the data from a sample of $N = 1767$ seventh-grade high school students in Switzerland on physical abuse by their parents, by conducting an online questionnaire. We found that in our sample, about 20% of the participating adolescents' parents had physically abused them. We considered violence resilience a multi-systemic construct that included the absence of psychopathology on one hand and both forms of well-being (psychological and subjective) on the other. Our latent construct included both feeling good (hedonic indicators, such as high levels of self-esteem and low levels of depression/anxiety and dissociation) and doing well (eudaimonic indicators, such as high levels of self-determination and self-efficacy as well as low levels of aggression toward peers). By applying a person-oriented analytical approach via latent transition analysis with a sub-sample of students who experienced physical abuse ($n_{W3} = 523$), we identified and compared longitudinally over three waves four distinct violence-resilience patterns and their respective trajectories over time. By applying to the field of resilience, one of the most compelling insights of well-being research (Deci & Ryan, 2001), we identified violence resilience as a complex, multidimensional latent construct that concerns hedonic and eudaimonic well-being and is not solely based on terms of psychopathology

Socio-emotional violence resilience – a two wave latent transition analysis
Keywords: Anxiety and Stress, At-risk Students, Peer Interaction, Resilience
Presenting Author:Céline Favre, PH FHNW, Institut Forschung und Entwicklung, IFE, Switzerland; **Co-Author:**Dilan Aksoy, University of Applied Sciences and Arts Northwestern Switzerland PH (FHNW), Switzerland; **Co-Author:**Wassilis Kassis, School of Education, FHNW, Switzerland

Adolescent's exposure to intimate partner violence (IPV), which is increasingly recognized as a distinct form of childhood maltreatment, is associated with a range of negative psychosocial outcomes, including increased risk for psychopathological behaviors and posttraumatic stress symptoms. Violence-resilient adolescents are those that act and grow in a social and emotional way that is adaptive despite IPV. The school class context as part of the social system gains importance especially in adolescence as a place of socio-emotional development and in the context of IPV as an alternative to the dysfunctional home. Therefore, this study considers a person-centered approach that focus on the social system in school context. Based on a sample in autumn 2020 of 933 (t1) and a sample in spring 2021 of 776 (t2) secondary school students in Northwestern Switzerland (7th and 8th grade) with IPV experiences, a latent transition analysis with two waves is conducted in the present study to uncover socio-emotional resilience classes and the respective latent transitions over two time points. We identified four different patterns of socio-emotional violence resilience for both measurement time points and compared them longitudinally with their respective trajectories. The non-resilient pattern appeared to be the most stable pattern. Using multinomial logistic regression analysis, gender, migration background, peer rejection, prosocial behavior of school class and dissociation emerged as significant predictors of pattern membership.

Mediation of interpersonal relationships in school stress and student academic achievement.
Keywords: Achievement, Anxiety and Stress, Peer Interaction, Social Aspects of Learning and Teaching
Presenting Author: Olga Cuadros Jiménez, Universidad Católica Silva Henríquez, Chile; **Co-Author:**Benito León del Barco, Universidad de Extremadura, Spain

Stress in the educational context exerts significant pressure on individuals, affecting the competencies to face the challenges in different aspects. The consequences of stress on different dimensions of student's life are especially evident in the impairment of interpersonal relationships which would explain problems of maladjustment and social adaptation (Davies, Janus, Duku, & Gaskin, 2016). The diminish of quality of interpersonal relationships that students have with others in their educational environment is significant, since these bonds are promoters for psychological and social well-being that affect the academic achievement. This study proposed a mediation model, to test the effect of school stress on academic achievement, mediated by positive interpersonal relationships with peers and teachers. The sample consisted of 1273 students; with mean age= 14.20 years (SD= 2.43); 47.5% (n=605) females, 48% (n=611) males and 4.5% (n=57) non-binary.The results show a statistical significant effect in mediation models. The indirect effect that best statistically quantifies the effect of scholar stress on academic achievement is the one corresponding to the mediating of Positive Interpersonal Relationships with Teachers (β=0.022). Results highlight the relevance of the interpersonal dimension in the processes of learning and academic performance. It also provides clues about the protective factor of positive interactions with significant others in the learning context, highlighting the socio-affective role of the teacher in particular. Data quality considers a good fit, reliability and validity indicators. All research procedures were approved by the ethics committee of the sponsoring university.

Analysis of Teacher-Child Interactions in Tablet-Supported Episodes During Constructive Play
Keywords: Early Childhood Education, Learning Approaches, Multimedia Learning, Science and STEM
Presenting Author: Jossen Priska, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Ueli Thomas Studhalter, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Marco Seeli, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Annette Tettenborn, University of Teacher Education of Lucerne, Switzerland

The use of tablet computers in early childhood education has steadily increased in recent years. The question is no longer whether or not to use digital devices, but how to use them wisely. In this study, we investigate the use of tablets in a scenario of constructive play in kindergarten classes. The participating teachers use tablets to add visual feedback to their conversations with children about the stability of their block constructions. Theoretically, we locate the quality of teacher-child interactions in the concept of *sustained-shared thinking* and in the importance of attention and motivation for young children's learning. Based on these theories, we ask (Q1) to what extent a number of quality indicators of teacher-child interactions are reflected in tablet-supported episodes and (Q2) which tablet-specific patterns can be identified. Based on 8.7 hours of video material, we evaluate ten selected teacher-child interactions by conducting a qualitative content analysis with MAXQDA. The results indicate that the teachers show a rich scaffolding behavior and frequently use content-specific language when discussing the tablet videos with the children. A higher level of verbal involvement on the part of the children could not be determined. Further, we identify four patterns associated with the use of the tablet in the classroom: (1) delay in the course of action, (2) magnet-effect of the video, (3) revisiting of an observation and/or emotion, and (4) fascination with the medium. We discuss these findings against the background of integrating digital media in early childhood education.

Exploring Polyadic Sustained Shared Thinking-Interactions during Free Play, Meal and Tidying Up
Keywords: Cognitive Skills and Processes, Dialogic Pedagogy, Problem Solving, Social Interaction
Presenting Author: Alexandra Waibel, University of Teacher Education, St. Gallen, Switzerland, Switzerland

In the discourse on quality in early childhood education, educator-child interaction is considered to influence children's developmental progress (Wirts et al.

2017). Sustained Shared Thinking (SST) was identified as an important factor of successful interaction in early childhood institutions (Siraj-Blatchford et al. 2002). However, SST-interactions are rarely observable in kindergarten practice and usually identified and analysed in dyadic sequences. As communication in kindergarten also takes place in group settings the present study focuses on polyadic SST-interactions. Using an explorative qualitative research design, micro-process were analysed in order to identify strategies of kindergarten teachers that facilitate SST in groups of children during free play, meal or everyday sequences. The data include videography and information on children's family language from the international “SpriKiDS” study (Vogt et al. 2019). The analysis was conducted through Linguistic Conversation Analysis (Brinker & Sager 2010) and Grounded Theory (Strauss & Corbin 1996) supplemented by visualisations (Waibel 2021). Ten SST-sequences were explored in different group sizes involving ten kindergarten teachers and 43 monolingual and multilingual children. The results indicate that kindergarten teachers show an explorative and process-oriented approach and use combinations of several strategies to facilitate SST in groups. No differences can be observed in the applied combinations of strategies in multilingual and monolingual groups. Sensitive responsiveness to the interests and imagination of children and questions seem to facilitate SST as well as referring to children‘s life and switching between practical actions and cognitive reflections. The findings will be discussed regarding possible implications for pedagogical practice.

The technological landscapes with IoToys early childhood education in Norway
Keywords: Critical Thinking, Digital Literacy and Learning, Early Childhood Education, In-service Teachers
Presenting Author: Maria Dardanou, University of Tromsoe, Norway

According to the Norwegian Framework for Kindergartens (Norwegian Directorate for Education and Training, 2017), kindergarten teachers should use digital technology as a method in their everyday activities and practices. Norwegian ECE focuses on play, and especially free play activities that promote children participation and the holistic development of the child. The chapter discusses how Norwegian ECE discourses related to play may affect teachers’ views and attitudes and how children’s own participation in play activities with IoToys are a means for implementing IoToys. In this qualitative study, forms of play and learning with IoToys are investigating as spaces that open for creative and experimenting activities (Bølgan, 2017). As digital judgement is an aspect of kindergarten’s digital practices, play activities with IoToys provide opportunities for practising ethical reflections around use of these toys (Dardanou & Kofoed, 2019). Children’s reflections during play activities with IoToys relates to an introduction to the ideas and values of digital judgement and ethical considerations. Implementation of kindergarten practices shape conditions for human experience, identity and meaning making, providing a variety of avenues to understand how people are shaped and shape themselves. It will be discussed in what ways use of IoToys in ECE can introduce conditions for children’s cultural formation in kindergarten’s educational practices.

Stereotypes on Educational Tracks Among Secondary School Students in Flanders (Belgium)
Keywords: Attitudes and Beliefs, Peer Interaction, Quantitative Methods, Secondary Education
Presenting Author: Margo Vandenbroeck, KU LEUVEN (BE 0419.052.173), Belgium; **Co-Author:**Jonas Dockx, KU LEUVEN, Belgium; **Co-Author:**Rianne Janssen, KU LEUVEN, Belgium

According to the Stereotype Content Model (SCM), members of other groups are perceived according to the dimensions of competence and warmth. The model has been successfully applied to the perception of groups such as gender groups, ethnic groups and national groups. The present study’s aim was to empirically investigate stereotypes on educational tracks held by Grade 12 students belonging to three different tracks (general track, technical track, vocational track) in Flanders (the northern part of Belgium). Participants had to rate students in different educational tracks related to 12 personality traits, which were based on existing warmth- and competence questionnaires. Exploratory and confirmatory factor analyses were conducted to examine the structure of stereotypes, ANOVA was used to investigate mean differences. Analyses showed that the SCM could not be fitted for stereotypes on educational tracks. Exploratory factor analysis resulted in two factors: a positive valence factor and a negative valence factor. Results further indicated that students from different educational tracks were perceived significantly different with regard to several personality traits. Additionally, evidence was found for ingroup favoritism, meaning that students rated their own educational track more positively compared to other educational tracks. By identifying stereotypes on educational tracks, this study contributes to the literature on stereotypes and to an increased awareness of their existence and consequences.

Delayed tracking and the social meanings of educational tracks: an ethnographic study
Keywords: Peer Interaction, Qualitative Methods, Secondary Education, Social Aspects of Learning and Teaching
Presenting Author: Pomme van de Weerd, Utrecht University, Netherlands

Delayed tracking, i.e. postponing the separation of students into levels of education, is currently being proposed by educational bodies in the Netherlands to address two problems resulting from early tracking: inequality of educational opportunities and social segregation. There is a long-standing international tradition of research on the effects of (delayed) tracking on inequality. However, much less is known about social aspects of delayed tracking. This paper reports on ethnographic research at a delayed tracking school in the Netherlands. It analyzes discourse of students, teachers, and the school board, around tracking and detracking, and addresses the contradictions that arise when, at a local (school) level, explicit efforts are made to blur borders between tracks and present them as equally valuable, while at a societal level, they are usually kept separate and are perceived as hierarchically ordered. Furthermore, I address how issues around ethnic and social background arise and get entangled with tracking discourse. The paper contributes to academic knowledge about the social aspects of tracking and detracking, and has practical applicability for policy discussions around tracking in the Netherlands and internationally.

Social support stability in school transitions: Associations with truancy and completing education
Keywords: Achievement, Peer Interaction, Quantitative Methods, Social Interaction
Presenting Author: Tuomo Virtanen, University of Jyväskylä, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Jenni Pelkonen, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland

Dropping out of school during upper secondary education may lead to problems in the transition to adulthood and integration into society as well as to low well-being. A precursor to school dropout is truancy, that is skipping classes or school without a valid excuse. Prior evidence shows that social support in the relations between students and adults serves as a protective factor hampering students from school absenteeism and dropout. The aim of this study was three-fold. First, we investigated the extend student-perceived social support from family, peers, and teachers is stable (trait-like) across three educational contexts (primary school, lower secondary school, and upper secondary education) versus grade-specific (state-like, RQ1). Second, we used perceived support trait variance to predict whether students play truant from upper secondary education and do not complete the education in normative time (maximum 3.5 years, RQ2). Third, we tested whether truancy at the first year of upper secondary education mediated the associations between the three sources of support and non-completion of upper secondary education in normative time (RQ3). The STMS models showed, first, that 46%, 38%, and 31%, of the variances of student-perceived support from family, peers, and teachers respectively were trait-like. Therefore, 54%, 62%, and 69% of the variance were state-like, respectively.

Second, the results indicated that support from family and peers decreased upper secondary students' likelihood of truancy and of not completing upper secondary education. Third, teacher support predicted a lower likelihood of truancy but not completion of upper secondary education in normative time.

School dropout: Investigating pathways of academic achievement and psychosocial learning environment
Keywords: Achievement, Peer Interaction, Secondary Education, Social Aspects of Learning and Teaching
Presenting Author: Maren Tvedt, University of Stavanger, Norway; **Co-Author:**Edvin Bru, University of Stavanger, Norway

As one of very few, this study combined upper secondary school students' (n = 1241) self-reports on how they perceive the psychosocial learning environment in school with register data on academic achievement, to investigate dropout from upper secondary education. The study was conducted in the Norwegian upper secondary education context, where "dropout" is typically defined as non-obtained graduation within five years after starting upper secondary education. The aim was to investigate whether aspects of the psychosocial learning environment (i.e., perceived emotional support from teachers, and loneliness among peers at school) have unique predictive roles on school dropout, either directly or indirectly via subsequent academic achievement. Results indicated that perceived emotional support from teachers during first year of upper secondary school had a negative indirect effect on school dropout – via increased academic achievement. On the other hand, loneliness among peers at school did not affect subsequent academic achievement but yielded a positive, direct effect on school dropout.

Friluftsliv in Teacher Education – a step towards Environmental Awareness
Keywords: Environmental Education, Example-based Learning, Sustainable Development, Teaching Approaches
Presenting Author: Helga Aadland, Western Norway University of Applied Sciences, Faculty of Education, Arts and Sports, Norway; **Co-Author:**Joergen Nerland, Western Norway University of Applied Sciences, Norway; **Co-Author:**Trond Egil Arnesen, Western Norway University of Applied Sciences, Norway

While outdoor education may traditionally be linked to aspects such as personal development and outdoor skills, environmental issues now prompt a consideration of how outdoor education can contribute to pro-environmental changes. In our research we explore the environmental education potential of friluftsliv as a Nordic outdoor education tradition. Special attention is directed toward friluftsliv's environmental dimension and the possible potential such a quality could have in the development of environmental awareness. An extended version (Nerland & Nygård, 2019) of the environmental staircase model (Langholm et al., 2011; Staberg et al., 2020) is presented and applied as a basis for analyses of empirical data consisting of statements from international Erasmus students participating in the pedagogical friluftsliv course "Fjords and Glaciers". To analyze our data, we used systematic text condensation (Malterud, 2012). Interpretation of the statements reveal that students experience a positive change in their values and attitudes towards nature, albeit differences in environmental awareness development are apparent. Independent of their level of environmental awareness, all the teacher education students express that the course had an influence on their future professional practice.

Climate change discourses on social media: Clarifying the potential of relevant literacies
Keywords: Attitudes and Beliefs, Digital Literacy and Learning, Environmental Education, Social Media
Presenting Author: Catharina Philine Pfeiffer, Leibniz University Hanover, Germany; **Co-Author:**Stefanie Dr. Lenzer, Leibniz University of Hannover, Institute for Science Education, Germany; **Co-Author:**Andreas Nehring, Gottfried Wilhelm Leibniz Universität Hannover, Germany

From the perspective of science education, *literacies* describe a promising construct for effective climate education in the digital era. They are supposed to define the factual knowledge, relevant competencies, as well as specific attitudes and behaviours students have to develop in order to a) take climate-friendly action or b) evaluate controversial online information about anthropogenic climate change. In international educational research, many *literacies* were already defined that are focussing either on the development of pro-environmental behaviour like climate action, or on the evaluation of online information. Besides that, it remains unclear which *literacies* are indeed relevant in the context of climate change discourses on social media and which critical components they contain. Based on a systematic literature review according to the PRISMA statement, this contribution will first of all address the research question, which relevant *literacies* in the context of climate change discourses on social media can be found in the literature. Through a qualitative content analysis with the definitions of these *literacies* the specific components they contain will be presented. Finally, the *literacies'* potential for students' competent information gain from social media will be clarified. Thereby, the authors will mainly contribute to the state-of-the-art in international science education literature. Furthermore, the authors will be able to provide implications for future climate education and educational research in the digital era.

Elementary students' understanding and changing discourse about climate change
Keywords: Environmental Education, Misconceptions, Primary Education, Qualitative Methods
Presenting Author: Gertraud Benke, Klagenfurt University, Austria

Action to combat climate change is one of the UN's 17 Sustainable Development Goals. A basic understanding of climate change is vital for people to support political action. In the school context, curricula have been developed for middle and high school students; students' understanding of climate change has been investigated mostly concerning pre-service teachers and to a lesser degree for middle and high-school students' ideas. Almost no study analyses elementary students' understanding of climate and climate change. Using conceptual change research as a framework, the present paper analyzes 31 3rd-grade students' understanding of climate and climate change. Students were interviewed in a period of 2-3 months before and after instruction about climate change. We asked students about their ideas on climate change, the greenhouse effect, climate, and weather. The interviews were transcribed and coded, and concept maps were drawn for each interview by the researcher. The analysis looks at the breadth of existing concepts concerning climate and climate change and the difference of students' answers in the two interviews. The analysis of the pre-interviews found four different understandings of the relation between weather and climate, a lack of relation between the notions of climate and climate change, a negative valuation of climate change, and a lack of understanding that climate change affects humans. For the presentation, these findings will be compared with the findings of the post-interviews, and the stability or systematicity of change between the answers in the two interviews will be addressed.

Teaching psychology with science-fiction at the Bachelor level
Keywords: Developmental Processes, Emotion and Affect, Environmental Education, Qualitative Methods
Presenting Author: Laure KLOETZER, Institute of Psychology & Education, University of Neuchâtel, Switzerland

For the past five years, we have been teaching environmental psychology at Bachelor's level, with an original approach using science-fiction writing and more precisely the *protokools* invented by the Zanzibar group of science-fiction writers (www.zanzibar.zone). This paper will examine this attempt from two complementary angles: on the one hand, from a pedagogical point of view: how can science-fiction help students think about their own relationship with nature? On the other hand, from a scientific point of view: what do we learn through the dreamed or distressing worlds constructed by our students? We analyze a corpus of 100 stories and use Vygotskij' concept of the cycle of imagination as a way to understand what happens in this exercise.

Maternal contingency and their relation to preschoolers' problem-solving and strategic behaviors
Keywords: Informal Learning, Parental Involvement in Learning, Problem Solving, Self-regulated Learning and Behaviour
Presenting Author: Maren Stern, Heidelberg University, Germany; **Presenting Author:**Leonie Köllbichler, University of Heidelberg, Germany; **Co-Author:**Silke Hertel, Ruprecht-Karls-Universität Heidelberg, Germany

Parental contingency is characterized by adjusting the support to children's developmental level. This gradual support has been shown to enhance children's self-regulatory development. However, in preschool age, micro-analytical approaches are lacking that measure this dynamic process in more detail. Therefore, the current study aimed to develop a new coding scheme measuring different levels of maternal contingency during mother-child interaction and examine how these levels are related to joint task performance, child-alone task performance, and children's strategic self-regulatory behaviors. *N*=34 mothers and their preschool-aged child worked collaboratively on several problem-solving tasks. Afterwards, the child solved the same tasks independently. Four levels of maternal contingency were observed: 1) contingent (dynamically adapted support), 2) non-contingent-up (more support than needed), 3) non-contingent-down (less support than needed), and 4) non-contingent non-gradual support (support increases too quickly). Mothers provided contingent support during most of the problem-solving tasks. The different levels of contingency were significantly related to mother-child task performance, child-alone task performance, and children's strategic self-regulatory behaviors.

The Role of Kindergartners Private Practice in Self-Regulation and Phonological Awareness in English
Keywords: Early Childhood Education, Learning Strategies, Multicultural Education, Self-regulated Learning and Behaviour
Presenting Author: Ana Paula S. Loures-Elias, Interdependent Researcher, Portugal; **Co-Author:**Marilia Mendes Ferreira, University of Sao Paulo, Brazil

This study investigates how kindergarten children's private practice fostered their self-regulation and phonological awareness in early reading and writing in English as a second language (L2). Private speech emerges as a mediational and a psychological sign for thinking and self-regulation in which children use their private speech to guide them to focus attention, control their affective states, pace their motor activity, self-motivate, and self-praise. In the case of second language (L2) learners, the self-regulatory function of private speech has been extended to private practice during their learning process (Saville-Troike, 1988) in English as an L2 so children could be outside of social conversations with others, return back in time and place themselves in other contexts in their minds, and privately practice what they wanted or needed to. In this way, private speech in the private practice of children's learning process is considered a self-regulatory (Saville-Troike, 1988) and phonological awareness tool. The findings from this study advances empirical research grounded in the notion of language, conceptualized by Vygotsky, and help teachers to better understand their students' phonological awareness even when they are not the interlocutors of the teacher.

Regulating Emotions to Improve the Quality of Teaching and Learning in the Early Years
Keywords: Cognitive Development, Early Childhood Education, Emotion and Affect, Self-regulated Learning and Behaviour
Presenting Author: Erika Galea, University College London, Institute of Education, Malta

Emotion regulation (ER) is considered a crucial developmental milestone necessary over the lifespan, especially during early childhood. The principal objective of the study was to trial and test the effectiveness of an intervention to support the promotion of ER strategies based on Gross' model of ER (2015) by teachers within early years settings, which would foster better effective learning leading to improved academic performance and eventually safeguard against mental/adjustment problems later on in life. The use of learning strategies (the antecedent-focused strategies: situation modification, distraction, cognitive reappraisal) alongside ER can support self-regulation of both positive and negative emotional episodes and equip pupils with effective strategies in order to cope with the pressures of everyday life. Effectiveness of the intervention programme was assessed in terms of evidence of ER and quality of classroom environment relative to a control sample through video-recorded systematic classroom observations and semi-structured interviews at implementation stage. When comparing the results of the Intervention Group to the Control Group, the former adopted the antecedent-focused ER strategies with their pupils at implementation stage following the teacher training workshop whilst the latter did not, as they chose to engage using the response-focused ER strategy (suppression). At implementation stage, cognitive scaffolding of the ER strategies through co-regulation was apparent for the Intervention Group, which led to peer and/or self-regulation, with a favourable impact on the students' behaviour and learning environment. Gross, J. J. (2015). The Extended Process Model of Emotion Regulation: Elaborations, Applications and Future Directions. *Psychological Inquiry, 26*, 130 – 137.

Do Primary School Teachers Know How Accurately Their Students Monitor and Regulate Their Learning?
Keywords: Mathematics/Numeracy, Metacognition, Primary Education, Self-regulated Learning and Behaviour
Presenting Author: Tamara Van Gog, Utrecht University, Netherlands; **Co-Author:**Sophie Oudman, Utrecht University, Netherlands; **Co-Author:**Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:**Mariette van Loon, University of Zurich, Switzerland

To be able to help students to improve their self-monitoring and self-regulation skills, teachers should have an accurate idea of how well students can monitor and regulate their learning. We investigated how well primary school teachers can judge their students' monitoring and regulation accuracy and whether and how student characteristics influence this process. Thirty-three teachers, teaching 9-10 year old students, participated with their classes (N = 495 students). Students completed a multiplication and division task and made monitoring and regulation judgments before and after self-scoring their work. We measured (the accuracy of) teachers' judgments of their students' monitoring (before self-scoring) and regulation (before and after self-scoring) skills. Additionally, we measured teachers' perceptions of student characteristics (e.g., conscientiousness, general math ability, amount of teacher-student contact). Results showed that the teachers seemed to know that in general, their students made quite accurate monitoring and regulation judgments. However, they had difficulties with identifying those students who made substantially inaccurate judgments (for whom it is particularly important that the teachers can intervene). Teachers' perceptions of student characteristics, when taken together, explained substantial variance in (the accuracy of) teacher judgments of students' monitoring and regulation skills. Moreover, teacher judgments of students' regulation accuracy prior to self-scoring seemed to be somewhat biased by students' nationality. These findings and measures can ultimately contribute to the design of interventions to help teachers judge and develop their students' self-regulated learning skills.

How intellectual curiosity and interest manifest in information seeking and knowledge attainment
Keywords: Interest, Learning Analytics, Learning Approaches, Personality
Presenting Author: Aki Schumacher, Hector Research Institute of Education Sciences and Psychology, University of Tübingen, Germany; **Co-Author:**Yvonne Kammerer, Stuttgart Media University, Stuttgart, Germany, Germany; **Co-Author:**Christian Scharinger, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Steffen Gottschling, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:**Tobias Appel, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Lisa Bardach, University of Tübingen, Germany

Non-cognitive interindividual differences such as intellectual curiosity and domain-specific interest are important predictors of educational outcomes. But what exactly do intellectually curious or interested learners do differently that makes their learning more beneficial? This study used data from a lab experiment in which university students (N = 312, M_{age} = 23.3, SD_{age} = 3.04, 70.5% female) participated in a hypertext learning task to investigate the effects of intellectual curiosity and interest on (a) knowledge attainment (performance in a knowledge test), and (b) learning behaviour (information-seeking indicators extracted from log-file data). Additionally, we tested whether the combination of high intellectual curiosity and interest is particularly advantageous for knowledge acquisition in this task. Using latent profile analysis, we found four different information-seeking profiles (disengaged, superficial, broad, and deep-diving) that performed differently well on the knowledge test. Interindividual differences were related to information-seeking behaviour in that intellectually curious participants were more likely to revisit certain concepts (deep-diving information-seeking style) compared to seeking out many different hyperlinks (broad information-seeking style). On the other hand, highly interested participants were more likely to be broad information-seekers compared to being disengaged. The results showed that neither intellectual curiosity nor interest were directly related to knowledge attainment. The interaction between intellectual curiosity and interest did not significantly predict information-seeking behaviour and knowledge attainment. We discuss the theoretical and practical implications of using objective behavioural data to measure interindividual differences in learning processes.

The associations between children's trait and state curiosity
Keywords: Cognitive Skills and Processes, Emotion and Affect, Interest, Primary Education
Presenting Author: Jamie Jirout, University of Virginia, United States; **Co-Author:**Natalie Evans, University of Virginia, United States; **Co-Author:**Virginia Vitiello, University of Virginia, United States; **Co-Author:**Sharon Zumbrunn, Virginia Commonwealth University, United States

Curiosity is linked to learning behaviors and better learning (Shah et al., 2018), yet there is not yet enough known about curiosity to inform educational practice on how to promote it in learners (Authors, 2018). For example, curiosity research often focuses on studying either individual differences in curiosity (trait) or momentary curiosity (state), with few studies exploring associations between the two (Authors, 2012; Hassinger-Das & Hirsh-Pasek, 2018). Exploring this association was the main aim of the current study. Twenty-six children (age=7.9 years (*SD*=1.3); data collection ongoing) participated. Individual differences in trait curiosity were assessed using a self-report survey (e.g., "I ask questions to learn more about things"; five-point Likert scale). Two behavioral measures assessed state curiosity by the amount of information explored: in a free exploration task, children could see and hear up to seven interesting facts about nine different topics; in an uncertainty exploration task, children were constrained in how much they could explore across options varying in uncertainty level. Trait curiosity was high across age (*M*=3.99; *SE*=.16; no correlation with age *tau*=.126, *p*=.395) and related to exploration on the uncertainty task (*tau* = .336; *p* = .031; free exploration, *tau*=.008; *p*=.960). Qualitative findings of children's explanations for their exploration on the tasks and results from our full sample will be presented. Findings suggest the importance of providing children with opportunities to explore varying amounts of uncertainty with encouragement and low risk, rather than with more open-ended exploration opportunities, to encourage state curiosity and develop trait curiosity.

Integrating two lines of research on how children's state curiosity relates to their learning
Keywords: Cognitive Skills and Processes, Emotion and Affect, Interest, Primary Education
Presenting Author: Tessa van Schijndel, University of Amsterdam, Netherlands; **Co-Author:**Brenda Jansen, University of Amsterdam, Netherlands

Epistemic curiosity is considered to drive knowledge acquisition, but empirical support for this claim is fragmented and limited (Peterson, 2020). Two separate lines of research on children's curiosity-based learning can be distinguished: one focusing on memory for factual information as a learning outcome (e.g. Fandakova & Gruber, 2021), the other on exploratory behaviours as a learning outcome (e.g. Bonawitz et al., 2012). The present study aims at integrating these lines of research by adding a measure for children's willingness to explore subjects to an existing paradigm focusing on children's memory for factual information. In addition, we aim to study whether intelligence affects the effect of curiosity on memory. To this end we administered an adaptation of the Trivia-task (e.g. Fandakova & Gruber, 2021) to 36 10- to 12-year olds, and the RSPM (e.g. Hamel & Schmittmann, 2006) to a subset of this group. The results replicated those of Fandakova and Gruber: epistemic state curiosity was related to better memory performance in children, but no effect of a curious state on the recall of unrelated information was found. In line with the information gap theory (Loewenstein, 1994), curiosity also had a positive effect on children's willingness to explore. Last, a trend suggested that the curiosity memory effect might be higher for the high- than for the low-intelligence group. To conclude, this study took a first step in integrating two separate lines of research on curiosity-based learning, and contributed to building a theoretical foundation for educational interventions aimed at stimulating curiosity-based learning.

What do Chinese students perceive and experience about curiosity in schools?
Keywords: Cognitive Skills and Processes, Emotion and Affect, Interest, Secondary Education
Presenting Author: Xin Tang, Shanghai Jiao Tong University, China; **Co-Author:**Huier Zheng, University College London, United Kingdom

This study aimed to understand students' definition, experiences, perceptions and attitude towards curiosity from subjective and cross-cultural perspectives. Five open-ended questions regarding curiosity in schools were collected from 337 Chinese adolescents (age from 12 to 15). Through text analyses, we found that most things students curious about were related to subjects outside the classroom (about 70%), even though the question specified that the setting should be "at school". Although students were not curious about studying contents, classroom activities were reported as critical channels to facilitate their curiosity, suggesting the importance of pedagogy in promoting school curiosity. Finally, Chinese adolescents reported mixed attitude towards curiosity with most students held dialectical views of curiosity.

Idioms exposure in shared book reading and child vocabulary growth: An exploratory study
Keywords: Early Childhood Education, L1/Standard Language Acquisition, Mixed-method Research, Parental Involvement in Learning
Presenting Author:JUNYI YANG, University of Oslo, Norway; **Co-Author:**Vibeke Grøver, University of Oslo, Norway; **Co-Author:**Joshua Lawrence, Univeristy of Oslo, Norway

Idioms make up an essential part of our language, and so children acquire idioms as part of their linguistic repertoire. Developmental research suggests that children as young as five can comprehend the literal meaning of idioms, yet we know little about how young children are exposed to idioms in natural discourse and how the idiom exposure might contribute to child language. This study followed thirty-three 3-to-5-year-old Chinese-Norwegian dual language learners, observed their idioms input during mother-child shared book reading, and assessed their Chinese vocabulary development three times over a year. We analyzed the conversation contexts of idiom instances and applied individual growth models to test the relations between idioms and child vocabulary growth. We found that Chinese mothers' use of idioms during shared book reading, even without discussion, served as a significant predictor for child receptive vocabulary growth. The current exploratory study shed light on idioms as specific language input, providing a presumably more nuanced contextual factor for child language development and practical significance for the home literacy environment.

Parent-Child Picture Book Co-creations as a Blessing in Uncertain Times
Keywords: Creativity/Divergent Thinking, Parental Involvement in Learning, Reading, Writing/Literacy
Presenting Author: Wai Ming Cheung, The University of Hong Kong, Hong Kong; **Presenting Author:**Serene Chan, The University of Hong Kong, Hong Kong

Learning has been greatly disrupted over the past few years because of the pandemic. While schools and policy makers are rethinking education in the new normal, parents can also play a very important role in helping their children develop literacy and language skills. In this study, seven parent-child dyads joined a picture book workshop conducted in a kindergarten. Parents learned about different types of picture books and strategies for reading with their children. The children, aged 5 to 6, co-designed and co-created picture books with their parents when school hours were greatly reduced. They read a specially written picture book with a set pattern based on the ten special features found on the island where their school was situated. Some parent-child picture book co-creations have shown children's observation power in collecting information for writing their book. A few children were able to go beyond their observations and imagine highly creative stories about topics they were passionate about. Using a multiple case study method, this study shows that reading picture books together is important for children's literacy development and a blessing in these uncertain times.

Patterns of infants' home literacy environment: threshold effects of family social risk factors
Keywords: Early Childhood Education, Informal Learning, Parental Involvement in Learning, Quantitative Methods
Presenting Author: Sabine Blaurock, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Luisa Prokupek, Otto-Friedrich-University of Bamberg, Germany; **Co-Author:**Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

Although studies report on the significance of the home literacy environment (HLE) in the early years for early language acquisition, studies are primarily focused on the importance of family background characteristics for parent-child interactions. Little is known about which other social risk factors are associated with different facets of home literacy activities in infancy and toddlerhood. The present paper therefore investigates patterns emerge among families with different levels of social risk for informal (intentional and non-intentional) home literacy activities. Data were drawn from the German intervention project "Development and implementation of a digital pedagogical component to increase family stimulation quality" with a sample size of 221 parents of children with an average age of 13 months. Results reveal that the construct of HLE should already be considered in a differentiated way in families with infants. Families with a comparatively higher risk level stimulate their children less intentional and non-intentional than families with a lower risk level. Intentional activities, such as dialogical reading with the child, seem to be independent of family background characteristics. However, not all parents seem to be aware that non-intentional literacy activities, such as talking with the child in everyday situations, are also important for development of emergent literacy skills. Parental competences with regard to literacy stimulation might slightly compensate for the association between social risk factors and informal home literacy activities. Results are discussed regarding the potential of (digital) family education programmes for higher social risk families with infants.

Chairperson: Antti Lehtinen, University of Jyväskylä, Finland

Strategies of students with learning difficulties in math number line tasks: An eye-tracking study
Keywords: Eye Tracking, Learning and Developmental Difficulties, Mathematics/Numeracy, Special Education
Presenting Author: Anna Lisa Simon, Universität zu Köln/ University of Cologne, Germany; **Presenting Author:**Maike Schindler, Universität zu Köln/ University of Cologne, Germany

Students with learning difficulties (LD) tend to have difficulties in various school subjects, one of which is mathematics. Mathematical skills are important for coping with everyday life. However, relatively little is currently known about the mathematical learning of students with LD and their particular or general difficulties in mathematics. In order to provide appropriate support for students with LD, research is needed on possible difficulties in mathematics and on what strategies they use. The number line is an important tool in mathematics education, especially in primary school, to support the development of mathematical skills and is used in mathematics teaching to foster students' number sense. However, it is currently not known how students with LD cope with the number line in mathematics teaching and how they could best benefit from the use of the number line. The aim of this study was to investigate if students with LD differ from students without LD in their strategy use to locate numbers on marked number lines, as they are used in mathematics teaching in many countries. In our empirical study with fifth-graders with LD (n=21) and without LD (n=156), we used eye tracking (ET) to investigate student strategies. Analyses of ET videos revealed significant group differences in strategy use and that students with LD used strategies less adaptively than students without LD. This indicates that students with LD are less proficient using the number line and that they could benefit from customized support.

Sublexical Processing in Finnish Typical and Compromised Reading Development
Keywords: Eye Tracking, Quantitative Methods, Reading, Special Education
Presenting Author: Lisa Hintermeier, University of Jyväskylä, Finland; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland

The present study investigates sublexical processing in Finnish, a language with a highly transparent orthography and a rich, agglutinative morphology. More specifically, we aim to explore how the use of sublexical units (i.e. syllables and morphemes) changes throughout the course of typical and atypical reading development.Finnish second graders and fourth graders (including both typically developing readers and children indicating reading difficulties) were asked to conduct a lexical decision task in which they needed to decide whether a stimulus presented on a screen is a real Finnish word or not. The stimuli were shown under different conditions: either concatenated (talossa) or separated at the syllable (talos#sa) or morpheme (talo#ssa) boundary, and reaction times as well as eye movements were recorded simultaneously during the task. In addition, reading fluency assessments were conducted.Preliminary results revealed significant differences between the conditions in word versus pseudoword items across the reading fluency continuum, with older and more fluent children being more disrupted by the syllable and morpheme boundary conditions as compared to the concatenated condition when reading word items, while this did not seem to be the case for pseudoword items.The results of this study will help understanding how reading develops through the initial years of reading development and the gained knowledge can be used to design training programs for struggling readers, for example by supporting them to enhance the automatization of their word recognition skills.

Designing accessible assessment tasks: Impacts on student performance and engagement

Keywords: Classroom Assessment, Eye Tracking, Inclusive Education, Secondary Education
Presenting Author: Callula Killingly, Queensland University of Technology, Australia; **Presenting Author:**Linda Graham, Queensland University of Technology, Australia; **Co-Author:**Sonia White, Queensland University of Technology, Australia; **Co-Author:**Naomi Sweller, Macquarie University, Australia

To succeed in summative assessment, students need to understand task requirements; yet accessibility of critical information is often impeded by complex task sheets. This ARC Linkage Project is examining the impact of accessible task sheet redesign on student comprehension, visual engagement, and achievement. Students in Grade 10 in 2021 or 2022 were recruited from three partner secondary schools in Queensland, Australia. Students were assessed on baseline reading comprehension and screened for language and attention difficulties. In 2021, 73 current Grade 10 students were eye-tracked while they read their English assessment task for the first time. Afterward, a five-minute interview was conducted with each student to assess their comprehension of the task. Task sheets were then collaboratively redesigned with the English head of department of the respective school. To inform the redesign, visual engagement data and interview responses were triangulated with accessibility principles derived from previous task analysis work by Graham et al. (2018). Using the redesigned task sheets, 124 students who were in Grade 10 during 2022 were then eye-tracked and interviewed. Achievement on the task was compared in both cohorts, revealing higher results for the redesigned task sheet in comparison to the original task sheet, accounting for baseline reading comprehension. The redesign worked equally well for students with and without language and attention difficulties. Additionally, the redesigned task resulted in improved access to key information, as shown by visual engagement and interview responses. These findings showcase the significance of accessible task design in promoting student achievement and engagement.

Comparing Continuous and Discretized Tape Diagrams of Fractions: An Eye-Tracking Study with Adults
Keywords: Cognitive Skills and Processes, Eye Tracking, Mathematics/Numeracy, Secondary Education
Presenting Author: Sabrina Schwarzmeier, Technical University of Munich, Germany; **Co-Author:**Andreas Obersteiner, Technical University of Munich, Germany; **Co-Author:**Martha Wagner Alibali, University of Wisconsin-Madison, United States; **Co-Author:**Vijay Marupudi, Georgia Institute of Technology, United States

Fractions are challenging for many students. In particular, students often do not fully understand fraction magnitudes. Visualizations such as tape diagrams could be helpful in comparing fractions quickly and intuitively because the larger fraction can easily be identified visually. However, textbooks mostly use discretized tape diagrams (which include countable segments) rather than continuous tape diagrams (without countable segments). Although discretized tape diagrams facilitate direct mapping between the diagram and fraction symbols, continuous diagrams may encourage more holistic processing. We investigated adults' performance in a fraction comparison task using discretized and continuous tape diagrams. We used eye tracking to assess eye saccades in addition to assessing accuracy and response times. Participants compared continuous tape diagrams of fractions more accurately, faster, and with fewer within-diagram saccades. These results suggest that people are more efficient at using continuous visualizations compared to discretized visualizations to visually compare fraction magnitudes. The study supports recommendations to use continuous visualizations in the early phases of teaching fractions.

Professional Knowledge in Pre-Service Teacher Education in Social Sciences: the SoWi-L study
Keywords: Competencies, Higher Education, Social Sciences and Humanities, Teacher Professional Development
Presenting Author: Sabine Manzel, Universität Duisburg-Essen, Germany; **Co-Author:**Dorothee Gronostay, TU Dortmund University, Germany

Social Science teachers need professional knowledge to offer students deeper learning processes for understanding politics and democracy. Following Shulman (1987), the professional knowledge is differentiated into subject-related content knowledge, pedagogical content knowledge and pedagogical knowledge and can be developed during teacher education. In contrast to Maths (e. g. COACTIV), there is hardly any data on subject-related knowledge for Social Sciences with its reference disciplines of political science, economics and sociology. An instrument for evaluating professional knowledge was designed by Weißeno, et al. 2013. However, economic and sociological expertise was not taken into account. Due to this research gap, a standardised test instrument SoWis-L was developed by the authors in 2019. For the first time the SoWis-L-test (71 items, multiple-choice-single-select-format) makes it possible to capture systematically and empirically the professional knowledge of teachers across the entire spectrum of the Social Science curriculum. The main study (N=500) is based on a quasi-longitudinal survey at three measurement points. There are significant increases in knowledge in Political Science and subject-didactic knowledge, but not in Economics and Sociology. There are significant positive correlations between the predictor gender and professional expertise. One goal is to encourage evidence-based research to improve the teacher education in Social Sciences.

Challenges of teacher educators in integrating research competence in graduation assignments
Keywords: Competencies, Curriculum Development, Higher Education, Teacher Professional Development
Presenting Author: Belinda Ommering, Utrecht University of Applied Sciences, Netherlands; **Co-Author:**Marloes van Dijk, Marnix Academie (PABO), Netherlands; **Co-Author:**Lisette Munneke, Utrecht University of Applied Sciences, Netherlands; **Co-Author:**Marjolijn Peltenburg, Marnix Academie, Netherlands; **Co-Author:**Miranda Timmermans, Marnix University of applied sciences, Netherlands

Professional higher education aims to deliver graduates able to use research competence for their profession. Conducting practice-oriented research resulting in a thesis in order to graduate no longer seems to fit this purpose, as opposed to working towards professional products for which research competence is needed. Marnix Academie (University of Applied Sciences, the Netherlands) initiated a curriculum change by redesigning its graduation phase in which students are stimulated to deploy research competence in order to deliver professional products. Action research is carried out parallel to redesigning the graduation phase, with an initial focus on the following research questions: 1) how did teacher educators integrate research competence within graduation assignments, and 2) what challenges do teacher educators face in integrating research competence in graduation assignments? Document analysis was conducted to answer the first question and semi-structured interviews with thirteen teacher educators were conducted to answer the second question. Document analysis revealed practical implications for further developing graduation assignments, such as emphasizing authentic professional products, explicitly informing students on the role of research competence in professional processes and products, striving for consistency in integrating research competence, and optimizing constructive alignment. Interviews disclosed teacher educators' satisfaction with content of current assignments and challenges entailing, among others, balancing student autonomy versus structuring learning opportunities, just-in-time peer feedback, increasing perceived relevance regarding research competence among students, and needs for collective teacher professionalization. The identified challenges will serve to guide next steps in professionalizing teacher educators and optimally integrating research competence in graduation assignments.

What quality features make online professional development for teachers effective?
Keywords: E-learning/ Online Learning, Lifelong Learning, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: André Meyer, University of Potsdam, Germany; **Co-Author:**Marc Kleinknecht, Leuphana University Lueneburg, Germany; **Co-Author:**Dirk Richter, University of Potsdam, Germany

The number of online professional development (PD) activities for teachers has increased over the past decade. While there is evidence on characteristics of effective face-to-face PD, little is known about the quality of online PD activities. The present study investigates the quality of online PD activities as perceived by teachers, and the relationship between PD quality and teachers' satisfaction and their changes in practice. The study is based on survey data from N = 387 teachers who participated in a formal online PD activity. Our results indicate high levels of cognitive activation, as well as high clarity and structure of the online PD activity, and moderate levels of collaboration among participants in online PD. While all quality characteristics predict teachers' satisfaction, only cognitive activation and collaboration in online PD predict changes in teachers' professional practices.

Teacher Design Teams in secondary vocational education

Keywords: Curriculum Development, Qualitative Methods, Secondary Education, Teacher Professional Development
Presenting Author: Tina Gryson, Ghent University, Belgium; **Co-Author:**Katrien Strubbe, Ghent University, Belgium; **Co-Author:**Tony Valcke, Ghent University, Belgium; **Co-Author:**Ruben Vanderlinde, Ghent University, Belgium

The course Project Integrated General Subjects (PGS) which integrates the general subjects in Flemish vocational secondary education does not succeed in its goal to teach basic literacy and numeracy to the most vulnerable students (Janssens & Willem, 2022). PGS teachers struggle to adequately design the course since they frequently lack specific teacher training in PGS and/or struggle with the extensive and non-specific attainment targets (Sierens et al., 2017). Teacher Design Teams (TDTs) could provide a solution to this problem. Using TDTs, both immediately usable instructional materials are designed and participating teachers are trained. This qualitative research examines at four secondary schools, perceived as four case studies, what the conditions are for TDTs to succeed for the course PGS and how these TDTs prepare PGS teachers to teach more effectively. A TDT programme was implemented at the four schools during the school years 2020-2021 and 2021-2022. An important component in this study period is the COVID 19 measures and the educational reforms that rendered PGS's existence in the schools uncertain for a time. Interviews and reports are analysed with inductive thematic analysis. In terms of professional development, preliminary findings showed remarkable results in terms of instructional practices and attitudes towards the course PGS and collaborative design. Additionally, it became apparent that important structural prerequisites must be satisfied for training initiatives like a TDT to be successful in schools.

Social networks and key moments of student teachers' learning during internship

Keywords: Communities of Learners and/or Practice, Higher Education, Pre-service Teachers, Teacher Professional Development
Presenting Author: Marco Galle, University of Teacher Education Lucerne, Switzerland; **Co-Author:**Annelies Kreis, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Sonja Hiebler, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:**Esther Brunner, Thurgau University of Teacher Education, Kreuzlingen (PHTG), Switzerland; **Co-Author:**Sanja Stankovic, University of Teacher Education Thurgau, Switzerland

In teacher education, internships are considered as significant for the professional development of student teachers. From a social constructivist perspective, student teachers have collaborative learning opportunities during joint processing of professional issues. However, there is currently a lack of exploratory studies in which student teachers themselves describe their significant learning situations during internships and related actors therein. In a sub-study of the SNF-project "DiaMaNt", we investigate key moments of student teacher learning and analyze which actors are relevant and how they support them. Data has been collected using a survey instrument for social networks regarding key moments of professional development. 141 student teachers for primary education (1^{st}–6^{th} grade) listed key moments in their internship in a standardized PowerPoint file. Then, they selected the most significant one, and visualized the social network of relevant interactors regarding these moments from their perspective. Furthermore, student teacher audio recorded explanations about their network maps. The qualitative data were analyzed by a structuring qualitative content analysis, and the number and function of interactors were quantified. Based on that we created an overall network by quantitative procedures of social network analysis. First results showed that the key moments are mostly related to generic aspects of teaching quality. In the network maps of the most significant key moments, actors who are frequently present in the internship classes (mentor teacher, peer, and pupils) are mentioned more often and rated more significant for professional development than all other actors, for example, university-based teacher educators.

Virtual Reality as a Catalyst in the Transition Towards Student-Centred Methods and Beliefs

Keywords: Attitudes and Beliefs, Immersive Technologies for Learning, Science Education, Teacher Professional Development
Presenting Author: Sebastien Wall-Lacelle, University of Montreal, Canada; **Co-Author:**Bruno Poellhuber, University of Montreal, Canada; **Co-Author:**Christine Marquis, Cégep de Saint-Jérôme, Canada; **Co-Author:**Normand Roy, University of Montreal, Canada

In a context where the literature reports declining levels of interest, motivation, engagement and achievement in higher-education science classes, the use of VR simulations offers the potential to address the high level of abstraction, lack of contextualization and predominance of teacher-centred methods that are seen as sources of these issues. The pedagogical scenario into which these simulations are integrated is often seen as decisive for their effectiveness. Moreover, the teachers' adoption of technological tools is linked with a change towards student-centred methods and beliefs. This study presents the professional development of seven teachers who took part in our large-scale research on the use of desktop VR simulations in science classes using Clarke and Hollingsworth's interconnected model (2002). Our results show that all the teachers gained knowledge about scenarization that they intend to transfer to their practice outside of the project and that these changes were mainly brought about by student comments and results from student questionnaires. Teachers initially oriented towards teacher-centred methods and knowledge transmission described how they realized the importance of the emotional components of learning and how this realization may lead them to adopt more student-centred methods.

Teachers' professional growth in teaching social scientific reasoning

Keywords: Citizenship Education, Reasoning, Social Sciences and Humanities, Teacher Professional Development
Presenting Author: Thomas Klijnstra, University of Amsterdam, Netherlands; **Co-Author:**Gerhard Stoel, Radboud University, Nijmegen, Netherlands; **Co-Author:**Geerte Savenije, University of Amsterdam, Netherlands; **Co-Author:**Gerard Ruijs, University of Amsterdam, Netherlands; **Co-Author:**Carla Van Boxtel, University of Amsterdam, Netherlands

In social science education, students need to reason about social problems. However, social problems are often complex (e.g., they have multiple causes, consequences, and solutions) and reasoning is challenging. Hence, promoting students' ability to reason about political and social problems is relevant, but complex to teach. This study investigates how the use of educative materials in a professional development program contributes to teachers' professional growth in teaching reasoning skills in social science lessons. Previous research showed that a Teacher Development Program (TDP) can be effective when it is subject-specific and when educational materials are central. We used previous insights on characteristics of effective professionalization activities for the design of the TDP. In this study, ten social science teachers participated. Teachers' professional growth is examined by qualitative data analysis using pre- and post-interviews, a logbook and lesson observations of each teacher, and a questionnaire. The results showed an increment in teachers' knowledge of reasoning skills.Almost all teachers mentioned that the scaffolding of thinking steps in structured assignments and diagrams received more attention in their own lessons because of the TDP. Teachers shifted their focus in their lessons in such a way that they focused more on learning reasoning skills and applying the concepts more deeply by examining them in meaningful contexts. We expect that this will make the subject more meaningful for students *and* teachers. Teachers and teacher-educators can use these insights in practice. Ultimately, this can increase students' abilities to reason about social problems.

Developing Self-Regulation as a Core Competency of Social-Emotional Learning: Action Research
Keywords: Instructional Design, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Ronen Kasperski, Gordon College of Education, Israel; **Co-Author:**Merav Hemi, Gordon Academic College, Israel; **Co-Author:**Ditza Maskit, Gordon Academic College, Israel

This study describes the design and implementation of a self-regulation (SR) intervention embedded within a social-emotional learning (SEL) seminar for M.Ed. students. The intervention was rooted in the mimetic learning theory - a technique designed to replace actual experience with observing others interact in the same conditions. Content analysis was applied to analyze twenty-five written reports of M.Ed. students who participated in the seminar. The participants stressed that through the mimetic learning process they were able to become aware of the emotional load involved in complex interpersonal situations that occur in the daily school routine; identify the necessary SR skills needed to navigate the situation effectively; and expand the SR skills by receiving structured rules. This study adds an important perspective regarding applying mimetic learning as an effective means for developing SR skills among educators.

SRL Practices Growth Following Authentic Experience Program: One Teacher's Long Term Case Study
Keywords: Metacognition, Self-regulated Learning and Behaviour, Simulation-based Learning, Teacher Professional Development
Presenting Author: Orna Heaysman, Hemdat College of Education, Israel; **Co-Author:**Bracha Kramarski, Bar-Ilan University, Israel

Self-regulated learning (SRL) is a cyclic process of forethought, performance, and evaluation, in which the learner advances towards the learning goals. Even though it is agreed that SRL strategies can assist learners to increase their academic achievement, teachers refrain from teaching it for multiple reasons, including a lack of SRL theoretical knowledge, SRL practical skills, or beliefs in their ability to teach it. Although many studies on professional development (PD) were conducted for students' SRL, few studies have examined teachers' SRL practice following a PD program in the long term, using qualitative methodology. This study offers a unique program that combines theory and practice in SRL and follows the practices characteristics development of one teacher as a case study, before, immediately after the program, and 6 months later. The teacher was randomly chosen out of a focus group of teachers who were highly motivated to implement SRL practice and willing to participate in the long-term study. The training program includes interactive video analysis and simulations with real actors who can portray authentic characters of students in class by using *body language and tone of voice* We used authentic assessment measures: in-class video as well as an interview to gain a deeper understanding of the teacher's perception of events. The findings indicate a sustainable change in *SRL practice* that includes teacher and students talk-time, use of SRL promoting practice, and the physical location of the teacher and students in class. The study has implications for teacher professional development programs.

Enhancing student self-regulation through programmatic assessment
Keywords: Assessment Methods, Feedback, Higher Education, Self-regulated Learning and Behaviour
Presenting Author: Niels Bohnen, HAS University of Applied Science, Netherlands; **Co-Author:**Suzan van Ierland, HAS University of Applied Sciences, Netherlands

The terms flexible education, flexible learning and personalized education have been frequently used in scientific and professional literature in recent years. In implementing personalized learning, course programs in Dutch universities of applied sciences have started to implement or adapt educational concepts, to ensure possibilities for students to take control. One of the concepts that has been implemented is programmatic assessment. Programmatic assessment aims to stimulate students to monitor and self-regulate their learning. Programmatic assessment thus requires students to have self-regulating skills. In 2022, we conducted a pilot study to compare students' self-assessment on self-regulatory skills in a traditional versus a programmatic assessment programme. The results showed some promising trends. The aim of our current, longitudinal (4-year) study is therefore to follow students' development over time. Research is conducted at a Dutch university of applied sciences (4 year bachelor programme Applied Biology). To measure self-regulatory skills, a questionnaire (CP-SRLI) has been administered to two groups of students. Both groups follow the same bachelor programme, however, group 1 consists of students enrolled in a course program based on programmatic assessment and group 2 consists of students enrolled in a traditional course program. The questionnaires will be complemented with focus group discussions with students, and interviews with the students' personal coaches (teachers) in both the traditional and programmatic course program. In this symposium we will present the results after year 1.

Development of metacognitive monitoring in primary school and its association with achievement
Keywords: Achievement, Metacognition, Primary Education, Self-regulated Learning and Behaviour
Presenting Author: Elien Bellon, KU Leuven, Belgium; **Co-Author:**Wim Fias, Ghent University, Belgium; **Co-Author:**Bert De Smedt, KU Leuven, Belgium

Metacognitive monitoring, the subjective self-assessment of how well a (cognitive) task will be/is/has been performed (Nelson & Narens, 1990), is believed to be crucial for academic achievement and to develop substantially over primary school, including a shift from domain-specificity to domain-generality. However, to date there is a lack of empirical research in young primary school children specifically investigating this. The current research examined developmental changes in metacognitive monitoring in primary school children (i.e. grades 2, age 7-8 years, and grade 3, age 8-9 years) and its role in their arithmetic and spelling achievement. We investigated this issue in 579 second and third graders. Our data reveal that young primary school children already engage in efficient metacognitive monitoring and that metacognitive monitoring already plays a role in early academic achievement. Furthermore, our data suggest that the role of metacognitive monitoring is stable over academic development in young primary school children. Lastly, our results provide evidence for the emergence of domain-generality of metacognitive monitoring between second and third grade (i.e. 7-9-year-olds). Our findings might suggest novel ways to instruct metacognitive monitoring to primary school children, for example, by recommending instruction in metacognitive monitoring in each academic domain separately in early primary school, and only expecting it to transfer to other domains starting in third grade.

First-Graders' Persistence of Overconfidence Despite Feedback
Keywords: Cognitive Skills and Processes, Feedback, Metacognition, Self-regulated Learning and Behaviour
Presenting Author: Kristin Kolloff, University of Bern, Switzerland

AbstractMetacognitive experiences can be provided in the form of repeated feedback on monitoring accuracy to foster calibration, at least in adults. So far, only a few studies have investigated the possible effects of item-specific feedback on monitoring accuracy in young children. We investigated whether first-graders can benefit from repeated feedback in paired-associate memory tasks in terms of monitoring accuracy (discrimination between correct and incorrect answers). Over six sessions, $N = 112$ children evaluated whether they solved tasks correctly or not and provided item-specific confidence judgments. One group obtained only feedback about performance, whereas the other group was informed whether their confidence judgment matched performance. Overall effects of feedback on monitoring accuracy revealed a positive but constant discrimination score over time. Children have already developed a metacognitive monitoring awareness; however, the type of feedback did not lead to more fine-tuned monitoring skills. Surprisingly, children in both groups seemed to remain remarkably optimistic in their confidence. The findings imply that first-graders do not easily take advantage of available feedback to lower their confidence. *Keywords:* metacognition, monitoring, confidence judgments, feedback, intervention, multi-level analysis

Pre-service teachers' self-regulated learning skills and skills to scaffold self-regulated learning
Keywords: Feedback, Learning Strategies, Pre-service Teachers, Self-regulated Learning and Behaviour
Presenting Author: Piia Naykki, University of Jyväskylä, Finland; **Co-Author:**Laura Hirsto, University of Eastern Finland, Finland; **Co-Author:**Marjaana Veermans, University of Turku, Finland

Studies have shown that skills to self-regulate learning (SRL) can be supported, but teachers rarely engage in the pedagogical practices that are in support for

SRL development. The aim of this study is to explore pre-service teachers' self-reported SRL skills and skills to scaffold SRL. The research questions are: 1. How is the study phase related to the pre-service teachers' level of SRL skills and skills to scaffold SRL, 2. How is the amount of teaching practice related to pre-service teachers' SRL skills and skills to scaffold SRL, 3. How do pre-service teachers' SRL skills explain their skills to implicitly and explicitly scaffold SRL? The questionnaire data from 112 pre-service teachers was collected in four teacher education institutes in Finland. The results indicate that pre-service teachers in the beginning phase regulate task value more often and implement implicit explanations when scaffolding SRL. Students with less experience of teaching practice self-regulate their learning more often in general and by regulating task value. No significant difference was found in terms of the amount of teaching practice for explicit or implicit scaffolding of SRL. The results further indicate that self-efficacy for promoting SRL explains 37.2% for explicit scaffolding and 8% for implicit scaffolding. Skills to self-regulate own learning process explains 28.5% for explicit scaffolding and 6.5% for implicit scaffolding. Regulation of task value together with task interest explains 19.8% for explicit scaffolding and 8.2% for implicit scaffolding. The findings provide information for the development of teacher education.

Session F 20

23 August 2023 14:45 - 16:15
UOM_R02
Poster Presentation
Assessment and Evaluation, Developmental Aspects of Instruction, Learning and Instructional Technology, Lifelong Learning

Vocational and Workplace Learning

Antecedents and Effects of Boredom during Classroom Instruction at Vocational Schools
Keywords: Emotion and Affect, Instructional Design, Mixed-method Research, Vocational Education and Apprenticeship Training
Presenting Author: Katrin Rehrl, Paris - Lodron University Salzburg, Austria

Boredom in classroom is a phenomenon that should not be underestimated in vocational schools and is influenced by factors of classroom design (Kögler & Wuttke, 2012). Previous studies on the experience of boredom have focused on secondary school students, while the empirical evidence on vocational school students is comparatively limited.This is where the present study comes in: Based on the control-value theory (Pekrun, 2006) and the basic dimensions of teaching quality (Praetorius et. al, 2018), we investigate which characteristics of teaching quality can explain vocational students' boredom as well as its change in the subject.For this purpose, a longitudinal mixed-methods study in an explanatory sequential design (QUAN à qual) is conducted. Pre- and posttesting (online-questionnaire) will take place in a vocational school block (Ø 9.33 weeks). Participants are 215 (longitudinal section [t1: 522; t2: 284]) learning manual and technical trades. An interview (online) study with 15 students forms the qualitative part. Based on the preliminary theoretical considerations, it is expected that the experience of boredom changes over the course of a school block and that this change can be explained by the perceived instructional design. Implications for emotion-favorable instructional design can be derived from the longitudinal SEM models and the interviews.

Using desktop virtual reality simulation in nursing education: a cluster randomized controlled trial
Keywords: Health-care Education, Immersive Technologies for Learning, Instructional Design, Simulation-based Learning
Presenting Author: Minna Ruoranen, University of Jyväskylä, Finland; **Co-Author:**Ville Heilala, University of Jyväskylä, Finland; **Co-Author:**Jaana Mäkelä, JAMK University of Applied Sciences, Finland; **Co-Author:**Jeri Varjosalo, University of Jyväskylä, Finland; **Co-Author:**Paavo Räty, University of Jyväskylä, Finland; **Co-Author:**Katriina Sipiläinen, University of Jyväskylä, Finland; **Co-Author:**Toni Pekkola, JAMK University of Applied Sciences, Finland; **Co-Author:**Tommi Kärkkäinen, University of Jyväskylä, Finland; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland

The global nursing shortage is a critical concern in healthcare. Technology-enhanced learning (TEL) is expected to provide effective and efficient support for medical education in uncertain times and under changing societal, economic, and educational settings. For example, teaching and learning practices that utilize virtual simulations have been gaining popularity in nursing education. Specifically, desktop virtual reality (dVR) simulations utilizing 360-video provide scalable and low-cost solutions to create educational content. Our study examines the educational use of dVR simulation in the context of nursing education and learning a common medical assessment skill: the ABCDE approach. The study aims to assess what is the difference in learning outcomes between dVR simulation and live simulation (i.e., a simulation involving actor patients). A cluster randomized controlled trial (cRCT) design (n = 100/100) is used to compare the effectiveness of dVR simulation and live simulation in learning the ABCDE approach among Finnish nursing students. The dVR simulation material is created using Thinglink, which is an online platform for creating virtual media that is accessible without dedicated VR hardware. A unique feature of our study is that the dVR learning material is created by the teaching staff in the medical school. Thus, the results provide evidence and a realistic scenario that other educational institutions could follow to develop their pedagogical approaches in practice. Also, the results will increase knowledge about the added value of VR in teaching and learning in nursing education.

Justifying the diploma decision differently: how do teacher teams design their new assessment plan?
Keywords: Assessment Methods, Classroom Assessment, Competencies, Vocational Education and Apprenticeship Training
Presenting Author: Judith Gulikers, Wageningen University, Netherlands; **Co-Author:**Liesbeth Baartman, University of Applied Sciences Utrecht, Netherlands

Many educational institutions are changing the ways they think about assessment of student learning. Currently, vocational education mostly uses externally developed, end-of-the-program, performance assessments. This practice leads to a strict divide between instruction/learning and assessment, not fostering optimal student development. This proposal reports on a two-year participatory project with fourteen teams for vocational education institutions who all are changing towards more programmatic assessments for making high stakes (i.e. diploma) decisions about their students as well as more optimally fostering students learning throughout their educational trajectory. While theoretical principles for programmatic assessment exist (Heeneman et al., 2022), different design decisions are made in practice, leading to different actual assessment programs with different implications and effects. Moreover, they are developed and studied in the higher – mostly medical – education context. Via a rich data collection from the fourteen participating teams, this multiple case study identifies themes that show differences and commonalities in design decisions made by the teams. The identified themes are vision, quality criteria, educational setup, data-points, feedback and formative assessment, decision. Additionally, success and fail factors were identified. This project makes programmatic assessment, and its variations, more tangible in the vocational education context. Largely supporting findings from theory and higher education practice (Authors, 2022) though also showing some context specific elements.

Developing Relational Work as a Design Tool in activities with health professionals
Keywords: Health-care Education, Informal Learning, Lifelong Learning, Qualitative Methods
Presenting Author: Koula Charitonos, The Open university UK, United Kingdom; **Co-Author:**Littlejohn Allison, University College London, United Kingdom; **Co-Author:**Saraswati Dawadi, The Open University, United Kingdom, United Kingdom; **Co-Author:**Abhinav Vaidya, Public Heath Research Development Nepal / Kathmandu Medical College, Nepal; **Co-Author:**Santosi Giri, Public Health Research Development Nepal, Nepal; **Co-Author:**Alex Owusu-Ofori, Kwame Nkrumah University Of Science and Technology, Ghana; **Co-Author:**Fereshte Goshtasbpour, The Open University, United Kingdom, United Kingdom

This paper focuses on relations that emerge between professionals in different roles in the public health systems in low-and-middle income countries (LMICs) as they engage in activities related to the surveillance of antimicrobial resistance (AMR). It illustrates the potential for a designed learning activity to promote relational expertise among participants based at the same workplace. Grounded in sociocultural theory and leveraging theoretical contributions from the field of professional learning, we draw on qualitative digital data across a period of six months to examine the development of an AMR Toolkit - a set of activities to

encourage dialogic reflection about new sets of relations that are needed as work evolves - and the organization of activities that the Toolkit enabled. Analysis of accounts generated by lead participants (written proformas (n=12); interviews (n=11)) across 12 public health organisations in two LMICs reveal how the concept of relational expertise combined with maintaining a view of the new object of activity in the local system serve in the design of an artefact that supports professionals to come to understanding and negotiate wider work arrangements and practices, envision new practices and engage in re-configurations of relational aspects of work.

The development of math competence and its relation to math interest
Keywords: Competencies, Developmental Processes, Interest, School Effectiveness
Presenting Author: Triinu Kilp-Kabel, Tallinn University, Estonia

Understanding mathematics and the ability to use mathematics in different situations is helpful for a successful life. Through researching the development of math competence we can better understand what supports and what hinders math competence development. The better we understand how math competence develops, the easier it is to support students' math competence development and to pinpoint what aspects need intervention. In addition, interest has been related to math ability. The aim of the current study is to examine how math competence develops from 3rd to 5th grade, taking into account students' knowledge profiles and math-related interest using a person-oriented approach. Math competence is analyzed using computer-based tests that assess: 1) conceptual knowledge by using word problem solving tasks, 2) procedural knowledge by using calculation and conversion tasks, and 3) competence by using novel problem tasks. Students' math interest is assessed through a questionnaire (for example: "I enjoy calculation and math-related tasks") where the answers are on a 5-point Likert type scale.

Value and Utility: What Students Learn and Transfer from a Graduate Motivation Course
Keywords: Attitudes and Beliefs, Conceptual Change, Engagement, Motivation
Presenting Author:BOBBY HOFFMAN, University of Central Florida, United States

Knowledge transfer is the "ultimate aim of teaching" (McKeough et al., 2013, p. 1). Although researchers thoroughly examine the importance of teaching for transfer, little is known about precisely what students transfer when taking specific graduate courses in educational psychology. As such, a grounded theory, qualitative methodology employing open, axial, and selective coding was used to determine what graduate students gain, apply, and transfer when taking a motivation course. Results analysis revealed minimal variance among student conceptions of the value and utility of motivation knowledge. Recurring themes suggested that the motivation course experience generated greater self-awareness, acceptance or revision of self-beliefs, agentic engagement, and openness toward changing unproductive learning strategies. Suggestions for cultivating value and enhancing transfer during motivation instruction are discussed.

Interests and motivation in secondary education in Flanders
Keywords: Achievement, Interest, Motivation, Secondary Education
Presenting Author: Merel Dutry, Ghent University, Belgium; **Co-Author:**Laura de Ruijter, Ghent University, Belgium; **Co-Author:**Nicolas Dirix, Ghent University, Belgium; **Co-Author:**Stijn Schelfhout, Ghent University, Belgium; **Co-Author:**Wouter Duyck, Ghent University, Belgium

It is important that students choose a study program that matches their interests from the very beginning of their educational career, as there are many negative consequences associated with a mismatch between students and their education, both on personal and on societal level. Although previous research has already shown that interests and motivation are important factors in predicting study success in higher education, there is relatively little research involving younger pupils in secondary education. In this study, we investigate the relationship between interests, motivation and school results in secondary education in Flanders. A sample of 867 pupils completed a RIASEC interest-inventory and a motivation scale in the beginning of the school year, their school results will be collected at the end of the school year.

Promoting interest in high school science among Palestinian students in East Jerusalem
Keywords: Interest, Science Education, Secondary Education, Teaching Approaches
Presenting Author: Mohamed Amine Mahhou, University of Quebec in Montreal, Canada; **Co-Author:**Olivier Arvisais, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Patrice Potvin, Université du Québec à Montréal, Canada

Many researchers have attempted to understand the reasons behind the decline in interest in science among students during high school as well as ways in which it can be corrected. However, the scientific literature on this topic mostly includes studies that were conducted in highly institutionalized educational settings, and under stable political conditions. There is much less scientific literature when it comes to educational systems under great pressures. The Palestinian educational system in addition to being chronically affected by the lack of resources, is constantly challenged by such numerous acts of political violence affecting its different actors and sectors. Local researchers have indicated that Palestinian students show little interest in learning science. In this study, two concepts are put forward. First, the notion of *situational interest*, and secondly *contextualization of learning*.This research therefore proposes to develop, in collaboration with teachers, a contextualized pedagogical situation that has the potential to stimulate interest in science among East Jerusalem high school students, and then to test it with their students. Our hypothesis is that we will record a positive gain when compared to a regular pedagogical intervention. To test this hypothesis, we measured general interest first and secondly to assess the effect of our intervention we used the *situational interest questionnaire.* Our results appear to show that it is indeed possible to stimulate students' situational interest in science when they are offered activities that provide them the opportunity to learn withing a context.

A Study on the Effectiveness of Encouragement from Friends in Recoverable Failure Situations
Keywords: Achievement, Anxiety and Stress, Higher Education, Motivation
Presenting Author: Maki Nakamura, Kagoshima University, Japan; **Co-Author:**Kumiko Yoshitake, Nagasaki Junshin Catholic University, Japan; **Co-Author:**Maori Urakawa, Nagasaki Junshin Catholic University, Japan

In situations of failure during student life, encouragement and comfort from friends, the adolescent's "significant others," are considered effective to move on. However, there are some students who cannot accept encouragement. Therefore, this study examined what kind of encouragement from close friends would be accepted by students within four types of attachment patterns (Secure, Preoccupied, Dismissing, Fearful) in a serious failure situation, a delayed assignment submission situation. An internal working model scale was conducted with 121 university students (53 males and 159 females). In addition, they were asked how receptive they were to eight types of encouragement (empathy, perspective shift, advice, encouragement, assistance respecting the other person's pace, different topics or jokes, indirect encouragement, physical contact). The results of a two-factor analysis of variance with attachment pattern 4 ×encouragement method 8 were as follows: (1) Preoccupied and Fearful groups were less likely to accept encouragement from friends than the Secure and Dismissing groups. (2) Among the methods, for empathy, perspective shift, and advice, the Preoccupied and Fearful students were as likely to accept them as the Secure and

Dismissing students, while for encouragement, they were less likely to accept encouragement from their friends than the Secure and Dismissing types. These results indicate that even encouragement from close friends requires some thought in the way the encouragement is given, since different types of attachment are more or less likely to accept it.

The effects of cognitive and noncognitive skills on achievement in higher education: SEM analysis
Keywords: Achievement, Cognitive Skills and Processes, Higher Education, Motivation
Presenting Author: Sofie Van Cauwenberghe, Ghent University, Belgium; **Co-Author:**Nicolas Dirix, Ghent University, Belgium; **Co-Author:**Stijn Schelfhout, Ghent University, Belgium; **Co-Author:**Wouter Duyck, Ghent University, Belgium

Why does someone succeed in the first year of higher education; while others seem to struggle? Choosing a suitable study program is a challenging process for prospective students. First students have to find a program of their interest and make an attainable choice. Secondly, they need to achieve study success if they want to stay on track to acquire a degree. Research on study achievement focuses either on cognitive skills, or on motivation, interests and other noncognitive skills. However, interrelations between cognitive and noncognitive skills in higher education achievement are understudied. McGrew (2022) developed the Cognitive-Affective-Motivation Model of Learning (CAMML) which is a framework for integrating affective (Big 5), cognitive (CHC theory) and motivational factors. This integrative framework hypothesizes that the interrelations between cognitive and noncognitive skills predict the effectiveness with which students are ready to learn. The present study sets out to test this framework in a specific higher education context. Prospective students (N = 5679) in Flanders (Belgium) were questioned on different components of the framework. According to structural equation modeling, our data were adequate to a good fit with the theoretical framework. Preliminary results showed that cognitive skills remain the major factor towards more study efficiency, but the noncognitive abilities and interests also play an important role. We argue that study orientation and counseling tools can improve when focusing on both cognitive and noncognitive skills.

Epistemic Beliefs and Interest as Predictors of Student Teachers' Attitudes towards Deep Learning
Keywords: Attitudes and Beliefs, Cognitive Skills and Processes, Motivation, Teaching/Instructional Strategies
Presenting Author: Christian Brandmo, University of Oslo, Norway; **Co-Author:**Helge I. Stromso, University of Oslo, Norway; **Co-Author:**Øistein Anmarkrud, University of Oslo, Norway; **Co-Author:**Leila Ferguson, Kristiania University College, Norway; **Co-Author:**Ivar Bråten, University of Oslo, Norway

In the context of a national curriculum reform, this study aimed to explore how two types of epistemic justification and interests are related to preservice teachers' attitudes towards a much-debated pedagogical principle: the deep learning approach. The deep learning approach emphasises greater concentration on less subject matter over time to promote well-organised, principled and transferable knowledge and metacognitive reflection among students. Deep learning has become a pervasive principle of the new national curriculum launched in Norway in 2020. Nevertheless, this principle has been met with much debate and controversy, as experts and practitioners have taken different positions. Given this context and based on previous research on epistemic cognition and motivation, we investigated whether personal justification and interests are predictors of student teachers' attitudes towards deep learning. Findings based on data from 150 student teachers indicated that epistemic justification beliefs and interest in educational issues in general predicted a more positive stance towards deep learning. However, personal justification appeared to be a more potent predictor of attitudes than justification by authority. Moreover, personal justification was found to interplay with interest, which fully mediated the relationship between personal justification and attitude. These and other relationships, as well as their implications, will be further elaborated on and discussed.

Session F 22

23 August 2023 14:45 - 16:15
UOM_GYM
Roundtable
Assessment and Evaluation, Instructional Design, Teaching and Teacher Education

Eye Tracking in Instruction and Assessment

Teaching Visual Problem-Solving: Understanding how Experts Transfer Visual Expertise to Novices
Keywords: Cognitive Skills and Processes, Eye Tracking, Social Sciences and Humanities, Teaching/Instructional Strategies
Presenting Author: Christine van Nooijen, Erasmus University Rotterdam, Netherlands

Visual problem-solving is a critical 21st-century skill in various domains, including the social sciences. It is often developed in expert-novice interaction. Differences between experts and novices have been identified in a variety of domains, such as (but not limited to) sports and game domains like soccer and chess, and vocational domains spanning from air traffic control to surgery. Yet the process by which this expertise is transferred to novices is still understudied. This project aims to investigate verbal and non-verbal expert-novice interactions to uncover effective practices for developing this skill in complex visual tasks in the social sciences domain; specifically, forensic criminology. We record expert-novice interactions to study which scaffolding strategies experts in visual problem-solving use to diagnose and assist the novice's learning process, with a focus on the use of cueing and chunking strategies. Cueing strategies are perceptual; attention is guided to a specific point, influencing attention allocation. Chunking strategies are cognitive; concepts are grouped together to show relations between and within the information. These scaffolding strategies may manifest in both verbal and nonverbal behaviours. We use mobile eye-tracking, audio and video recording to study the effects of these actions on novices' visual perception, attention allocation and performance. By understanding which cueing and chunking strategies are used, and how, we hope to improve our understanding of expertise transfer. This understanding will allow us to develop instructional and scaffolding interventions to assist novices in gaining confidence and proficiency in visual problem-solving faster, and experts in optimally transferring their knowledge.

Investigating pre-service teachers' sense-making of educational dashboards using multichannel data
Keywords: Eye Tracking, Learning Analytics, Pre-service Teachers, Teacher Professional Development
Presenting Author: Clara Schumacher, Humboldt Universität zu Berlin, Germany; **Co-Author:**Roger Azevedo, University of Central Florida, United States; **Co-Author:**Dirk Ifenthaler, University of Mannheim, Germany

With the increased availability of educational data, it is expected that teachers make use of them for educational decision-making. Such data are often visualized on dashboards. Interpreting and using educational data is considered complex and demands educational data literacy of teachers. Hence, this work-in-progress experimental study investigates pre-service teachers' interaction with a teacher dashboard either after having received training or no training while we collected their multichannel data (e.g., eye-tracking, think-aloud, logfile data). Results should give insights into pre-service teachers' sense-making of the educational data, and if a short training can support educational data literacy. The findings could be used for designing teacher dashboards, supportive functions (e.g., explanations of algorithms, possible interventions) and trainings on educational data literacy.

Using Multimodal Data to Diagnose Probabilistic Misconceptions via an Online Diagnostic Tool
Keywords: Assessment Methods, Eye Tracking, Mathematics/Numeracy, Misconceptions
Presenting Author: Daryn Dever, University of Central Florida, United States; **Co-Author:**Roger Azevedo, University of Central Florida, United States

Probabilistic reasoning is a fundamental component for developing learners' rational thinking and statistical literacy. Despite the importance of this reasoning, learners' fundamental understanding is severely impacted by misconceptions regarding probability that persist through adulthood. Several attempts have been made to diagnose probabilistic misconceptions using concept inventories with multiple-choice items relating directly to a particular misconceptions, though these inventories can be largely unreliable and inconsistent due to measurement errors. As such, it is essential to collect multimodal data to triangulate the presence of

a misconception to later introduce remediation methods. This paper explores the methodologies, preliminary findings, future directions, and challenges of an on-going study (N=8) which uses a combination of eye tracking, concurrent verbalizations, log-files, and self-reports to accurately diagnose when learners demonstrate misconceptions.

Instructional Design

Reinvigorating reading as an imaginative, vital experience for young people

Keywords: Communities of Learners and/or Practice, Comprehension of Text and Graphics, Engagement, Reading
Interest group: SIG 02 - Comprehension of Text and Graphics

How actively engaged are teenagers when they read literary texts at school? This workshop focuses on a seven-year Australian qualitative research and professional learning project involving secondary students and English teachers in 44 diverse secondary schools. Findings suggest that for too many contemporary young people, the reading experience at school involves a murky mix of mind wandering, fake reading, strategic regurgitation, and polite compliance. Drawing upon student interviews and students' metaphorical drawings of reading, as well as broader research into reading processes, the researchers worked collaboratively with English teachers to develop, implement, and evaluate a framework of reading capabilities to inform instructional design and formative assessment. The framework describes reading as an imaginative act fueled by connection-making, visualisation, embodied involvement, dialogic interaction, and metacognition. In this workshop, participants will learn about the qualitative approaches used to gather insights into students' complex and diverse reading experiences. Participants will encounter the Reading Capability Framework and actively participate in associated reading activities trialed and evaluated by teachers which aim to involve students actively and meaningfully in reading so that deep understandings develop. Dialogue will be used to collaboratively examine what readers do in their heads as they read and to further explore the implications for effective teaching.

Building bridges between research and schools: Feedback to primary education teachers on handwriting

Keywords: Educational Technologies, Feedback, Synergies between Learning / Teaching and Research, Writing/Literacy
Interest group: SIG 12 - Writing

The digitization of pupils´ handwriting samples together with platforms for collaboration open new spaces to work with teachers around writing. Through these platforms, you can share files and videos of the writing processes with teachers of the next course, offer feedback to and have synergies in the work environment. This digitization can contribute to the early detection of difficulties regarding students' written competence. Several reasons lead us to carry out the detection in the first cycle of primary school (6-8 years): 1) quickly made legible letters and careful spelling have a substantial influence on the quantity and quality of the texts. 2) the collected samples are short, and their analysis does not take much time. 3) our administration wants to implement the Response to Intervention model, where detection is fundamental. Even though there are international guidelines for teachers on how to detect writing difficulties, we still need to get down to it. We have collected and given feedback on digital writing samples (alphabet test, word copy and text created from an image) to five tutors, responsible for 32 students in the first year and 51 in the second year, in a public school in the Basque Country. Our contribution aims to: outline key concepts on the writing of the theoretical model by Berninger & Winn (2006); teach how to digitize writing samples using the smart pen, digital paper, and the HandSpy system; use platforms like Padlet and Wix to answer questions and offer feedback.

Knowing Your ABCs: Asset Based Communication for Actionable Learning Interventions

Keywords: Communication Skills, Ethics, Learning Analytics, Quantitative Methods
Interest group: SIG 17 - Methods in Learning Research

Asset-based narratives consider the funds of knowledge, values, skills, and identities that students bring to the table as assets to their learning. Narratives matter in that they are used to construct policies, curricula, and educational interventions that impact students. In this workshop, participants will interact with anonymized data to construct asset-based narratives for learners. Importantly, participants will define actionable insights from the data, directed at communication with different stakeholders (e.g., students, educators, other researchers). All activities will be guided by the data feminism framework, which considers the ways data narratives can challenge unequal power structures. Participants will leave the workshop with increased understanding of how to construct asset-based narratives of learners, and form actionable insights for different stakeholders. We expect this workshop to contribute to the ongoing conversation on ethical processes for collecting, analyzing, and disseminating data about students.

Assessment and Evaluation, Instructional Design, Learning and Instructional Technology

Phases of inquiry in practice: Contexts and Variations

Keywords: Assessment Methods, Competencies, Educational Technologies, Gifted and Talented Students, Inquiry Learning, Instructional Design, Mathematics/Numeracy, Science and STEM, Science Education, Secondary Education, Teaching Approaches
Interest group: SIG 20 - Inquiry Learning
Chairperson: ANASTASIOS CHOVARDAS, University of Cyprus, Greece
Organiser: Koen Veermans, University of Turku, Finland
Organiser: Valentina Nachtigall, Ruhr University Bochum, Germany
Discussant: Margus Pedaste, University of Tartu, Estonia

Pedaste et al. (2015) synthesized 32 articles describing inquiry phases or cycles, resulting in a theoretical model on inquiry-based learning. This model has been used in different contexts and leaves considerable room for variations. Our symposium brings some of the different variations and contexts together in order to discuss how this widely cited model has been conceptualized and used. The first paper by Jaakkola focuses on different potential *variations* of the model by reflecting – based on empirical evidence and design examples – on the scope of an inquiry cycle, differentiation within inquiry phases, and the role of scaffolding for inquiry learning. The second and third paper present two different *contexts* for the use of the model. The paper by Trautwein et al. presents how the model from Pedaste et al. has been used in order to develop an instrument for assessing learners' understanding of the scientific inquiry process. Hagenkötter et al. compare the model from Pedaste et al. with a model for mathematical modelling. Based on this comparison and empirical findings, they discuss how the model from Pedaste et al. can be used to refine the model for mathematical modelling. The last paper by Hovardas focuses on one certain *variation* of the model from Pedaste et al., namely the hypothetico-deductive paradigm, and problematizes such a linear conceptualization of inquiry learning. By exploring these different variations and contexts of the model from Pedaste et al., our symposium points to future directions for further investigating and developing a theoretical model on inquiry-based learning.

Problematizing a linear conceptualization of inquiry learning
Presenting Author:ANASTASIOS CHOVARDAS, University of Cyprus, Greece

Inquiry learning in science education and STEM/STEAM has been largely taken to closely resemble scientific practice. The relationship between inquiry learning and the scientific practice, however, has been predominantly marked by a supposedly linear arrangement of tasks according to the hypothetico-deductive paradigm. The main aim of this contribution is to problematize a linear conceptualization of inquiry learning, which needs to go along with challenging a linear conceptualization of the scientific practice itself. Results from two implementations will be presented and discussed, which showcase the inability of the linear conceptualization of inquiry to address several needs of pedagogical design, critical reflection of students through retrospective action, and integration of inquiry learning in learning contexts informed by educational robotics, engineering design education and maker education. Model-based inquiry is much more compatible than linear versions with such learning contexts. It will be proposed to acknowledge the Pedaste et al. (2015) inquiry cycle as a map for diagnosing the proper entry and exit points for student inquiry among multiple options instead of taking the cycle to necessarily denote a unique, linear path.

Mathematical Modelling With Hands-on Experimentation as a Possibility for Inquiry Learning
Presenting Author: Ramona Hagenkötter, Ruhr-University Bochum, Germany; **Co-Author:**Valentina Nachtigall, Ruhr University Bochum, Germany; **Co-Author:**Katrin Rolka, Ruhr University Bochum, Germany; **Co-Author:**Nikol Rummel, Ruhr University Bochum, Germany

Mathematical modelling with hands-on experimentation can be considered as a possibility for inquiry learning in mathematics education as it has many similarities to the phases of inquiry learning described in the model from Pedaste et al. (2015). During mathematical modelling with hands-on experimentation, students deal with a real-world question and conduct a mathematical hands-on experiment to answer it. In doing so, students make assumptions, plan and conduct an experiment, excerpt a mathematical model from the real world, answer mathematical questions within this mathematical model, interpret mathematical results in a real situation, validate the solution and reflect on their approach. However, as part of our quasi-experimental field study, we analyzed the notes of 74 9^{th} and 10^{th} graders working on a mathematical modelling task with hands-on experimentation and found difficulties of students during all steps of mathematical modelling with hands-on experimentation. For example, we observed that students tend to interpret their results in a biased way and, consequently, to falsely confirm their initial assumptions. Based on the model of Pedaste et al. (2015), we, therefore, discuss that Communication and Reflection, which are included in all phases of inquiry learning, should also play a stronger role in all steps of mathematical modelling with hands-on experimentation in order to counteract these difficulties.

Enrichment for talented students: Scientific inquiry competencies in primary schools
Presenting Author: Ulrich Trautwein, University of Tübingen, Germany

The Hector Children's Academy Program (HCAP) is a statewide enrichment program for talented primary school students (grades 1 to 4) with a focus on STEM topics in Baden-Württemberg, one of the largest states in Germany. The so-called Hector Core Courses—courses that are offered by almost all of the 70 local sites—undergo a strict quality assurance process in which their effectiveness is tested with regards to central outcomes in randomized controlled field trials (RCT). Inquiry learning plays a key role in several of these courses. The presentation will provide an insight into the role of scientific inquiry learning within the HCAP. First, we describe the development and validation of a scientific inquiry cycle (SIC) instrument for primary school students. Second, we summarize

findings from several randomized controlled field trials using the instrument to evaluate the effectiveness of a Hector Core Course. Third, we will discuss several important implications for talent research and educational practice, including necessary improvements to the assessment instruments, the need to better understand the association between SIC skills and students' motivational development including a theory of change, as well as the affordances and challenges of modern digital media.

Refining Phases of Inquiry: bridging between model and practice
Presenting Author: Koen Veermans, University of Turku, Finland; **Presenting Author:**Antti Lehtinen, University of Jyvaskyla, Finland; **Co-Author:**Tomi Jaakkola, Tampere University, Finland; **Co-Author:**Wouter Joolingen, Utrecht University, Netherlands

Pedaste et al. (2015) refer to Inquiry-Based Learning as "an educational strategy in which students follow methods and practices similar to those of professional scientists in order to construct knowledge". The aim of the model was to provide a model for inquiry learning in schools that could support the inquiry skills. This presentation discusses three topics in connection to the model: the scope of a cycle, the notion of development of skills and the role of reflection. Development of inquiry skills is closely connected to the need for scaffolding in IBL. Scaffolding is needed to tailor guidance to the learners' needs to the extent that they can accomplish the inquiry processes, but for the development of inquiry skills it is also important to fade scaffolding. The presentation will share examples of how this was translated into fading within the same inquiry cycle through miniature inquiry cycles, and into multiple versions of the same inquiry cycle that differentiate the level of scaffolding. Merits of these approaches, but also the risk over-scaffolding and how that may conceal important aspects of inquiry and decrease reflection and motivation will be discussed based on results of empirical studies and implementations. This will be used to illustrate that one cannot assume that content learning outcomes, inquiry learning outcomes and motivational outcomes are automatically aligned, that reflection be an important factor connected to aligning and that one future direction could therefore be to highlight both the role and place for reflection within the model more explicitly.

Session G 2

23 August 2023 17:00 - 18:30

Symposium
Instructional Design

Understanding and Optimizing Effects of Retrieval Practice in Education

Keywords: Educational Technologies, Foreign and Second Language Acquisition, Higher Education, Instructional Design, Learning Strategies, Mathematics/Numeracy, Primary Education, Quantitative Methods, Reading
Interest group: SIG 06 - Instructional Design
Chairperson: Niklas Obergassel, Ruhr University Bochum, Germany
Chairperson: Sterre Ruitenburg, Netherlands
Organiser: Gino Camp, Netherlands
Organiser: Julian Roelle, Ruhr University Bochum, Germany
Discussant: Vered Halamish, Bar-Ilan University, Israel

Practicing by retrieving information from memory is highly beneficial for learning. However, although there is consensus on the general effectiveness of retrieval practice, it is not yet fully understood *when* (i.e., under which conditions) retrieval practice works best and *how* (i.e., using which instructional means) its effectiveness can be optimized. Drawing upon four experiments from the field of retrieval practice, the present symposium aims to extend our knowledge regarding these research gaps. Contribution 1 and 2 shed light on the *when* of retrieval practice. Specifically, Contribution 1 examines the effects of retrieval practice (compared to the effects of summarization and restudy) when comprehension versus retention of news-related texts is required. Contribution 2 investigates the role of task complexity and retention interval for the effects of retrieval practice compared to studying worked examples in acquiring problem-solving skills. Contributions 3 and 4 shed light on *how* the effectiveness of retrieval practice can be optimized. Specifically, Contribution 3 examines whether increasing the retrieval effort involved in answering multiple-choice questions (by delaying the display of the answer options) enhances the benefits of retrieval practice in primary education. Contribution 4 investigates whether combining retrieval practice (tasks) with generative learning (tasks) can optimize overall effectiveness of retrieval practice by overcoming the comprehension deficits typically associated with retrieval practice. Taken together, using different theoretical approaches, the symposium will contribute to our understanding of *when* to implement retrieval practice and *how* to optimize its effectiveness. The implications for educational practice will be discussed.

Effects of Retrieval Practice and Summarization on Retention and Comprehension in Primary Education
Presenting Author:fieke ophuis, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Leen Catrysse, Open Universiteit, Department of Online Learning and Instruction, Belgium; **Co-Author:**Lucia Rozendal, Open University of the Netherlands, Netherlands; **Co-Author:**Desirée Joosten-ten Brinke, Open University of the Netherlands, Netherlands; **Co-Author:**Gino Camp, Open Universiteit, Department of Online Learning and Instruction, Netherlands

The effects of retrieval practice and summarization on text retention and text comprehension were investigated in an authentic primary school setting. 57 third and fourth grade pupils (M = 9.04 years old, SD = 0.63) read three different news-related texts. In subsequent practice sessions, pupils applied three different learning strategies (retrieval practice, summarization or restudy), one for each text. A final test was administered two weeks after the last practice session. Compared to summarization and restudy, retrieval practice showed a positive effect on the retention of factual knowledge. Additionally, both summarization and restudy provided better text comprehension than retrieval practice, but no difference was found between summarization and restudy. Thus, successful retrieval practice with factual information improves text retention, but appears not to aid text comprehension. Also, using summarization as a practice strategy does not lead to better understanding of the text than simple restudy under authentic learning conditions.

Worked-Examples and Retrieval Practice in Primary School Students' Mathematical Problem-Solving
Presenting Author: Sterre Ruitenburg, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Gino Camp, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Kevin Ackermans, Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Paul Kirschner, kirschner-ED / Open Universiteit, Department of Online Learning and Instruction, Netherlands; **Co-Author:**Halszka Maria Jarodzka, Open Universiteit, Department of Online Learning and Instruction, Netherlands

Two practice strategies are generally considered to be effective for acquiring problem-solving skills: worked-examples and retrieval practice. To better understand which strategy works under which conditions, we integrated two existing perspectives into one model. In that model, the optimal practice strategy depends on both the complexity of the learning task and the interval between the final practice opportunity and the test (i.e., retention interval). To test the model, we conducted a multi-classroom experiment with a 2 (Task Complexity: simple vs. complex) x 2 (Practice Strategy: worked-examples vs. retrieval practice) x 2 (Retention Interval: 5 minutes vs. 1 week) between-subjects design (N = 170). We performed a Bayesian 2 x 2 x 2 ANCOVA on participants' problem-solving performance. Although the data provided evidence that prior mathematical knowledge and task complexity affect participants' problem-solving performance, no evidence was found for the hypothesized interaction effects. Further analyses on the effect of practice strategy on problem-solving performance will be presented at the conference.

Benefits of Retrieval Practice with Stepwise Multiple-Choice Questions: A Study in Primary Education
Presenting Author: Gesa van den Broek, Utrecht University, Netherlands; **Co-Author:**Gerard Hoogenhout, Utrecht University, Netherlands; **Co-Author:**Laurie Kist, Utrecht University, Netherlands; **Co-Author:**Liesbeth Kester, Utrecht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Retrieval practice is a powerful tool for learning. One frequent format of retrieval practice is answering multiple-choice questions. However, multiple-choice questions require less retrieval effort than open-ended questions and might therefore be less effective for learning. Recent research shows that stepwise presentation, in which answer options appear after a brief delay, might make multiple-choice questions more effective for retrieval practice: Students can then

(attempt to) retrieve the answer from memory before the answer options are shown. The present classroom experiment aimed to (i) investigate whether stepwise multiple-choice questions are also beneficial for primary school children, and (ii) extend prior research by testing the effectiveness of two different types of stepwise multiple-choice questions (fixed delay and self-paced delay) in comparison to standard multiple-choice questions. Results of the 102 participating students (M_{age} = 10.74) showed that children benefited from stepwise multiple-choice questions. There were no differences between children who received the answer options after a fixed delay or self-paced delay. Furthermore, preliminary analyses suggest that whether students (reported that they) attempted to retrieve the answer from memory before the multiple-choice options became visible, did not moderate benefits of the stepwise display. Overall, findings indicate that the stepwise display of multiple-choice questions is a practical solution to increase children's learning from retrieval practice.

Effects of Combining Retrieval Practice and Generative Learning Tasks
Presenting Author: Niklas Obergassel, Ruhr University Bochum, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany; **Co-Author:**Tino Endres, University of Freiburg, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany; **Co-Author:**Shana Carpenter, Iowa State University, United States; **Co-Author:**Julian Roelle, Ruhr University Bochum, Germany

Engaging learners in retrieval practice tasks is an effective means to promote retention. However, when it comes to fostering comprehension, effects of retrieval practice tasks are often limited. One option to address this issue could lie in combining retrieval practice tasks with generative learning tasks. In contrast to retrieval practice activities, generative learning activities are theorized to predominantly serve the construction of coherent mental representations rather than their consolidation. Hence, by engaging learners in both types of activities, a combination of generative learning tasks and retrieval practice tasks might allow for compensating comprehension deficits typically associated with retrieval practice tasks (analogous to retention deficits typically associated with generative learning tasks). This, in turn, should result in better learning than pure retrieval practice tasks (and pure generative learning tasks). Thus, in the present study we explored benefits of a combination in comparison to pure retrieval practice and generative learning tasks, along with possible differences in effectiveness resulting from different types of sequential combinations. We addressed our research questions by conducting an experiment with university students, using a 5x2-factorial between-subjects-design with *sequence of learning tasks* (generative-learning-only- vs. retrieval-practice-only- vs. generative-learning-first- vs. retrieval-practice-first- vs. restudy-only-sequence) and *posttest timing* (immediate vs. one-week-delayed) as factors. Analyzing a fraction (N = 180) of the foreseen sample (N = 320), we did neither find benefits of a sequential combination nor differences between the two types of combinational sequences. Results based on the full data set will be presented at the conference.

Session G 3

Symposium
Teaching and Teacher Education

Teacher competence to see and engage in mathematical thought with their preschoolers

Keywords: Early Childhood Education, Informal Learning, Mathematics/Numeracy, Teacher Efficacy
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Simone Dunekacke, Freie Universität Berlin, Germany
Organiser: Joke Torbeyns, KU LEUVEN, Belgium
Organiser: Simone Dunekacke, Freie Universität Berlin, Germany
Discussant: Esther Brunner, Switzerland

Preschoolers' mathematical competencies are pivotal for their later academic achievements and can be effectively stimulated in preschool. As preschool instruction mainly involves informal, play-based learning situations, preschool teachers are challenged to see the mathematics in these situations and engage their preschoolers in mathematical interaction and reflection. This symposium brings together four empirical studies on preschool teachers' competencies to provide mathematical learning opportunities in simulated and authentic classroom situations with 1-to-6-year-olds. The symposium is based on the model of competence as a continuum (Blömeke et al., 2015) that distinguishes between dispositions, situation-specific skills (SSS) and performance and is frequently applied in studies on teaching and learning also at the preschool level (e.g., Dunekacke et al., 2012). All four contributions systematically investigate teacher performance and/or underlying dispositions and SSS in preschool mathematics education. The first contribution addresses preschool teachers' questions during picture book reading activities and their associations with teachers' dispositions and SSS. In the second contribution, a new instrument to assess SSS in preschool teacher education is presented. The study in the third contribution focuses on preschool teachers' SSS in the context of picture book reading. In the fourth contribution, the interaction between teachers and preschoolers when sharing a picture book is analyzed. Together, these contributions deepen current insights into preschool teachers' competencies to see the mathematics and offer learning-supportive activities in informal situations. These deepened insights are important for teacher training and professional development initiatives, as will be discussed by Esther Brunner, expert in preschool mathematics teaching and learning.

Preschool teacher competencies when sharing a picture book in view of mathematical development
Presenting Author: Joke Torbeyns, KU Leuven, Belgium; **Co-Author:**Emke Op 't Eynde, KU LEUVEN, Belgium; **Co-Author:**Fien Depaepe, KU Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium

We studied the number and complexity of the mathematical questions that preschool teachers formulate during shared picture book reading (SPBR) in authentic classroom situations, in association with teachers' dispositions and situation-specific skills (SSS). Departing from the teacher professional competence model of Blömeke et al. (2015), 44 preschool teachers answered four online instruments addressing their mathematical content knowledge (MCK), mathematical pedagogical content knowledge (MPCK), beliefs about the nature of mathematics and teaching and learning mathematics, and mathematical questions proposed during a simulated SPBR activity (SSS). We observed two SPBR activities using picture books written with versus without a mathematical aim in their classrooms. We analyzed the number and abstraction level of the mathematical questions during these SPBR activities, and their associations with teacher dispositions and SSS. For picture books written with as well as without a mathematical aim, we found inter-individual differences in the number of mathematical questions asked, and typically questions at abstraction level 2. Again for both types of picture books, we did not observe any association between (a) teachers' dispositions and SSS and (b) the number and abstraction level of the mathematical questions asked. Although our findings point to teachers' ability to formulate questions that might engage preschoolers in mathematical interaction and reflection during SPBR activities using various types of picture books, future studies are needed to validate and refine our findings taking into account the complex interplay between teacher competencies, child and context variables and actual classroom behavior.

Pre-service EC teacher's situation-specific skills: An insight in quantity and quality
Presenting Author: Simone Dunekacke, Freie Universität Berlin, Germany; **Co-Author:**Lisa Starcke, Freie Universität Berlin, Germany; **Co-Author:**Julia Barenthien, Universität Hamburg, Germany; **Co-Author:**Mirjam Steffensky, Universität Hamburg, Germany; **Co-Author:**Aiso Heinze, Leibniz Institute for Science and Mathematics Education, Germany

Early childhood (EC) teachers' professional competence can be modelled as a multidimensional and domain-specific construct, which includes dispositions, situation-specific skills, and performance. Situation-specific skills are particularly important in preschool contexts where children's domain-specific learning takes place predominantly in everyday situations. The domain-specific assessment of such situation-specific skills is challenging for research on EC teachers. This paper aims to present a new illustration-based instrument to assess two components of situation-specific skills: *perceiving math-related situations* (PERC) and *planning math-related actions* (ACT). The developed test addresses EC teacher's PERC and ACT for different mathematical content areas. It does not only capture the quantity of perceived situations (PERC) and planned actions (ACT) like existing tests, but also the quality of the ACT based on 13 indicators for high and low stimulation quality. First results from a sample of 233 pre-service EC teachers indicate that the test provides a reliable measure for PERC. The findings

are comparable to those from former studies. For ACT, the EC teachers showed a higher number of planned actions compared to the existing research. The distribution of the stimulation quality indicators for ACT was quite heterogeneous. Especially, for the stimulation of reflections in the situation, the EC teachers reached a high quality.

Early childhood teachers' competence to identify mathematics in picture books
Presenting Author: Iliada Elia, University of Cyprus, Cyprus; **Co-Author:**Van den Heuvel-Panhuizen Van den Heuvel-Panhuizen, Utrecht University, Netherlands & Nord University, Norway, Norway; **Co-Author:**Eleni Deliyianni, Cyprus Ministry of Education, Sports and Youth, Cyprus

Several studies have provided evidence for the significant contribution of picture book reading in stimulating children's mathematical thinking and development. However, the role of the teachers when using picture books to support children's learning in mathematics has received limited research attention. As a first step to address this gap, in this study we focused on investigating early childhood teachers' competence to identify the mathematics in picture books. The participants of the study were 9 early childhood teachers. The teachers were asked to identify the mathematics that can be found in two high literary quality picture books which have not been written for teaching mathematics, by filling in an open questionnaire for each book. Results revealed that teachers were able to see mathematical content in a large part of both picture books. However, identifying mathematical processes in the picture books was extremely rare in their responses, while for a part of the books teachers identified aspects that did not correspond to mathematical content, by giving, for example, story-related responses and teaching-related responses. The mathematical content teachers recognized in the picture books included a wide range of mathematical topics. The implications of these findings are discussed for research and practice regarding teachers' competences in using picture books in early mathematics.

Teachers' performance and toddlers' numerical learning opportunities when reading picture books
Presenting Author: Camilla Björklund, University of Gothenburg, Sweden; **Co-Author:**Hanna Palmér, Linnaeus University, Sweden

The aim of this study is to deepen the understanding of how to teach numeracy when reading picture books. The specific research question is: What mathematical learning becomes possible based on teacher performance when reading a picture book designed for numerical learning purposes? Seventy-three video documentations of reading sessions over the course of three semesters were analyzed. The results indicate that how one and the same picture is handled by the teacher impact what the children are afforded to learn. In particular, it seems to make a difference if one or two pages are shown at the same time: one page merely inducing focus on composition of a set, while two pages shown simultaneously open up for exploring differences in quantities, and part-whole relations within sets. This contributes to our understanding of the importance of teacher performance when reading picture books with pedagogical purpose.

Session G 4

23 August 2023 17:00 - 18:30

Symposium
Cognitive Science, Higher Education, Motivational, Social and Affective Processes

The emergence of creativity within and between individuals and its educational implications

Keywords: Attitudes and Beliefs, Cognitive Skills and Processes, Creativity/Divergent Thinking, Early Childhood Education, Engagement, Metacognition, Peer Interaction, Problem Solving, Self-efficacy, Social Interaction
Interest group: SIG 04 - Higher Education, SIG 10 - Social Interaction in Learning and Instruction, SIG 18 - Educational Effectiveness and Improvement
Chairperson: Evelyn Kroesbergen, Radboud University, Netherlands
Organiser: Honghong Bai, China
Organiser: Kim van Broekhoven, Erasmus University Rotterdam, Netherlands
Discussant: Mare van Hooijdonk, Radboud University Nijmegen, Netherlands

Across the world, there is a broad call for fostering students' creativity in all levels of education, ranging from kindergarten education to tertiary education. But how can teachers foster students' creativity in an effective and adaptive manner? We believe an important starting point is to understand how creativity actually emerges, as only then, teachers will be flexible and precise in setting goals and designing instructions in the classroom. The traditional view regards creativity as an individuals' ability to create products or ideas that are novel and useful (Runco & Jaeger, 2012). However, recent research increasingly points out that creativity is dynamic and situated in nature (Kupers et al, 2019; Glaveanu, 2020). Following this new development, creativity is not viewed as a static, individual trait, but rather, it emerges from the interactions of different cognitive processes within individuals and from the interactions between individuals and the external social and physical environment. Yet, there is a lack of empirical evidence that helps teachers gain insight into the dynamic and situated aspects of creativity, leaving the question "How does creativity emerge within and between students?" largely unanswered. To answer this question, this symposium will bring together four presentations that either focus on creativity of kindergarteners when they interact with adults (Presentation 1), creativity of students when they interact with peers (Presentation 2-3), and the process of creativity within students (Presentation 4). Next, this symposium aims to wonder and articulate how our findings could support future education in fostering students' creativity.

Creativity in dialogues: Parents vs. strangers, who can better support idea generation in children?
Presenting Author: Honghong Bai, Tsinghua University, China; **Co-Author:**Luk Shu Chan, Faculty of Education, University of Hong Kong, Hong Kong; **Co-Author:**Hetao Zhang, School of Education and Information Studies, University of California, United States; **Co-Author:**Li Shang, School of Education and Information Studies, University of California, United States; **Co-Author:**Stella Christie, Tsinghua University, China

Researchers increasingly point out that creativity does not occur in isolation within individual minds but rather through continuous interactions between the person and the environment including the social environment. This study investigated whether and how the interactions that revealed perspective taking within dyads facilitate children's creativity. A group of Chinese children aged 4 to 6 years of age were assigned to two experimental conditions. In the child-parent condition, children worked with a (grand)parent on a known idea generation task—the Alternative Uses Task (AUT). And in the child-stranger condition, children performed the AUT with an unfamiliar university student. Analyses results showed that children interacted slightly more with their parents than with strangers, but children from child-parent dyads did not perform better on the AUT than children from child-stranger dyads. In general, strangers or parents, when they displayed more high-level perspective taking behaviors, thus more often taking in and expanding children's ideas, children could generate more ideas (increasing also the chance of generating more original ideas). But when children more often took in and expanded adult-partners' ideas, although they may generate more ideas, the originality of their ideas decreased. These findings suggest that, when aiming to foster children's (expression of) creativity, adults should try to expand and revise children's ideas and integrate their own, new inputs with that of children's.

Types of talk in student teams: Enabling or stifling creative synergy in teams?
Presenting Author: Kim van Broekhoven, Erasmus University Rotterdam, Netherlands; **Co-Author:**Evelyn Kroesbergen, Radboud University, Netherlands; **Co-Author:**Ming Ming Chiu, Department of Educational Studies, Purdue University, Hong Kong

Worldwide, policy makers call for creativity in higher education to tackle increasingly complex problems. Students working in teams should learn to collaboratively develop creative ideas. Yet, little is understood how certain types of talk in team dialogue enable or stifle creative synergy in teams. Using Mercer's classification of "cumulative", "disputational" and "exploratory" in types of talk, this study examines how patterns in types of talk (e.g., disagree, objecting the idea, clarifying the idea, approving) affect the likelihood of (i) original and (ii) useful ideas in teams. For this, we have conducted statistical discourse analysis on 3.816 turns of talk by 12 students in 4 teams working on an open-ended task in the classroom. Results showed that patterns in types of talk - characterized by cumulative talk – enhances the likelihood of the development of creative ideas, while patterns in types of talk - characterized by exploratory talk – reduces the likelihood of the development of creative ideas but enhances the likelihood of the development of more useful ideas in succeeding turns. These findings suggest that criticism on each other's ideas may stifle creativity synergy in the classroom, but simultaneously, a critical voice may be essential once students start developing more appropriate and useful solutions. Implications and directions for future research are discussed.

The effect of reflective debriefs on team behavior during creative problem solving
Presenting Author: Roni Reiter-Palmon, University of Nebraska, United States; **Co-Author:**Payge Japp, University of Nebraska at Omaha, United States; **Co-Author:**Kyle Christensen, Clemson University, United States; **Co-Author:**Marissa Shuffler, Clemson University, United States; **Co-Author:**A Patel, University of Texas, Dallas, United States; **Co-Author:**Joshua Summers, University of Texas, Dallas, United States

Team reflexivity as a team process does not happen naturally in many cases. Early research on team reflexivity has indicated that the degree to which teams engage in the process is a predictor of team creative performance. Given that team reflexivity may not occur spontaneously and its importance for team outcomes is paramount, an important question emerges: How can team reflexivity be facilitated? In this study we discuss one approach to facilitate team reflexivity and its effect on team creative problem solving. In addition, we will discuss how this intervention influences dynamic team behavior over time, and its effect of team creative performance.

Everyday dynamics of students' creative engagement
Presenting Author: Maciej Karwowski, University of Wroclaw, Poland; **Co-Author:**Aleksandra Zielińska, University of Wrocław, Poland

Is it possible to strengthen students' engagement in creative activities using simple everyday tasks focused on creative thinking, self-efficacy, or valuing creativity? This talk explores this question by summarizing the findings from two intensive, daily-diary studies on university students. In Study 1, during eight days, students (N = 80; 935 student-day units) were faced with simple tasks that required them to focus on creativity for a few minutes, while no prompts were presented during the remaining eight days. Using multilevel modeling, we demonstrated that days with prompts were associated with higher emotional engagement (both positive and negative) and greater creative activity than those without prompts. Specifically, students felt more creative and engaged more intensively in everyday creative activities, yet this effect did not transfer to more domain-specific creativity in science, programming, or design. In a more extensive Study 2 (N = 279 students, 5990 student-day units), we found that motivation-oriented tasks resulted in a higher creative self-efficacy and more intense everyday creative activity compared to more typical, cognitive creative-training-like tasks. These findings open an avenue for developing brief interventions to make creativity more salient in school, work, and family.

Symposium
Learning and Instructional Technology, Motivational, Social and Affective Processes

Advancing SRL research with Artificial Intelligence – theoretical and conceptual foundations

Keywords: Artificial Intelligence, Assessment Methods, Computer-assisted Learning, Computer-supported Collaborative Learning, Emotion and Affect, Metacognition, Mixed-method Research, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Sanna Järvelä, University of Oulu, Finland
Organiser: Sanna Järvelä, University of Oulu, Finland
Organiser: Inge Molenaar, Radboud University Nijmegen, Netherlands
Discussant: Marcus Specht, TU Delft, Netherlands

The aim of this symposium is to discuss theoretical and conceptual foundations to advance self-regulated learning (SRL) research with Artificial Intelligence (AI). We review our recent research progress and support our claims with empirical research. Measuring SRL has been a major challenge in the learning sciences field. Recently, research has recognized the potential of analyzing multichannel data about SRL with intelligent learning technologies (Järvelä & Bannert, 2021). Advancement in artificial intelligence (AI) has brought novel opportunities to enable sophisticated analysis of different types of data to gain new insights into the learning processes and SRL (Molenaar, 2022; Nguyen et al. 2022) Specifically, interdisciplinary efforts with strong theory-based understanding on SRL could make learning technologies more intelligent by providing real-time SRL support (Azevedo & Gašević, 2019). However, analyses of multichannel SRL process data face several challenges that are associated with the alignment between theoretical notions, data structures, and methodological assumptions that underlie AI techniques used to analyse the data. Research progress is needed in theory and methods to support evidence-based view on the role of AI in SRL research. The four teams will share their current theoretical and conceptual advancement and related empirical evidence and the discussant will raise the critical issues in that progress.

Research on the grid: measuring self-regulated learning with multimodal data and the role of AI
Presenting Author: Susanne de Mooij, Radboud University, Netherlands; **Co-Author:**Joni Lämsä, University of Oulu, Finland; **Co-Author:**Roger Azevedo, University of Central Florida, United States; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:**Dragan Gasevic, Monash University, Australia; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands

Learning sciences are embracing the significant role AI can play to better detect, diagnose, and act upon self-regulated learning (SRL). The field of SRL is challenged to advance our understanding of how multimodal data can unobtrusively capture the temporality, sequence, and order of learners' cognitive, metacognitive, affective, and motivational states. We conducted a systematic literature review to map empirical research on this topic in a visual grid, which is called the self-regulated learning processes, multimodal data, and analysis (SMA) grid. In our presentation, we use this two-dimensional grid of SRL processes and multimodal data to position the research done so far to visualise the relations and possible combinations between the data streams and the measurement of SRL processes. Moreover, we define analytical approaches in the grid (unimodal, horizontal, vertical, and integrated approaches) to discuss our understanding of the interactions between the axes so far and how AI is applied to investigate these interactions. The methodological results show that there is a historic development in measuring SRL from a unimodal approach with simple statistical analyses to using multimodal data to capture temporal and sequential characteristics of SRL processes. The increasing role of AI in these various advanced data analytic techniques to assess the full complexity of SRL is also discussed.

Towards Hybrid Human-AI Regulation: Supporting Young learners' Self-regulated Learning
Presenting Author: Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Anne Horvers, Radboud University, Netherlands; **Co-Author:**Rick Dijkstra, Radboud University Nijmegen, Netherlands; **Co-Author:**Rianne Kooi, Radboud University Nijmegen, Netherlands; **Co-Author:**Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands

Education is a unique area for application of artificial intelligence (AI). Hybrid systems combining artificial and human intelligence hold great promise for training human skills. Hybrid Human-AI Regulation (HHAIR) is a novel way to develop learners' Self-Regulated Learning (SRL) skills within Adaptive Learning Technologies (ALTs). In this contribution, I discuss the first research results of such a system. HHAIR targets young learners (10-14 years) for whom SRL skills are critical in today's society. Many of these learners use ALTs to learn mathematics and languages every day in school. ALTs optimize learning based on learners' performance data but even the most sophisticated ALTs fail to support SRL. In fact, most ALTs take over (offload) control and monitoring from learners. Grounded in the COPES model of SRL and based on empirical studies, this contribution describes how HHAIR can resolve this issue. HHAIR positions hybrid regulation as a collaborative task of the learner and the AI which is gradually transferred from AI-regulation to self-regulation. Learners will increasingly regulate their own learning progressing through different degrees of hybrid regulation. In this way HHAIR supports optimized learning and the transfer and development of SRL skills for lifelong learning (future learning). The HHAIR concept is novel in proposing a hybrid intelligence approach training human SRL skills with AI. This contribution outlines the theoretical and empirical foundations and the research results of the HHAIR system to train SRL skills with AI.

Studying and developing metrics for socially shared regulation in learning
Presenting Author: Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Andy (Khanh Xuan) Nguyen, University of Oulu, Finland; **Co-Author:**Márta

Sobocinski, University of Oulu, Finland; **Co-Author:**Eija Vuorenmaa, University of Oulu, Finland, Finland; **Co-Author:**Ahsen Çini, University of Oulu, Finland

While the benefits of regulated learning for effective collaborative learning are evidenced, little is known about the events that determine regulation. We have introduced the trigger concept framework whereby we will be able to detect adaptive/maladaptive socially shared regulation processes involving regulatory responses. This study aims to investigate, test and evidence our trigger concept framework with multimodal data and AI-based methods. We designed experimental and control study among high school students (N= 87) with manipulated challenge events in collaborative learning tasks for answering the main research question: What are the triggers of cognitive and emotional regulation in CL? The results of this study will advance current understanding in metrics of regulation in collaborative learning and contributes to understanding how various data can be used for developing AI-enabled real-time support for regulation in collaborative learning.

Closing the feedback loop for self-regulated learning with learning analytics
Presenting Author: Mladen Raković, Monash University, Australia; **Co-Author:**Yizhou Fan, Peking University, China; **Co-Author:**Tongguang Li, Monash University, Australia; **Co-Author:**Shaveen Singh, Monash University, Australia; **Co-Author:**Xinyu Li, Monash University, Australia; **Co-Author:**Dragan Gasevic, Monash University, Australia

Although development of self-regulated learning (SRL) skills is commonly considered important for students to become productive life-long learners, many students find this task challenging. They often need external feedback to advance their SRL. To provide appropriate feedback on student SRL, it is critical to validly measure SRL processes that students enacted, identify processes that benefit/harm learning and performance, and, based on that, tailor feedback to help them alter their SRL behaviours in a productive way. Following recent advancements in the field, learning analytics methods for collecting and analysing student trace data can be utilised in closing the feedback loop for SRL. In particular, these methods can aid understanding of SRL processes as they dynamically unfold during the learning task and provide automated and personalised scaffolding of SRL. We propose a conceptual framework describing how the feedback loop for self-regulated learning may be closed with learning analytics. Our framework is motivated by the three-stage approach to learning analytics adoption (Authors, 1) and includes the following stages: gathering trace data that describe SRL processes (i.e., data stage), generating analytics of SRL (i.e., model stage) and tailoring analytics-based scaffolds of SRL to students (i.e., transformation stage). We describe each of these stages in the context of SRL and list several challenges for future research.

Symposium
Assessment and Evaluation, Learning and Social Interaction

Investigating students' active participation in classroom discourse

Keywords: Artificial Intelligence, Assessment Methods, Classroom Assessment, Dialogic Pedagogy, Engagement, Motivation, Social Aspects of Learning and Teaching, Social Interaction, Teacher Professional Development
Interest group: SIG 01 - Assessment and Evaluation, SIG 10 - Social Interaction in Learning and Instruction
Chairperson: Ricardo Böheim, Technical University of Munich, Germany
Organiser: Ricardo Böheim, Technical University of Munich, Germany
Discussant: Maria Vrikki, University of Nicosia, Cyprus

Students' active participation in classrooms is considered to be crucial for student learning. During classroom discourse, students are commonly expected to exchange ideas and to co-construct knowledge by building on each other's contributions. However, research highlights that students' active participation varies significantly among individuals, as some are very active while others are quite reluctant to participate at all. The extent to which students are actively involved in classroom discourse is usually conceptualized through observable indicators such as hand raising or verbal engagement. This symposium presents three empirical studies that provide new insights into central antecedents and outcomes of students' active participation in classroom discourse. An additional methodological contribution presents recent advances in the automated coding of student participation. The first contribution examines whether an intervention on teachers' dialogic discourse can enhance verbal participation and student learning. The second contribution focuses on shy students' hand raising and investigates how contextual and teacher-specific factors are related to their hand raising behavior. The third contribution analyzes the bidirectional nature of the relationships between hand raising and cognitive or motivational student characteristics throughout one school year. Using a machine learning approach, the last contribution presents results on the automated detection of hand raising as a time- and cost-effective method for assessing students' active participation in classrooms. Results from this symposium aim to help educators better support students' active participation as well as highlight the potential of automated methods for student participation data collection in future research.

Can dialogic discourse enhance student participation and student learning?
Presenting Author: Klara Sedova, Masaryk University, Czech Republic; **Co-Author:**Martin Sedlacek, Masaryk University, Czech Republic; **Co-Author:**Roman Švaříček, Masaryk University, Czech Republic; **Co-Author:**Zuzana Salamounova, Masaryk University, Czech Republic; **Co-Author:**Tomáš Lintner, Masaryk University, Czech Republic

Recent educational research strongly focuses on students' active participation in classroom discourse and its potential to enhance student learning. Many intervention studies conducted in the past two decades tried to promote more productive dialogues in everyday classrooms, some of them with remarkable success. However, these studies typically investigate classrooms as analytic units and neglect differences between individual students. In the present study, we designed an intervention that aimed at promoting a collective and dialogic discourse in which all students can participate actively. We conducted a quasi-experimental study. Six classes took part in an intervention group focused on implementing collective dialogue. Before the project and at its end we measured the quantity of students' active participation in classroom discourse. In addition, students completed achievement tests. There were six control classes included in the study who did not participate in the intervention program but completed pre- and post-measurements. Results showed that the intervention was effective in terms of increasing students' active participation in classroom discourse in intervention classes and, at the same time, in decreasing differences in talk time between students. Furthermore, intervention classes outperformed the control classes in the achievement test at the end of the project. Results may encourage teachers to integrate dialogic approaches into their discourse practice to foster students' active participation and to reduce inequalities in students' vocal engagement.

Promoting active participation: Examining contextual factors influencing shy students' hand raising
Presenting Author: Lukas Mundelsee, University of Heidelberg, Germany; **Co-Author:**Susanne Jurkowski, Universität Erfurt, Germany

This field study sought to contribute to a deeper understanding of what promotes the active participation of students, in particular of shy students whose passive silence is thought to pose a risk to their academic adjustment. Data were collected using (1) student self-reports, (2) observations, and (3) behavioral measures of student hand raising of 204 middle-school students during a total of 116 lessons. Multilevel analysis indicate that shy students raise their hands more in the social sciences, the better the student-teacher relationship, the more a teacher uses warm calling, but also the colder the class climate. The findings confirm some previous assumptions, but also raise the question of whether shy students should sometimes be allowed to remain silent as long as they are cognitively and emotionally engaged.

Hand raising and its bidirectional relationships with cognitive elaboration and self-concept
Presenting Author: Ricardo Böheim, Technical University of Munich, Germany; **Co-Author:**Martin Daumiller, University of Augsburg, Germany; **Co-Author:**Tina Seidel, Technische Universität München, Germany

Hand raising is a key student behavior in everyday classrooms. Recent studies show that hand raising is related to important learner characteristics. However,

most research on hand raising is limited to correlational interpretations; directional influences among hand raising and learner characteristics over time have not been explored. In the present study, we investigate reciprocal relationships of hand raising with cognitive and motivational learner characteristics. We collected behavioral data on students' hand raising using video-recordings of 376 high school students at the beginning and at the end of the school year. Results show that students' hand-raising behavior is relatively stable throughout the school year. A latent cross-lagged panel analysis revealed bidirectional relationships between hand raising, cognitive elaboration and academic self-concept. Specifically, hand raising functioned as both an antecedent and an outcome of students' cognitive elaboration. In addition, hand raising at the beginning of the school year positively predicted changes in students' academic self-concept. Results suggest that engaging in hand raising seems to create opportunities that provoke positive changes in students' cognitive and competence-related learning experiences.

Automated hand-raising detection in classroom videos
Presenting Author: Babette Bühler, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Ruikun Hou, University of Tübingen, Germany; **Co-Author:**Efe Bozkir, University of Tübingen, Germany; **Co-Author:**Patricia Goldberg, University of Tübingen, Germany; **Co-Author:**Peter Gerjets, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany; **Co-Author:**Enkelejda Kasneci, Technical University of Munich, Germany

Hand-raising is an important indicator of students' active participation in classroom discourse, and thus a crucial prerequisite for successful learning. The automated detection of hand-raising events in classroom videos can offer a time and cost-effective substitute for the manual annotation of human observers. Main challenges for the automated detection are diverse camera angles and student occlusions in the classroom setting. In this study, we propose a novel view-invariant, occlusion-robust machine learning approach to hand-raising detection in classroom videos, based on body pose estimation. We employed a dataset stemming from 29 real-world classroom videos, capturing 264 students from grades 5 to 12 and 1916 manually annotated hand-raising events. Our temporal models trained on body pose embeddings achieved a F1 score of 0.701, which is the harmonized mean of precision and recall of hand-raising predictions. The potential of this detection approach to enable future large-scale research on student participation and to allow privacy-preserving data collection in the classroom is discussed.

Assessment and Evaluation, Learning and Instructional Technology

Current Reading Research: Covid-19 Impact, Risks and Benefits of Digital Technologies for Reading

Keywords: Achievement, Digital Literacy and Learning, E-learning/ Online Learning, Educational Technologies, Instructional Design, Large-scale Assessment, Mathematics/Numeracy, Pandemic, Primary Education, Reading
Interest group: SIG 01 - Assessment and Evaluation, SIG 02 - Comprehension of Text and Graphics, SIG 07 - Technology-Enhanced Learning And Instruction
Chairperson: Ulrich Ludewig, Institute for School Development Research, TU Dortmund University, Germany
Discussant: Danielle McNamara, Arizona State University, United States

The COVID-19 pandemic had an impact on education worldwide and triggered a shift to digital learning in many countries. More and more evidence on the pandemic's impact on children's literacy has been gathered lately. These findings help us to better understand the impact of the home literacy environment and digital technology, and not only contribute to the unraveling of the unique pandemic situation. This symposium focuses on elementary students' reading skills and bridges research on the impact of COVID-19 on students' and their home literacy environments, the long-term impact of reading on digital devices versus on paper, and the benefits of educational technologies for literacy instruction. The first contribution looks at the overall impact of reading achievement loss, family background and gender with a representative school panel study of German fourth graders. The second paper focusses on the quantification of learning losses in reading and math of 3rd graders based on longitudinal data from Finland. The third paper investigates the effects of reading frequency, on screen and in print, during reading for leisure and for homework, on the development of reading comprehension skills. The study has a longitudinal design with 4th to 6th graders in Spain. The fourth paper presents a multi-study summary with randomized field trials and observational studies on the literacy instruction applications *Inference Galaxy* and *iSTART-Early* for children between kindergarden and 4th grade. The symposium connects perspectives of representative large-scale studies, in-depth longitudinal analyses and instructional effectiveness research to understand and improve elementary school students' reading ability.

COVID-19 Pandemic and Student Reading Achievement – Findings from a School Panel Study
Presenting Author: Ulrich Ludewig, Institute for School Development Research, TU Dortmund University, Germany; **Co-Author:**Ruben Kleinkorres, Institute for School Development Research, TU Dortmund University, Germany; **Co-Author:**Rahim Schaufelberger, Institute for School Development Research, TU Dortmund University, Germany; **Co-Author:**Theresa Schlitter, Technical University Dortmund, Germany; **Co-Author:**Ramona Lorenz, Institute for School Development Research, TU Dortmund University, Germany; **Co-Author:**Nele McElvany, Institute for School Development Research, TU Dortmund University, Germany

Since 2020, the COVID-19 pandemic had an impact on education worldwide. There is increased discussion of possible negative effects on students' learning outcomes and the need for targeted support. We examined fourth graders' reading achievement based on a school panel study, representative on the student level, with $N = 111$ elementary schools in Germany (total:$N = 4{,}290$ students, age: 9-10 years). The students were tested with the*Progress in International Reading Literacy Study* instruments in 2016 and 2021. The analysis focused on (1) total average differences in reading achievement between 2016 and 2021, (2) average differences controlling for student composition, and (3) changes in achievement gaps between student subgroups (i.e., immigration background, socio-cultural capital, gender). The methodological approach met international standards for the analysis of large-scale assessments (i.e., multiple multi-level imputation, plausible values, clustered mixed-effect regression). The results showed a substantial decline in mean reading achievement. The decline corresponds to one-third of a year of learning, even after controlling for changes in student composition. We found no statistically significant changes of achievement gaps between student subgroups, despite numerical tendencies towards a widening of achievement gaps between students with and without immigration background. It is likely that this achievement decline was related to the COVID-19 pandemic. The findings are discussed in terms of further research needs, practical implications for educating current student cohorts, and educational policy decisions regarding actions in crises such as the COVID-19 pandemic.

Reading and Math Skills Development among Finnish Children before and after COVID-19 School Closure
Presenting Author: Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Minna Torppa, University of Jyväskylä, Finland

This study quantified the possible learning losses in reading and math skills among a sample of Finnish Grade 3 children ($n = 198$) who spent eight weeks in distance learning during the first wave of the COVID-19 pandemic in spring 2020. We compared their reading and math skill development trajectories across Grades 1, 2, and 4 to a pre-COVID sample ($N = 378$). We also examined if gender, parental education, maternal homework involvement, and child's task-avoidant behavior predict children's academic skills at Grade 4 differently in the pre-COVID sample compared with the COVID sample. Children's reading and math skills were tested, mothers reported their education and homework involvement, and teachers rated children's task-avoidant behavior. The results showed, on average, lower reading skills in the COVID sample than in the pre-COVID sample but there were no differences in math skills. Although the COVID sample had lower levels in reading, their developmental trajectories in reading and math skills were not different from the pre-COVID sample before the pandemic in Grades 1 and 2. From Grade 2 to 4, however, the development was slower in reading fluency and comprehension in the COVID sample, but not in math. The predictors of change from Grade 2 to 4 in reading and math skills were not different in the samples. The results showed that the development of reading skills in particular may have been affected by the COVID-19 pandemic.

Associations Between Reading Habits and Comprehension Skills in Primary School
Presenting Author: Lidia Altamura García, University of Valencia, Spain; **Co-Author:**Ladislao Salmerón, University of Valencia, Spain; **Co-Author:**Mari Carmen Blanco, University of Zaragoza, Spain; **Co-Author:**Pablo Delgado, University of Sevilla, Spain; **Co-Author:**Victoria García, University of Valencia, Spain; **Co-Author:**Amelia Mana, University of Valencia, Spain; **Co-Author:**Sandra Montagud, University of Valencia, Spain; **Co-Author:**Johannes Naumann, University of Wuppertal, Institute for Educational Research, Germany; **Co-Author:**Luis Ramos, University of Valencia, Spain; **Co-Author:**Mario Romero, University of Valencia, Germany; **Co-Author:**Cristina Vargas, University of Valencia, Spain

On-screen reading has been introduced in classrooms across the world faster than our knowledge of its potential effects on reading comprehension. Our study aims to analyze the implications of this phenomenon in primary school classrooms, exploring the relationship between reading frequency, on screen and in print, when students read for leisure or for homework, in the development of reading comprehension skills. Data from 831 4th to 6th grade students revealed small-sized positive relationships for reading frequency for leisure-paper and school-paper, as well as a small-sized negative relationship for school-digital reading. The relationship was not significant for leisure-digital reading. We discuss the results in light of the current debate regarding digitalization of reading in schools, and identify limitations of our work.

The Promise of Educational Technologies in Improving Literacy Instruction and Student Outcomes
Presenting Author: Panayiota Kendeou, University of Minnesota, United States; **Co-Author:**Kristen McMaster, University of Minnesota, United States; **Co-Author:**Danielle McNamara, Arizona State University, United States

Recognizing the promise of educational technologies for literacy instruction, we developed two theory-based tools that promise to improve reading comprehension in elementary school students. *Inference Galaxy* was developed to improve students' inferencing in Kindergarten to Grade 2 and*iSTART-Early* was developed to improve students' use of comprehension strategies, including comprehension monitoring and question asking, paraphrasing, inferencing (prediction, bridging, elaboration), explanation, and summarization in Grades 3-4. In this paper, we present these tools as well as initial evidence for their efficacy in improving proximal and distal reading comprehension outcomes. Overall, results of several studies demonstrate initial promise for both tools in improving students' inferencing and comprehension, and highlight the promise of standardized, individualized delivery of instructional tools in classroom settings.

Effects of physical, and social environmental factors on creative thinking.
Keywords: Cognitive Skills and Processes, Creativity/Divergent Thinking, Emotion and Affect, Problem Solving
Presenting Author: Kim Ouwehand, Erasmus University Rotterdam, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands

The present study investigated whether environmental physical (open or separated space) and social (feeling included or excluded from the others in a shared space) factors influence creative thinking. All participants (N = 92) were tested in groups of four. Half of the participants were tested in an open space and the other half in a separated space. Within the space conditions participants were further divided into a group with a socially inclusive atmosphere and a group with an exclusive atmosphere. Preliminary results showed that convergent thinking is enhanced in a separated compared to an open space. Interestingly, for divergent thinking the inclusion group benefited from an open compared to a closed space, while in the social exclusion condition, this pattern was reversed. These outcomes are of direct importance to learners and educators and can provide guidelines on how to design learning environments and stimulate a positive social climate for optimal performance.

Sketchnoting - visual notetaking for creative thinking and learning from educational science text
Keywords: Creativity/Divergent Thinking, Emotion and Affect, Student Drawings, Teaching/Instructional Strategies
Presenting Author: Laura Ohmes, Carl von Ossietzky University Oldenburg, Germany

Sketchnoting is a note taking strategy for summarizing complex information not only by writing, but also by constructing diagrammatic structures, simple sketches and visual metaphors (Rohde, 2013). Drawing on models about cognitive and affective processes in creative and self-regulated learning, the aim of this study was to investigate the benefits and costs of sketchnoting for learning from educational science text and creative learning in teacher education. Ten student teachers (90 % female) participated in stimulated recall interviews, in which they reported their thoughts and experiences based on a video stimulus which showed their sketchnoting. Preliminary findings indicate, that sketchnoting helped the students to better understand the text and that sketchnoting implies and enables creative learning processes (e.g., *analysis*, *synthesis*, and the development of ideas for visual representations including *fluency*, *flexibility* and *originality*) which occur in bottom up and top down self-regulation processes. While sketchnoting, students experienced various emotions and metacognitive feelings (e.g., joy and a feeling of satisfaction vs. confusion and feelings of difficulty) whereas unpleasant emotions and feelings led to modifications in the sketchnoting process (e.g., feeling of insecurity led to the adjustment of drawings). Difficulties in the sketchnoting process were due to various reasons, including identifying key points in the complex text. In conclusion, the findings point to the connection between self-regulated and creative learning in sketchnoting. They suggest that sketchnoting supports learning from science text and provides an opportunity for creative learning in teacher education. However, teachers should be aware of students´ difficulties to provide appropriate support.

Patterns of creativity in teacher-student interactions in the context of elementary science lessons
Keywords: Creativity/Divergent Thinking, Quantitative Methods, Social Interaction, Teaching/Instructional Strategies
Presenting Author: Elisa Kupers, University of Groningen, Netherlands; **Presenting Author:**Astrid Menninga, University of Groningen, Netherlands; **Co-Author:**Marijn Van Dijk, University of Groningen, Netherlands

How can teachers best facilitate students' creativity in their lessons? The way educational research has tried to answer this question depends on how creativity is conceptualized: as a personal characteristic or as a process that unfolds in interaction between students, peers, and teachers in the classroom. In this study, we took the latter approach and studied how two important elements of creativity, novelty and appropriateness, emerge in joint discussion and action of teachers and students during pre-school and early elementary science lessons. Seven experienced, and seven novice teachers participated with 3-6 students (4-6 years old) per teacher. Video recordings of the science lessons were coded from moment to moment on two dimensions: the degree of novelty and appropriateness of each student utterance, and the type of teacher instruction (aimed at divergent or convergent thinking). With lag sequential analyses and permutation tests, we explored patterns in teacher behavior and student creativity. Results showed that student utterances with a high degree of novelty were relatively rare. Likewise, teachers' behaviors were more aimed at convergent, than at divergent thinking. The sequential analyses showed significant (p

Creativity in education – an explorative study on student teachers´ concepts of creativity
Keywords: Conceptual Change, Creativity/Divergent Thinking, Qualitative Methods, Teacher Professional Development
Presenting Author: Laura Ohmes, Carl von Ossietzky University Oldenburg, Germany; **Co-Author:**Lena Haug, Carl von Ossietzky University Oldenburg, Germany; **Co-Author:**Uta Wagener-Praed, University of Oldenburg, Germany; **Co-Author:**Juliane Schlesier, Carl von Ossietzky University Oldenburg,

Germany; **Co-Author:**Gerd Hoffmann, C.v.O. Universität Oldenburg, Germany; **Co-Author:**Barbara Moschner, Carl von Ossietzky Universität Oldenburg, Germany

The implementation and facilitation of creativity in schools is a highly relevant, but challenging task of 21st century education (Vincent-Lancrin et al., 2019). In the scientific literature, creativity is often associated with originality and effectiveness which can be promoted by an environment that provides self-determination and a certain degree of structure. The current study aims to investigate student teachers' concepts of creativity. A hundred and forty one student teachers (71.42% female; M_{age} = 22.52 years, SD = 3.40) responded to an open question on their definition of creativity which was part of a qualitative online questionnaire. The data was analysed using content analysis.Preliminary results suggest, that student teachers´ concepts of creativity are about creating something new and original (material or immaterial, e.g., ideas) which does not have to be necessarily useful. Creativity is also described as an individual process which implies the development and modification of ideas as well as the expression of individual feelings, thoughts and perceptions. The students emphasize individuality, freedom and the absence of restrictions with regard to creativity, but refer less explicitly to supportive structured environments and cooperation. The results are discussed in the context of scientific concepts of creativity and self-determination theory. Teacher trainings should highlight the relevance of structured environments for creative thinking and production as well as the importance of cooperation for creativity.

The Children`s perspective of play in pre-primary and primary school settings in Finland
Keywords: Creativity/Divergent Thinking, Cultural Diversity in School, Learning Approaches, Peer Interaction
Presenting Author: Taina Kyrönlampi, University Oulu, Finland; **Co-Author:**Riikka Sirkko, University of Oulu, Finland

In Finland, children start pre-primary education when they are six years old. After one year, they move to the first grade of primary school. Although the operating environments of pre-primary education and direct education efforts have been made to harmonize, children experience a distinctive change in their social relationships and physiological space when they enter first grade. In this research, we are interested how children's experiences in their play differ in the pre-primary and primary school contexts. This study explores "play-activity" in photographs initially taken by the children in their primary and preprimary school activities. The research data consist of 13 children's (aged 6) photographs and group discussions in which the children viewed the photographs with the researcher. The second research data consists of 16 children`s (old 7: first grade) photographs and the group discussion with the research on their school experiences. In this study, we used a phenomenological approach (Giorgi 1994). The phenomenological theory describes how the world is experienced by individuals (Merleau- Ponty 1988.)Preliminary research results show that recess at school and indoor and outdoor play moments at preprimary school and primary school are important moments for children. In addition, it is essential for children's experiences that they can use nature's diversity as part of the play.

Students' decision-making during playing educational games
Keywords: Game-based Learning, Learning Approaches, Problem Solving, Social Interaction
Presenting Author: Fredrik Rusk, Åbo Akademi University, Finland; **Co-Author:**Senja Celius, Nord University, Norway; **Co-Author:**Wenche Rønning, Nord Universitet, Norway

The current research paper focuses on analysis of video recordings of students playing a card game about fractions. The analysis focuses on the students' social interactions and decision-making. The results indicate that decision-making and negotiation are not straightforward practices when students are playing games. Based on different situations when students make decisions when playing the fraction game, they express their knowledge and assumptions regarding who has the bigger fraction, and hence affect the decision-making process. Focus is on describing and exemplifying how students organize their social interaction as they make decisions. When studying the situations closely we find recurring patterns regarding how students express their knowledge and how decisions are made when playing the card game. For negotiations to start, there needs to be some tension or disagreement about the decision. When there is disagreement students either express explanations and strategies about how they think, or they make use of available learning resources. When explanations are not accepted by the other student, the turn to the learning resources to settle the disagreement. Also, finding indicate that preconceived epistemic status does not seem to influence students' ability to express disagreement and take the initiative to make a decision.

Pre-service teachers' playfulness and its connections to the working life
Keywords: Early Childhood Education, Emotion and Affect, Higher Education, Pre-service Teachers
Presenting Author: Signe Pirkko Siklander, University of Oulu, Finland, Finland; **Co-Author:**Marjaana Kangas, University of Lapland, Finland; **Co-Author:**Tarja-Riitta Hurme, University of Turku, Finland; **Co-Author:**Anitta Melasalmi, University of Turku, Finland

Playfulness is a requisite for designing and realizing playful child-centred methods in the early childhood education (ECE) contexts. Playfulness is useful also in interaction with colleagues and caregivers and it has potential to bring hope. It is assumed that ECE teachers naturally bring playfulness into the daily practices. Despite of the vast amount of playfulness studies, ECE teachers nor the ECE teacher education have not gained scientific interest. The aim of this mixed method research is to explore pre-service teachers' playfulness, particularly in the area of ECE. Following research questions were set: 1) How playful do the pre-service ECE teachers view themselves, and what are the main qualities connected with their playfulness? and 2) How pre-service teachers' agency relates to the playfulness in the context of working life? Quantitative analysis and qualitative abductive content analysis resulted findings: teacher's playfulness-connected pedagogical actions are teacher-initiated, child-centered and community-related with shared agency. Pre-service teachers' cautiousness prevents their playfulness and adaptivity. The results are useful in designing ECE education. In addition, results bring new knowledge about playfulness in the ECE domain. The findings will be discussed from the theoretical perspectives including the relations of agency, cautiousness and playfulness, and practical pedagogical usefulness.

The impact of esports on the youth from a human capital perspective: A systematic review
Keywords: Competencies, Educational Technologies, Game-based Learning, Qualitative Methods
Presenting Author: Samuel Kai Wah Chu, The University of Hong Kong, Hong Kong; **Co-Author:**Chenguang Du, Tangshan Normal University, China; **Co-Author:**Kevin Conn, California State University Northridge, United States; **Co-Author:**Qi Zhang, Dalian University of Finance And Economics, China

Esports have picked up steam among adolescents and young adults over the last decade. Participation in esports is believed to have widespread negative consequences for a young person's health but positive effects on skill development. However, there are no systematic reviews that clarify and consolidate esports impact, and we presently lack a comprehensive understanding of esports on which to construct educational applications. This paper intends to undertake a systematic literature review on the influence of esports on young people from the perspective of human capital, which is a vital task in education for individual and social development. The findings indicate that esports can positively influence knowledge, skills, and abilities required in the 21st century but have positive and negative health implications. Although esports is associated with unhealthy diets and sleep problems, the sedentary nature does not contribute to a

decline in physical activity. Esports has been linked to mental health disorders like gaming disorder and problem gambling but can generate positive attitudes, including self-directedness. Based on the findings, the article proposes the potential of esports-based learning techniques to accumulate human capital and facilitate educational transformation. This review not only contributes to redefining human capital by addressing health issues and sheds light on the novelty of considering esports in the human capital accumulation process. Identifying the impact of esports has implications for designing esports-based learning programs in both formal and informal learning contexts and for reforming game-based learning and serious games to enhance educational effectiveness.

Debiasing (student) teachers' anchoring effects to support appropriate interpretations of evidence?
Keywords: In-service Teachers, Misconceptions, Quantitative Methods, Science Education
Presenting Author: Kristina Bohrer, University of Education Karlsruhe, Germany; **Co-Author:**Kirstin Schmidt, University of Education Karlsruhe, Germany; **Co-Author:**Samuel Merk, PH Karlsruhe, Germany

Since evidence-informed educational practice implies, for example, advantages for development and a beneficial handling of challenging situations, teachers are encouraged to engage with such evidence. This is impeded by various barriers, which include cognitive biases such as the anchoring effect, according to which numerical estimates are aligned with an already known standard for comparison. In the context of education, this anchoring effect has rarely been studied. Hence, we examined in a randomized controlled trial anchoring effects on student teachers' interpretation of scientific evidence (N = 233). Participants were presented with two study reports and were asked to rate the appropriateness of the sample sizes. We assumed that the sample size of the first study report acts as an anchor for the appropriateness rating of the sample size in the second report. Bayes factors showed strong evidence for large anchoring effects in the appropriateness rating of sample sizes (d = 2.97 , BF10 > 100). Because of the operationalization of the anchoring effect as an interpretation rather than a mere numerical estimation, we hypothesize that the appropriateness rating in study one is a matter of mediation. Regarding this, we are planning a second study that examines this mediation effect and thus reveals how to debias the anchoring effect in (student) teachers' interpretation of scientific evidence. The results will allow us to give recommendations for the communication of scientific study results that enable the successful engagement with evidence despite the ubiquitous anchoring effect.

Learning From Texts: Effects of Instructions on Preservice Teachers' Judgment Biases
Keywords: Metacognition, Pre-service Teachers, Reading, Self-regulated Learning and Behaviour
Presenting Author: Sabine Schlag, University of Wuppertal, Germany; **Co-Author:**Jennifer Knellesen, Bergische University of Wuppertal, Germany

Student's ability to judge his or her comprehension is essential to successful learning from texts. In general, students are overconfident about their comprehension. Overconfidence can result from mismatches between cues used to judge comprehension and future test requirements. In this study, students were given instructions that provided them with information about how the future test will look, thereby reducing misalignment and overconfidence. 171 pre-service teacher students received one of three instructions (none – memory test – application test) and read one of two texts, judged their overall comprehension and answered both memory test (recognition task) and application test questions (transfer tasks). Results for one of the two texts have shown that (1) students who received memory instruction or no instruction were underconfident about their memory performance, while students who received application instruction showed no tendency towards over- or underestimation, (2) students who received application instruction showed less overestimation of their application performance than students in the memory instruction and control groups. For the other text results showed that students were – for all three instructions - (3) underconfident about their memory performance and (4) neither under- nor overestimated their application performance. In conclusion, our results showed that an application instruction - at least for one of the two texts - can help students to reduce overconfidence regarding their application performance.

Dual Language Use as a Resource in Word Explanations During Shared Reading
Keywords: Bilingual Education, Early Childhood Education, Reading, Social Interaction
Presenting Author: Dilman Nomat, University of Oslo, Norway; **Co-Author:**Vibeke Grøver, University of Oslo, Norway; **Co-Author:**Veslemøy Rydland, University of Oslo, Norway

In the present study, we report on the home component of a larger shared reading intervention in Norway that primarily targeted preschools (Authors, 2020). Bilingual families were invited to participate in a study on how preschools and parents could work together to support children's bilingual development. As part of the intervention, the preschools and parents received the same children's picture books to read together with the children. Most of these were wordless books that built a narrative through pictures only. We examined the transcribed audio-tapes of 151 bilingual parent-child dyads who shared the same book at home to better understand the characteristics of parents' *labelling* and *word explanations* during this literacy activity. Dyads came from 11 language minority groups, and children's ages ranged from three to five years. While bilinguals naturally alternate between their languages (i.e., code-switch) when communicating, we sought to examine the role of parents' code-switching when labelling and explaining words to their children during shared reading. The results indicated that parents code-switched more frequently when explaining the meaning of words compared to labelling words. These findings suggest that parents' alternation between their first and second languages serves as a resource that helps them explain words to their children during shared reading.

Student Writers' Metalinguistic Understanding of Transitions in Written Argument
Keywords: Foreign and Second Language Acquisition, Higher Education, Metacognition, Writing/Literacy
Presenting Author: Debra Myhill, University of Exeter, United Kingdom

Research in metadiscourse has foregrounded the ways in which writers build a relationship with readers through internal discourse where textual choices engage readers, signal the flow of ideas, and indicate the writer's stance towards those ideas. Yet, despite a substantial body of research undertaking textual analysis of metadiscourse used in writing, few studies consider the relationship between the texts writers create and the metalinguistic thinking which informs their decision-making as writers. This paper draws on data from a study which sought to address this gap by investigating both the occurrence of metadiscourse in students' writing and their metalinguistic understanding of metadiscourse usage in their own texts. The sample comprised 195 students who wrote argument texts in both Arabic (first language) and English (second language), generating a corpus of 390 texts. Interviews were conducted with a sub-sample of 41 students to determine their metalinguistic thinking. In this paper we focus on *transitions* – the internal devices which mark the steps and connections in the discourse. The analysis evidences limited metalinguistic understanding of the metadiscoursal function of transitions, but strong understanding of the linking function of transitions. This understanding tends to foreground the textual, rather than interpersonal role of transitions, emphasising the semantic and ideational. The paper argues that developing students' metalinguistic understanding of this interpersonal role would empower them to make more strategic and informed use of transitions in their own writing.

Metalinguistic questioning: how teachers develop understanding of linguistic choice.
Keywords: Dialogic Pedagogy, Qualitative Methods, Teaching Approaches, Writing/Literacy
Presenting Author: Ruth Newman, University of Exeter, United Kingdom

This paper presents findings from an ongoing ESRC funded study focused on the investigation and development of an evidence-based pedagogy for metalinguistic talk about writing. Working with 7 teachers and their Key Stage 3 classes (students aged 11-14) in the South West of England, pedagogical strategies, co-constructed iteratively with teachers, emphasise questioning and discussion of linguistic choice. Data analysis reveals how the interweaving of questioning which initiates a student response, invites elaboration, but also focuses attention on specific linguistic features and their effects, can support students' verbalisation of linguistic choice and the development of their metalinguistic understandings. Drawing on a multi-layered, inter-related dataset of observational and textual data drawn from 7 sample classes, this paper will illustrate how teachers *adjust* metalinguistic questioning according to the understandings of their students, revealing the complexity of managing and promoting metalinguistic talk with students who vary in terms of attainment, linguistic confidence, and textual experience. This paper, and the findings arising from the wider project, contribute to theoretical understandings of metalinguistic talk in writing instruction, whilst contributing pedagogical strategies that may support teachers and students in implementing metalinguistic talk.

The effect of written metalinguistic feedback on cognitive effort and revision success
Keywords: Cognitive Skills and Processes, Engineering Education, Feedback, Writing/Literacy
Presenting Author: Jan-Mikael Rybicki, Aalto University, Finland; **Co-Author:**Wilhelmiina Hämäläinen, Aalto University, Finland; **Co-Author:**Kari K. Pitkänen, University of Helsinki, Finland; **Co-Author:**Lauri Malmi, Aalto University, Finland

Feedback is an important component in teaching academic writing and helps students to learn the conventions needed in writing their bachelor and master's theses. Although written corrective feedback (WCF) has been extensively researched in recent decades within second language (L2) writing instruction, the findings are mixed in terms of understanding which WCF approaches are the most efficient and in which contexts.The general consensus seems to be that less is more, but feedback on just a couple of error types in academic writing tasks can be dissatisfying both for learners to receive and teachers to provide. In the field of writing research, the cognitive processes in writing and revision have typically excluded the analysis of WCF. Nevertheless, the cognitive models of writing and revision processes could allow explaining some of the mixed findings in WCF research.
To examine the influence of cognitive load caused by WCF on revision success, this study analyses the metalinguistic WCF and subsequent revisions in student texts. The study was conducted in an online academic writing course for university-level engineering students. The results indicated that cognitive load had a moderately strong correlation with revision success. Particularly, the more cognitively demanding WCF reduced the probability of students being able to revise their texts. Therefore, writing instructors should evaluate the cognitive load of the WCF they give on student writing and adjust the type and focus of feedback accordingly.

ICT in effective writing interventions: an empirical review
Keywords: Computer-assisted Learning, Digital Literacy and Learning, Instructional Design, Writing/Literacy
Presenting Author: María Victoria González Laguna, University of León, Spain; **Co-Author:**Raquel Fidalgo, University of León, Spain, Spain; **Co-Author:**Gert Rijlaarsdam, University of Amsterdam, Netherlands

Information and Communication Technologies (ICTs) have changed the nature of instructional writing practices. This has led to the need to incorporate ICTs into traditional practices, requiring knowledge of the content, uses and pedagogical potential of ICTs.Thus, the aim of this study is to explore which of the activities in the teaching of writing included in effective instructional designs can be taken over by ICT.A review was conducted following the PRISMA Statement guidelines. The documentary search was performed through Web of Science and Scopus and, after applying inclusion and exclusion criteria, the final sample consisted of 22 empirical articles. These were analyzed according to two dimensions. For the content dimension, Intermediate Learning Objectives were analyzed, identifying their object of learning and type of knowledge. Regarding the instructional dimension two elements were analyzed: a) Learning Activities, identifying their type and use or non-use of ICTs; and b) Instructional Activities, identifying their typology, ICT used, and scaffolding provided. Findings showed most ICTs were focused on teaching high-level cognitive writing processes, providing declarative and procedural knowledge. Regarding the instructional dimension, all learning activities can be realized through ICTs, which reduce teaching workload by taking over instructional tasks as explaining contents or providing strategic and/or metacognitive scaffolding. In conclusion, this information allows researchers to know in detail the elements that can contribute significantly to the intervention's success. Likewise, at educational level, it provides useful information for applying ICTs in classroom, showing their characteristics and contents that can be covered by them.

How Can Parents Encourage Adolescents to Choose a Non-Gender Stereotyped High School Major?
Keywords: Gender Issues, Motivation, Parental Involvement in Learning, Science and STEM
Presenting Author: Idit Katz, Ben-Gurion University of the Negev, Israel; **Co-Author:**Tzvia Samuha, The Ben-Gurion University of the Negev, Israel; **Co-Author:**Ortal Slobodin, Ben-Gurion University of the Negev, Israel

This study examined whether gender interacts with parental autonomy support in predicting adolescents' motivation while choosing a high school major and the mediating role of identity processing style in this relationship. Based on self-reports of 571 9th-grade students (296 boys), we found that the relationship between adolescents' perceived parental autonomy-support and their ability to make an autonomous choice of a high school major varied between genders and fields. Boys' autonomous choice of a non-STEM high school major was more strongly linked to their parents' support than girls' motivation to make a similar choice. Girls' autonomous choice of STEM as a high school major was more strongly related to the provision of parental support than boys. The informative identity style mediated the relationship between parental autonomy support and adolescents' experience of autonomy for boys and girls. Our findings highlight the role of

socio-cultural, familial, and personal variables in making a first career decision.

Parental beliefs and their influence on learning an instrument at primary school age
Keywords: Art Education, Competencies, Parents' Beliefs and Affect, Primary Education
Presenting Author: Patrizia Bieber, University of Tübingen, Germany; **Co-Author:**Barbara Busch, Mannheim University of Music and Performing Arts, Germany; **Co-Author:**Jessika Golle, University of Tübingen, Germany; **Co-Author:**Richard Goellner, University of Tuebingen, Germany

Parental beliefs can have an important impact on student's learning motivation as well as on their learning behavior (Eccles, 1993; Simpkins et al., 2012). This is known especially from STEM-related studies (Frenzel et al., 2010; Šimunović & Babarović, 2020). In our study, we aim to investigate to what extent parental beliefs affect children's learning behavior in terms of learning an instrument at primary school age. Therefore, we use a longitudinal study design, collecting data from $N = 162$ parents, $N = 176$ children, and their instrumental teachers ($N = 73$). The study started in November 2021 and is spread over the period of one year.A parent questionnaire was developed with twelve separable scales, providing satisfying reliabilities.Results from the first data collection show correlations between the children's motivation and their parents' beliefs towards the relevance of making music for personality development, as well as their beliefs regarding their children's self-responsibility. Moreover, findings from the second data collection indicate that parental beliefs regarding practicing are related to children's learning progress, whereas parental control beliefs were negatively correlated with children's motivation in instrumental lessons.

What parents do for their children – links with their expectations and child's indicators
Keywords: Competencies, Early Childhood Education, Parental Involvement in Learning, Parents' Beliefs and Affect
Presenting Author: Anne-Mai Meesak, Tallinn University, Institute of Educational Sciences, Estonia; **Co-Author:**Dmitri Rozgonjuk, University of Tartu, Institute of Computer Science, Estonia; **Co-Author:**Tiia Õun, Tallinn University, Institute of Educational Sciences, Estonia; **Co-Author:**Eve Kikas, Tallinn University, Estonia

Studies have shown that what parents do for their children matters. Children whose parents do more activities at home with them, who are taken to extracurricular activities and whose parents are involved in kindergarten activities have better social-emotional and cognitive skills and exhibit less disruptive behaviours. However, the evocative effect between children's developmental indicators and parental activities is less studied. Also, the relation of parental home activities and expectations for outcomes should be explored. The aim of this study is to show the links between the activities parents do for their children, parental perceptions of their children's developmental indicators and expectations for skills needed for starting primary education. The research will show which aspects predict the activities parents do with their children at home. 334 parents from 46 kindergartens across Estonia filled out a questionnaire in the autumn of 2021. The preliminary results showed that parents who believe their children have less cognitive difficulties do more language or math related activities with them. Children who have fewer social difficulties, less disruptive behaviours and better learning behaviours are taken to more extracurricular activities. The level a parent is involved in kindergarten activities is positively related to doing more social activities with a child at home and parents' expectations in language and math are also related to the activities parents do with their children at home.

Role of teachers' and parents' evaluations in the development of motivation and achievement
Keywords: Cognitive Development, Developmental Processes, Motivation, Parents' Beliefs and Affect
Presenting Author: Satu Koivuhovi, University of Turku, Finland; **Co-Author:**Mari-Pauliina Vainikainen, Tampere University, Finland

Teacher's and parents' evaluations and expectations of child's ability have shown to be important for the formation of children's self-appraisals. In this study, we used longitudinal data (N=1065) of elementary school pupils in Finland for examining the development of children's motivational self-beliefs and achievement and the role of teacher's and parents' evaluations in it. Results showed that teacher's evaluations of a child's academic schoolwork skills are stronger predictor of child's own motivational beliefs during the school years whereas evaluations of parents' had predictive value at the beginning of school. Girls were evaluated more positively both by parents' and teachers' in all the measurement points but overall this was not reflected in their self-evaluations or achievement. Girls did see themselves as more industrious than boys at grade 4 but boys surpassed girls in achievement at grade four and their ability beliefs and expectations for success developed more positively than girls' beliefs. Mother's education level was a significant predictor of children's motivational self-beliefs and achievement as well as teacher's evaluations at all time points. In other words, children whose mothers were highly educated were evaluated more positively by teachers both at the beginning of school years but their evaluations as well as self-beliefs and achievement developed more positively than children's with less educated mothers.

The impact of mathematics anxiety on arithmetic performance: a dual-task study.
Keywords: Anxiety and Stress, Mathematics/Numeracy, Primary Education, Quantitative Methods
Presenting Author: Serena Rossi, Loughborough University, United Kingdom; **Co-Author:**Krzysztof Cipora, Loughborough University, United Kingdom; **Co-Author:**Sara Caviola, University of Padova, Italy; **Co-Author:**Irene C. Mammarella, University of Padova, Italy; **Co-Author:**Iro Xenidou-Dervou, Loughborough University, United Kingdom

Anxiety may influence mathematics performance by affecting cognitive processes such as Working Memory (WM) and attentional control (Eysenck & Calvo, 1992; Eysenck et al., 2007). Specifically, mathematics anxiety (MA) may activate intrusive thoughts and attentional bias on threat-related stimuli that could reduce WM resources necessary for solving the task at hand, thus resulting in poorer performance. This study aimed at investigating the interplay between MA and WM by implementing a dual-task paradigm. 428 4^{th} and 5^{th} graders (9-10 years old) were tested in their school settings. First, we assessed the children's MA. Then, they were presented with three computerized tasks: an arithmetic task presented in a stand-alone condition (primary task), a word recall task stand-alone (secondary task), and a condition where they had to perform the arithmetic and the word recall task concurrently (dual-task). To test whether children with elevated MA have a specific attentional bias toward threat-related stimuli, we manipulated the type of words presented in the secondary task, namely they were presented with: Neutral, Mathematics-related, or Emotional words. Results demonstrated that WM load impacted performance, and this was further amplified by the individuals' MA. However, we found only a limited effect of MA based on the type of words presented in the trials. Our finding generates important implications for research in the domain of MA and its relationship with mathematics performance.

Reducing mathematical test anxiety: why different interventions lead to similar outcomes
Keywords: Achievement, Educational Neuroscience, Emotion and Affect, Mathematics/Numeracy
Presenting Author: Yulia Kovas, Goldsmiths University of London, United Kingdom; **Co-Author:**Evgeniia Alenina, National Research University Higher School of Economics, Russian Federation; **Co-Author:**Maxim Likhanov, National Research University Higher School of Economics, Russian Federation; **Co-Author:**Elina Tsigeman, National Research University Higher School of Economics, Russian Federation

Only a handful of studies reported effectiveness of methods to reduce mathematics anxiety before the exam, such as physical exercises (Pascoe et al., 2020), expressive writing (Ramirez & Beilock, 2011a) and reappraisal. However, the efficacy and size of effect of these regulation techniques remain unclear. Some

studies find positive effects (Mesghina & Richland, 2020; Park et al., 2014); whereas other studies fail to find the effects (Camerer et al., 2018; Reinhold et al., 2018). We tested the efficacy of expressive writing, short motor exercises, and reappraisal techniques of emotional regulation before a mathematics test. More than 3000 students and schoolchildren participated in the experimental study. The results demonstrated no overall significant differences in efficacy between the tree types of regulation. However, some small differences were found in participants with high mathematics anxiety. The results shed a light on effectiveness and replicability of existing emotional regulations approaches. We discuss the results in the context of existing evidence from twin studies on the aetiology of mathematical anxiety.

Positive teachers' perceptions foster children's math performance against math anxiety
Keywords: Anxiety and Stress, Mathematics/Numeracy, Metacognition, Teacher Effectiveness
Presenting Author: Enrica Donolato, University of Oslo, Norway; **Presenting Author:**Sara Caviola, University of Padova, Italy; **Co-Author:**David Giofrè, School of Psychology, University of Leeds, United Kingdom; **Co-Author:**Irene C. Mammarella, University of Padova, Italy

Mastering math skills are essential for students' educational and work success. Recent research has examined how children's math anxiety and math skills are shaped by core socializers, such as the interplay between children and teachers. To the best of our knowledge, however, no research has examined the relationship between students' math attainment, their math anxiety levels and how their relationship with teachers, evaluated from both students' and teachers' perspectives, may come into play. The present contribution aims to address this gap and test the potential mediational role of math-related metacognitive beliefs in a sample of schoolchildren.This study involves 269 5^{th} to 7^{th} graders (128 M; mean age = 11.55 years) and their math teachers. Children completed self-report questionnaires assessing their math-anxiety levels and the quality of their relationship with math teachers. They also completed a series of standardized math tasks. Conversely, math teachers filled out questionnaires to evaluate their relationship with students and their perception of students' math-related metacognitive beliefs.We conducted path analyses to test whether math-related metacognitive beliefs mediated the association between math anxiety and student-teacher relationships with children's math skills. We evaluated this hypothesis in two distinct models that examined the student-teacher relationship assessed from the students' or teachers' perspectives. Both models showed that math-related metacognitive beliefs mediated the relationship between students' math anxiety and their relationship with the teachers, on the one hand, and their math skills, on the other hand. Theoretical and practical implications will be discussed.

Test anxiety fluctuations during secondary school assessments: the role of basic psychological needs
Keywords: Anxiety and Stress, Classroom Assessment, Emotion and Affect, Secondary Education
Presenting Author: Stefanie De Jonge, Ghent University, Belgium; **Co-Author:**Evelien Opdecam, Ghent University, Belgium; **Co-Author:**Leen Haerens, Ghent University, Belgium

Test anxiety poses a fundamental educational challenge as it has been associated with lower academic performance, decreased self-efficacy and lower well-being. Prior literature has addressed test anxiety at one point in time during end-of-term exams. Only a few studies have focused on test anxiety fluctuations in educational contexts with weekly assessments. Grounded in the Self-Determination Theory, this study examines test anxiety fluctuations and how it relates to fluctuations in basic psychological needs satisfaction and frustration, an unexamined potential test anxiety antecedent. Three test anxiety scales and students' need-based experiences were administrated to 253 11th and 12th grade secondary school students at three different times. Multilevel analyses revealed that students showed higher test anxiety in weeks in which their need for competence was more frustrated. This association was robust across the three test anxiety instruments and after accounting for important test anxiety covariates (e.g., gender and prior achievement). These findings imply that reducing competence frustration is important when designing test anxiety-reducing interventions.

Non-religious pupils in RE: Exploring differences in cognitive activation and relevance beliefs
Keywords: Attitudes and Beliefs, Cultural Diversity in School, Religiosity and Spirituality, Social Aspects of Learning and Teaching
Presenting Author: Alexander Unser, TU Dortmund University, Germany

This presentation draws on the ongoing discussion in some European countries about whether and how non-religious worldviews and pupils should be included in religious education (RE). Currently, this discussion lacks empirical knowledge about the specific learning conditions of these pupils in RE – a desideratum that this paper addresses. Building on a classification of non-religiosity proposed by Lois Lee, this presentation distinguishes between pupils that show anti-religious, indifferent and positive different relations to religion. It investigates whether they differ significantly from other pupils in RE classes regarding cognitive activation and relevance beliefs. To this end, this presentation draws on data from 952 pupils who attended Catholic or Protestant religious education classes in southwestern Germany (state of Baden-Württemberg). ANOVAs with additional Welch tests and post-hoc tests (Scheffé or Dunnett-T3) were computed to test for differences between the subgroups. The results of the ANOVAs show that pupils with anti-religious, indifferent and positive different relations indeed have lower scores in cognitive activation and relevance beliefs than the majority of pupils, which can be interpreted as an indicator of poorer learning conditions for the former. The differences found have medium to large effect sizes ($0.095 < \eta^2 < 0.188$). Furthermore, significant differences were found between pupils with anti-religious, indifferent and positive different relations, which underlines the importance of distinguishing between different types of non-religiosity in the discussion.

Using VaKE in higher education in Georgia: Experiences and challenges
Keywords: Cultural Diversity in School, Instructional Design, Knowledge Construction, Morality and Moral Development
Presenting Author: Ekaterine Shaverdashvili, Ilia State University, Georgia; **Co-Author:**Tamar Mosiashvili, Illa University, Georgia; **Co-Author:**Magda Gogrichiani, Ilia University, Tbilisi, Georgia

Moral values towards democracy and individual responsibility are considered important goals in modern Georgian education. A challenge was that they represent a complete turnaround compared to the ideological values education system practised in Soviet times in Georgia. It is a significant part of the National Curriculum and teachers' preparation and professional development programs. The goal of the National Curriculum is to develop values as crosscutting competencies. In 2016, V*a*KE was introduced in Georgia through an ERASMUS+ project; it fits society's needs quite well. Between 2016 and 2019, the VaKE Model and courses adapted to the Georgian conditions including the Georgian framework of teachers' professional standards and the National Curriculum, were developed and implemented in eight Georgian universities that provide teacher training courses. Few teachers encountered challenges; most reported no problems with applying V*a*KE. One of the V*a*KE courses in a teacher preparation training program is analysed in more detail. The course is an integral part of teachers' certification exams. The study focuses on the factors of interest, use in practice, cooperation, activity, innovation and over-challenge; these are issues that are important to check whether the implementation of V*a*KE is following the theoretical requirements. Students' responses are measured through an adapted questionnaire on a 5-point Likert scale. The students are highly satisfied, can easily comply with the tasks, and show high cooperation; their primary

challenge is how to formulate good dilemmas. Consequences for values education in Georgia using V*a*KE are discussed.

Implicit and Explicit Attitudes of Pre-service Teachers: The Case of Ethnicity and Sexuality
Keywords: Attitudes and Beliefs, Cultural Diversity in School, Migrant / Refugee and Minority students, Pre-service Teachers
Presenting Author: Andreas Gegenfurtner, University of Augsburg, Germany; **Co-Author:**Aldin Alijagic, University of Augsburg, Germany; **Co-Author:**Sylvia Gabel, Universität Augsburg, Germany; **Co-Author:**Özün Keskin, University of Augsburg, Germany; **Co-Author:**Jule Neubauer, University of Augsburg, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany

Research indicates that ethnic and sexual minority students are often marginalized at school. Teacher attitudes might contribute to the disadvantages minority students tend to experience. So far, most research on teacher attitudes has focused on majority teachers. As a remedy, the two studies presented in this proposal compare majority and minority teachers. The goal was to estimate the extent to which attitudes differ as a function of German pre-service teachers' own ethnic background and sexual orientation. Study 1 focused on attitudes toward students with a Turkish migrant background, the largest ethnic minority group in German schools. Study 2 focused on attitudes toward homosexual students. In both studies, implicit association tests measured implicit attitudes while a feeling thermometer measured explicit attitudes. We also assessed pre-service teachers' enthusiasm, self-efficacy, stereotypes, and beliefs associated with teaching Turkish migrant and homosexual students. Results of both studies suggest that the correlations between implicit and explicit attitude measures were relatively small. In Study 1, ethnic minority pre-service teachers showed significantly higher levels of explicit attitudes and enthusiasm than ethnic majority pre-service teachers. In Study 2, bisexual and homosexual pre-service teachers showed significantly higher levels of implicit attitudes, explicit attitudes, and enthusiasm than heterosexual pre-service teachers. We discuss these findings with regard to ingroup favoritism in social identity theory and the benefits of a heterogeneous teaching workforce for ethnic and sexual minority students in classrooms.

Finnish ethnic minority youth constructing civic identity
Keywords: Attitudes and Beliefs, Citizenship Education, Cultural Diversity in School, Migrant / Refugee and Minority students
Presenting Author: Anuleena Kimanen, University of Turku, Finland; **Co-Author:**Samaneh Khalili, University of Turku, Finland; **Co-Author:**Aleksi Seger, University of Turku, Finland; **Co-Author:**Jenni Alisaari, University of Turku, Finland; **Co-Author:**Elina Kilpi-Jakonen, University of Turku, Finland

Civic identity is formed during adolescence in formal, non-formal and informal educational contexts. It has been defined as sense of connection and responsibility to act for a common good. Both sense of connection and civic engagement of ethnic minority youth have specific features in the Western countries. In our study we have interviewed ethnic minority youth aged 15–19 in a Finnish neighbourhood with high cultural diversity about their social and civic engagement. We expand the notion of civic identity to a discursive process where the young people define themselves as actors in the communities they belong to. In addition to the degree and forms of belonging and action with and for others, the discursive analysis pays attention to the sense of having a voice and the young people's concerns. Action took forms of helping, creating community spirit and supporting younger children. Having a voice was constructed as leadership in some cases, as a consequence of action in others, and still in other cases as a vague self-evidence. However, their concerns driving their civic action were not very societal, but rather local or personal, constructing an identity of a local actor or actor within the community of peers. The elements of civic identity (belonging, action, voice and concern) and their obstacles identified in this study may guide civic education to foster active citizenship for ethnic minorities more efficiently.

Promoting self-regulated learning in children's daily lives: The effects of a mobile intervention
Keywords: E-learning/ Online Learning, Educational Technologies, Motivation, Self-regulated Learning and Behaviour
Presenting Author: Jasmin Breitwieser, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Lea Nobbe, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Daniel Biedermann, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Garvin Brod, DIPF | Leibniz Institute for Research and Information in Education, Germany

Mobile technologies offer new opportunities for encouraging children to learn in their daily lives. In this pre-registered study, we tested what kind of mobile intervention helps children maintain a regular study routine for vocabulary learning. Study behavior was measured objectively and with high ecological validity using logfiles of a vocabulary app that the children used. The mobile intervention was delivered via a separate study app and combined two critical components: planning and prompting. Children (N = 130, mean age = 10.75 years) first received a digital instruction on the benefits of distributed practice. Children in the full intervention group also formulated a plan for when and where to learn vocabulary. On about half of the next 36 days (within-subject manipulation), they received prompts reminding them of the instruction and the plan. The comparison groups lacked either the prompting or planning intervention component (between-person manipulation). The results revealed that the reminder prompts had a positive but only short-term effect on whether or not children learned vocabulary on a given day. Planning, in contrast, had a more long-term impact in that it helped children maintain a high frequency of learning over time. Overall, our findings show that mobile interventions can be highly effective in supporting SRL in children. We discuss the results in light of theoretical assumptions about the different mechanisms underlying planning and prompting effects, and highlight the practical importance of finding the optimal frequency of prompting.

Designing Self-Regulation interventions for different target groups in Entrepreneurship Education
Keywords: Motivation, Self-regulated Learning and Behaviour, Tool Development, Vocational Education and Apprenticeship Training
Presenting Author: Tobias Jenert, Paderborn University, Germany; **Co-Author:**Ronja Büker, Paderborn University, Germany

Entrepreneurs differ from the average population in various personal characteristics. These include a high level of self-efficacy, excessive optimism and selective information processing. These characteristics are important because they make it easier to take risks and make quick decisions. At the same time, these characteristics can lead to entrepreneurs neglecting tasks and information that would be relevant for successful firm development. Overestimated profit expectations, for example, are a frequent reason for the failure of startups.
This results in a contradiction: On the one hand, certain personal characteristics are necessary for entrepreneurs to engage in a start up at all, on the other hand, they are themselves a reason for failure. To counteract this contradiction, we developed an intervention that supports entrepreneurs in recognizing and actively managing their own dispositions in dealing with entrepreneurial action and decision-making situations. As a theoretical framework, we use the established concept of self-regulated learning according to Zimmerman (2000) to promote entrepreneurial self-regulation in the dimensions of cognition, motivation and metacognition. To tackle the challenge of developing an intervention, which is adaptable to the needs of specific target groups and contexts, we used a research design, which incorporates principles of Design-Based research. In our talk, we specifically discuss the issue of how to develop a research design which on the one hand tests for (statistical) effectiveness, and on the other hand is adaptable to the needs of different target groups and their respective contexts.

Motivational Regulation, Academic Effort, and Academic Success Among International Students
Keywords: Achievement, At-risk Students, Educational Attainment, Higher Education

Presenting Author:Hüseyin Hilmi Yildirim, FernUniversität in Hagen, Germany; **Co-Author:**Julia Zimmermann, FernUniversität in Hagen, Germany; **Co-Author:**Kathrin Jonkmann, FernUniversität in Hagen, Germany

Motivational regulation is an important predictor of academic effort and, thus, of academic success. Yet, little is known about its importance with regard to the GPA and study satisfaction of international students in Germany. Therefore, we analyzed these contingencies with a set of cross-sectional, semi-longitudinal, longitudinal, and longitudinal autoregressive mediation models (N = 1,060). The analyses substantiated indirect effects of different motivational regulation strategies on grade point average and study satisfaction via academic effort in cross-sectional, semi-longitudinal, and longitudinal models, but not in the full longitudinal autoregressive mediation model. We discuss theoretical and methodological implications of these findings as well as practical inferences for the counselling of international students in Germany.

Rhythm perception fosters motor skills through music training: a neurobehavioral study with children
Keywords: Cognitive Skills and Processes, Educational Neuroscience, Primary Education, Quantitative Methods
Presenting Author: Marta Martins, University Institute of Lisbon (ISCTE-IUL), Portugal; **Co-Author:**Daniela Coimbra, Polytechnic Institute of Porto, Portugal; **Co-Author:**Ana Mafalda Reis, Unilabs - Boavista, Portugal; **Co-Author:**Christian Gaser, Friedrich Schiller University of Jena, Germany; **Co-Author:**São Luís Castro, Faculty of Psychology and Educational Sciences, University of Porto, Porto, Portugal, Portugal

Rhythm and motor function are intrinsically linked to each other and to music, but evidence on the rhythm-motor interplay during music training, and the brain-related mechanisms, is scarce. Here, we asked if rhythm skills play a role in the fine-motor improvements resulting from music training, and which brain regions would be implicated. We conducted a longitudinal study in natural school settings and compared the effects of a 6-month music training to those of a sports training and to a passive control. Fifty-seven third graders were pseudorandomly assigned to music (n = 21), sports (n = 18), and control (n = 18) groups. They completed a structural scan, and rhythm and fine-motor tasks before and after training. Better pre-training rhythm perception was related to less gray matter volume in regions of the cerebellum, fusiform gyrus, supramarginal gyrus, ventral diencephalon, inferior/middle temporal gyri, and superior frontal gyrus and motor area. Music training improved motor performance, and greater improvements were associated with better pre-training rhythm discrimination. Music training led to a significant loss of gray matter volume in the left cerebellum and fusiform gyrus cluster, and volume loss correlated to higher motor gains. No such effects were found for sports and control groups. Summing up, children with fine-tuned rhythm perception are more prone to improve fine-motor skills through music training, and this rhythm-motor interplay is to some extent handled by the left cerebellum and fusiform gyrus. These findings have implications for models of music-related plasticity and rhythm cognition, and for educational/clinical programs targeting motor function.

The Effect of Problem Format on Children's Arithmetic Performance
Keywords: Comprehension of Text and Graphics, Instructional Design, Mathematics/Numeracy, Primary Education
Presenting Author: Iro Xenidou-Dervou, Loughborough University, United Kingdom; **Co-Author:**Emine Simsek, Loughborough University, United Kingdom; **Co-Author:**Ilona Friso - van den Bos, University of Twente, Netherlands; **Co-Author:**Menno Van der Schoot, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Sara Rashid, Cambridge University, United Kingdom; **Co-Author:**Ruth Trundley, Devon Education Services, United Kingdom; **Co-Author:**Ernest Van Lieshout, Vrije Universiteit Amsterdam, Netherlands

In primary school education, arithmetic problems can be presented in various formats, e.g., in a symbolic format (e.g., 32 + 15 = ?) or as word problems, which may or may not be accompanied by illustrations. Past studies have identified three types of illustrations in Dutch mathematics textbooks: helpful, unhelpful and illustrations that entail essential information and indicated that they can have a detrimental effect on children's arithmetic performance (Berends & van Lieshout, 2009). The present study's aims were to examine a) if similar formats are used in UK mathematics textbooks and b) the effect that they have on young children's arithmetic performance. Our textbook analysis showed that UK mathematics textbooks entail similar arithmetic problem formats, namely bare word problems and word problems accompanied by helpful, unhelpful, and essential illustrations. The highest percentage of illustrations entailed essential information. To elucidate the role of problem formats, a sample of 220 6- to 10-year-olds (Year 3 and Year 4) completed a mathematics task involving 20 two-digit mental arithmetic problems (addition and subtraction), presented in five different conditions: (1) Symbolic, (2) Bare word problem, word problem accompanied by (3) an Unhelpful, (4) a Helpful, and (5) an Essential illustration. As expected, our results showed that the children performed best (accuracy and RT) in the symbolic condition. Also, they were slowest in the Essential condition, but other illustrations did not have a negative effect. Results are discussed in the context of Cognitive Load Theory and bring forth implications regarding instructional design in mathematics education.

Effects of emotionality on news credibility: Insights from self-reports and brain imaging
Keywords: Cognitive Skills and Processes, Critical Thinking, Digital Literacy and Learning, Educational Neuroscience
Presenting Author: Mareike Bacha-Trams, Research Methods in Psychology – Media-based Knowledge Construction, Faculty of Engineering, University of Duisburg-Essen, Duisburg, Germany, Germany; **Co-Author:**Daniel Bodemer, Research Methods in Psychology – Media-based Knowledge Construction, Faculty of Engineering, University of Duisburg-Essen, Duisburg, Germany, Germany

In information searching processes as a part of informal learning, the distinction between reliable and less reliable information or news is essential. Furthermore, the use of online media as a source for news is rising. As online media are increasingly infiltered by fake news (i.e. news intentionally created to deceive or manipulate the recipient), it is important to understand processes of news evaluation and to develop strategies to foster critical media literacy. In this multidisciplinary study, we used a combination of self-reports and brain imaging to examine the neurocognitive processes of fake news evaluation. In a three factorial within-subject design, we examined the effect of features of the stimuli such as the topic, writing style and source on the perceived credibility of the news. The analyses suggest that from all examined variables, only the writing style affected the news' credibility, while the news' topic and source did not influence the perceived credibility. Exemplary fMRI results of one study subject indicate brain activation in areas associated with emotion processing and reward when the subject rated the news' credibility. Taken together, our results suggest that the affective and social aspect of news evaluation is of major importance for rating the perceived credibility. Thus, studying learning processes using online media as a source for information and also instructing learning processes regarding news evaluation should not solely focus on cognitive processes but should also consider emotional features of news articles and include social and affective neurocognitive mechanisms.

Realizing adaptive teaching with educational technology? A benefit for low achieving school students
Keywords: Computer-assisted Learning, Educational Technologies, Mixed-method Research, Teaching Approaches
Presenting Author: Leonie Sibley, University of Tübingen, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany; **Co-Author:**Christine Plicht, University of Tübingen, Germany; **Co-Author:**Armin Fabian, University of Tuebingen, Germany; **Co-Author:**Christian Wettke, University of Tübingen, Germany; **Co-Author:**Thorsten Bohl, University of Tübingen, Germany

Educational technology has the potential to realize adaptive teaching by supporting formative assessments as well as adaptions on the macro and the micro level. Although educational research provided valuable, but technology intense approaches (e.g., ITS, dashboards), it is largely unclear how adaptive teaching can be realized with available tools and infrastructure, as well as which learner- (e.g., prior knowledge) and topic-related (e.g., domain) boundary conditions determine the effectiveness of technology-enhanced teaching. Against this background, we conducted a sequential mixed method study, in which we used qualitative data to explain quantitative results on a deeper level. In the quantitative phase, we first realized a ManyClasses study: In collaboration with eight high school teachers, we developed and evaluated 12 teaching units (N = 183 school students) in which educational technology was adopted to realize adaptive teaching and investigated students' knowledge gains and monitoring accuracy (judgment of learning). Results showed a large increase of knowledge and more accurate judgements of learning across all units. Interestingly, especially students with low prior knowledge benefited from the teaching units, and apparently, teaching units were mainly effective in the STEM but not languages domain. In the qualitative phase, we interviewed three teachers whose teaching units showed either small, medium, or large effects to further explore boundary conditions of implementing educational technology in adaptive teaching. Qualitative analyses revealed that regular formative diagnoses, monitoring students' individual or group work, and a didactical use of educational technology likely accounted for higher learning gains.

Epistemic changes when university teachers use digital technology in assessing student learning
Keywords: Assessment Methods, Educational Technologies, Higher Education, Qualitative Methods
Presenting Author: Linda Barman, KTH, Royal Institute of Technology, Sweden; **Co-Author:**Maria Weurlander, Stockholm University, Sweden

Digital technology is increasingly used in Higher Education assessment practices. The aim of the present study was to illuminate digital transformation by exploring teachers' experiences of using digital technology to assess students' performances. Twelve teachers from different disciplines located at two universities in Sweden were interviewed. From a theoretical position viewing assessment as a social practice, we analysed the data using a thematic analysis. The findings illuminate changes of different nature as result of the teachers' use of digital technology and relate to either *how* the teachers worked, (the assessment processes), or *what* the teachers designed and created, (the 'products', i.e. assessment tasks or course design). Overall, based on the teachers' design decisions in this study, the assessments via digital tools *converged*, making it harder for teachers to allow for variation in student responses. In contrast to the intentions reported by several teachers, the assessments became about measuring students' fulfilment of specified and detailed outcomes of learning ('the correct answer') and limited teachers' opportunities to provide supporting feedback (feedforward). As digital technology is increasingly being implemented in higher education and promises of technology-enhanced-learning are stressed, this study provide perspective in highlighting some concerning consequences regarding assessment of student learning. We argue that epistemic changes in assignments when digital technology is applied should be taken seriously and needs further exploration.

The educational potential of programming and the role of teachers. A scoping of systematic reviews
Keywords: Computational Thinking, Educational Technologies, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Synnøve H. Amdam, Volda University College, Norway; **Co-Author:**Sanna Forsström, University of Stavanger, Norway

Programming and computational thinking has become an important area of teaching and learning in education across the world, often linked to 21st century skills and what is needed for future citizens to function well in tomorrow's workforce. For instance, in Norway, programming was introduced in four subjects from year 2020 in the curriculum, mathematics, science, arts and crafts, and music. Computational thinking is additionally seen as a cross-curricular competence. However, the inclusion of programming and computational thinking in and across subjects in the curriculum also requires that teachers have the competence to include these themes in their teaching practices. In this scoping meta review of systematic reviews, we investigate what is the educational potential of programming in primary and secondary education, and what is required for teachers to be able to utilize this potential. We do this by first exploring how research through the last decade focus on the use of programming in educational contexts in primary and secondary education in 23 systematic reviews, and on the necessary means to develop teachers' professional digital competence in 12 systematic reviews. We then discuss the premisses and challenges for teachers' inclusion of programming and computational thinking in their teaching practices, through a further investigation of the teachers' role as presented across the included research.

Becoming a teacher to digitally transform education? Developing and applying the D(FIT)-Choice
Keywords: Educational Technologies, Higher Education, Motivation, Pre-service Teachers
Presenting Author: Judit Martínez Moreno, University of Education Zurich / University of Zurich, Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland

The reasons for choosing a teaching career have been widely studied. However, only a few studies have investigated whether digital factors influence teacher students' decision of becoming a teacher. In this study, we answer this question by using the (D)FIT-Choice (Digital Factors Influencing Teacher Choice) scale, which we had previously developed and validated, with a sample of more than 230 beginning primary, lower and upper secondary teacher students. Preliminary results indicate that digital factors are among the least important reasons for becoming teachers. This is a cause for concern since this seems to contradict common expectations towards new generations of teachers. We also explore which factors are correlated with having higher levels of digital reasons to become a teacher. The main correlated factors are prior digital technology usage in education and perceived digital teaching competence, but also job security and job transferability. Learning more about the digital factors influencing teacher choice will contribute to better designing teacher education to foster an effective digital transformation in education.

Informal science learning: an overview of activity types and their design characteristics
Keywords: Informal Learning, Instructional Design, Science and STEM, Science Education
Presenting Author: Tessa Eysink, University of Twente, Netherlands; **Co-Author:**Natasha Dmoshinskaia, University of Twente, Netherlands; **Co-Author:**Hannie Gijlers, University of Twente, Netherlands

People learn science everywhere: at school, but especially outside school. This informal science learning is not only fun, but can also contribute to the development of people's science proficiency, which is a person's knowledge, skills and attitudes towards science. It is not clear, however, how different informal science learning activities contribute to the development of science proficiency and which design characteristics are important for that. In the current study, we interviewed more than 200 stakeholders (activity providers, school teachers, and participants/visitors of informal science learning activities) from 20 countries to get an overview of different types of activities and their design characteristics. Based on the interviews and a check on existing repositories covering informal science learning activities in Europe, 14 activity types in three contexts were identified. Moreover, based on the analysis of the interview data and literature, a set of key design characteristics and their success criteria were identified for each context. The results give insight into the design of successful learning activities and are input for the next steps: the development of a systematic assessment methodology for science proficiency and the analysis of the impact of different informal science learning activities.

School social media and the datafication of children
Keywords: Educational Policy, Ethics, Primary Education, Social Media
Presenting Author: Karley Beckman, University of Wollongong, Australia; **Presenting Author:**Tiffani Apps, University of Wollongong, Australia; **Presenting Author:**Sue Bennett, University of Wollongong, Australia

Digital platforms for learning, school management and communications are now routine in schooling systems, and social media use by schools has become part of the increasing digitalization of education. Yet the use of such platforms in school contexts raises critical questions about the data being collected about children through social media activity, how it is being used and what protections are afforded to children as a vulnerable social group. Drawing on children's digital rights and a data justice framing, this research investigates the data practices associated with school use of social media and the implications including the rights of children and their families. Using a mixed methods approach the research undertook content analysis of 200 primary school social media sites, and conducted case studies of five primary school leaders and six parents in Australia. The findings of the study show limitations in stakeholders' understanding of the use and reuse of children's data by social media platforms, thus highlighting a number of ethical concerns. We share suggestions for more considered and inclusive school social media policy and practices that better protect the rights of children.

Social dimensions of learning: unpacking the collaborative process in an online initiative
Keywords: Cooperative/Collaborative Learning, Informal Learning, Social Aspects of Learning and Teaching, Social Media
Presenting Author: Karin Ekman, University of Gothenburg, Sweden; **Co-Author:**Thomas Hillman, University of Gothenburg, Sweden

Since its inception, social media has both been hailed as a hopeful space for learning where the production of knowledge and exploration of ideas may be democratized and also been derided as a space that fosters intolerant and even hateful discourse. However, what discourse takes place on social media and how it might support learning is a matter of the details. Seeking to unpack these details, this paper reveals how social dimensions of learning can be identified through examination of the productive and exploratory elements of dialogue in an online informal community. These social dimensions are unpacked through analysis of the ways members of a Facebook group with a STEM focus communicate in relation to different topics of conversation. Social dimensions of learning in this context are seen in relation to the building of social ties through community work when engaging in collaborative problem-solving activities, idea development, and working together to understand common problems. Expanding on earlier research, the findings reveal ways that when considered in relation to the contextual aspects of dialogue, existing theory on exploratory elements can be reinterpreted to better understand social dimensions particular to learning in social media groups.

Children's Leisure Writing Activities and Related Beliefs
Keywords: Attitudes and Beliefs, Informal Learning, Primary Education, Writing/Literacy
Presenting Author: Lisa Birnbaum, Friedrich-Alexander-Universität Erlangen-Nürnberg, Germany; **Co-Author:**Stephan Kroener, Friedrich-Alexander-Universität Erlangen-Nürnberg (FAU), Germany

Recent research has shown that beliefs can explain children's leisure writing frequency. However, researchers are asking what types of text children are writing in their leisure time. This is followed by the question of whether certain beliefs are particularly explanatory of certain writing activities. This is where this study comes in: Questionnaire data from 1,054 German third-graders on their leisure writing activities and related beliefs were analyzed using regression analyses. Results showed that children were not writing that much in their leisure time. However, what drived them to write in their leisure time was primarily their intrinsic value. However, depending on the writing activity, other beliefs had substantial explanatory value. We discuss to what extent knowledge about recreational writing activities can help teachers and parents to promote writing experiences with different text forms among elementary school children.

Who cares? Gender role representation of same-sex parents in children's picture books
Keywords: Early Childhood Education, Gender Issues, Informal Learning, Quantitative Methods
Presenting Author: Lars Burghardt, University of Bamberg, Germany

Picture books are a central part of early childhood and contribute to the picture children form of the world. While most picture books are oriented towards the concept of heteronormativity, more picture books featuring same-sex parents have been published in recent years. This presentation addresses the question of how same-sex parents are portrayed in relation to gender roles. Data stems from 23 German-language picture books, 17 with two mothers, six with two fathers. A quantitative coding approach using was used to capture the portrayal of gender roles. In the presentation, in addition to the general depiction of gender roles, the focus is primarily on the depiction of care activities. The analyses showed that fathers, as well as mothers, are comparatively often shown emotionally or in caring activities, especially when the results of this study are compared to the state of research. Although in a large number of picture books both parents provide care and household-related activities, there is a statistically significant difference in the sample of two fathers in terms of one parent performing these activities more frequently. In this respect, it can be seen that the portrayal of same-sex parents is partially oriented towards heteronormative models, as these activates are usually depicted as female.

The role of student-teacher relationships for classroom adjustment and later academic achievement
Keywords: Mathematics/Numeracy, Reading, Self-regulated Learning and Behaviour, Social Interaction
Presenting Author: Ragnhild Lenes, University of Stavanger, Norway; **Co-Author:**Dieuwer ten Braak, University of Stavanger, Norway; **Co-Author:**Ingunn Størksen, University of Stavanger, Norway

Research has indicated that student-teacher relationship quality is associated with students' adjustment to the classroom, social competencies, and academic achievement (e.g, Roorda, Koomen, Spilt, & Oort, 2011). The present study investigated: 1) Do first-grade teachers` perceived conflict and closeness with students predict students' adjustment difficulty to the classroom and self-regulation in first grade and academic achievement in fifth grade? 2) Do first-grade teachers` perceived conflict and closeness have indirect effects on academic achievement in fifth grade through students` adjustment difficulty and self-regulation in first grade? The study included data from 240 Norwegian children. First-grade teachers reported perceived conflict and closeness with students through the Student-Teacher Relationship Scale (Pianta, 2001) and students` adjustment difficulty to the classroom through the Survey of Early School Adjustment Difficulty (Rimm-Kaufman, 2005). Self-regulation was directly assessed with the Head-Toes-Knees-Shoulders task (McClelland et al., 2014). Fifth-grade scores in reading comprehension and mathematical achievement derived from mandatory National assessments. Results showed that teacher-perceived conflict significantly predicted students` self-regulation ($\beta$=-.16**) and adjustment difficulty ($\beta$=.70***) in first grade but not academic achievement in fifth grade. Closeness in first grade directly predicted students` reading comprehension (β=.15*) in fifth. Teacher-perceived conflict in first grade had a significant indirect effect on reading comprehension in fifth grade through students` adjustment difficulty ($\beta$=-.18*). Closeness did not have a significant indirect effect on academic achievement. Findings are discussed in light of improving our understanding of the role of student-teacher relationships in students` adjustment, self-regulation, and academic achievement.

The relationship between teacher-child interaction and EF: A cross-cultural meta-analysis
Keywords: Cognitive Development, Meta-analysis, Social Aspects of Learning and Teaching, Teaching/Instructional Strategies
Presenting Author: Canmei Xu, KU LEUVEN, Belgium; **Co-Author:**Dieter Baeyens, KU Leuven, Belgium; **Co-Author:**Mariette Huizinga, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Wim Van Den Noortgate, KU LEUVEN, Belgium

Executive functions (EFs) are fundamental for children's learning, school functioning and academic achievement. Recent meta-analyses (e.g., Vandenbroucke et al., 2018) indicated that positive teacher-child interactions (TCI) are consistently associated with children's EF growth, and that this relationship is likely to be causal (Sankalaite et al., 2021). However, these reviews predominantly use data from North American and European samples and often fail to differentiate between TCI levels. Therefore, we set out to investigate in a meta-analysis whether the relationship between dyadic and classroom level TCI and EF is universal across cultures. Starting from a screening of 13,115 papers, 72 empirical studies from 16 cultural regions on the association between TCI and EFs were included. Using three-level meta-analytic models, it was found that overall TCI at both the dyadic and classroom level is related to EF, with effect sizes ranging from small (classroom-level) to medium effects (dyadic level). Moderation analyses suggest that this relationship is often stronger when using EF questionnaires compared to EF performance tasks. As for moderation by cultural parameters, our data showed that there is a stronger relation between closeness and EF for children from collectivistic cultures than individualistic cultures. Power distance moderated the relationship between instructional support and EF, with larger effect sizes found in participants from the large-power-distance societies. These cultural findings should be interpreted with caution as for other TCI-EF relationships, cultural differences proved to be an artefact of the EF instrument type being used.

Teacher-student relationships and psychosocial adjustment of students with learning disabilities
Keywords: Emotion and Affect, Learning and Developmental Disabilities, Primary Education, Social Aspects of Learning and Teaching
Presenting Author: Fotini Polychroni, NATIONAL AND KAPODISTRIAN UNIVERSITY OF ATHENS, Greece; **Co-Author:**Alexander-Stamatios Antoniou, National & Kapodestrian University of Athens, Greece; **Co-Author:**Evgenia Kyriakidou, National and Kapodistrian University of Athens, Greece; **Co-Author:**Despoina Kontaratou, National and Kapodistrian University of Athens, Greece

The aim of the present study is to explore students' with learning disabilities (LD) perceptions of psychosocial adjustment and their perceptions of teacher-student relationship as compared to their typical peers. Moreover, classroom teachers' perceptions of their quality of interaction with students were investigated.

The sample consisted of 400 5th and 6th grade primary school children aged 10 to 12 years. Of the sample, 46 students had a formal statement of learning disabilities by a state assessment centre or were rated as having difficulties in reading and writing by their teachers. The sample included also 24 primary school teachers teaching in these 8 schools in the children's respective classrooms who rated 107 students in terms of teacher-student quality (of those 45 students with LD). The Psychosocial Adjustment Questionnaire (Hatzichristou et al., 2008) and The Children's Appraisal of Teacher as a Secure Base Scale (Al-Yagon & Mikulincer, 2004) were administered to the students and the Student- Teacher Relationship Scale (Pianta, 2001) was administered to the teachers. Results showed that LD students reported significantly lower social adjustment, emotional adjustment, school adjustment, self-esteem and higher levels of behavior problems and teacher rejection as compared to their typical peers. Teachers' perceptions of closeness, conflict and dependency did not vary significantly between LD and typical students. Moreover, students' perceptions of teachers' availability and acceptance and existence of LD were positive predictors of social, emotional and school adjustment while the only significant positive predictor for students' behavior problems was students' perceptions of teachers' rejection.

The role of autistic traits in peer influence on social skills in special needs classrooms
Keywords: At-risk Students, Peer Interaction, Social Development, Special Education
Presenting Author: Gina Nenniger, University of Fribourg, Switzerland; **Co-Author:**Christoph Müller, University of Fribourg, Switzerland

Research on typical development indicates that the skill level among classmates influences individual skill development through processes such as social learning. Less is known on such classroom influence and the factors it depends on in students with an intellectual disability (ID). Since ID is often associated with autistic traits that may impede social learning, we examined in how far individual levels of autistic traits diminish classroom peer influence on social skills in students with ID. We used data collected at the beginning (T1) and end (T2) of a school year on 1,177 students with ID (29.7 % girls; *M* age = 11.26 years, *SD* = 3.76) attending 182 special needs classrooms. Information on students' social skills and autistic traits was reported by school staff. Results from multilevel analyses showed a significant interaction between individual autistic traits levels and classroom mean social skills at T1, predicting individual social skills at T2 (controlling for individual social skills at T1 and other variables). Our findings indicate that students with ID and higher autistic traits levels are less influenced by the peer context than students with ID and lower levels of autistic traits. Results are discussed in terms of the importance to support students with ID and high levels of autistic traits in learning from their peers at school.

Improving Computational Thinking for Children with Autism in the Virtual Environment
Keywords: Computational Thinking, Educational Technologies, Immersive Technologies for Learning, Special Education
Presenting Author: Nuodi Zhang, Florida State University, United States; **Co-Author:**Alex Barrett, Florida State University, United States; **Co-Author:**Fengfeng Ke, Florida State University, United States; **Co-Author:**Zlatko Sokolikj, Florida State University, United States; **Co-Author:**Jewoong Moon, The University of Alabama, United States

Computational thinking (CT) skills are fundamental 21st-century skills all students should acquire. The purpose of this study is to investigate the effectiveness of simulation design and coding activities in the virtual environment (VE) on learners' CT skill development. Two adolescents with autism participated in the study over a period of 10 to 15 months. A single subject design (A-B-A) was used with a 5-week baseline, a 19- to 29-week intervention, and a 2-week baseline. During the intervention, the participants were instructed to design and code a non-player character (NPC) for specific scenarios. The CT behaviors of the participants, including decomposition, abstraction, algorithmic thinking, evaluation, and generalization, were systematically coded based on an evidence-centered CT competency model. The results indicated that VE-based intervention is effective in improving CT skills for children with autism.

Inclusion of Children with Autism Spectrum Disorder in Portugal: A Social Network Analysis Approach
Keywords: At-risk Students, Inclusive Education, Social Development, Social Interaction
Presenting Author: Paulo César Dias, Universidade Catolica Portuguesa, Portugal; **Co-Author:**Ana Oliveira, Universidade Católica Portuguesa, Faculty of Philosophy and Social Sciences, Centre for Philosophical and Humanistic Studies, Portugal; **Co-Author:**Irene Cadime, Psychology Research Center, University of Minho, Braga, Portugal; **Co-Author:**Christoforos Mamas, University of California, San Diego, United States

Although most countries include inclusive education in their education policies to ensure the participation and inclusion of all students, research findings indicate that children with special education needs still face difficulties in social participation. This is the case of children with autism spectrum disorder (ASD), whose challenges in social skills create several barriers to their inclusion. In this regard, peer attitudes and behaviors are extremely important for creating and maintaining social networks and, consequently, for the inclusion of children with ASD in the classroom. The present study aims to describe the social participation of children with ASD, through a sociometric analysis and to analyze the perceptions of peers about inclusion. Two instruments were used to collect data: a sociodemographic questionnaire and the Social Networks Assessment Questionnaire. These were conducted on five classes of 3rd and 4th grade elementary school students in public schools in Portugal. The results show that the number of friends identified by students with ASD is similar to the number of friends identified by students without social needs. However, the results also suggested that children with ASD do not occupy central positions. Regarding the recreational network, the frequency of mentions decreased significantly. Moreover, in the help and conversation networks, most students with ASD were excluded. Regarding personal variables, a very low and negative correlation was perceived between age and "positive feelings towards school". The findings of this study suggest that improvements in inclusive education, intervention and attention to social participation of students with ASD are still needed.

What do secondary school teachers need to optimally educate students with Autism Spectrum Disorder?
Keywords: In-service Teachers, Q-methodology, Secondary Education, Teacher Professional Development
Presenting Author: Maria Fernanda Esqueda Villegas, University of Groningen, Netherlands; **Co-Author:**Steffie van der Steen, University of Groningen, Netherlands; **Co-Author:**Alexander Minnaert, University of Groningen, Netherlands

Teachers are essential in providing inclusive education to students with Autism Spectrum Disorder (ASD). Yet, little is known about what they need to optimally support this group of students in mainstream secondary education. The main goal of this study was to identify the needs of secondary school teachers when educating students with ASD in the Netherlands and Mexico (N=79). Using Q-methodology, we identified four groups of teachers with different needs in each country. The first group of Dutch teachers wanted ideas to improve the social skills of the student with ASD; the second group needed suggestions to improve the student's skills to deal with the mainstream environment; the third group wished to collaborate with other professionals and the fourth group of Dutch teachers needed advice on how to adjust their lessons. The first group of Mexican teachers wanted suggestions to structure and adapt their lessons; the second group not only needed help from other professionals but also to refresh their knowledge of ASD; a third group wanted to get ideas to improve the social skills of the student and the last group of Mexican teachers wanted more autonomy-support to know they were doing things right in their practice. Our findings revealed that teachers from the Netherlands and Mexico share some similarities regarding their needs to educate students with ASD. By acknowledging and meeting these needs, teachers might feel more confident in their interactions with this group of students who often struggle in mainstream school settings.

Fostering Pre-service Teachers' Assessment Skills: Establishing Adaptivity in a Video Simulation
Keywords: Educational Technologies, Pre-service Teachers, Simulation-based Learning, Teacher Professional Development
Presenting Author: Michael Nickl, Technical University of Munich (TUM), Germany

Novice teachers oftentimes struggle with the assessment of students' characteristics. To help building their assessment skills already in university-based teacher education, simulations including scaffolding have proven effective. Personalizing scaffolds in such simulations is expected to further increase learning gains. To empirically ground this kind of adaptivity in the context of pre-service teachers' assessment skills, we conducted two studies with $N = 150$ and $N = 108$ pre-service teachers in an already existing video-based simulation. In the first study, we aimed at investigating individual needs of pre-service teachers in the simulation by identifying profiles of their learner characteristics and the relation of the profiles to assessment skills. The three identified profiles reveal motivational and cognitive needs of pre-service teachers. For the second study, we thus evaluated the effects of cognitive and motivational scaffolding. We found that conceptual prompts (cognitive scaffolding) were helpful for learners with high motivational learner characteristics and learners with an average or low success expectancy. Learners with a high success expectancy benefitted most from a utility value intervention (motivational scaffolding). Concluding, an adaptive simulation for fostering pre-service teachers' assessment skills should take pre-service teachers' learner characteristics and their success expectancy into account to assign them adaptively to conceptual prompts or a utility value intervention. Further research may specify, how further types of scaffolding can be included in the simulation. This research gives an example on how adaptivity may be empirically grounded and established in learning environments.

VIPP-School: Feasibility of a video-feedback intervention to improve teacher-child interaction
Keywords: Primary Education, Qualitative Methods, Teacher Professional Development, Video-based Learning
Presenting Author:K.M. Starreveld, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Mathilde Overbeek, Vrije Uiniversiteit Amsterdam, Netherlands; **Co-Author:**Agnes Willemen, VU University Amsterdam, Netherlands; **Co-Author:**Marian Bakermans-Kranenburg, University Institute of Psychological, Social and Life Sciences, Portugal

Around the age of four most children find themselves in a new environment: primary school, where teachers start to play a key role in their lives. Longitudinal studies show that positive teacher-child relationships are associated with positive child functioning. The capacity of teachers to sensitively respond to the needs of children predicts positive interactions. However, teachers sometimes find it challenging to deal with children with behaviour problems. The Video-feedback Intervention to promote Positive Parenting and Sensitive Discipline (VIPP-SD) is proven to be effective in enhancing sensitive caregiving in different types of families and daycare settings. Given the effectiveness of VIPP-SD, we aim to test its potential for supporting teachers in interaction with children with challenging behaviour in their classroom (VIPP-School). In this qualitative study we investigated the feasibility of VIPP-School by analysing the perceptions of teachers and VIPP-interveners participating in VIPP-School. Results show that the participating teachers (n=3) noted the time investment, but appreciated the

video fragments as a great mean to become more aware of small signals of the child and their own behaviour. VIPP-School has potential for supporting teachers in the interaction with their children with challenging behavioural and creating more positive teacher-child relationships. Currently, we are testing VIPP-School in a randomized controlled trial. *Keywords:* Qualitative methods, Teacher professional development, Video-based learning, Primary education

Multimedia principles in instructional videos for classroom: A case study with pre-service teachers
Keywords: Multimedia Learning, Pre-service Teachers, Qualitative Methods, Video-based Learning
Presenting Author: Juliette Desiron, University of Zürich, Switzerland; **Co-Author:**Eliana Brianza, University of Zurich, Institute of Education, Switzerland

Multimedia learning is a component of almost every teaching and learning setting and the literature describes well-established design principles at its base. Nevertheless, at present teachers frequently appear to have misconceptions related to multimedia learning and few studies have investigated the implementation of these principles in authentic materials. This study investigated nine preservice teachers attending a course on multimedia learning in videos and examined the effects of the course on their understanding and implementation of multimedia learning principles in instructional videos. Preliminary analyses show that with regards to their multimedia learning misconceptions assessed at the beginning of the semester, preservice teachers appear to be less secure in the extent to which they agree with multimedia statements but more secure in aspects with which they disagree. Initial coding of a subsample of videos (n = 21 out of 49) selected by preservice teachers for their teaching subject found a predominant presence of effective use of the signaling principle whereas segmentation and the coherence principle appeared to be more frequently misalignment with multimedia learning recommendations. Further analyses on multimedia learning principles will be carried out on the remaining 28 videos and the findings will be discussed in relation to the potential of developing preservice teachers' multimedia learning expertise through teacher education.

Effects of quizzes on (self-regulated) learning when studying instructional videos
Keywords: E-learning/ Online Learning, Higher Education, Instructional Design, Video-based Learning
Presenting Author: Margot van Wermeskerken, Utrecht University, Netherlands; **Co-Author:**Floor van Rosse, Erasmus MC Rotterdam, Netherlands

Blending traditional face-to-face and web-based learning has been shown to be very effective for learning – at least if students come to face-to-face meetings well-prepared. However, this is not always the case presumably because students overestimate their own learning when studying educational videos. One possible solution is to integrate a form of retrieval practice (i.e., quizzes) in online educational videos. Performance on these quizzes is expected to reveal students' knowledge gaps which helps them to monitor their learning process and regulate it accordingly.In a blended course of medicine, 168 master students were either assigned to a quiz or no quiz condition. During this 7-week-course, students were weekly presented with educational videos on drugs with/without a quiz prior to each face-to-face meeting. At the end of the course, formative test performance and exam performance were compared between the *quiz* and *no quiz* conditions. SRL ratings at the start and end of the course were compared between conditions.Although drop-out was substantial, the results indicate that integrating quizzes fostered students' learning as indicated by higher performance on the formative test at the end of the course compared to students in the no-quiz condition. Exam performance and SRL ratings did not differ between conditions. Although promising, this study calls for more applied research to replicate the current findings including larger samples.

Effects of collaborative reception of explanatory videos on knowledge and competencies
Keywords: Cooperative/Collaborative Learning, Multimedia Learning, Secondary Education, Video-based Learning
Presenting Author: Laura Schultze, Universität Hildesheim, Germany; **Co-Author:**Raphael Koßmann, Universität Hildesheim, Germany; **Co-Author:**Nicoletta Bürger, University of Hildesheim, Germany; **Co-Author:**Melanie Fabel-Lamla, Universität Hildesheim, Germany; **Co-Author:**Christof Wecker, Universität Hildesheim, Germany

Explanatory video plays a substantial role in many adolescents' informal learning experiences. While the flipped classroom format in which the students prepare an in-class lesson at home by watching videos individually has been the subject of a substantial body of research, the question of how explanatory video can be employed effectively in the classroom itself has not been answered systematically yet. Research on multimedia learning focuses on the design of instructional videos in order to reduce cognitive load and foster meaningful learning activities. A complementary approach in a classroom setting might be the collaborative reception of explanatory videos supported by collaboration scripts. Following these considerations, the study presented on this poster investigates to what extent the collaborative reception of explanatory videos supported by a collaboration script has an effect on the acquisition of content knowledge and collaborative competencies. A quasi-experimental intervention study with a pre-post control group design is conducted in a lesson in two English as a foreign language classes at a secondary school. The unit contains two explanatory videos. In the control group, the students work on the videos individually. In the experimental group, the students work in pairs; their interaction is structured by means of worksheets. Content knowledge and collaborative competencies are assessed by means of open-ended and single-choice questions in the pre- and post-tests. The study promises insights about possibilities to promote the effective reception of explanatory videos in classroom settings.

Learning genre knowledge from comparing argumentative texts: zooming in on the comparison processes
Keywords: Argumentation, Knowledge Construction, Secondary Education, Writing/Literacy
Presenting Author: Tine Mombaers, University of Antwerp, Belgium; **Co-Author:**Roos Van Gasse, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium

Argumentative writing skills are paramount for students' academic and occupational success. But students struggle with writing a good argumentative text. Enhancing students' genre knowledge can help overcome students' difficulties. A recent study on enhancing genre knowledge of argumentative texts through (comparing) exemplars showed some discrepancies with literature. First, looking for differences seems less effective than searching for similarities. Second, learning from comparing exemplars does not increase genre knowledge more than learning from single, sequential exemplars. This study aims to explain these discrepancies by looking at the 10% highest (responders) and lowest raisers (non-responders to treatment) regarding genre knowledge. Through a qualitative exploration, their learning processes will be investigated in depth.

Personal Relevance and Refutation: Fostering High School Students' Argument-Evaluation Skills
Keywords: Argumentation, Citizenship Education, Instructional Design, Secondary Education
Presenting Author: Nina Udvardi-Lakos, University of Freiburg, Germany; **Co-Author:**Tino Endres, University of Freiburg, Germany; **Co-Author:**Laura Wevelsiep, University of Freiburg, Germany; **Co-Author:**Lisa Bender, University of Freiburg, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Germany

Young adults in democratic societies should know how to evaluate political arguments to form their own decision and decide which parties and politicians to vote for. However, studies show that many people show low ability for argument evaluation and adhere to false concepts in this respect. As citizens of many countries

can vote once they are 18 years old, high school seems to be an important place to foster argument evaluation skills before young adults cast their first votes. We developed a learning intervention meant to foster the use of formal criteria for argument evaluation and to reduce adherence to false concepts. These aspects were addressed using emotional design videos. We used a 2x2 between-subjects design, experimentally varying the presence of personal relevance prompts and refutation components. Personal relevance prompts should increase learners' motivation for and subsequent effort invested in the learning materials. Refutation components should decrease the adherence to false concepts. We will implement this intervention with approximately 128 high school students in Spring 2023. We expect that participants who receive refutation components will show lower adherence to false concepts than participants who did not receive refutation components; and that participants who receive personal relevance prompts before the videos will show higher learning gains compared to participants who receive the personal relevance prompts at the end of the study. This pattern of results would suggest that our intervention is an efficient approach to fostering skills that young adults will need to play their role in democratic societies.

Opening the black box of students' argumentative writing processes
Keywords: Argumentation, Cognitive Skills and Processes, Secondary Education, Writing/Literacy
Presenting Author: Fien De Smedt, Ghent University, Belgium; **Co-Author:**Nina Vandermeulen, Umeå University, Sweden; **Co-Author:**Yana Landrieu, Ghent University, Belgium; **Co-Author:**Bram De Wever, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

The current study aims to uncover students' actual approach during writing an argumentative text based on two source texts. More particularly, we aim to study the occurrence of particular reading and writing processes and the temporal patterns between these processes. Furthermore, we aim to uncover how these processes relate to students' argumentative writing performance. In total, 37 eleventh-grade students individually wrote an argumentative text and their keystrokes as well as their screens were captured. Furthermore, the text quality of students' written texts were evaluated using comparative judgement. Currently, preparatory analyses based on the keystroke log and screen data are conducted. In a next phase, educational process mining will be applied on the keystroke log data to visualize students' writing behavior to facilitate a thorough understanding of the course of students' complex real-time writing processes.

Reclaiming habit formation for democratic values in schools: practicing and experiencing citizenship
Keywords: Argumentation, Citizenship Education, Critical Thinking, Social Interaction
Presenting Author: Gabriel Fortes, Universidad Alberto Hurtado, Chile; **Co-Author:**Andreas Reichelt Lind, OsloMet - Oslo Metropolitan University, Norway; **Co-Author:**Antonia Larrain, Universidad Alberto Hurtado, Chile

Many citizens in democracies are growing increasingly disillusioned with their governments' efforts to actively promote and endorse democratic values. There is a lack of public trust in institutions, and a declining willingness to participate in public life. The trend seems to be most pronounced in countries where participation is low, and the democratic process is being constantly challenged. Students are experiencing uncertainty and doubt about the future, and they are not equipped with the critical thinking skills they need to engage critically with the democratic process. We problematize, that even in places where students are knowledgeable related to citizenship and democracy, the general experience they are exposed to is of distrust of democratic values and public decision-making. Reclaiming Dewey's argument for habit formation and his ideas of practicing and experiencing democracy we argue that citizenship education should be centered around designing spaces for the exercise of democratic deliberation. Further, through a discussion of argumentation literature, we suggest how to promote habits of critical thinking, participation, and informed decision-making through collaborative deliberation. We argue that to address the challenges of uncertainty the future generations have with climate change, rise of polarization, fake news, and many other social issues, experiencing and practices of deliberation will be key. In this sense, providing young people with opportunities to engage in democratic experiences and supporting formation of democratic habits, we can help them to become more civically engaged citizens.

Dealing with conflicting sources in argumentative writing and its consequences
Keywords: Argumentation, Cognitive Skills and Processes, L1/Standard Language Acquisition, Writing/Literacy
Presenting Author: Hyeyoun Kim, Dongguk University-Seoul, Republic of Korea; **Co-Author:**Gyeonghoon Yoon, High School Attached to College of Education, Dongguk University, Republic of Korea

Use of various sources that support competing views during argumentative writing has been addressed less than its importance. The current study thus aims to investigate the relations between the use of sources supporting conflicting views during undergraduate students' source-based argumentative writing and their writing performance. To this end, 75 undergraduate students wrote an argumentative essay based on two conflicting sources and filled out questionnaires about their perspectives on writing and awareness on the writing performance. Writing process and source use data were collected through Inputlog. Participants' writing outputs were both holistically and analytically scored. As a preliminary result, undergraduate writers who spent less time in reading the task description and sources for writing tended to write better instruction. In addition, writers who read the two conflicting sources in a balanced way tended to produce stronger and organized arguments and showed more interest in the task. The educational implications for the source use in argumentative writing were drawn from the results.

Stories of Crises in Art: A Potential for Democratic Education?
Keywords: Art Education, Citizenship Education, Creativity/Divergent Thinking, Learning Approaches
Presenting Author: Britta Breser, University of Vienna & University of Graz, Austria

Art that visually addresses social order and political events increasingly focuses on crises. As a report on everyday social life or a chronicle of political events, art has always told stories of other realities in a reflective mode, illustrated their disruptions and contrasted hegemonic constructions of reality. In this presentation, stories of crises in art will be critically examined as a potential space for democratic educational processes: Based on the panorama video installation "More sweetly play the dance" (Bloemheuvel/Guldemond 2015), in which the South African artist William Kentridge did not refers to a hoped-for or expected state after the crisis, but to the presence in the crisis, this presentation addresses stories of art from the perspective of democratic education in their constitutive ambivalence. Democratic possibilities of educational processes with visual stories of crises are highlighted.

Dialogue and critical questions to promote critical thinking in Secondary Education students
Keywords: Argumentation, Cooperative/Collaborative Learning, Critical Thinking, Secondary Education
Presenting Author: Jose Luna, University of Barcelona, Spain; **Co-Author:**Núria Castells, Faculty of Psychology, University of Barcelona, Spain; **Co-Author:**Esther Pérez, Universitat de Barcelona, Spain; **Co-Author:**Marta Minguela, University of Barcelona, Spain; **Co-Author:**Amelia Tey, Universitat de Barcelona, Spain

One of the most relevant competences for the 21st century that schools should promote is critical thinking. In collaborative tasks, dialogue is crucial for arguing and developing critical thinking is dialogue. However, students may be uncritical and accept misleading information when they discuss. Asking students to solve critical questions, either individually or while engaged in dyadic dialogue, has shown that it helps students to focus on assessing the arguments orally. The main aim of this study is to assess the impact of including a dyadic dialogue and/or critical questions in the number of arguments students include in their texts. 53 secondary school students participated in this study. They were assigned to one of the three experimental conditions: critical questions (CQ); dialogue (D), and dialogue and critical question condition (DCQ). First they answered a reading comprehension test. Then, they had to read two news that included arguments in favour or against school segregation, and write an argumentative text on this topic individually. After this, students in CQ answered critical questions before rewriting the text individually. Students in the D condition discussed the source texts in pairs and rewrote the argumentative text individually. Dyads in the DCQ solved critical questions and were asked to rewrite their initial text individually. While the experimental condition has no significant impact in the number of arguments included either in the first or the second version of the texts, participants in the D and DCQ conditions included fewer arguments in favour of segregation in their second text.

Domain-specificity and domain-generality in teaching sensitive and controversial issues
Keywords: Cultural Diversity in School, Secondary Education, Social Aspects of Learning and Teaching, Teaching Approaches
Presenting Author: Machteld Vandecandelaere, KU Leuven, Belgium; **Co-Author:**Rushda Kaleem, KU Leuven (BE), Belgium; **Co-Author:**Cato Teughels, KU Leuven (BE), Belgium; **Co-Author:**Nafen Zhuo, KU Leuven (BE), Belgium; **Co-Author:**Jan Sermeus, KU Leuven, Royal Observatory of Belgium, Belgium

Teachers around the world are faced with teaching sensitive and controversial issues (SCIs). While SCI's are not new, tension within classrooms increases with increased diversity in the classroom and with raised critical consciousness and activism in society (i.e., wokeness).
Research on SCIs is fragmented across disciplines. Exchange between disciplines however has the potential to provide a basis for future research and professional development. A common language, captured within an interdisciplinary framework is therefore indispensable. By means of a systematic review and interviews with teachers in soft and hard science education, we address this lack by mapping the diversity of SCIs that teachers are confronted with in secondary education, covering content in both soft and hard sciences.
The systematic review demonstrated a diverse range of topics spread more or less evenly between hard and soft disciplinary groups. Of these, topics are more concentrated in pure disciplines than applied. For the interviews with 8 teachers, we hypothesize the domain-specificity and domain-generality to be related to dimensions of Biglan's (1973) classification of disciplines. Overall, the results from this study will allow contacts to be made and research collaborations to be promoted between school subjects and disciplines and across countries.

Evaluation of a Pilot School-Based Teacher-Coaching intervention to change the social climate
Keywords: Achievement, Classroom Assessment, Inclusive Education, Social Interaction
Presenting Author: Carina Wikman, Stockholm University, Department of Special Education, Sweden; **Co-Author:**Mara Westling Allodi, Stockholm University, Sweden; **Co-Author:**Laura Ferrer-Wreder, Stockholm University, Department of Psychology, Sweden

Evaluation of a Pilot School-Based Teacher-Coaching intervention to change the social climate in Second Grade Carina Wikman, Mara Westling Allodi, and Laura Ferrer-Wreder. Abstract: The structure of relationships in the classroom and what is proceeding socio-emotionally in the learning environment may hinder or support children´s learning and development. Therefore, measuring the social climate is essential to identify challenges, successes, and areas for additional improvement. The present study examined the effect of a practice-based coaching intervention in improving the social climate in the learning environment and academic achievement and behavioral outcomes for students. The design was experimental with a cluster randomized assignment. Eligibility criteria for participants and clusters were 1) municipal primary schools, 2) second-grade classes 3) teacher certification. Intervention pertains to the cluster level: classes were *N*= 4 and students *N*=66, Wait-list-control group: classes were *N*= 4 and students *N*= 77. The duration of the intervention was eight months. It consisted of three key components: action planning, observation, and professional conversation, accordingly to the Practice Based Coaching model. The overall aim of the present study was to develop and test the effects of the intervention that involves the introduction of activities, self-assessment, observation, and coaching aimed at beneficially changing the social climate in the classroom, with a hypothesized indirect impact on students´ self-concept, prosocial behavior, well-being, and academic achievement.

Reference norm orientations of teachers and characteristics of professional contexts
Keywords: Assessment Methods, Goal Orientations, Inclusive Education, Teaching/Instructional Strategies
Presenting Author: Josephine Tanneberger, University of Potsdam, Germany; **Co-Author:**Jessica Jaeuthe, Universität Potsdam, Germany; **Co-Author:**Sebastian Kempert, University of Potsdam, Germany; **Co-Author:**Nadine Spörer, University of Potsdam, Germany

Teachers' reference norm orientations play an important role in describing and explaining student performance assessment practices in German classrooms. So far, research has mainly focused on the effects of different reference norm orientations on students' learning processes and outcomes. However, what influences the choice of reference norms in the classroom is largely unknown. In order to obtain first indications of which aspects turn out to be important for teachers' choice of reference norms, this contribution addresses the question of associations between reference norm-specific teacher groupings and individual characteristics of the professional context. To this end, *N = 2763* teachers from inclusive schools in Germany are grouped via latent profile analyses (LPA) according to their reference norm choice in different assessment contexts. Subsequently, correlation structures between the groups of teachers and the characteristics of *access to teaching profession*, *professional function*, *school type*, and *working hours* are statistically tested. The central findings, possible limitations as well es implications for pedagogical practices will be discussed.

Online studying with special needs - a student perspective
Keywords: E-learning/ Online Learning, Higher Education, Inclusive Education, Mixed-method Research
Presenting Author: Maria Öhrstedt, Stockholm University, Sweden; **Presenting Author:**Annika Käck, Stockholm University, Sweden; **Co-Author:**Helena Reierstam, Stockholm University, Sweden

The Covid-19 pandemic forced many universities to rapidly transition into remote online teaching, which of course had implications for students that attend and study in Higher Education. However, there is still a lack of research on how the students themselves perceive these online learning environments. This study aims to reveal and compare how students with and without disabilities perceived online learning. The data collection draws from a survey with both quantitative and qualitative questions, conducted among Swedish university students (N=6156 students, whereof 430 were students with disabilities, SWD) in late spring 2021. The results indicate that SWD preferred online learning over onsite learning in certain aspects, with better opportunities to focus, less distractions and less energy thieves as the students could work from home. Some SWD expressed that online teaching minimized disabilities and that the technology provided scaffolds. Barriers on the other hand were identified as lack of communication and insufficient instructions from the teachers, the teachers' lack of technological pedagogical knowledge, and students' lack of motivation and managerial skills. Based on the findings we propose a need to consider both the benefits and the challenges as Higher Education embraces inclusive online learning, to improve teaching and learning with all students in mind. SWD requested more transparent course designs, more interactions with peers and teachers, and inclusive online behaviour.

Case study: Students' emotional well-being and social participation with focus on SEN during COVID19
Keywords: Inclusive Education, Pandemic, Social Interaction, Well-being
Presenting Author: Alexandra Pirker, University of Vienna, Austria; **Co-Author:**Katharina-Theresa Lindner, University of Vienna, Austria

Research indicates that emotional well-being is an important factor for social participation in the school context (Blumenthal & Blumenthal, 2021). Furthermore, social participation is seen as a key element for students' self- perceived inclusions (Schwab & Alnahdi, 2020). For students with special educational needs (SEN), some studies have found that they have a lower level of emotional well-being (e.g. McCoy & Banks, 2012; Skrzypiec et al., 2016), while others have not found a group difference compared to peers without SEN (Schwab et al., 2015). For social participation, students with SEN research consistently show that students with SEN are at risk of low social participation (Schwab, 2018). Within the current case study, students' emotional well-being and social participation

was investigated during the period of the COVID-19 pandemic. Two 4th graders with SEN and two without SEN participated in the photovoice project. Photovoice belongs to the participatory action research approach and is often used for participants with limited power (Wang & Burris, 1997). Moreover, semi-structured interviews with the participants have been conducted and analyzed according to the Qualitative Content Analysis (Mayring, 2021). The results point towards fairly similar experiences of emotional well-being and social participation of students with and without SEN. Spaces like the school yard have been identified as highly important places for social interaction during the COVID-19 period. Generally, the pandemic was addressed as an exclusively negative experience by the students and in this context referred only to hygienic measures and regulations implemented in the school (e.g. mandatory face masks).

Social Inclusion in Secondary School
Keywords: Inclusive Education, Pandemic, Social Aspects of Learning and Teaching, Special Education
Presenting Author: Reto Luder, Zurich University of Teacher Education, Switzerland; **Co-Author:**Andre Kunz, Zurich University of Teacher Education, Switzerland; **Co-Author:**Giuliana Pastore, Zurich University of Teacher Education, Switzerland; **Co-Author:**Ariane Paccaud, Pädagogische Hochschule Zürich, Switzerland

At present, school systems are shifting towards inclusive support for children with special educational needs (SEN). In order to feel socially included, students should experience schools as reliable places of learning and support. Particularly adolescents with SEN at lower secondary school level are at risk of being socially excluded and of developing a lower academic self-concept. The research questions of the present study aim at the situation of children with SEN in the transition from primary to lower secondary school in Switzerland, focusing on their social inclusion.The study conducts a multi method, longitudinal design, analyzing data from pupils with SEN (N=49), their peers (N=584), as well as their parents and teachers. Quantitative data was collected using a questionnaire with standardized scales as well as sociometric data. The qualitative data was collected by semi-structured interviews.Results show that differences in social status and perception of inclusion as well as in the mutual development of these two aspects during the three years of secondary school are strongly influenced by the SEN-status of the students.

Education Accessibility in Challenging Circumstances: A Case of Displaced Persons in Nigeria.
Keywords: Educational Policy, Inclusive Education, Migrant / Refugee and Minority students, Primary Education
Presenting Author: Vivienne Kachollom Rwang, University of Southampton, United Kingdom

In Nigeria, forced displacements due to protracted conflicts have disrupted schooling, leaving some children confined in camps and most displaced children without access to any form of education. Educational deficits have however, remained prevalent in Central/Northern Nigeria precisely, owing to protracted insurgencies by Boko Haram and Fulani herdsmen, causing displacement of millions, primary age children comprising the larger percentage. This situation has adversely affected education quality and equitability, resulting to high levels of marginalisation and educational displacements. This paper aims to shine the light on Nigeria's basic education policy and its practice to examine its implementation as it relates to accessibility for displaced children who reside in IDP camps. A case study of some IDP camps in North-Central and North-East Nigeria was adopted, using qualitative methods of data collection to answer the research question. Data instruments included individual and focus-group interviews and document review. Data was drawn from three IDP camps, one neighbouring school and from the State Universal Basic Education Board (SUBEB); two policy makers, three camp managers, three camp teachers, two neighbouring schoolteachers and twenty displaced children. Data collected was transcribed, coded, and analysed thematically. The findings revealed that the reality on ground is at variance with policy statements. Although the children expressed optimism in their desire for education, viewing it as a means for a bright future, lack of accessibility, rejection or demand for huge tuition/levies by neighbouring schools in some instances, have remained impediments to the children's desires.Displacement, Policy, Education, Accessibility

Learning to judge religious conflicts: A structural model of judgement competence for RE
Keywords: Competencies, Quantitative Methods, Religiosity and Spirituality, Secondary Education
Presenting Author: Frederike Gabelt, TU Dortmund University, Germany

In times of increasing polarisation, the ability to judge is growing in relevance. Judgement competence is, therefore, one of the key competencies that students at German schools should develop. However, in didactics and official school requirements for RE in Germany, it has so far not been clearly defined what is to be learned and tested in terms of judgement competence. Moreover, there has been limited research on how such competence can be empirically measured. This study aims to elucidate the process of religious judgement of students and to identify factors, e.g. knowledge and motivation, that influences this process. For this purpose, a structural model of students' religious judgement competence has been developed, which will be empirically validated. The results are intended to contribute to elaborating suitable didactic measures to foster the religious judgement competence of students.

Historical narratives among students and their meaning-making function
Keywords: Attitudes and Beliefs, Cultural Diversity in School, Qualitative Methods, Secondary Education
Presenting Author:G.M. Gaans, University of Amsterdam, Netherlands

People use narratives to give meaning to life by connecting present, past and future in a meaningful way. These narratives are studied from various disciplines, including history and religious studies. Insights from both disciplines are rarely combined. This research project explores the possibility of using strategies from spiritual care to uncover the meaning-making layer of stories students tell about the shared past. Using newly designed data collection tools, students explicate their narratives about a shared past. These narratives are analysed qualitatively to characterize and understand the way in which they give meaning and how they help the students to orientate themselves in their lives and towards their future. The designed methods were applied among high-school students of 15 and 16 years old. The analysis showed that students with a more explicit social self-identification used more coherent narratives about the past and connected these to their core values and foundational views of people and world. Because of the latter connection, these stories also have meaning. These insights may help to better understand the sensitive nature of some historical topics in classroom situations.

What is religious literacy? A delphi study design on Finnish academic experts' perceptions.
Keywords: Competencies, Conceptual Change, Qualitative Methods, Religiosity and Spirituality
Presenting Author: Martin Ubani, University of Eastern Finland, Finland

I aim to present a research design of a starting research. The purpose of this study is to develop a conceptual model of religious literacy (RL) for understanding conceptions about religion. The main research question in this study is: "How does academia conceptualise and theorize RL today?" This includes four sub-questions:a) What is RL?b) What are the key threshold concepts and key domains of RL?c) What are the boundaries of the concept of RL?d) How can RL be distinguished from overlapping skills/concepts?The Delphi method (DM) is used for data gathering. The data will be collected from 25 scholars. DM is an iterative method aiming at a consensus outcome by "eliciting and refining group judgments" from a group of experts on a studied topic (Dalkey, Brown & Cochran 1969). The DM typically has many rounds and uses empirical data-gathering methods. The study employs Grounded theory (GT) as the data analysis

method.

Preparing upper-secondary school students for higher education with emphasis on academic literacy
Keywords: Knowledge Construction, Lifelong Learning, Mixed-method Research, Reading
Presenting Author: Tonje Stenseth, University of South-Eastern Norway, Norway; **Presenting Author:**Liv Lofthus, University of southeastern Norway, Norway

We live in a time characterized by major changes, where the diversity of information offered is enormous, and at times very unclear. Consequently, such changes has huge implications for knowledge acquisition and production, with individuals' literacy skills becoming core competences. Against this background, we want to address two key challenges in the current study: the development of academic literacy in upper-secondary school students with a particular focus on reading, as well as the transition between upper-secondary school and higher education. Our aim is to better equip students in upper-secondary school to meet the complex text and knowledge culture in higher education by fostering their academic literacy skills and hopefully reducing the gap between these two education levels.

Workshop
Assessment and Evaluation

Evaluating quality of assessment in higher education with the online Assessment Web tool

Keywords: Assessment Methods, Educational Technologies, Higher Education, Tool Development
Interest group: SIG 01 - Assessment and Evaluation

Quality of assessment is increasingly approached from a more holistic perspective, in which assessment quality implies more than assuring quality on the assessment level. To analyze quality of assessment as a whole five entities should be distinguished: assessment (tasks), assessment program, assessment policy, assessment organization and assessment literacy. To provide educational practitioners with tools which help them to determine, improve and maintain assessment quality as a whole and on each entity, the assessment web and a self-evaluation method were designed. Research was conducted to establish whether the assessment web is understandable and complete, and the web and the self-evaluation method are usable for determining, improving and maintaining quality of assessment. In the workshop the re-design of the assessment web and the design of the online Assessment Web tool will be presented.

AI-supported acquisition of argumentation skills: the 'Argueniser'

Keywords: Artificial Intelligence, Computer-supported Collaborative Learning, Peer Interaction, Tool Development
Interest group: SIG 07 - Technology-Enhanced Learning And Instruction

Please bring your own device if you are attending this ICT demonstration.Over the last decades, student enrollment at universities has increased, while capacities – above all in terms of teachers – to support their learning are limited. Especially for improving argumentation skills, individual feedback is important. How can universities bridge this growing gap? We present a teaching tool for an AI-supported learning scenario. It aims to achieve high learning effectiveness within strictly defined subject areas: supporting the acquisition of argumentation competence in the disciplines of Economics and Law. It enables individual feedback for large audiences and interaction in online learning environments. The tool implements a scaffolding exercise: Students are aided by a predefined argumentation scheme in writing an answer to an open question. They receive feedback from their peers and an artificial intelligence (AI) for each respective argumentation element. Further, the tool integrates this exercise within the larger context of the class. The tool is part of an interdisciplinary project training an AI in the areas of Economics and Law. Both student answers and peer reviews are being used as training data, indicating the tool's notable double purpose of teaching students and an AI simultaneously.

Invited Symposium
Developmental Aspects of Instruction, Learning and Instructional Technology, Learning and Social Interaction

From Access to Impact: A Quality Perspective on Early Childhood Digital Education

Keywords: Creativity/Divergent Thinking, Digital Literacy and Learning, Early Childhood Education, Educational Technologies, Engagement, Foreign and Second Language Acquisition, Social Interaction
Interest group: SIG 05 - Learning and Development in Early Childhood
Chairperson: Franziska Cohen, University of Education Freiburg , Germany
Organiser: Franziska Cohen, University of Education Freiburg , Germany
Discussant: Yvonne Anders, Otto-Friedrich-University of Bamberg, Germany

One of the most significant changes in recent years is the expansion of information and communication technology (ICT) and widespread digitization in society. This has had a significant impact on the early childhood education and care (ECEC) system, as children are exposed to ICT at an early age in their family environments (Grassland, 2018). As ECEC settings are a crucial environment for children's learning and development, it is essential to address the challenges and harness the potential of ICT to promote children's development and well-being.However, it is important to note that although the use of ICT is closely linked to learning, there is no necessary correlation between access to technologies, children's usage patterns, and the impact on children in family and educational contexts. Therefore, it is crucial to consider what constitutes "good practice" in digital education.
Questions such as how pedagogical quality can be related to digital learning environments, particularly in regards to interactions in ECE settings and the family, and how they affect the use of ICT, as well as what features enable ICT to become a tool for promoting children's learning and well-being are crucial to address. The contributions in the symposium will address these questions from interdisciplinary research perspectives, with an integrative discussion ultimately serving as the starting point for further insights into how high-quality early digital education can be achieved.

How can guided pretend play contribute to the quality of digital education in early childhood?
Presenting Author: Franziska Vogt, St.Gallen University of Teacher Education, Switzerland; **Co-Author:**Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland

How can high-quality digital education be implemented (Cohen & Hemmerich, 2019)? Often curricula focus on competencies for using digital media and on specific aspects of computer science such as coding (i.e. Friedrichs-Liesenkötter, 2019; Lienau & van Roessel, 2019). Competencies such as a basic understanding of developing digital technologies, as well as their production and repair, or questions around artificial intelligence, have received little attention in early childhood education so far.The following research questions are examined: (I) Which areas of early digital education are encouraged with the pretend play impulses? (II) In what ways do early childhood educators support the pretend play of children and foster digital competencies?In the framework of the explorative intervention study "We play the future!" eight different pretend play impulses for digital transformation were developed. 15 kindergarten educators were taking part in the study and received an introduction in a half day professional development course. After that course they implemented the free play impulses in their kindergarten for nearly four months. Video observation was carried out twice, capturing the educators' implementation and the children's play. The video data was analysed qualitatively.Sequences of pretend play were selected and analysed using multimodal interaction analysis (Goodwin, 2018; Montada, 2014).Results show that children gain experience in above-mentioned areas (Grassmann et al., 2021) through the pretend play impulses. Using multimodal interaction analysis, the importance of the guidance by the kindergarten teacher becomes clear.

Learning words with social robots: Preschoolers' multimodal behavior during retrieval difficulties
Presenting Author: Nils Frederik Tolksdorf, Paderborn University, Germany

Social robots have emerged as a new technology in early digital education and harbor the possibility of complementing future educational environments by engaging children in motivating and embodied learning contexts. While contemporary research indicates that social robots can support children in a variety of learning domains, less is known about children's interactional behaviors toward artificial agents such as social robots during educational long-term interactions. However, taking a closer look at children's communicative behavior holds the potential of informing future educational scenarios and develop implementations in a more responsive way. Therefore, in this study, we systematically addressed children's multimodal behavior over the course of two consecutive sessions and observed their attentional patterns and the use of gestures when they were engaged in a task with a robot to retrieve previously learned words during a shared book reading situation. Specifically, our analysis focused on the instances when children encountered difficulties in retrieving the learned words and relied in their response on nonverbal means. Overall, our results highlight that children not only frequently responded multimodally with gestures when interacting with the social robot and that they extended the interaction and involved their accompanying caregivers, but that this behavior also persists long-term. Results are discussed in terms of the role of children's communicative requirements in interaction with social robots and the implications for the design of future child–robot interactions to become responsive and helpful when interacting with a child.

Criteria for and development of high quality multilingual digital picture books
Presenting Author: Trude Hoel, University of Stavanger, Norway; **Co-Author:**Katarzyna Tunkiel, University of Stavanger, Norway

Shared book reading is a resource for language learning in early childhood settings (Dickinson & Morse, 2019). Digital books with language selection gives opportunity to read the story in a familiar language before it is read in the second language, which can support second language acquisition (Grøver, Rydland, Gustafsson, & Snow, 2020). Digitization also allows for pre-recorded audio recordings, so that caregivers who do not get to read with their child can still offer their child valuable reading experiences.In the research project SPrELL we aim to increase 3-4-year-old multilingual children's second-language learning as an effect of reading the same digital picture books in homes (in first language) and ECEC (in second language). In collaboration with the digital producer Lexplore, the research team are developing 20 digital picture books which offer a choice of language. In the design of the digital multilingual books, we aim to maintain high quality, both literary, linguistic, and digital. The book selection and the production are guided by the questions: What characterizes high quality in children's literature? What characterizes high quality in the translation of children's literature? What characterizes high quality in the digitization of children's literature? The result we aim for is a digital library consisting of 20 high-quality multilingual digital picture books, which have been selected in collaboration with children and EC teachers, developed in line with research-based knowledge and which facilitate work with children's second language acquisition.

Creativity apps for young children: analysis of app store data, characteristics, and quality
Presenting Author: Pinar Kolancali, University of Oxford, United Kingdom; **Co-Author:**Victoria Murphy, University of Oxford, United Kingdom; **Co-Author:**Sophie Booton, University of Oxford, United Kingdom

Many touchscreen apps claim to support children's creativity. Our study takes a systematic approach to reviewing a sample of commercially available apps to determine whether existing apps are indeed well designed to support children's creativity. The quality of a sample of 152 Android apps targeting 4- to 12-year-olds, claiming to involve creativity was rated using criteria based on extant research about factors that support creativity (e.g., experimentation, modelling). Quality ratings for creativity were overall low, particularly in relation to convergent thinking and modelling creativity. Key app store data was not a consistent predictor of creative app quality. Apps for older children also tended to score more highly. Thus, current apps for children's creativity are low in quality and app store data provides limited indication of their quality. Implications for parents, educators and app designers are considered.

Practice-Based Research Exploring the Complexity Between Teaching, Wellbeing and Innovation

Keywords: Artificial Intelligence, Communities of Learners and/or Practice, Emotion and Affect, Higher Education, Immersive Technologies for Learning, In-

service Teachers, Pre-service Teachers, Social Aspects of Learning and Teaching, Synergies between Learning / Teaching and Research, Teacher Professional Development, Teaching Approaches, Vocational Education and Apprenticeship Training, Well-being
Interest group:
Chairperson: Essi Ryymin, Häme University of Applied Sciences, Finland
Discussant: Emmy Vrieling, Open University of the Netherlands, Netherlands

In 2006, a team of EARLI researchers founded EAPRIL, the European Association for Practitioner Research on Improving Learning, which promotes collaboration between educational researchers and practitioners engaged in practice-based research on learning. In addition, EAPRIL encourages researchers interested in different levels of formal education to share knowledge; the collaboration provides a holistic perspective on education and allows researchers to examine the journey of students at different levels, identifying patterns, trends and gaps in their learning experiences. This will lead to a better understanding of the European educational system as a whole.

This EAPRIL symposium focuses on research on teaching practices and aims to explore the complexities and relationships between teachers' competence, teacher/student well-being and the promotion of innovation. The symposium will present various examples involving teacher and student perspectives across different cultures, school levels and age groups. The first presentation offers new insights into the physiological and self-reported wellbeing of university teachers in authentic teaching situations. The second contribution presents research on meaningful teaching and guidance practices of higher education students' writing their thesis. The third case introduces an empirical study of 360° video-supported teaching practices aimed at developing vocational students' emotional regulation skills and well-being. The fourth case describes a research programme investigating teachers' collective innovative behavior in comprehensive schools and its impact on innovative student projects. Finally, the symposium will discuss the impact of teaching practices on the perceived well-being and innovativeness of both teachers and students, and why it is important to develop these practices in a research-based way.

Promoting wellbeing of higher education teachers
Presenting Author: Liisa Postareff, HAMK University of Applied Sciences, Finland; **Co-Author:**Anna Parpala, University of Helsinki, Finland; **Co-Author:**Petri Nokelainen, Tampere University, Finland

Higher education teachers' psychological wellbeing is often challenged by various factors, such as time pressure, high workload, and challenges in supporting students' various needs. Moreover, demands caused by online and hybrid teaching have resulted in elevated levels of stress and anxiety. Recent research implies that through supporting teachers' learning-focused and interactive approaches to teaching it is possible to enhance their teaching-related wellbeing. Learning-focused and interactive teaching approach is associated with positive emotions and increased wellbeing, while lack of interaction and transmissive teaching strategies is associated with more negative emotions and stress. However, in-depth research on the relations between teaching approaches and wellbeing has been limited, and research has often adopted self-report measures. In our recent research, we have combined psychophysiological measures with self-report measures to examine the relations between teaching approaches and wellbeing in authentic teaching situations. Measurements with an ambulatory biosensor (Moodmetric Smart Ring) measuring electrodermal activity (EDA) imply that high arousal during teaching sessions is often captured during teaching focusing on information transmission, while lower levels of arousal are related with more interactive teaching episodes. In the presentation we will introduce our recent studies utilizing EDA measurement, self-report data as well as video-recorded data in authentic teaching situations and present findings of the relations between teachers' wellbeing and teaching approaches. We will also suggest diverse solutions to promote wellbeing of higher education teachers.

Guiding thesis circles in higher education: creating value for teachers and learners
Presenting Author: Kamakshi Rajagopal, AE - Adapt & Enable, Belgium; **Co-Author:**Ya Ping Hsiao, Tilburg University, Netherlands; **Co-Author:**Steven Verjans, Open University of the Netherlands, Netherlands; **Co-Author:**Emmy Vrieling, Open University of the Netherlands, Netherlands; **Co-Author:**Inge Damen, Open University of the Netherlands, Netherlands

Although the thesis is an integral part of an academic study program, supervisors approach the guidance of thesis students in various ways, focusing on eliciting high-quality research practice and academic writing. This type of guidance is often complicated and tailored to the needs of individual students, which is often not feasible due to increasing numbers of students and the need for efficiency. Moreover, in a world where generative AI and tools like ChatGPT is more prevalent, the focus on the process of thesis development is likely to become increasingly important - posing different challenges to supervisors. One possible solution to achieve efficient and quality guidance is working with thesis circles: small collaborative groups in which students, together with one or more supervisors, conduct research on the same subject or theme. Thesis circles offer opportunities for self-regulated learning, (peer) feedback and prevention of feelings of loneliness. Using the Educational Design Research paradigm, we aim to support supervisors implementing this type of educational innovation with sufficient conceptual, theoretical and practical support, through iterative cycles of problem analysis, instrument design and evaluation. This presentation will reflect on the trajectory undertaken by this distributed research team over more than 5 years as well as the practicalities of implementing a productive research strategy that creates academic conceptual value as well as gains for practice. We will also present the latest outcomes of our recent practice-based study on the design of thesis circles and their effects on students' perception of the thesis process.

Does watching oneself / someone in an immersive video affect emotions and sense of presence?
Presenting Author: Vito Candido, SFUVET, Switzerland; **Co-Author:**Francesca Amenduni, Swiss Federal University for Vocational Eduation and Training (SFUVET), Switzerland; **Co-Author:**Alberto Cattaneo, Swiss Federal University for Vocational Education and Training, Switzerland

An immersive 360° video (360°VR) allows to elicit emotions like those people experience in real life contexts. For this reason, 360°VR has been growingly considered a tool to support emotion regulation competences in professional learning situations. Video recording a professional performance is a common instructional strategy, which can also be implemented with a 360°VR. As with traditional video, you can both work on recordings of your own or of other people. However, to the best of our knowledge, it is unclear to what extent watching oneself or others in a 360°VR affect emotions and sense of presence (SoP). This exploratory research was conducted in a Vocational Education and Training course for social and health workers on the topic of blood sampling, a procedure which requires novices to regulate their emotions (e.g., fear of injuring the patient). Participants (N=36; F=24; Mean age=17,6) were assigned to two conditions: watching a video of themselves performing blood sample (SELF) or of a peer performing the same procedure (PEER). Both groups filled out a questionnaire on epistemic emotions and SoP immediately after viewing the 360°VR. For both conditions, the three highest emotions have positive valence: curiosity, enthusiasm, and surprise. However, in the SELF condition participants reported significantly higher level of high-arousing negative emotions (anxious and frustration) compared to the PEER condition. Moreover, in the SELF condition participants reported significantly higher level of SoP than in the PEER condition. SoP strongly correlates with three emotions: curiosity, enthusiasm, and confusion. This study suggests that watching oneself in a video is more emotionally engaging and creates greater SoP than watching others. The research provides initial contributions on the relation among SoP and emotions in 360°VR in relation to the difference between watching oneself and someone else. Limitations include small sample size and non-randomized assignment to conditions.

Social capital related to teachers' innovative behaviour: a scientific and practice-based approach
Presenting Author: Stefan Robbers, Open University Netherlands, Netherlands; **Co-Author:**Emmy Vrieling, Open University of the Netherlands, Netherlands; **Co-Author:**Marjan Vermeulen, Heerlen Open Universiteit, Netherlands; **Co-Author:**Arnoud Evers, Open Universiteit, Netherlands

The rapid changes in the knowledge and skills that students need to learn require education, and therefore teachers, to innovate in order to continue to provide students with the education that will benefit them in their future careers. When teachers are in the process of developing or implementing innovations on their own initiative, this can be considered innovative behaviour (IB). IB is characterised by the generation, promotion, and realisation of new ideas, which makes it a form of knowledge development and therefore learning. In contrast to learning, to our knowledge, IB has not been categorised as formal/informal or individual/collective, leaving a gap in the literature, as IB, like learning, is likely to take place informally and collectively, in collaboration with colleagues. Because teachers' collective IB is a highly relevant topic for both science and educational practice, a two-pronged research program with a scientific and a practice-oriented approach was designed. The scientific approach led to the development of a new questionnaire for IB and insights into how shared vision as part of social capital theory plays a role in explaining informal, collective IB. These scientific findings were consistent with practice, where it was found that teachers who participated in knowledge networks with shared goals exhibited higher levels of IB. This led to a number of innovative projects for students in different

primary schools, in which teachers from primary and secondary schools collaborated.

Symposium

Mathematical strategy use: can we expect everyone to be flexible in all circumstances?

Keywords: Cognitive Skills and Processes, Developmental Processes, Mathematics/Numeracy, Misconceptions, Primary Education, Quantitative Methods, Science and STEM, Secondary Education
Interest group:
Chairperson: Erika Schlatter, Leiden University, Netherlands
Organiser: Marian Hickendorff, Leiden University, Netherlands
Organiser: Jake McMullen, University of Turku, Finland
Organiser: Erika Schlatter, Leiden University, Netherlands
Discussant: Hedwig Gasteiger, Germany

Procedural flexibility, or being able to solve a problem in multiple ways, is viewed as an important goal in mathematics education. However, not everyone is equally able to use a variety of strategies for solving math problems. Furthermore, even if someone has a variety of strategies at hand, choosing the most suitable strategy (i.e., behaving adaptively) can prove to be difficult. This symposium brings together four studies addressing the factors enabling and inhibiting procedural flexibility in both children and adults.The first contribution focuses on how grade level is related to second, third and fourth graders' flexibility and adaptivity in multi-digit subtraction, finding that third graders show most flexibility, but fourth graders more often choose the strategy that works best for them. The second contribution focuses on the relation between flexibility and executive functions in multidigit subtraction in fifth grade students. This study found that strategy selection related to updating, and strategy execution related to both updating and shifting. The third contribution relates adaptive number knowledge with mathematical flexibility in upper secondary school students, finding that students with high adaptive number knowledge are more flexible mathematical problem solvers as well. The fourth contribution addresses how misconceptions concerning the order of operations may inhibit flexible strategy use, specifically strategies using the associativity principle, in adults solving three-term arithmetic problems. Together, these studies provide insight as to what does and doesn't help children and adults to flexibly solve math problems, which can help teachers address these factors more accurately in their lessons.

What strategy works for whom? Flexible and adaptive strategy use in primary school mathematics.
Presenting Author: Erika Schlatter, Leiden University, Netherlands; **Co-Author:**Marian Hickendorff, Leiden University, Netherlands

Adaptive expertise, the ability to use multiple strategies and select the optimal strategy to solve an arithmetic problem, is an important goal in Dutch primary school mathematics. Previous research shows children do not use all the strategies they know and often stick to a single strategy, even if that strategy is not mathematically optimal (i.e. requires the easiest and/or smallest number of steps). As children consistently show this behavior, the question rises what the best strategy to solve a problem is: the mathematically optimal strategy, or the strategy children use so often it has been fully automated. The current study used an innovative, personalized choice/no-choice paradigm to determine what strategies Dutch second, third, and fourth graders (N = 204) use for multi-digit subtraction in a free choice condition, and in a second session investigated whether the strategy of their choice is faster and more accurate than the mathematically optimal strategy. Children overwhelmingly chose one single strategy on all eight free-choice problems, showing limited procedural flexibility. When prompted, children were able to produce additional strategies. Third graders produced significantly more additional strategies than second graders, and fourth graders produced significantly more additional strategies than third graders. Children rarely chose a shortcut strategy suited to a particular problem, and also had trouble recognizing appropriate shortcut strategies. However, fourth graders were able to choose the strategy that worked best for them in terms of accuracy and speed.

Are strategy selection and execution in multidigit subtraction related to executive functions?
Presenting Author: Stijn Van Der Auwera, KU Leuven, Centre for Instructional Psychology and -Technology, Belgium; **Co-Author:**Bert De Smedt, KU Leuven, Belgium; **Co-Author:**Joke Torbeyns, KU Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium

We examined 150 fifth-graders' (M_{age} = 10y11m) selection and execution of direct subtraction (DS; e.g., 712–346=?; 712-300=412, 412-40=372, 372-6=366) and subtraction by addition (SBA; e.g., 712–346=?; 346+54=400, 400+300=700, 700+12=712 and 54+300+12=366) strategies to solve multi-digit subtractions, and whether these two strategy parameters were associated with their executive functions (EFs). Both strategy selection and execution were examined by means of the choice/no-choice method. Participants were offered ten subtractions in one choice condition (free choice between DS and SBA) and in two no-choice conditions (mandatory use of either DS or SBA). Strategy selection was examined in the choice condition, and strategy execution (in terms of accuracy and speed) in the no-choice conditions. Concerning the EFs, updating was measured using a 2-back task, inhibition by means of a Flanker task, and shifting via a Trail Making Task. Results showed that strategy selection was associated with updating, but not with inhibition and shifting. Concerning strategy execution, children's accuracy in the no-choice conditions was associated with updating and shifting, but not with inhibition. Furthermore, no associations were found between EFs and speed in the no-choice conditions. This study shows the different associations of EFs components with strategy selection and execution in the domain of multi-digit subtraction, and helps to unravel via which mechanisms EFs are associated with mathematical performance.

Misconceptions of the order of operations and the use of conceptually-derived arithmetic strategies
Presenting Author: Joanne Eaves, Nottingham University, United Kingdom; **Co-Author:**Camilla Gilmore, Loughborough University, United Kingdom; **Co-Author:**Nina Attridge, University of Portsmouth, United Kingdom

Knowledge of the associativity principle is important for progressing beyond elementary mathematics, however few individuals use associativity-based arithmetic strategies. We explored whether misunderstanding or misapplication of the order of operations played a role in this. First, we developed an instrument that quantitatively measures how people interpret the order of operations. We then used this instrument in a well-powered, pre-registered study to investigate whether those interpretations relate to use of the associativity shortcut strategy. We found that only 16% of adults (university students) fully understood the order of operations, and that a particular misconception of the order of operations (a 'literal' misconception of the acronym 'BODMAS') hinders associativity shortcut use. We conclude that procedural rules can be a barrier to flexibility with arithmetic strategies, if those rules are faulty and/or rigidly adhered to. Teachers should be made aware of the dangers of misconceptions, and could use our instrument to identify them.

Adaptive number knowledge is related to procedural flexibility in highschoolers
Presenting Author: Irene Pampallis, University of the Witwatersrand, South Africa; **Co-Author:**Jake McMullen, University of Turku, Finland; **Co-Author:**Jon Star, Harvard Graduate School of Education, United States; **Co-Author:**Koen Veermans, University of Turku, Finland

Adaptive expertise is increasingly regarded as an important element of students' mathematical development. One component of adaptive expertise with arithmetic is adaptive number knowledge (ANK), the well-connected understanding of numerical characteristics and relations which can be used to solve novel problems. However, the relationship between ANK with whole numbers and ANK with rational numbers remains uncertain. It is also not known whether ANK is related to procedural flexibility. In this paper, we show that all three constructs are interrelated. A sample of 447 US high school students aged 13-18 completed a pen-and-paper test of ANK and procedural flexibility. The relationship between ANK with whole numbers and ANK with rational numbers was investigated using an exploratory factor analysis. The analysis revealed a single factor which explained 54.65% of the observed variance after extraction, suggesting a single ANK construct that is consistent across both whole and rational numbers. A paired-samples t-test revealed a significant difference in ANK between flexible and non-flexible problem solvers: flexible problem solvers had on average 3 more correct solutions on the ANK task than non-flexible problem solvers (Cohen's d=.50). This paper therefore establishes a strong relationship between ANK for whole numbers, ANK for rational numbers, and procedural flexibility in high

school students. Further research should explore the precise nature of these relations.

Symposium
Assessment and Evaluation, Teaching and Teacher Education

Investigating the Technological Pedagogical and Content Knowledge model from a bird's eye view

Keywords: Assessment Methods, Competencies, Computer-assisted Learning, Educational Technologies, Meta-analysis, Teacher Professional Development
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Andreas Lachner, University of Tübingen, Germany
Organiser: Armin Fabian, University of Tuebingen, Germany
Organiser: Iris Backfisch, University of Tuebingen, Germany
Discussant: Charoula Angeli, University of Cyprus, Cyprus

The Technological Pedagogical and Content Knowledge (i.e., TPACK; Mishra & Koehler, 2006) model has been proven useful when contemplating teachers' professional knowledge necessary for meaningful technology integration in teaching. Within this model, TPACK refers to an integrated form of knowledge that emerges through the interplay of several different knowledge components (i.e., technology-related, pedagogy-related and content-related knowledge). Despite its conceptual clarity, research findings have identified at least two major issues regarding the TPACK model: The lack of empirical clarification and the models' practical applicability in designing training programs. To provide guidance for future researchers, the present symposium seeks to address these issues by providing four synthesis contributions (3 reviews & 1 meta-analysis) on TPACK granting a birds-eye perspective on TPACK. By analysing TPACK-related reviews, the first contribution outlines overarching themes that have emerged since the models' introduction, and hence provides a meta-meta perspective on TPACK. The second and third contribution then zoom in onto issues regarding the empirical validation of TPACK. Whereas the second contribution offers a systematic review on measures of competence-related beliefs framed within TPACK, the third contribution focuses on self-report measures and uses a meta-analytical approach to investigate whether these measures have been successful in empirically validating the TPACK model. Finally, the fourth contribution offers a systematic review on TPACK-based training programs to shed light onto the practicality of the TPACK model in teacher education.Taken together, this symposium clarifies central issues surrounding the TPACK model, and therefore paves the way for future research in this complex field.

Looking at the forest (not the trees): A systematic review of systematic reviews on TPACK
Presenting Author: Eliana Brianza, University of Zurich, Institute of Education, Switzerland; **Co-Author:**Mirjam Schmid, University of Zurich, Switzerland; University of Queensland, Australia, Switzerland; **Co-Author:**Sog Yee Mok, University of Teacher Education of the Grisons, Switzerland; **Co-Author:**Dominik Petko, University of Zurich, Switzerland

As one of the most prominent frameworks for describing teachers' professional knowledge in the digital age, the technological pedagogical content knowledge framework (TPACK; Mishra & Koehler, 2006) has now over 15 years of research at its heels. Today, there are hundreds of studies employing the TPACK framework. In recent years, the framework has evolved with regard to several aspects: On a theoretical level, the framework has undergone adaptations, extensions, and specifications relating to the school subject, the technology, or the pedagogical approach. On a methodological level, a variety of instruments have been developed and empirically tested and validated. Extensive research exists around TPACK, which is why various (systematic) reviews and meta-analyses on TPACK have been published. However, these each address different aspects and due to the abundance of such summary work, it is now necessary to go a step further and a systematic review of reviews and meta-analyses is needed. We conducted a systematic review on systematic reviews and meta-analyses of TPACK published between 2006 and 2020 following the PRISMA statement. This resulted in a final sample of $N = 13$ records meeting all eligibility criteria. To uncover the main themes and gaps, we applied content analysis to the discussion and conclusion sections of the reviews. Six main overarching themes in relation to TPACK emerged: Conceptualizing, researching, fostering, applying, situating, and relating.

A systematic review on measures of teachers' competence-related beliefs about ICT use
Presenting Author: Charlott Rubach, University Rostock, Germany; **Co-Author:**Rebecca Lazarides, University of Potsdam, Germany

The TPACK model is a significant theory that explains how teachers integrate digital technology in class. The model suggests that competence and competence-related beliefs based on technological, content, and pedagogical knowledge are essential for effective digital technology use. However, several TPACK-inspired instruments exist on competence beliefs, raising questions about the extent to which they differ and the possibility to replicate findings across studies. This systematic review summarizes existing TPACK instruments on teachers' competence beliefs related to covered knowledge areas. In the second step, we focused on technology knowledge (TK) and have investigated the extent to which different competence dimensions have been covered across different measures. 17 studies published between 2016 and early 2021 were included in this rapid systematic review. These 17 studies assessed TPACK competence-related beliefs in 17 different ways with varying thematic focuses. In addition to the large variability of used instruments, the labels also vary. Competence beliefs on technology knowledge mainly covered the competence dimension of problem solving and technology use. Thus, our systematic review points to a high diversity of measures of teachers' competence-related beliefs contextualized within the TPACK model. These results point to the fact that the comparison of results among studies using TPACK instrument might be challenging.

Meta-analysis to examine the validity of TPACK self-report assessments
Presenting Author: Iris Backfisch, University of Tuebingen, Germany; **Co-Author:**Jürgen Schneider, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany; **Co-Author:**Ronny Scherer, University of Oslo, Norway

Teachers' technological-pedagogical-content knowledge (TPACK, Mishra & Koehler, 2006) for meaningful technology-enhanced teaching is conceptualized as an amalgam of several knowledge components (e.g., technological-pedagogical knowledge TPK; technological knowledge, TK). Due to its complexity, TPACK is mostly assessed via self-report questionnaires. However, the use of self-report TPACK measures might lack conceptual validity as self-report measures might not represent the structure of the TPACK model and the relations of its dimensions and, therefore, the interpretation of results from these studies might be complicated and biased. We conducted a meta-analysis with a final sample of $N = 80$ papers encompassing data from 29,212 teachers. Meta-analytical correlation analyses revealed that the conceptually proposed structure of TPACK as a Venn diagram with all knowledge components being similarly correlated to TPACK does not hold. Rather, the findings suggest a hierarchical structure of the knowledge components with basis knowledge components (e.g., TK), leading to intersections (e.g., TPK), ultimately, leading to TPACK. These findings should be considered when interpreting and drawing conclusions from studies based on self-report data.

A data-driven systematic review of TPACK-based professional development programs
Presenting Author: Armin Fabian, University of Tuebingen, Germany; **Co-Author:**Iris Backfisch, University of Tuebingen, Germany; **Co-Author:**Kenneth Kirchner, University of Tuebingen, Germany; **Co-Author:**Andreas Lachner, University of Tübingen, Germany

Fostering teachers' professional knowledge regarding the integration of technology is paramount in today's digitized society. Due to its accessibility, the Technological Pedagogical and Content Knowledge (TPACK) framework has been commonly used as a theoretical foundation for the design of adequate professional development programs (PDPs). By adapting TPACK to their specific research needs, however, researchers have introduced a variety of seemingly different approaches to foster technology-related knowledge within TPACK-based PDPs. To date, there is no comprehensive overview of how such approaches relate to the seven knowledge components of TPACK (i.e., TK, PK, CK, TPK, TCK, PCK & TPCK) making it difficult to compare and build upon existing research findings. Therefore, the present data-driven systematic review seeks to shed some light onto the diversity of TPACK-based PDPs. To do so, we applied content analysis to analyse $n = 138$ TPACK-based PDPs and investigate which of the seven TPACK-components were explicitly addressed during these PDPs. Then,

we explored possible relationships of TPACK-components by means of several χ^2-tests. Results indicate that researchers still consider TK a central pre-requisite for the aquisition of technology-related knowledge. Moreover, TPACK seems to have been approached most frequently from a subject-specific perspective.

Symposium
Developmental Aspects of Instruction, Learning and Social Interaction

Children's argumentation

Keywords: Argumentation, Communication Skills, Developmental Processes, Dialogic Pedagogy, Early Childhood Education, Learning Strategies, Social Aspects of Learning and Teaching, Teacher Professional Development, Teaching Approaches
Interest group: SIG 26 - Argumentation, Dialogue and Reasoning
Chairperson: Chrysi Rapanta, Universidade Nova de Lisboa, Portugal
Chairperson: Jarmila Bubikova-Moan, Norway
Discussant: Antonia Larrain, Universidad Alberto Hurtado, Chile

It is well reported in scientific literature that children are able to argue and counterargue from a very young age. Although this naturally developed skill does not imply mastery, it does not exclude the possibility of improvement through different forms of instruction. However, the conditions that favour the emergence and development of argument skills during childhood are not yet sufficiently understood from a pedagogical point of view. In this symposium, we adopt a socio-constructivist view of argument(ation) development combined with philosophical theories that underlie the concept of argument, argumentation, and the criteria of their quality. Our overall aim is twofold: first, to show the early presence of the so-called “argument schema” and second, to understand how the framing or design of specific pedagogical situations can lead to its fuller emergence. Papers 1 and 2 address the first sub-goal, whereas Papers 3 and 4 respond to the second. The symposium’s expected contributions and points for discussion are threefold: 1) a better understanding of argument development in the early years (Papers 1 and 2), 2) an illustration of pedagogies that aim at the full manifestation of children’s argument skills through dialogue, as well as teacher-related obstacles to their implementation (Paper 3), and 3) a cross-sectional comparison of argument skills from early childhood to adolescence (Paper 4). The symposium relates to the conference’s general theme of education under uncertainty as it focuses on children’s argumentation about ill-defined issues as a skill and as a practice, both key in nowadays’ fluid societies.

Argumentation in the early years: a meta-synthesis of research
Presenting Author: Jarmila Bubikova-Moan, Oslo Metropolitan University, Norway

There is a considerable body of research on argumentation in the educational field, particularly as it is fostered through dialogic forms of instruction among school-aged children and youth. For reasons of both conceptual and methodological nature, there is generally less scientific evidence on argumentation in the youngest, preschool age-groups. While on the rise, the available research does not form a unified body of scholarship but is spread across a number of different scientific fields, including argumentation studies, education, linguistics and developmental psychology. Facilitated by a meta-synthesis of 57 studies that met our inclusion criteria, we aimed to systematize the current body of knowledge and, as such, propel to visibility its main conceptual patterns and tendencies. The review documents that children’s argumentation has been studied from a range of theoretical perspectives, with the dialogic view of argumentation and a productive theoretical eclecticism as their common denominators. Furthermore, the review sheds light on a range of structural and discursive features in children’s argument construction and evaluation as well as children’s great sensitivity to aspects of the social-interactional context in which they engage in argumentation. Lastly, the review provides systematic evidence on the developmental nature of these features. We will discuss the implications of our findings in terms of further theory-building but also their practical educational significance.

Argumentation and dialogical shifts in young children’s role play
Presenting Author: Margareth Sandvik, Oslo Metropolitan University, Norway

Children’s free play in the kindergarten mostly goes on undisturbed with no involvement from the practitioners. To fully participate in all aspects of role play, language competences in negotiation and argumentation are required. The present paper shows how a group of three children (aged four), roleplay around making food in a quiet corner of the kindergarten, equipped with typical food making artefacts. Disagreement arises around the competition of some of the artefacts. The paper focuses on how the children manage to solve the disagreement, how the argumentation escalates into a quarrel and a physical fight, before the conflict is solved. The argumentation analysis combines pragma-dialectical reconstruction, thus showing the structure of the children’s argumentation, and a functional perspective on argumentation schemes and dialogical shifts, showing how children relate their arguments to their claims and how the role play can be described along phases, which means that different types of argumentative dialogue can be characterised. The data is drawn from a project on children’s audio recorded and transcribed talk in the kindergarten.

Changing practices in dialogue and argumentation:Teachers’ voice on effective aspects of PD
Presenting Author: Maria Vrikki, University of Nicosia, Cyprus; **Co-Author:**Riikka Hofmann, University of Cambridge, United Kingdom; **Co-Author:**Elena Papanastasiou, University of Nicosia, Cyprus; **Co-Author:**Maria Evagorou, University of Nicosia, Cyprus; **Co-Author:**Fiona Maine, University of Exeter, United Kingdom

Changing teaching practices and classroom culture in ways that support dialogue and argumentation has proved challenging. Research evaluating the outcomes of teacher professional development (PD), which aim to promote classroom dialogue and argumentation, has offered mixed findings to date. The purpose of this study is to explore which aspects of a PD program specially designed to promote dialogue and argumentation teachers appreciate the most. As part of a larger European project, which aimed to promote young students’ cultural literacy (values such as tolerance, empathy and inclusion) via dialogue and argumentation in pre-primary, primary and secondary schools, a PD program was developed. The PD will be presented in detail during the presentation. A Reflection Questionnaire was completed by 134 teachers from six countries at the end of the PD to obtain information on the PD. The central finding from the quantitative and qualitative data is that the teachers evaluated the PD as very useful in supporting them to: improve their dialogue and argumentation teaching practices; to use wordless texts; and to improve their cultural literacy teaching practices. A high and positive correlation was found between the reported effects of the programme on teaching practices in dialogue and argumentation and their own understanding of the concept of cultural literacy. In addition, teachers point to specific aspects of the PD that they have found helpful for their own learning; these include behavioral strategies, peer reflection and use of discursive tools. Such insights from teacher voice can inform future designing of professional development programmes.

A cross-comparative analysis of children’s arguments in 5 European countries
Presenting Author: Chrysi Rapanta, Universidade Nova de Lisboa, Portugal; **Co-Author:**FABRIZIO MACAGNO, Universidade Nova de Lisboa, Portugal

Participating in reasoned discourse facilitates the manifestation of more advanced argument strategies by both children and adolescents. However, the conditions under which this facilitation takes place are not yet fully uncovered. Several factors may be influential, such as: topic/ issue of discussion, prompts made by others, either peers or adults, and students’ ability and motivation. Other factors such as culture and age are not yet sufficiently studied within a formal education context. The present study aims to address this gap, by asking: How do students from three developmentally distinctive age groups (5-6, 8-9, and 14-15 years old) perform in oral argumentation when discussing about issues of a social nature? Are there sociocultural differences in their argumentive performance? And how such performance can be assessed? We focus our analysis on an extended corpus (53.000 turns) of classroom discussions taking place in UK, Portugal, Spain, Cyprus and Germany as part of a larger study. Discussions aimed at the development of dialogic and argument skills among children and adolescents. In this presentation, our focus will be on young children, and how and when they argue in more or less sophisticated ways, as

compared across settings (whole class/small group), country, and age group. Our analysis combines a structural (Toulmin Argument Pattern) and functional (Walton's argumentation schemes) approach to argumentative reasoning. Our findings show significant variations across age groups and social settings. Discussion aims at a sociocultural framing of argument reasoning development.

Symposium
Learning and Special Education, Motivational, Social and Affective Processes

Meeting the Needs of Gifted and Talented Students

Keywords: At-risk Students, Creativity/Divergent Thinking, Cultural Diversity in School, Curriculum Development, Gifted and Talented Students, In-service Teachers, Inclusive Education, Mixed-method Research, Motivation, Parental Involvement in Learning, Primary Education
Interest group: SIG 08 - Motivation and Emotion, SIG 15 - Special Educational Needs
Chairperson: Marielle Wittelings, Behavioural Science Institute, Radboud University Nijmegen, Netherlands
Organiser: Jessica Vergeer, Radboud University Nijmegen, Behavioural Science Institute, Netherlands
Organiser: Marielle Wittelings, Behavioural Science Institute, Radboud University Nijmegen, Netherlands
Organiser: Mare van Hooijdonk, Radboud University Nijmegen, Netherlands
Discussant: Karine Verschueren, KU LEUVEN, Belgium

Currently, gifted students are not always able to reach their full potential because they receive an education that does not match their talents and educational needs. The misconception that "gifted students will make it on their own" remains persistent, and a one-size-fits-all curriculum for gifted students simply does not work, nor does it exist. This symposium is focused on meeting the needs of the diverse group of gifted and talented students and on what is needed to provide adequate education for these students. More specifically, the symposium aims to discuss how a well-formed, motivating curriculum can be developed for these students, that includes and encourages creativity but also pays attention to the environment of the student (i.e. the school and home environment) and all actors within. Besides that, the specific needs of low-achieving and disadvantaged gifted students will also be discussed. This will provide us with valuable insights in the needs of this diverse group of gifted students and will highlight future research angles and implications for practice to further study and develop gifted education. After all, it is important to provide accurate and effective education to all of those students to ensure they can develop to their full potential.

CANCELLED: The effectiveness of the Achievement Motivation Enhancement (...)
Presenting Author: Ophelie Desmet, Dewar College of Education, Valdosta State University, United States

This presentation has been cancelled and will not be presented at the EARLI conference.
This presentation will include findings from a series of five studies evaluating an affective-motivational curriculum for gifted and talented youth, the Achievement Motivation Enhancement (AME) curriculum, to gain a further understanding of its effectiveness. We evaluated the AME curriculum in five different educational settings (summer enrichment program, middle school, emergency remote teaching during the pandemic, through a mixed-methods program of studies. This program of studies showed that positive changes in academic achievement, behavioral engagement, self-perception, self-regulation, planning skills, self-monitoring, and attitudes toward school occurred when the intervention was implemented. Therefore, these findings offer valuable insights for developing and implementing affective interventions targeting achievement motivation with gifted and talented students.

Creativity in full-time and part-time gifted education
Presenting Author: Mare van Hooijdonk, Radboud University Nijmegen, Netherlands; **Co-Author:**Loes Marsman, Radboud University Nijmegen, Netherlands

This study investigated differences in creativity between elementary school pupils aged 9 to 12 years (M age = 9.68), attending full-time and part-time gifted education, and those attending regular education at the same school. A total of 93 pupils participated. The pupils' creativity was assessed with divergent thinking and creative drawing tasks. Apart from that, students and teachers completed a short creativity questionnaire. The study showed that pupils in full-time gifted education scored higher than pupils in part-time gifted education and regular education on two out of three aspects of divergent thinking: fluency and originality. No differences were found between pupils on the elaboration indicator. The pupils in full-time gifted education also outperformed the other students on creative drawing, but only when the creative drawing scores were adjusted for time. Additionally, pupils attending full-time gifted education perceived themselves as more creative than students in the other educational settings. On the contrary, teachers in part-time gifted education perceived their students as more fluent and more original in their ideas. In short, pupils attending full-time gifted education outperformed pupils from part-time gifted education and regular education on most creativity tasks. Full-time gifted education thus seems to cater to gifted pupils' need for creativity.

Inclusive Education for Gifted Students: A Systemic Approach
Presenting Author: Jessica Vergeer, Radboud University Nijmegen, Behavioural Science Institute, Netherlands; **Co-Author:**Marjolijn van Weerdenburg, Radboud University Nijmegen, Behavioural Science Institute, Netherlands; **Co-Author:**Trudie Schils, Maastricht University, School of Business and Economics, Netherlands; **Co-Author:**Anouke Bakx, Fontys University, Radboud University, Netherlands

This paper presentation is about a large scale study, consisting of multiple studies, entitled "Inclusive Education for Gifted Students: A Systemic Approach". This project focuses on the impact of environmental (f)actors on educational interventions for gifted students, in order to improve inclusive primary and secondary education for Dutch gifted students. The impact of educational adaptations for gifted students may vary, depending on several (f)actors and partly due to a lack of knowledge and empirical evidence. From a systemic perspective, it seems likely that the success of interventions for gifted students may depend on involvement of different environmental (f)actors in the system around the student. Therefore, this project focuses on educational (teachers), policy (school leaders), and family (parents) actors, using a systemic approach to investigate working mechanisms and underlying conditions of educational interventions for gifted students. Teachers, school leaders, and parents took part in a questionnaire and in an interview. All three actor groups seemed to be more satisfied with primary gifted education compared to secondary gifted education, and considered all of each other's involvements as important. Gifted education teachers and parents of primary gifted students were mutually more satisfied with each other's interactions compared to secondary gifted education. In order to map and measure the actual impact of the collaboration and interaction between these actor groups on gifted education, more research is needed.

Identifying and Providing Supports for Gifted Students from Low-Income Households in Dublin, Ireland
Presenting Author: Leeanne Hinch, Dublin City University, Ireland

Currently there are no standardised provisions for gifted students in the Irish education system. As such, this means that individual teachers must shoulder the burden of differentiating in the classroom without adequate support if they wish to try to support the high ability students in their classes. Often students' families must seek out alternative educational opportunities for their child to ensure they are adequately challenged, which is not something that every family is capable of doing, particularly those from socio-economically disadvantaged backgrounds. The Centre for Talented Youth, Ireland (CTYI) based in Dublin City University (DCU) provides enrichment classes for approximately six thousand gifted students across Ireland each year. CTYI has run multiple projects focussing specifically on high ability students from socio-economically disadvantaged backgrounds. To better advocate for and accommodate these students, CTYI has carried out numerous studies on the various supports that exist for gifted socially economically disadvantaged students in Ireland. This presentation will highlight the findings of several of these studies and provide recommendations for what accommodations can be made for children in similar situations. Supports provided by CTYI in the form of enrichment programmes for disadvantaged students have been shown to raise the self-esteem of many of these students, with the majority feeling more confident in their academic abilities. In addition, these programmes had positive outcomes for students' social skills.

Symposium
Learning and Social Interaction, Motivational, Social and Affective Processes

Using experience-sampling methods to understand processes of learning and instruction

Keywords: Achievement, Developmental Processes, Emotion and Affect, Engagement, Mathematics/Numeracy, Motivation, Peer Interaction, Primary Education, Quantitative Methods, Science Education, Secondary Education, Self-concept, Self-regulated Learning and Behaviour, Social Aspects of Learning and Teaching, Teacher Effectiveness, Teaching/Instructional Strategies
Interest group:
Chairperson: Hanna Dumont, University of Potsdam, Germany
Organiser: Hanna Dumont, University of Potsdam, Germany
Discussant: Garvin Brod, Germany

Experience-sampling methods (ESM), sometimes also referred to as Ecological Momentary Assessment (EMA), Ambulatory Assessments (AA), and including the Daily Diary (DD) methodology, examine individuals' experiences, behaviors, thoughts or feelings via self-reports which are collected at multiple time points over several days or weeks and "in-situ" as individuals go about their daily lives. Typically, mobile devices are used to collect these intensive longitudinal data. ESM have several advantages over traditional self-report methods: First, given the proximity in time to individuals' experiences, they reduce retrospective bias. Second, because data are collected in real-world settings, ESM have greater ecological validity. Third, the multiple measurement points lead to more statistical power and higher reliability. Fourth, intensive longitudinal data allow to disentangle intra-individual differences from inter-individual differences and context-specific factors and to study intra-individual processes over time. The aim of this symposium is to bring together four papers, which have made use of these advantages to study intra-individual processes of student motivation, engagement and self-regulation in school via ESM. All papers have in common that they employ event-focused sampling by surveying students from different classrooms after multiple lessons; Paper 2 additionally collected data from students within lessons. Moreover, all papers use cross-lagged models accounting for the hierarchical data structure with time points nested in students. Taken together, the set of papers shows the great potential of ESM to better understand processes of learning and instruction.

Intraindividual dynamics between self-concept and perceived mathematics learning achievement
Presenting Author: Christoph Niepel, University of Luxembourg, Luxembourg; **Co-Author:**Herb W. Marsh, Australian Catholic University, Australia; **Co-Author:**Jiesi Guo, Australian Catholic University, Australia; **Co-Author:**Reinhard Pekrun, Australian Catholic University, Australia; **Co-Author:**Jens Möller, Kiel University, Educational Science, Germany

Achievement and academic self-concept have been found to be reciprocally related across time. So far, existing research has focused on interindividual relations across longer time periods. This is problematic in that findings from interindividual (between-person) approaches do not necessarily correspond to those from intraindividual (within-person) approaches. Moreover, it appears that no longitudinal study of the relations between self-concept and achievement has used intensive longitudinal methods to examine the short-term dynamics of self-concept and achievement in real time in actual learning situations. For the first time, the present study investigated intraindividual dynamics of students' momentary (state) academic self-concept and lesson-specific perceived learning achievement (i.e., self-reported comprehension) on a lesson-to-lesson basis. We focused on the domain of mathematics. We implemented an e-diary (experience sampling via smartphones) study and examined data from 372 German ninth and tenth graders after every mathematics lesson. Data were collected over a period of 3 weeks. State mathematics self-concept and lesson-specific perceived learning achievement were assessed with 3 items each. A multilevel confirmatory factor analysis confirmed the assumed 2-factor structure. Both mathematics self-concept and learning achievement showed substantial intraindividual variation over time. We specified a multilevel first-order vector autoregressive model within the dynamic structural equation modeling framework in Mplus. We found short-term, intraindividual reciprocal relations between state self-concept and perceived learning achievement from one school lesson to the next. We discuss practical and theoretical implications of our findings.

Intraindividual dynamics and fluctuations of competence, engagement and disaffection
Presenting Author: Jussi Järvinen, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Elina E. Ketonen, University of Helsinki, Finland; **Co-Author:**Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:**Katariina Salmela-Aro, Helsinki University, Finland

Educational researchers have been increasingly interested in situational learning experiences, such as momentary engagement. However, the research on dynamic relationships between different components of engagement and its facilitators is scant. The aim of the present study was to examine the intraindividual fluctuations of and dynamic relationships between perceived competence, behavioural and emotional engagement, and emotional disaffection. The participants were first-year high school students who responded to three momentary experience sampling method (ESM) questionnaires in science lessons during a two-week period. We used two different samples to examine the dynamics from moment to moment within lessons ($N_{situations}$ = 3823, $N_{students}$ = 276) and between lessons ($N_{situations}$ = 1791, $N_{students}$ = 133), respectively. We specified random intercept cross-lagged panel models to examine these within-person associations on each of the two levels. The results showed a carry-over effect of competence and behavioural engagement both from moment to moment and from lesson to lesson. However, above expected emotional engagement carried over only within lessons and not between lessons whereas the reverse was true for emotional disaffection. Above expected behavioural and emotional engagement were predicted by heightened perceived competence in the previous occasion on both levels. Further, the relationship between competence and behavioural engagement was reciprocal and heightened emotional engagement was predicted by above expected behavioural engagement on the within-lesson level. These results corroborate previous findings on competence as a facilitator of student engagement on a momentary level and clarify the dynamic relationships between the dimensions of engagement and disaffection.

Intraindividual dynamics between social relatedness and learning engagement
Presenting Author: Simon Ohl, University of Potsdam, Germany; **Co-Author:**Hanna Dumont, University of Potsdam, Germany

The association between social relatedness and students' learning engagement is conceptualized as an intra-individual dynamics (Skinner et al., 2022). However, previous studies have focused on individual differences, leaving aside intra-individual processes (Sinatra et al., 2015). The aim of the present study is to investigate these intra-individual dynamics and their association with a sense of community in the classroom. Experience sampling data of N=457 primary school students, was analysed using dynamic structural equation modelling (Asparouhov et al., 2018). Results show that students' momentary social relatedness predicted learning engagement and social relatedness in the following lesson. A sense of community was associated with those intra-individual processes. The study therefore unveils inter-individual relationships that have been theoretically conceptualized but never empirically tested.

Relevance of perceived teaching quality for students' self-regulation in individual lessons
Presenting Author: Friederike Blume, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Florian Schmiedek, DIPF | Leibniz Institute for Research and Information in Education, Germany

Individuals have been found to differ in their self-regulation (SR), that is, the ability to control, direct, and plan cognitions, emotions, and behaviour. Recently, SR was also found to vary within students from day to day. Aspects of teaching quality (TQ), particularly student support (SS) and classroom management (CM), but not cognitive activation (CA), have been found to explain differences in student SR. However, whether associations between TQ and SR are also evident at the within-person level and with respect to individual lessons is yet to be investigated. Additionally, it was unclear whether students' dispositional SR would moderate these associations. Intensive longitudinal data collected from 11–13-year-olds over 15 school days were analysed using multilevel models. Lesson level SS and CM, but not CA, were associated with SR in individual lessons: in lessons for which students reported higher SS and CM than usual, they also

reported higher SR. Dispositional SR was not found to moderate these associations. Predictors accounted for 55.60% of the total variance in SR. Patterns of associations were largely the same at the between-person level. Findings emphasise the relevance of student-perceived TQ for their SR in individual lessons and suggest that more consideration should be given to students' perspectives. Additionally, they may be considered to suggest the potential of SS and CM to promote SR in individual lessons. Finally, they may be viewed to indicate that TQ is equally important for the lesson level SR of all students.

Symposium
Motivational, Social and Affective Processes

Methods for examining the strategic and timely deployment of SRL processes

Keywords: Educational Technologies, Learning Analytics, Metacognition, Motivation, Science and STEM, Self-regulated Learning and Behaviour
Interest group: SIG 16 - Metacognition and Self-Regulated Learning
Chairperson: Allyson Hadwin, University of Victoria, Canada
Discussant: Anastasia Efklides, Aristotle University of Thessaloniki, Greece

During task engagement self-regulation operates in the background, kicking in to direct or redirect regulatory actions as needed. This feature of self-regulation allows attention to be allocated to cognitive demands of the task itself. Put simply, productive learning and collaboration are not defined by the persistent and frequent deployment of regulatory practices and actions throughout a work session. Instead, regulation is about the strategic and timely deployment of strategies or practices when needed. Self-regulating learners are metacognitively primed to recognize and respond when task progress departs from goal standards or unexpected events impede progress. Therefore, it is not surprising that the timing and sequence of observed strategies and actions has become a focus for research about self-, co-, and shared regulation. Contemporary research methods leverage learning analytics, multi-modal data, and conventional methods such as think-aloud and self-report collected over time and across tasks to examine the frequency, timing and sequence of regulatory traces situated in authentic learning activities. In this symposium, presenters have been tasked with answering three main questions in the context of their empirical research: (1) How does this research advance understanding of SRL as a complex and adaptive process? (2) How are multiple data sources leveraged to identify meaningful episodes of self-regulation or shared regulation? (3) How can findings be leveraged to support learners to recognize when and how to strategically deploy regulatory practices?

Trigger events as a framework for empirically evidencing regulation in dynamic learning situation
Presenting Author: Sanna Järvelä, University of Oulu, Finland; **Presenting Author:**Allyson Hadwin, University of Victoria, Canada

This paper introduces *trigger events* as a framework for empirically evidencing modes of regulation (self-regulation, co-regulation, and socially shared regulation) during learning and collaboration episodes. Events and/or situations which may inhibit learning processes and, thus, require regulatory responses are defined as *trigger events*. We argue that trigger events offer a means for conceptually progressing understandings of regulation during complex individual and collaborative learning sessions. Empirically identifying trigger signals in multimodal data as markers for regulation of cognition, motivation, emotion, and behavior has great potential for advancing the field. We explain the theoretical framework of the trigger concept and propose multimodal methodologies for detecting trigger signals by demonstrating how various data modalities respond to the types of triggers following various regulatory responses. We believe the concept of trigger events provides a much-needed conceptual framework for leveraging new methodological opportunities and analytical power to advance research about the situated nature of regulatory responses. This paper strives to present an empirically testable model of trigger events as markers for self-regulated and socially shared regulation of learning with the goal of advancing research about regulation in dynamic and complex learning situations.

Theorized Self-Regulated Learning Events and Sequences and Task Performance During Biology Learning
Presenting Author: Matthew Bernacki, University of North Carolina at Chapel Hill, United States; **Co-Author:**Fatemeh Salehian Kia, Simon Fraser University, Canada; **Co-Author:**Jeff Greene, university of north carolina at chapel hill, United States; **Co-Author:**Linyu Yu, University of North Carolina at Chapel Hill, United States; **Co-Author:**Robert Plumley, University of North Carolina at Chapel Hill, United States; **Co-Author:**Shelbi Kuhlman, University of North Carolina at Chapel Hill, United States

As this symposium emphasizes, self-regulated learning (SRL) processes are not best deployed in volume but rather only at critical moments via strategic efforts cued by the nature of the task, the learner, or their dynamic interaction. Determining those critical moments when SRL is needed, and helping learners know which efforts to enact given the context, requires collecting rich data that can model the cyclical, temporal, sequential, and contingent nature of SRL. In this study, we asked 48 college students to engage in an authentic biology task while thinking-aloud, followed by a posttest assessment of learning. We coded think-aloud verbalizations for SRL processing, resulting in a rich, temporal depiction of SRL processing within the macro-cycle of the task as well as subtask micro-cycles. Transition analyses revealed the most common SRL macro-process and phase contingencies and how they correlated with post-test learning performance. Subsequent regression analyses further refined our understanding of key contingencies and sequences predictive of learning, demonstrating the advantages of modeling SRL as a complex and adaptive process via rich, think-aloud protocol data. Such data produced specific findings regarding which sequential and contingent SRL processes are best targeted for intervention to help learners strategically deploy regulatory practices.

Examining the adaptive nature of self-regulated learning in a large-scale university course
Presenting Author: Mladen Raković, Monash University, Australia; **Co-Author:**Jeff Greene, university of north carolina at chapel hill, United States; **Co-Author:**Matthew Bernacki, University of North Carolina at Chapel Hill, United States; **Co-Author:**Robert Plumley, University of North Carolina at Chapel Hill, United States; **Co-Author:**Kelly Hogan, University of North Carolina at Chapel Hill, United States; **Co-Author:**Abigail Panter, University of North Carolina at Chapel Hill, United States

Even though statistical models that predict student success in a course have achieved considerable prediction accuracy in detecting students who may benefit from intervention, they are typically administered at one time point in a semester and, as such, may fail to inform future efforts to support students who may not initially need or who do not respond positively to an early intervention. Moreover, predictions administered in one time window do not account for adaptation, an aspect of self-regulated learning (SRL) where students refine their learning behaviours over time. In the present study, we investigated whether incorporating multiple predictive models of student success during the semester can advance scholarly understanding of how students adapt their SRL behaviours across learning cycles, and whether those changes in SRL behaviours can predict student success. We collected digital trace data from 474 undergraduate students as they studied using six online learning platforms in an introductory biology course. We identified and labelled relevant trace data to reflect specific SRL processes. We further developed three prediction models using data collected in three different time windows during the semester. These models predicted whether a student was likely to perform poorly on the first exam. We also examined predictive SRL behaviours in each time window and thus provided empirical evidence about the contextual, dynamic, and adaptive nature of SRL. Our results indicate that students who committed effort to understand task requirements at the outset of the semester benefit from this effort on later summative assessments of their knowledge.

Facial expressions and regulation in students completing a collaborative, scenario-based online task
Presenting Author: Matthew Moreno, McGill University, Canada; **Co-Author:**Mariel Miller, University of Victoria, Canada; **Co-Author:**Allyson Hadwin, University of Victoria, Canada; **Co-Author:**Susanne Lajoie, McGill University, Canada; **Co-Author:**Keerat Grewal, McGill University, Canada; **Co-Author:**Reinhard Pekrun, University of Essex, United Kingdom; **Co-Author:**Jason Harley, McGill University, Canada

Examining facial emotion expressions and regulation strategies of 1st year undergraduate students completing a collaborative, scenario-based online taskPurposeResearch has indicated the importance of self-regulated learning (SRL), and socially-shared- regulated learning (SSRL) as instrumental to developing autonomous, engaged learners. What we know far less about is how SRL and SSRL occur in online, collaborative, scenario-based online tasks that incorporate multimodal data to help enhance how learners and researchers see individual and group-regulation occurring. To help address these, this study

asked the following questions:What facial emotions do 1st year undergraduate students express as they complete contrasting questions in a collaborative, scenario-based online task?What differences in self and socially-shared regulation strategies do 1st
year undergraduate students express as they complete contrasting questions in a collaborative, scenario-based online task?MethodParticipants were one-hundred and twenty-eight (n = 128) first-year undergraduate students enrolled in a first-year elective undergraduate course at comprehensive Canadian university. Participants were tasked with completing a collaborative, scenario-based, mid-term exam. During this collaborative mid-term exam, students were given a case-based scenario in which they had to assess the case and answer 10-questions involving analysis of the case as a team, applying principles of learning and regulation they had been taught in class, and then collaboratively justifying their decisions they had made. Participants came from 3 sections of the course and were formed using the principle of homogeneity, with individuals being grouped together according to their performance in the first half of the course, into 23 groups of approximately 4-5 students.Data in the current study included: 1) performance scores on the mid-term exam, 2) audio/visual recordings of the collaborative exam collected via Microsoft Teams for future analysis, and 3) facial emotion detection conducted by FaceReader by Noldus. The research team coded the videos of each team completing their exam using a coding scheme that was adapted to incorporate participant behaviors, SRL, and SSRL codes.
Results
Results from generalized estimating equations from facial emotion analysis indicate that groups have significantly ($p < .001$) differing expressions of questions that require them to collaboratively justify their responses, compared to questions where they need to select a response. When examining SRL codes, there were significant differences ($p < .001$) onjustifying and selection questions, with more codes emerging during section of collaborativejustification. Results indicated that the type of question had a significant effect ($p < .001$) on the number of SSRL strategies of and sence (ISP) codes when required to collaboratively justify their responses, compared to questions where they need to select a response.DiscussionResults from this study suggest that there are differences in the way groups approach collaborative work and SSRL within an online environment. This research advances our understanding of SRL and SSRL as a complex and adaptive process by describing how facial emotion expressions can provide insights into group-regulatory process, when tied to behavioral coding. Multiple data sources, including coding and facial emotion detection software, were leveraged to identify meaningful episodes of self-regulation and shared regulation by analyzing contrasting question types and how they pair together, researchers can hope to better understand how the group needs to make strategic shifts in its group regulation in order to meet the demands of different questioning. By conducting this research in an online environment, it allows researchers and learners to engage in post-areas for improvement as the learn to self-regulate and master their own learning. Finally, these findings can be leveraged to support learners to recognize when and how to strategically deploy regulatory practices by making learners more aware of how their emotions and regulatory practices help to inform their own learning. Having the opportunity to conduct this research within the context of a class dedicated to help newer-learners master SRL and SSRL dynamic can allow future findings to inform practice on how these topics are taught.

Session H 9

Learning and Social Interaction, Motivational, Social and Affective Processes

Social Development in Children and Adolescents

Keywords: Anxiety and Stress, Competencies, Critical Thinking, Developmental Processes, Early Childhood Education, Emotion and Affect, Parents' Beliefs and Affect, Personality, Self-concept, Social Aspects of Learning and Teaching, Social Development, Social Interaction, Well-being
Interest group: SIG 10 - Social Interaction in Learning and Instruction
Chairperson: Josef Guggemos, University of Education Schwäbisch Gmünd, Germany

Linkages between temperament, social skills, and self-concept in childhood
Keywords: Early Childhood Education, Personality, Self-concept, Social Development
Presenting Author: Eleni Kallia, University of Thessaly, Greece; **Co-Author:**Evaggelia Tsiara, University of Thessaly, Greece; **Co-Author:**Irini Dermitzaki, University of Thessaly, Greece

The aim of the present study was to investigate the relations between young children's temperament, their social skills, and aspects of their self-concept. Participants of the study were 171 parents and 108 of their children between 54-89 months old. Children's temperament was examined via a parent-rated scale assessing three dimensions: Effortful control, Surgency/Extraversion, and Negative affectivity. Moreover, parents evaluated children's social skills: Empathy, Emotion management, Emotion adaptability, and Positive social behavior. Self-concept was individually examined for each child by means of a structured interview. Four aspects of self-concept were assessed: Relations to parents, Relations to peers, School self-concept, and General self-concept. Structural equation modeling confirmed that Effortful control significantly contributed to all aspects of children's social skills. Negative effects of Negative affectivity on children's skills for Emotion Management and Emotion Adaptation were also shown. Children's Empathy skills were affected by temperamental characteristics and by children's Self-concept regarding relations to peers. The findings of the study could add to theory and to educational practice aiming at children's optimal development and psychosocial adaptation.

The role of body image to the psychological health and welfare of young students
Keywords: Anxiety and Stress, Developmental Processes, Emotion and Affect, Well-being
Presenting Author: Maria Zafiri, University of Thessaly, Greece; **Co-Author:**Angeliki Leondari, University of Thessaly, Greece; **Co-Author:**Grigoris Kiosseoglou, Aristotle University of Thessaloniki, Greece

Although we live in an era that is mainly defined by ongoing waves of challenge and change, societal preoccupation with appearance and beauty ideals attainment seems to remain a strong and impactful constant in people's everyday lives. Moreover, in school settings worldwide, both discrimination and bullying are often appearance related. Thus, it does not come as a surprise that increasing issues with body image are frequently reported among young students, with often detrimental and potentially lasting effects on their adjustment and psychosocial functioning. We present and discuss data from a study exploring the relationship between body image dimensions (body esteem, body image investment, body dissatisfaction) and psychological health (measures of anxiety, depression, social anxiety, self-esteem, and hope) in 609 Greek 6^{th}, 9^{th}, and 11^{th} Graders, while also investigating the role of internalization of mass-media promoted ideals, demographic characteristics (age, gender, socio-economic status), BMI, and physical exercise. Internalization of mass media-promoted ideals, gender, and BMI were found to have a significant impact on body image, whereas the impact of socio-economic status was not significant, and the effects of physical exercise were limited. Multigroup analyses revealed effects of gender and age on how the relationship between body image dimensions and psychological health is shaped. Moreover, notable connections between specific body image dimensions and psychological health also emerged. We propose the design and implementation of developmentally appropriate prevention and intervention programs for students, targeting at positive body image promotion and, by extension, their overall psychological health enhancement.

Assessing core socioemotional skills in adolescent students: A pilot study
Keywords: Competencies, Critical Thinking, Social Aspects of Learning and Teaching, Social Development
Presenting Author: Rui Maio, Faculty of Psychology and Educational Sciences of the University of Porto, Portugal; **Co-Author:**Ana Camacho, University of Porto, Portugal; **Co-Author:**Catarina Grande, University of Porto, Portugal; **Co-Author:**Teresa Leal, University of Porto, Portugal; **Co-Author:**Diana Alves, University of Porto, Portugal; **Co-Author:**Isabel M.P. Abreu-Lima, University of Porto, Portugal; **Co-Author:**Alan Oliveira, Columbia University, United States; **Co-Author:**Rachel Outhred, Oxford MeasurEd, United Kingdom; **Co-Author:**Joana Cadima, University of Porto, Portugal

Socioemotional skills are key predictors of educational and health-related outcomes. Despite their importance in contemporary societies, there is little research on whether and how teachers assess them in the school context. Aiming to bridge this research gap, in this study, we intended to: a) investigate how Portuguese teachers define, currently assess, and would like to assess three core socioemotional competences in the school context (i.e., empathy, critical

thinking, and ethical decision-making); b) provide teachers with new tools to assess these skills among adolescent students on a regular basis. To that end, we conducted two focus groups with six Portuguese teachers, developed ten school-based dilemmas and short self-report scales to assess students' empathy, critical thinking, and ethical decision-making. We then pilot-tested these tools with 63 Portuguese adolescent students. Findings from the focus groups revealed that teachers value students' socioemotional skills; however, they do not regularly assess them in the school context, nor do they know specific tools to use. Thematic analyses of students' responses to the school-based scenarios showed that most students could identify and acknowledge others' feelings and could come up with appropriate solutions, from basic to advanced, to diverse dilemmas. However, only a few students provided elaborate responses to the scenarios. Finally, Rasch analysis showed that the scales were highly reliable and that the items discriminated well for most students. Overall, this study contributed to further understanding school-based assessments of adolescent students' socioemotional skills and provided a more holistic approach for teachers to assess such skills.

Parenting styles and social behavior of children and adolescents: a latent profile analysis
Keywords: Parents' Beliefs and Affect, Social Development, Social Interaction, Well-being
Presenting Author: Wassilis Kassis, School of Education, FHNW, Switzerland; **Co-Author:**AIKATERINI VASIOU, University of Crete, Greece; **Co-Author:**Anastasia Krasanaki, Hellenic Open University, Greece; **Co-Author:**Spyridon Tandaros, National Kapodistrian University of Athens, Greece

Parenting is considered either risk or protective factor for a series of results related to behavioral problems and well-being of children and adolescents. The aim of this study was to examine the relationship between parenting styles (i.e., authoritarian, authoritative, and permissive) and externalized/internalized problems and prosocial behavior of children and adolescents. By applying a person-oriented latent mixture analysis via latent profile analysis we empirically validated by a sample of 1,203 Greek parents (questionnaire study in 2021) a significant overlap between these parenting styles. By the three introduced parenting styles and the consecutive tests on a different number of profiles (two to six profiles) we identified the four-profile solution as the best fitting. Regarding the distribution of the four profiles, we identified four classes, named highly authoritative style (class 1, 66.6% of the participants), relaxed authoritative style (class 2, 16.3% of the participants), mixed parenting style (class 3, 4.4% of the participants) and authoritarian focused authoritative style (class 4, 12.4% of the participants). The relationships between the four parenting profiles and social behavior of children and adolescents at school supported the insight parenting styles are rather a complex mix than a distinct single parenting style as commonly assumed.

Higher Education

Skills and Practices of University Teachers

Keywords: Communication Skills, Communities of Learners and/or Practice, Competencies, Higher Education, Mentoring and Coaching, Quantitative Methods, Social Sciences and Humanities, Teacher Professional Development, Teaching/Instructional Strategies
Interest group: SIG 04 - Higher Education
Chairperson: Özün Keskin, University of Augsburg, Germany

Generic skills in higher education - teaching conceptions, practices and pedagogical training
Keywords: Competencies, Higher Education, Teacher Professional Development, Teaching/Instructional Strategies
Presenting Author: Tarja Tuononen, University of Helsinki, Finland; **Co-Author:**Heidi Hyytinen, University of Helsinki, Finland; **Co-Author:**Katri Kleemola, University of Helsinki, Finland; **Co-Author:**Telle Hailikari, Häme University of Applied Sciences, Finland; **Co-Author:**Auli Toom, University of Helsinki, Finland

The present study explored higher education teachers' (N=286) conceptions of generic skills and their pedagogical practices, and how they were related to pedagogical training and teaching experience. We identified three types of conceptions: non-integrative, integrative, and participatory. Non-integrative conceptions related negatively to all pedagogical practices, whereas participatory conceptions related positively to two of them, namely sharing experiences and combining theory and practice. Integrative conceptions did not relate to pedagogical practices. The results also imply that pedagogical training has a significant relation to conceptions and pedagogical practices. We further found that teaching experience did not relate to conceptions of generic skills, but it did to two of the practices, namely combining theory with practice, and reflecting on and utilising feedback. The findings from this study indicate a need for teachers to enhance their awareness of conceptions related to teaching generic skills and highlight the importance of pedagogical training.

Mentoring for student reflection and employability competences: A quasi-experimental study
Keywords: Competencies, Higher Education, Mentoring and Coaching, Quantitative Methods
Presenting Author: Wendy Nuis, Maastricht University, Netherlands; **Co-Author:**Katharina Zimmerling, Maastricht University, Netherlands; **Co-Author:**Mien Segers, Maastricht University, Netherlands; **Co-Author:**Simon Beausaert, Maastricht University, Netherlands

Given the dynamic and fast-evolving labour market, developing students' employability competences has become of utmost importance for higher education institutions. To develop these competences, the ability to reflect is essential, as it helps students to identify their learning needs and make plans for further development. However, reflective abilities are not easy to acquire and students need guidance to help them reflect. Therefore, mentoring is often used as an instructional approach to stimulate students to reflect. When looking at prior research, empirical evidence on the relationship between mentoring and employability competences is scarce, and especially the mediating role of reflection has rarely been researched. Consequently, this quasi-experimental study researched this mediating relationship by employing a pretest-posttest design. Data were collected at four similar mentoring programs in higher education within the Netherlands and Belgium (n = 160). The path analysis demonstrated that, first, trust and availability, autonomy support and empathy significantly increased students' employability competences. Second, it was found that autonomy support and similarity stimulated students' critical reflection significantly. Third, critical reflection significantly influenced students' employability competences. Last, it was found that reflection partially mediated the relationship between mentoring (autonomy support and similarity) and employability. These results demonstrate that mentoring programs in higher education enable students to develop their reflective abilities and, in turn, their employability competences. Furthermore, it provides mentoring program directors and mentors with concrete guidelines on which mentor support types (trust and availability, autonomy support, similarity, and empathy) are most effective for developing students' reflective abilities and employability competences.

Supervision of degree projects: doing collectivity in practice
Keywords: Communication Skills, Communities of Learners and/or Practice, Higher Education, Social Sciences and Humanities
Presenting Author: Jenny Magnusson, Södertörn University, Sweden

In this presentation my aim is to investigate how social and collective aspects of supervision of degree projects come to show in practice, through looking at how supervisors speak of, refer to or give voice to other actors with relevance for the degree project process. The empirical material consists of recorded supervision meetings, which are analysed with the help of concepts like dialogism, scaffolding, attribution and active voicing. The results show that supervisors attribute or give voice to several actors in the supervision interaction. The discussion concerns how the different things they accomplish through doing this, may help the students in the process.

Children's and young people's value learning, worldviews and resilience in uncertain times
Keywords: Cultural Diversity in School, Religiosity and Spirituality, Resilience, Well-being
Presenting Author: Arniika Kuusisto, University of Helsinki, Finland

This presentation focuses on children's and young people's values and value learning trajectories, and the role of educational institutions from Early Childhood Education and Care (ECEC) to upper secondary schools in guiding their worldview construction. The topic is particularly relevant in the present sociopolitical world situation and the trajectories of constructing existential resilience and well-being during childhood and youth. Resilience has a central role in maintaining sustainable well-being in crises or difficult situations such as pandemics, and at present, not only the pandemic and climate crisis but also the war have contributed to many children and youths' existential anxiety.
The empirical and conceptual developments presented derive from two research projects, both funded by the Academy of Finland. Namely, (1)*Technology Assisted Multi-Method Autobiographical Approach to Value Learning during Transition to School* (ages 3-8, N=42 digital audiovisual autobiographical accounts and life history interviews, T1-T3, and puppet survey on values), which was carried out in Finnish ECEC and comprehensive school, and *(2) Growing up radical? The role of educational institutions in guiding young people's worldview construction* (ages 16-19, N=4025 survey; N=1667 written exam accounts; N=45 in-depth interviews).
The presented findings contribute to further understanding of children's and youths' values, world views, resilience and well-being, as well as their views on the elements influencing their value learning and worldview development trajectories. The aim was also to bring new insights and methodological openings into the field. Besides advancing the knowledge in this interdisciplinary field, the findings have important contributions to policy and practice.

Finnish ethnic minority youth and inspiration from religion for civic engagement
Keywords: Citizenship Education, Cultural Diversity in School, Ethics, Religiosity and Spirituality
Presenting Author: Anuleena Kimanen, University of Turku, Finland; **Co-Author:**Samaneh Khalili, University of Turku, Finland; **Co-Author:**Aleksi Seger, University of Turku, Finland; **Co-Author:**Jenni Alisaari, University of Turku, Finland; **Co-Author:**Elina Kilpi-Jakonen, University of Turku, Finland

Several European and U.S. studies show that religious affiliation is in connection with higher civic engagement, especially for immigrant-background Muslims. Civic engagement covers both participation in formal associations and informal action for common good. Critical agency, defined as the recognition of oneself as an actor in the society is an important factor behind civic engagement. We have interviewed ethnic minority youth aged 15–19 in a Finnish neighbourhood with high cultural diversity about their social and civic engagement. In our study we ask how religion as beliefs and as a community supports or restricts the interviewees' critical agency. A qualitative content analysis on the data shows that the local religious communities provide both ethical inspiration and possibilities for volunteering. However, the activities are led by adults, and the young people mainly serve in fulfilling certain tasks. Sometimes religion also restricted participation in youth-initiated activities that were considered to be foreign to Islam like Halloween. These insights show opportunities that probably are not fully recognized in religious and civic education. The civic potential of religion and religious communities could be addressed in religious and civic education, and pupils' experiences in their religious communities could be used as examples of civic engagement. Furthermore, education on one's own religious tradition would give the young people tools to negotiate issues in their own religious communities.

How teachers use digital data: A systematic review
Keywords: Educational Technologies, Instructional Design, Learning Analytics, Teacher Professional Development
Presenting Author: Alina Hase, Leuphana University Lueneburg, Germany; **Presenting Author:**Franziska Greiner, Universität Leipzig, Germany; **Co-Author:**Poldi Kuhl, Leuphana Universität Lüneburg, Germany

Digitalization is currently becoming more important in everyday life; also in the educational domain. When used in schools, digital media potentially provide great benefits, for example, because of the student learning data collected, especially for teachers' individualized, differentiated instruction and consequently also better achievement of students. In this systematic review, we give an overview of the current evidence on digital data-based development of teaching. Based on a literature search in FIS-Bildung, Psyndex, Scopus, and Web of Science, we identified 28 empirical studies addressing the question to what extent the current research discourse on data-based decision making already refers to data from digital media. In this systematic review, on the one hand, we provide a methodological classification of the papers. On the other hand, we analyzed the types of used digital media and data, the reasons for using the data and their effects on teaching. Finally, we discuss our findings and implications for educational research and practice.

Teachers' Technological-Pedagogical Knowledge, computer use in class, and students' ICT
Keywords: Computer-assisted Learning, Educational Technologies, In-service Teachers, Teacher Effectiveness
Presenting Author: Karsten Stegmann, University of Passau, Germany; **Co-Author:**Tamara Kastorff, Technical University of Munich, Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

A systematic facilitation of Technology-related Pedagogical Knowledge (TPK) is seen as key to successful digitization of teaching in schools. It is expected that that teachers with higher TPK, use digital media more often in the classroom to implement and enable constructive and interactive learning activities (in the sense of the ICAP model) and less often for passive and active learning activities. So far, there has been a lack of empirical findings relating TPK to quality of digitally supported teaching and ICT literacy of learners. The present study aims to answer following research questions: (RQ1) To what extent can teachers' TPK predict students' ICT literacy? (RQ2) To what extent can the extent of the use of computers in the classroom, the ICAP-level of classroom activity, and the interaction thereof predict students' ICT literacy? Analyses regarding RQ1 did not reveal any significant effect regarding teachers' TPK and students' ICT Literacy. Results regarding RQ2 show a small negative effect of the use of computers in the classroom. The ICAP-level 'passive' of classroom activity, and its interaction with the use of computers in classroom, showed small negative effects on students' ICT literacy. The ICAP-level 'active' of classroom activity, and its interaction with the use of computers in the classroom, showed small negative effects on students' ICT literacy. The effects of ICAP level of classroom activity and its interactions with the computer use in class further emphasises the need of TPK on part of the teachers to use digital media in a pedagogically meaningful way.

Relation between Teachers' Pedagogical Knowledge, Classroom Activities and Self-Regulated Learning

Keywords: Digital Literacy and Learning, In-service Teachers, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Karsten Stegmann, University of Passau, Germany; **Co-Author:**Sabrina Reith, Technical University of Munich, Germany; **Co-Author:**Tamara Kastorff, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Birgit J. Neuhaus, LMU Munich, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

In this study we investigate the relation between teachers' pedagogical knowledge, classroom activities and knowledge on SRL with digital media. Self-regulated learning (SRL) with digital media is expected to be positively related with learning, but requires knowledge on SRL with digital media. To facilitate knowledge on SRL with digital media, classroom activities may offer opportunities apply and train their knowledge on SRL with digital media. Consequently, knowledge about SRL with digital media is both, a learning goal as well as a learning prerequisite. The ICAP-model differentiates four levels of observable classroom activities which offer different extent of opportunities for self-regulation. The following research question was formulated: To what extent do teachers' Pedagogical Knowledge (PK) and ICAP-levels of classroom activities predict knowledge about SRL with digital media? In Autumn 2021 $N = 2{,}416$ Bavarian (Germany) 8^{th} Grade students from $N_{classes} = 135$ classes and $N_{schools} = 39$ schools as well as $N = 161$ teachers participated in a survey study. Schools were selected randomly and participated voluntarily. Teachers' pedagogical knowledge (PK) has a significant medium positive effect on students' knowledge about SRL with digital media. Significant effects of ICAP-levels of classroom activities on students' knowledge about SRL with digital media were found. The effects, however, were different between Math classes and Science Classes. The results provide evidence for a substantial relation between students' knowledge about SRL with digital media and classroom activities. Due to the cross-sectional design of the study, however, the direction of effects cannot be determined.

Structural Conditions of Professional Learning Communities on Educational Technologies
Keywords: Cooperative/Collaborative Learning, Educational Technologies, In-service Teachers, Teacher Professional Development
Presenting Author: Sonja Berger, Ludwig-Maximilians-Universität in Munich, Germany; **Co-Author:**Andrea Ludwig, ISB - State Institute for School Quality and Educational Research Munich, Germany; **Co-Author:**Pauline Woop, Ludwig-Maximilians-Universität in Munich, Germany; **Co-Author:**Vera Haldenwang, ISB - State Institute for School Quality and Educational Research Munich, Germany; **Co-Author:**Markus Teubner, ISB - State Institute for School Quality and Educational Research Munich, Germany; **Co-Author:**Karsten Stegmann, Ludwig-Maximilians-Universität in Munich, Germany

Which structural barriers in schools must be overcome to build successful Professional Learning Communities (PLCs) of teachers? This interview study examines school-internal structural conditions for successful establishment of PLCs in secondary education to expand insights into the functioning of teacher collaboration in Germany. 24 participants from four secondary schools participating in a federally funded project were interviewed about their experience with building a PLC at their school to improve their use of educational technologies. Our findings support previously investigated structural conditions at schools and extend them. Voluntariness as well as material, spatial and time resources were found to be essential for a teacher PLC to thrive. These results can support decision-making in educational administration when introducing PLCs.

Effective career orientation and career counselling in secondary education: a review study
Keywords: Attitudes and Beliefs, Curriculum Development, Parental Involvement in Learning, Self-efficacy
Presenting Author: Hanke Korpershoek, University of Groningen, Netherlands; **Co-Author:**Merlijn Karssen, Kohnstamm Institute, Netherlands; **Co-Author:**Alma Spijkerboer, University of Groningen, Netherlands; **Co-Author:**Regina Petit, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:**Annet Hermans, independent, Netherlands

In career guidance at school, orientation to subsequent education and vocational orientation should come together. This literature study investigated which approaches to *career orientation and counselling* could be effective for 12-16 years old adolescents. The 69 studies included in the final sample were published in peer-reviewed journals between 2000-2020. We mainly relied on (quasi-) experimental research in which pre- and post-measurements and partly also control groups were used to evaluate the effectiveness of a career guidance intervention, programme, or activity. We considered career guidance to be effective when it positively influenced adolescents' career development, e.g., more confidence in making suitable career choices or better insight into their own interests and capacities. We synthesized seven elements that can contribute to effective career guidance and the study and career choice process of young adolescents: (1) the activity is connected to practice (e.g., jobs), (2) the student has an active role in the activities, (3) the activity is linked to school / part of a coherent set of career guidance activities, (4) reflection on the activity before ánd after the activity takes place, (5) parents are involved, (6) attention is paid to dealing with expectation patterns (incl. parental expectations, stereotyping, discrimination), and (7) attention is paid to knowledge acquisition to progress students' self-efficacy and vocational interests.

Towards a curriculum targeting teachers' relationship-building competence: Results of a Delphi study
Keywords: Competencies, Curriculum Development, Pre-service Teachers, Teacher Professional Development
Presenting Author: Liedewij Borremans, KU Leuven, Belgium; **Co-Author:**Jantine Spilt, KU Leuven, Belgium

Although teachers often refer to their personal relationships with students as a motivating and fulfilling part of their job, they also report that building these relationships is one of the most difficult aspects of teaching. This study aimed to investigate which competencies beginning teachers need to gain in pre-service education in order to successfully build relationships with individual students. Using the Delphi method, 36 competencies were identified as 'need to know' by an expert panel consisting of teacher educators and researchers. The inclusion of international experts supports the international relevance of the study results. The selected 'need to know' competencies were structured into five categories: the importance of teacher-student relationships for students, key concepts to understand and describe teacher-student relationships, attitudes and self-reflection, specific strategies to establish and maintain relationships, and building relationships in the context of student diversity. For most competencies, an intermediate level of mastery was expected at the end of pre-service teacher education. Results of the study can inspire pre-service teacher training as well as professional development initiatives.

Mapping the main streams and foci of competence-based education research
Keywords: Competencies, Curriculum Development, Educational Policy, Quantitative Methods
Presenting Author: Joonas Mannonen, Finnish Institute for Educational Research, University of Jyväskylä, Finland; **Co-Author:**Felipe Urrutia Vargas, Universidad de Chile, Chile; **Co-Author:**Raija Hämäläinen, University of Jyväskylä, Finland; **Co-Author:**Roberto Araya, Universidad de Chile, Chile; **Co-Author:**Sami Lehesvuori, University of Jyväskylä, Finland

Competence-based education (CBE) has been one of the most widespread trends in education in the 21^{st} century. Yet, recent review articles suggest that there is still notable confusion around CBE and its theoretical conceptualization. To better understand the scientific landscape of this growing research domain, we employed a bibliometric analysis to identify the main streams of CBE research and their most influential articles. Next, we performed topic analysis with latent

semantic approach to explore the topics that the research streams have covered to date. We found three main streams of CBE research: the higher education stream, the vocational education and training stream, and the basic (primary and secondary) education stream. Based on the topic analysis, we present six main topics for each research stream. Our preliminary findings suggest that the higher education stream is trending the most with key competencies in sustainability as its most dominant topic. Our research contributes to a better understanding of the CBE research domain and its foci by visualizing the knowledge transfer in the domain and exploring the topics that have been covered to date. It can be used as a starting point to further manual qualitative analysis aiming to determine how competences are defined in the different CBE research streams.

Shifting technology leadership practices in a curriculum reform in Switzerland
Keywords: Curriculum Development, Digital Literacy and Learning, Educational Policy, School Leadership
Presenting Author: Thomas Wicki, PHBern, University of Teacher Education, Switzerland

This study engages in the implementation of media and information literacy (MIL) in elementary schools in German-speaking Switzerland. We focus on the three key functions of leadership postulated by Leithwood et al. (2020) - setting directions, developing people and developing the organisation - that were adapted to technology leadership practices by Dexter (2018). We argue that ICT coordinators (ICTC) as new actors in the field may manage the implementation process by overtaking certain technology leadership practices. We are specifically interested in the question of who takes over which technology leadership practices in schools and if there are any patterns of distribution of these practices. The mixed-methods research design consists of a quantitative cluster analysis (Ding & He, 2004) based on questionnaires answered by school principals (n=30) and ICTC (n=29) about technology leadership practices and a qualitative content analysis (Kuckartz, 2018) based on interviews with school principals (n=30) and ICTC (n=29) about their experience and role in the implementation process. As a result, we will be given an understanding of which practices formal school leaders are willing to share with ICTC and if these practices are consistent with the three key functions of leadership.

Digital competence in Swedish preschools
Keywords: Digital Literacy and Learning, Early Childhood Education, Educational Technologies, Multimedia Learning
Presenting Author: Anna-Lena Godhe, Jönköping University, Sweden

Digital competence was a few years ago added to the preschool curricula in Sweden, as something that children should have the opportunity to develop in preschool. This presentation aims to explore how preschool teachers define digital competence for themselves and the children, as well as the activities that children in preschool engage in to develop their adequate digital competence. Interviews with teachers and observations of groups of children at three different preschools, reveal that digital competence in these preschools connect to and expand stories and texts, such as fairy tales. With the use of digital resources, preschool teachers can engage the children in different stories, but they also use digital resources to develop children's critical attitude to digital information. The observed activities align well with the goals stipulated in curricula and contradict some of the fears expressed when digital competence was included in the preschool curricula.

A PlanningApp to help Children Make and Internalize Plans: A Case for Personalized Technology
Keywords: Computer-assisted Learning, Educational Technologies, Goal Orientations, Instructional Design
Presenting Author: Jasmin Breitwieser, DIPF | Leibniz Institute for Research and Information in Education, Germany; **Co-Author:**Daniel Biedermann, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Lea Nobbe, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Hendrik Drachsler, Goethe-Universität Frankfurt, Germany; **Co-Author:**Garvin Brod, German Institute for International Educational Research (DIPF), Germany

How should we best design an educational app that helps children create and internalize plans? The successful implementation of a plan requires that the plan is retrievable in everyday life when it is needed. Children in particular are unlikely to use effective strategies to internalize plans in a way that makes them easy to remember. In the current study, we compared different internalization activities that were hypothesized to promote deeper or shallower processing of plans. School-aged children (N = 106, 9-14 years) used a smartphone app for 27 days in their daily lives. Contrary to our hypotheses, the type of internalization activity was not associated with memory success overall. Instead, there were vast individual differences in what activity worked best for a particular child. These individual differences were predicted by children's grade level and their analogical reasoning abilities and mediated by time on task. Findings suggest that a child-appropriate planning app needs to be personalized to be effective; internalization activities have to be tailored to children's learning prerequisites.

Creating a communication bridge for refugee children's education with the eMascot
Keywords: Educational Technologies, Foreign and Second Language Acquisition, Migrant / Refugee and Minority students, Tool Development
Presenting Author: Charikleia Sparou, Radboud University, Netherlands; **Co-Author:**Caroline Pelletier, University College London, United Kingdom; **Co-Author:**Inge Molenaar, Radboud University, Netherlands; **Co-Author:**Manolis Mavrikis, UCL Knowledge Lab, United Kingdom

This research was conducted to address the communication issues teachers and refugee children face. The government of the host country is responsible for refugee children's education. However, in some countries, the teaching and learning of the host country's language as a mother tongue is promoted, excluding the refugees' mother tongue. The eMascot, an educational technology (EdTech) tool developed in previous research, was used. Firstly, the study aims to investigate how the eMascot facilitates communication between stakeholders in a multilingual educational context. Also, the study applies a design-based research method with 3 cycles to improve the eMascot tool and its usage to meet both the learners' and the teachers' needs. This qualitative research was conducted with 34 children, recruited by the International Organization for Migration (IOM), and the public kindergarten, based in a refugee camp in Greece. Through co-teaching activities using the eMascot, observations and an interview with the teachers were made. The observations were about children's interaction with the eMascot, Greek learning, and their involvement in the activities. The research showed that the communication between students and teachers was eased and switched from non-verbal to verbal. All stakeholders started using, increasingly, the words translated by the eMascot during the activities. The alterations made to the tool helped to increase students' interaction with the tool and the teachers. Consequently, using the tool as a translator in the refugee camp's educational settings increased students' initiative in verbal communication, social interactions and facilitated Greek language learning.

Integrative processes in primary school children during AR-supported lab work: An eye-tracking study
Keywords: Educational Technologies, Eye Tracking, Primary Education, Science and STEM
Presenting Author: Kristin Altmeyer, Saarland University, Germany; **Co-Author:**Michael Barz, German Research Center for Artificial Intelligence (DFKI), Germany; **Co-Author:**Sarah Malone, Saarland University, Germany; **Co-Author:**Luisa Lauer, Saarland University, Germany; **Co-Author:**Jochen Kuhn, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Markus Peschel, Saarland University, Germany; **Co-Author:**Daniel Sonntag, University of Oldenburg,

Germany; **Co-Author:**Roland Bruenken, Saarland University, Germany

Following the Cognitive Load Theory and the Cognitive Theory of Multimedia Learning, Augmented Reality (AR) can be used to reduce the spatial split that often concerns virtual and real information in lab work-bases learning scenarios. AR is expected to thereby support coherence formation processes that promote learning through experimentation. Although integrative gaze behavior has already shown to give valuable insights into these processes, it has rarely been investigated for AR-based learning environments. The present research compared AR-supported lab work to lab work without AR in terms of integrative gaze behavior and tried to link it to performance measures. Results showed that AR-support reduced transitions between virtual and real representations. Moreover, the number of transitions was negatively related to several learning outcomes, indicating that they displayed resources-consuming search-processes. These process-level findings can help to improve the design of future AR-based learning environments to promote coherence formation processes.

Students' Self-Regulated Activities While Working on an Online Task-based Instruction in Physics
Keywords: Computer-assisted Learning, Higher Education, Science Education, Self-regulated Learning and Behaviour
Presenting Author: Claudia von Aufschnaiter, Insitute of Physics Education, Germany; **Co-Author:**Alexander Eitel, University of Giessen, Germany; **Co-Author:**Jonas Gabi, Justus Liebig University Giessen, Germany; **Co-Author:**Anna Kienitz, Justus-Liebig-Universität Giessen, Germany; **Co-Author:**Joachim Stiensmeier-Pelster, Justus Liebig University Giessen, Germany; **Co-Author:**Andreas Vorholzer, Technical University of Munich, Germany; **Co-Author:**Julius Weckler, Justus Liebig University Giessen, Germany

Self-Regulation plays an important role for using online learning environments effectively. This study explores self-regulated activities of physics students in a task-based, non-linear online learning environment on Newtonian mechanics. Furthermore, we explore how these activities are related to students' dispositions and how dispositions and activities affect learning gains. The study employs a one-group pre-post design; the treatment comprises two 90-minutes learning sessions within the online learning environment. The learning environment comprises six units on different topics (e.g., basis properties of forces, multi-force systems), different elements (e.g., explanations, tasks on three levels of difficulty, self-assessments). Data collected comprises students' content knowledge (pre- and posttest), self-regulation strategies, interest in physics, goal orientation, self-efficacy, and contingent self-esteem (pretest only). Self-regulated activities are assessed with log files of students' navigation in the environment, their solutions of tasks, their answers to self-assessments and short questionnaires about their experiences. Results show significant learning gains for all students. Interestingly, these gains are only correlated with students work avoidance, not with their prior knowledge or with any other disposition assessed in the pretest. Analysis of the activities indicate two profiles but no clear relationship between individual activity patterns and learning gains.

Learning from data: using learning analytics to support self-regulated learning
Keywords: E-learning/ Online Learning, Higher Education, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Silvia Lipp, University of Graz, Austria; **Presenting Author:**Susanne Kamsker, University of Graz, Austria

Due to digitalization, opportunities for technology-enhanced learning environments are steadily increasing. As a result, the volume of data generated from these learning environments is also growing. Using this educational data is the goal in the research field of learning analytics. Learning analytics is the description, analysis, and interpretation of data produced using digital learning environments to improve learning processes. While technical issues dominate current discourses in the research field, this paper addresses learning analytics regarding self-regulated learning, taking a pedagogical point of view. After a brief introduction to the research field of learning analytics, a research project on learning analytics carried out at the Austrian University of Graz since January 2020 will be presented. Within this project, learning analytics was implemented in two blended learning courses in the master's program in Business Education and Development. A learning analytics dashboard was used to give learners access to their data and support their learning. The research on this application scenario aimed to determine how learners perceived support for self-regulated learning by using learning analytics. The study focuses on the past two semesters (October 2021 to June 2022), during which written questionnaires, learning journals, and group discussions were conducted with a total of 113 students. The results show that students perceive support in their self-efficacy and learning motivation using learning analytics dashboards. Based on the study's result, opportunities, challenges, and practical implications for the further use of learning analytics in education are derived.

Student self-regulated learning in online assessments
Keywords: Assessment Methods, Educational Technologies, Higher Education, Self-regulated Learning and Behaviour
Presenting Author: Tiffani Apps, University of Wollongong, Australia; **Presenting Author:**Karley Beckman, University of Wollongong, Australia; **Co-Author:**Sue Bennett, University of Wollongong, Australia; **Co-Author:**Lori Lockyer, Queensland University of Technology, Australia

The transition to study in higher education is complex and marks a period of uncertainty for many students. This was further complicated as teaching and learning pivoted to modes of emergency online delivery throughout the Covid-19 pandemic. For many institutes the pandemic accelerated an existing agenda to move to increasingly flexible modes of online and blended delivery. Importantly, these modes of delivery require students to navigate flexible online learning tasks and independently self-regulate their learning. The aim of this research was to extend fundamental understanding of online and blended learning at university. The mixed methods study was conducted across four Australian universities prior to the Covid-19 pandemic. The research used an embedded, multiple case study design. The case studies comprised ten first year units of study that involved an online or blended assessment task, including the educator and student cohorts, as well as individual student cases selected from the broader sample. A total of 24 teaching staff and 1167 students participated in the study with 113 embedded student cases. Data was collected through questionnaires, learning management system log data, assessments, as well as interviews with educators and student cases. We present findings about the challenges students experience across online and blended modes of learning and their approaches to task understanding and goal setting across the task period. We discuss the implications of these findings to support students through online and blended learning in light of the issues raised across the pandemic.

Who keeps up? Predicting persistence in non-formal online courses using machine learning
Keywords: E-learning/ Online Learning, Informal Learning, Quantitative Methods, Self-regulated Learning and Behaviour
Presenting Author: Maria Klose, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Philipp Handschuh, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Diana Steger, University of Kassel, Germany

The ongoing shift towards online learning also effects non-formal learning, visible through increasing numbers of online learning opportunities and a broad user community. However, completion rates tend to be low. In this study, we aim to predict persistence from users of non-formal online courses to identify learner-centered and course-centered characteristics that have an impact on a persistent learning behavior. Analyses were based on 1414 participants between age 16 and 84 who enrolled in one of 51 online courses from Bavarian universities that were freely accessible for everyone. As independent variables, we used learner characteristics from questionnaire data (i.e., demographic information, enrollment intentions, and motivational variables) and extracted course characteristics

from the online courses (e.g. course extent, course content, or type of assessment). The preliminary results of elastic net regressions displayed that 15% of the variance in persistence could be explained by learner and course characteristics, and the degree of overfitting was rather low ($\Delta R^2 = .04$). We identified variables that should be considered when predicting persistence in non-formal online courses, indicating in particular an important role of enrollment intentions for learner characteristics, and the percentage of correct self-testing required for a confirmation of participation for course characteristics. Eventually, we want to derive implications for improving course design decisions and recommendations for possible interventions for maintaining motivation.

Strategies to Promote Character Strengths Education in ECE Setting: A Scoping Review
Keywords: Curriculum Development, Early Childhood Education, Morality and Moral Development, Primary Education
Presenting Author: Cheuk Ming Ho, The Education University of Hong Kong, Hong Kong

Character strengths are key drivers of well-being and socio-emotional development. However, past studies on character strength interventions have mainly been conducted on adolescents and young adults. Not much work has focused on younger children, such as those in preschool and lower primary school. Hence, this scoping review aims to survey the different intervention studies that targeted the promotion of children's strengths. In this scoping review, we followed the framework proposed by Arksey and O'Malley and the protocol suggested by Peters et al. From a total of 13,135 articles, and twenty-nine papers were considered suitable. The majority of research is done in Western countries (20 out of 29). Seven out of twenty-nine studies focused on preschool students. Another eighteen studies focused on lower primary school students, and another 4 studies focused on both preschool and lower primary school students. Most of the interventions were using the pre-existed program (16 out of 29). Three interventions introduced characters to the young children through storytelling. Puppet shows, movies, computer games, music, and Martial arts were also used as the primary pedagogical tool in the intervention. We recommend further studies to fill the evidence gap in other regions, such as Asia and Africa. Furthermore, researchers can use only one strategy in the intervention design to examine the effectiveness of each strategy in promoting character education in early childhood. Research is also needed to examine the stage of implementation of character education and the components that affect its effectiveness, such as school leadership and professional development.

Teachers' personal interests: Do they have a place in early childhood curriculum?
Keywords: Curriculum Development, Early Childhood Education, Social Aspects of Learning and Teaching, Teacher Professional Development
Presenting Author: Maria Birbili, Aristotle University of Thessaloniki, Greece

Despite the extended literature on how teachers' personal experiences and knowledge interact with curriculum and life in classroom there is still an empirical gap on how teachers' personal interests find – or not – their way into the curriculum. Early childhood education is a particularly interesting context for exploring teachers' personal interests as a source of curriculum because the concept of children's interests dominates discourses on young children's curricula. With contemporary discussions on the most effective pedagogy for young children drawing their arguments from theories and approaches which prioritize identities and relations (e.g., Funds of Knowledge and Relational Pedagogy), it is time to revisit teachers' contribution to what is taught in classroom: Do teachers' personal interests have a place in the early childhood curriculum? The presentation will discuss the findings of a qualitative study which aimed to explore early childhood teachers' views on the role their personal interests can play in the enacted curriculum. The results suggest that teachers may resist the idea of bringing their interests in the classroom based on the perception that such a practice seems incompatible with child-centered education. Their resistance also seems to be linked to a conceptualisation of the term 'teacher's personal interests' as the topics they decide to teach children and not as their own relatively stable affective-evaluative orientation toward certain subject areas, objects, or activities. The results are discussed through the perspective of relational pedagogy and the presentation concludes that teacher professional learning needs to pay explicit attention to the concept of teachers' interests.

Aspects of learning in kindergarten: Listening to children's voices through photo-voice
Keywords: Attitudes and Beliefs, Curriculum Development, Early Childhood Education, Social Aspects of Learning and Teaching
Presenting Author: Maria Kanaki, Aristotle University of Thessaloniki, Greece; **Co-Author:**Maria Papandreou, Aristotle University of Thessaloniki, Greece

Discussion on learning in early childhood education (ECE) is growing globally. This study focuses on children's views of their learning experience in ECE settings. It derives from a larger, multiple-case, research which sought to investigate different aspects of learning from children's and other stakeholders' perspectives in the Greek context. The overall project is drawn on a participatory research perspective, which acknowledges young learners as competent actors and expert informants in research and value their views. Thus, for data collection, a multi-method approach was used, including visual methods. For this presentation, the findings from the photo-voice process with 35 kindergarteners (4-6 years old) were analysed and discussed. Thematically analysed, children's accounts (verbal and visual) suggest that they have rich ideas about the learning process in ECE settings. Specifically, data analysis uncovered their perspectives on a) what and how they learn in their classrooms, b) teachers' and peer's roles in the learning process and c) play-learning relationship. In addition, photo-voice was confirmed, once again, as a valuable method in early years research. The discussion supports the argument that young children must be considered as active participants in their learning process, highlighting the need to ensure their views inform practice in ECE. The implementation of the doctoral thesis was co-financed by Greece and the European Union (European Social Fund-ESF) through the Operational Programme «Human Resources Development, Education and Lifelong Learning» in the context of the Act "Enhancing Human Resources Research Potential by undertaking a Doctoral Research" Sub-action 2: IKY Scholarship Programme for PhD candidates in the Greek Universities.

The inclusion and importance of workshops in Early Childhood Education
Keywords: Curriculum Development, Early Childhood Education, Educational Policy, Qualitative Methods
Presenting Author: Alexandros Mokias, 2nd Public School of Atalanti Fthiotidas, Greece; **Presenting Author:**Spyridon Filippou-Filippis, University of Thessaly, Department of Early Chlidhood Education, Greece; **Presenting Author:**Anastasios Siatras, University of Thessaly, Greece

The purpose of the paper is to investigate the inclusion of the social dimension of knowledge in Early Childhood Education, through the critical analysis of the thematic unit "I am interested and active - Social Awareness & Responsibility" of the Skills Cultivation Program of the Educational Policy Institute. Curriculum research contributes to critical reflection on the educational process for the holistic development of children, with the goal of building attitudes and practices that empower democratic citizenship. In the context of qualitative research, in this work a content analysis is carried out based on four (4) axes: conceptual content, nature of content, scientific methods and socio-scientific issues. Taking into account the relevant literature on these four (4) axes, the interaction between the "discourse" of abstract academic concepts and the "discourse" of everyday practical experiences is explored. More specifically, for the purposes of the work, eleven (11) thematic sections were analyzed, which were divided into seven (7) workshops each. The learning objectives included in each workshop are classified in the four (4) axes of analysis based on the effect they are expected to have on the active involvement of young children. Finally, the presentation of the results of the work will contribute to the interdisciplinary presentation of knowledge that allows each child to develop social aspects cultivating the values of cooperation, respect and empathy.

Exploring the coherence of teacher education programmes via a mixed methods approach
Keywords: Curriculum Development, Pre-service Teachers, Qualitative Methods, Quantitative Methods
Presenting Author: Katharina Hellmann, University of Education Freiburg, Germany; **Presenting Author:**Michelle Laux, PH Freiburg, Germany; **Co-Author:**Vasileios Symeonidis, University of Education Freiburg, Germany; **Co-Author:**Mirjamaija Mikkila-Erdmann, University of Turku, Finland; **Co-Author:**Norbert Erdmann, University of Turku, Finland; **Co-Author:**Julia Nummi, University of Turku, Finland

The concept of coherence remains vaguely defined in the context of teacher education, although it bears the potential to help overcome issues of fragmentation. This study aims to examine coherence in teacher education programmes at both levels of policy and practice, in an attempt to holistically improve our understanding of the concept. Specifically, the study envisages to map policies and practices related to coherence in teacher education programmes across different countries, as well as to investigate student teachers' perceptions of coherence in two Finnish universities. Data are gathered via a mixed methods approach, through a qualitative survey that looks at organisational characteristics of teacher education programmes across five European countries, and a quantitative survey with Finnish master's level student teachers (N = 126) that examines their perceptions of the concept. Both qualitative and quantitative findings suggest that there is increasingly a coherent structure among teacher education programmes in Europe, while Finnish student teachers perceive their programme to be rather coherent.

Bachelor's and master's thesis in teacher education
Keywords: Educational Policy, Higher Education, Pre-service Teachers, Teacher Professional Development
Presenting Author: Marte Lorentzen, Oslo Metropolitan University, Norway; **Presenting Author:**Hilde Afdal, OsloMet, Norway; **Co-Author:**Hanna Holmeide, Oslo Metropolitan University, Norway

As part of academisation processes, teacher education programmes have developed to become more research-based. A part of this academisation process is that teacher students are required to complete a piece of independent research in the form of a bachelor (BA) or master's (MA) thesis. The thesis is meant to be both "research based" and "profession oriented", where the latter refers to the need for the thesis to be relevant for the students' future professional practice. This paper uses practice architectures as an approach to answer the questions: "What characterizes teacher students' and educators' notions of the final thesis as 'researched based' and 'profession oriented', and how do the practice architectures of the teacher education programs enable and constrain these conceptualizations?". The study was done in two phases. Phase one consisted of a quantitative survey to teacher educators responsible for the BA/MA thesis module. The second phase consisted of qualitative interviews with students, educators, supervisors and head of studies in four selected teacher education programmes. Preliminary results reveal that teacher students' and educators' perceptions of 'research based' and 'profession oriented' vary across the teacher education programs, whereby e.g. early childhood education considered the final thesis to be an inquiry-based project, and actors in the master's programme considered the thesis to be a minor research project that allowed for developing research related skills. In sum, the results will contribute to the existing literature on the ongoing academic orientation of teacher education and their pursuit of 'research based' and 'profession oriented' BA/MA theses

Readiness to Teach Social and Emotional Learning: The Importance of Teacher Education Programs
Keywords: Attitudes and Beliefs, Developmental Processes, Mixed-method Research, Pre-service Teachers
Presenting Author: Shea Ferguson, University of South Carolina, United States; **Co-Author:**Robbie Ross, University of South Carolina, United States; **Co-Author:**Kate Ascetta, University of South Carolina, United States; **Co-Author:**Molly Dawes, University of South Carolina, United States

Increasingly, teachers are responsible for teaching social and emotional learning (SEL) skills to their students, but questions remain about whether teachers are adequately trained to handle this demand during their initial preparation programs. To understand their degree of readiness for this important task, the current study examined preservice teachers' beliefs about SEL, beliefs about the necessity of developmental knowledge (i.e., knowledge about youth's change and growth) for teaching practice, and their perspective on the degree to which their program provided them with that developmental knowledge and specific SEL preparation. Undergraduate students (*N*=158) enrolled in a preservice educator preparation program at a southeastern university in the US completed an online survey, which measured their beliefs about SEL, importance of developmental knowledge for teaching practices, developmental preparation, SEL preparation and three open-ended questions. Analyses revealed that they believe SEL is important, and they plan to use developmental knowledge when making instructional decisions, but only slightly agreed that their program prepared them on developmental knowledge and SEL. The findings from this study demonstrate the importance of teacher preparation programs increasing developmental knowledge preparation and SEL preparation (including specific strategies to use) to effectively prepare students to address SEL in the classroom.

The mediating role of children's neurocognition in the relation between physical and academic skills
Keywords: Cognitive Skills and Processes, Educational Attainment, Primary Education, Quantitative Methods
Presenting Author: Anne de Bruijn, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Anna Meijer, Institute of Education and Child Studies, Leiden University, Netherlands; **Co-Author:**Marsh Königs, Emma Neuroscience Group, Emma Children's Hospital, Amsterdam UMC, University of Amsterdam, Netherlands; **Co-Author:**Jaap Oosterlaan, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:**Joanne Smith, Center for Human Movement Sciences, University Medical Center Groningen, University of Groningen, Netherlands; **Co-Author:**Esther Hartman, University Medical Center Groningen / University of Groningen, Netherlands

Many studies have examined relations among primary school students' physical, neurocognitive and academic skills. Yet, by focusing on specific aspects of these relations, studies have reported inconsistent results. This study aimed to get more insight into these relations by examining all three domains

simultaneously, testing a complete mediational model including measures of physical competencies (cardiovascular fitness and motor skills), neurocognitive skills (lower-order cognitive skills and executive functions), and academic achievement (reading, mathematics, spelling). A large sample of Dutch primary school students (n = 891, 440 boys, mean age 9.17 years, grades 3 and 4) were assessed on the Shuttle Run Test (cardiovascular fitness), items of the Körperkoordinationstest für Kinder and Bruininks-Oseretsky Test-II (motor skills), computerized neurocognitive tests, and standardized academic achievement tests. A multilevel structural equation model was constructed in Mplus to test mediational relations. Results showed that physical competencies were only indirectly related to academic achievement, via specific neurocognitive functions depending on the academic domain involved. Information processing and verbal working memory were important mediators for both reading and spelling, with an additional mediating relation via interference control for the domain of reading. Verbal and visuospatial working memory, and interference control were mediators in the domain of mathematics. Results provide important implications, as children's physical competencies have been declining in recent years. Our results suggest that this might not only have detrimental effects on children's physical development and health, but possibly also on their cognitive development, underlining the importance of increasing children's engagement in physical activity.

Effects of familiarity and complexity on inhibitory control in science learning: preliminary results
Keywords: Cognitive Skills and Processes, Conceptual Change, Primary Education, Science Education
Presenting Author:Élisabeth Bélanger, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Lorie-Marlène Brault Foisy, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Steve Masson, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**Patrice Potvin, Université du Québec à Montréal, Canada; **Co-Author:**Emmanuel Ahr, Université du Québec à Montréal (UQAM), Canada; **Co-Author:**François Thibault, Université du Québec à Montréal (UQAM), Canada

Students hold a multitude of intuitive conceptions about natural phenomena that are inconsistent with scientific knowledge and often persist even after science instruction. Past research has highlighted the role of inhibitory control to "resist" intuitive conceptions in scientific reasoning. However, it appears that the activation of inhibitory control could vary depending on the nature of the scientific content to be learned, as well as of the one to be inhibited. We hypothesize that two variables could influence this need for inhibitory control: 1- the *familiarity* of an intuitive conception: the more familiar it is, the more control it might require; 2- the *complexity* of the scientific conception: the more complex, the more demanding it might be to resort to; both situations resulting in a greater need for inhibition. To test these two hypotheses, several pairs of conceptions (intuitive and its scientific counterpart) were submitted to a panel of scientific experts. They were asked to assign them a *familiarity* and *complexity* score to allow an objective selection of the four pairs that best fit the intersection of the two levels (low and high) of both *familiarity* and *complexity*. Using those pairs, four cognitive tasks were created using a negative priming paradigm relying on response time latencies to reveal inhibitory control's magnitude. A hundred 5-6th graders were recruited to complete the tasks. The analyses will allow an identification of the individual and combined effect of *familiarity* and *complexity* on the negative priming effect. First results will be presented at the conference.

Children's School Readiness: Roles of Executive Functioning and Cumulative Family Risks
Keywords: At-risk Students, Cognitive Skills and Processes, Early Childhood Education, Learning and Developmental Difficulties
Presenting Author: Kevin Kien Hoa Chung, The Education University of Hong Kong, Hong Kong; **Co-Author:**Sing Yeung Alfred Lee, The Education University of Hong Kong, Hong Kong; **Co-Author:**Cuina Catrina Liu, The Education University of Hong Kong, Hong Kong; **Co-Author:**Kevin Chan, The Education University of Hong Kong, Hong Kong; **Co-Author:**Chun Bun Lam, The Education University of Hong Kong, Hong Kong

This study investigated the roles of executive functioning (EF) and cumulative family risks in explaining preschool children's school readiness during the COVID-19 pandemic. The cumulative family risks included socioeconomic status (SES), home literacy environment (HLE), children's health risk, and familial risk of dyslexia. Participants were 955 K1 children (M_{age} = 3.53 years, *SD* = 0.41, n_{female} = 46.60%) and their parents from Hong Kong, China. Parents completed a survey package, which measured children's school readiness, EF skills, and family risk factors of SES, HLE, child's health, and familial risk of dyslexia. Hierarchical regression analysis, controlling for children's age and gender, was performed to test the unique contributions of EF and family risks to school readiness. Results showed that in addition to the vital role of EF, the risks of HLE and children's health were negatively associated with school readiness. The interactions between EF and family risks further highlighted the importance of the familial risk of dyslexia in the association between EF and school readiness. Children at higher familial risk of dyslexia suffer from weakened EF skills in support of school readiness. Findings of this study yield practical information indicating the importance of EF and HLE (i.e., access to books, book-reading frequency) on school readiness. These results also shed light on the necessity of developing family literacy and EF interventions to promote home literacy practices and children's EF skills, respectively, especially when traditional schooling is unavailable.

Let's play and talk! An intervention to support vocabulary and narrative development for 3 year olds
Keywords: Cognitive Skills and Processes, Communication Skills, Early Childhood Education, Teacher Professional Development
Presenting Author:MARIA EVANGELOU TSITIRIDOU, International Hellenic University, Greece; **Co-Author:**Gillian Lake, DCU, Ireland; **Co-Author:**Eleni Tympa, International Hellenic University, Greece

Let's play and talk aims to enhance 3-4 years old vocabulary through stories and pretend play sessions. The project addresses children's vocabulary growth, narrative development and preschool teachers' professional development on supporting these. The study is a replication of a successful intervention implemented in England with two variations: i) a professional development component is added, and ii) the intervention is offered by early years teachers instead of a researcher. It is a validation of the original study in a different cultural and linguistic context, in Greece. The components of the intervention are strategically chosen children's stories with enhanced vocabulary and planned pretend-play sessions that derive from the stories. The 10-week implementation will take place in preschools in Thessaloniki. The study's design is a randomised wait-list controlled trial and 120 children, 60 in each group will be recruited. Pre and post-test assessments, before and after the intervention will assess children's outcomes: vocabulary, narrative, pretend play and executive function. The assessment instruments are standardised. Demographic characteristics will be collected, and the Greek validated Home Learning Environment Questionnaire will measure the quality of the HLE. Preschool teachers' understanding of dialogic reading, vocabulary, and narrative development, pretend play, the role of the adult in children's play and executive function, will be explored via focus groups and through professional development sessions. The Teachers' Self-Efficacy Scale will be used. The study will have direct results: the production of a detailed manual, the intervention model, and indirect results: better-trained early years teachers on children's vocabulary development.

The Links between Executive Function, Decoding and Reading Comprehension: English-Arabic Differences
Keywords: Cognitive Skills and Processes, Foreign and Second Language Acquisition, Primary Education, Reading
Presenting Author: Ibtehaj Alrushoud, University of Cambridge, United Kingdom; **Co-Author:**Rui WANG, University of Cambridge, China; **Co-Author:**Michelle Ellefson, University of Cambridge, United Kingdom

Reading comprehension is one of the most important skills in primary education. However, many children struggle to comprehend grade-level texts in their first and additional (could be second) languages despite having adequate decoding (word reading) skills and good additional language proficiency. Recent studies often resort children's poor comprehension in the first language to weak *executive function*. However, little research has investigated this association in children speaking more than one language. In this small-scale study, we recruited 9-to -10-year-old (*N* = 8, *Mage* = 9.99 years, *SD age*= 0.40 years) learners of English as an additional language. They completed a set of tasks including executive function (indexed by measures of *working memory*, *inhibition* and *cognitive flexibility*), reading comprehension and decoding of non-words (meaningless words) in Arabic and in English. Results using Spearman's correlation matrix indicated a positive correlation between inhibition and Arabic nonword decoding. Further, the results suggested a significant positive association between children's ability to decode nonwords in both languages as well as a strong link between their ability to comprehend English texts and to decode English nonwords. The findings highlight the importance of executive function in supporting the formation of a broader reading comprehension model and suggests the need to consider the role of executive function in supporting additional language learners with reading comprehension difficulties. Practically, it could support the inclusion of executive function measures alongside decoding and linguistic skills in reading comprehension test batteries to identify and support children at-risk with reading comprehension.

Effect of Stereotype Threat on the Performance of Elementary School Children: A Meta-Analysis
Keywords: Achievement, Attitudes and Beliefs, Cognitive Skills and Processes, Primary Education
Presenting Author: Fanny MAGOUTIER, University Grenoble Alpes, France; **Co-Author:**Pascal Pansu, Université Grenoble Alpes, France; **Co-Author:**Boris Vallée, université Rouen Normandie, France

Research on stereotype threat shows that students who are not socially stigmatized outperform those who are stigmatized at school. Here, we examine when and why stereotypes can become threatening at school. We conducted a meta-analysis to measure the extent of stereotype threat effect on academic performance among elementary school children. After identifying articles written between February 2022 and 1995 (date when the first studies were carried out by Steele and Aronson), we found 17 relevant studies, with 25 independent effect sizes, including gender, ethnic origin, obesity and low socio-economic status stereotype threats. Among the moderators tested, three were significant: “Grade” (kindergarten-1st grade versus 2nd to 5th grade), “Stereotype type” (gender versus other), and “Domain” (intelligence versus math and language arts). The results showed that younger children were less sensitive to stereotype threat than 2nd to 5th graders. Contrary to our expectations, the effect of gender stereotype was not as strong as that of the other stereotypes aggregated (obesity, plus low SES and ethnic minorities). We also observed that the effect of the lower intelligence stereotype was stronger than that of lower math and language arts ability. Thereafter, we ran an analysis including all moderators, controlling the effect of each moderator by the others. The results confirm again that school age (Grade) appears to be a key determinant of the occurrence of stereotype threat. However, additional analyses cannot rule out publication bias. Consequently, it is important to conduct more studies with this population to consolidate the results obtained.

Teachers‘ productive error management behavior as integral part of whole class interaction
Keywords: Achievement, Classroom Management, Dialogic Pedagogy, Social Interaction
Presenting Author: Martin Majcík, Masaryk University, Czech Republic

The goal of this proposal is to identify ways of teachers’ productive error management behavior which is associated with teachers’ support to pupils during the error situation. That productive approach could be concretized through a type of teacher’s feedback. This way of handling pupils’ errors is related to affective and cognitive dimensions of error management behavior. Qualitative research was conducted in Czech language and literature of lessons of the 9th lower secondary class. The observation of 24 lessons was supplemented by interviews with teachers and pupils. The data were analyzed by open coding and conversational analysis. Linguistic ethnography was chosen as an interpretative framework because of the different sources of data. The results present the productive ways how teachers handle errors during whole class interaction. Different approaches were identified in situations with discussion and during a task with repeating the curriculum. In the case of the discussion, teachers tend to use errors as opportunities to active pupils’ participation. On the other hand, during repeating task, they support pupils in the process of repair errors by using hints and questions.

A Theoretical Conceptualization of the Quality of Pedagogical Interactions. A 2*3*2 Systematic
Keywords: Classroom Management, Social Aspects of Learning and Teaching, Social Interaction, Well-being
Presenting Author: Boris Eckstein, University of Teacher Education Zurich, Switzerland; **Co-Author:**Alexander Wettstein, PHBern / University of Bern, Switzerland

This theoretical contribution proposes a 2*3*2 systematic for conceptualizing the quality of pedagogical interactions. The systematic builds upon social-cognitive constructivism, interactionism, and perceptual psychology. We further rely on three crucial concepts: 1. The supply-use model of teaching quality, 2. the three basic dimensions of teaching quality, and 3. the behavioral and the perceptual element of pedagogical interactions. The proposed 2*3*2 systematic differentiates between manifest behavior and individual perceptions, considers the different roles of teachers and students, and conceptualizes teaching as a genuinely interactional process. These ideas might fertilize methodological considerations for future studies to achieve precise analyses of the quality of pedagogical interactions.

Instructors body postures and their influence on perceived teacher enthusiasm and students’ interest
Keywords: Communication Skills, Social Interaction, Teaching/Instructional Strategies, Video-based Learning
Presenting Author:Sören Traulsen, Leibniz Universität Hannover, Germany; **Co-Author:**Lysann Zander, Leibniz Universität Hannover, Germany

Body postures can affect how people perceive themselves; postures of others can affect how they are perceived. Research on body postures has been critically discussed in the scientific community. Overall, findings are mixed but there is relatively strong evidence for posture effects on self-perceptions. In this preregistered study, we investigated how a teacher's posture in a video tutorial affects students’ perceptions of the teacher’s enthusiasm and their situational interest in the tutorial topic. Additionally, we measured teacher’s perceived agency and communion for exploratory data analyses. Differentiation of the body posture was carried out by systematically varying the dimensions of verticality (Upright/Slumped) and horizontality (Open/Closed). We hypothesized that perceived teacher enthusiasm and situational interest would be rated higher when students watched a tutorial with the teacher's posture upright versus slumped. Furthermore, we expected higher ratings for these variables when students watched the tutorial with the teacher's body posture open versus closed. Students (N=195) from different classes of a German University were randomly assigned to one of these tutorials and were asked to answer a subsequent survey. Group comparisons showed that the teacher's upright posture compared to a slumped posture had a positive effect on perceived teacher’s enthusiasm; no effects on students' interest were found. Additionally, posture openness was relevant to perceptions of communal traits while an upright posture paired with an open posture influenced perceptions of agency. We discuss the implications of these results for teachers in digital and in class-teaching and possible boundary conditions.

Beyond the Classroom Walls: De-encapsulation in a Change Laboratory Intervention with Adolescents
Keywords: Cooperative/Collaborative Learning, Secondary Education, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Pauliina Rantavuori, Tampere University, Finland; **Presenting Author:**Piia Ruutu, University of Helsinki, Finland; **Co-Author:**Yrjö Engeström, University of Helsinki, Finland; **Co-Author:**Maria Tapola-Haapala, University of Helsinki, Finland

In an encapsulated classroom, the school text (the knowledge conveyed by teachers and textbooks and reproduced in tests and exams) tends to become the object of the activity instead of being an instrument for understanding the world. The encapsulation of school learning is becoming increasingly dysfunctional due to two major societal transformations. These are the digital world's spread and pervasive influence that captures students' attention and the societal turmoil ranging from racism to the global climate crisis and calls for an entirely new depth and breadth of both conceptual understanding and activist involvement. In order to make sustainable progress in de-encapsulation, we need to identify, document, analyse, and foster a wide variety of actions and practices. In this study, 8th graders from two comprehensive schools in Finland worked on projects chosen and shaped by themselves, with the support of researchers during the

school year. The projects were carried out in Change Laboratory interventions. We examined adolescent students' initiated and enacted steps of breaking out of the encapsulated classroom and school. The de-encapsulation actions of the 11 student groups were analysed along three dimensions by paying attention to the individual or collective nature of the de-encapsulation efforts, the direction of the movement, as well as the composition of the movement (physical vs. imaginative and discursive movement). The findings show that we should seriously notice and nourish students' own attempts at de-encapsulation.

Dialogues across time and space in a video-based collaborative learning environment
Keywords: Computer-supported Collaborative Learning, Higher Education, Social Interaction, Video-based Learning
Presenting Author: Charlotte Beal, University of South-Eastern Norway, Norway; **Co-Author:**Rolf Steier, OsloMet, Norway

In this paper, we investigate how student teachers' group dialogues emerge and intersect across time and space as the students collaboratively constructed a video-based mind map to prepare for oral exams in pedagogy. Over two sessions during a one-week project, 22 4th year student teachers forming 5 groups were video recorded and analysed. The dialogues studied include both synchronous and asynchronous discussions among group members as they viewed, recorded, and uploaded videos. Findings from our interaction analysis offer in-depth understanding of how collaboration occurs in different space-time configurations within and across groups. The analysis shows how time and space shape learners' interactions and onward epistemic orientations in the computer-supported collaborative learning (CSCL) setting. Here, participants coordinate their actions towards prior conversations and extend present reality as they traverse the immediate conversational setting and become part of a network of emerging dialogues in the larger student community – intertwined in and enabled by their use of a digital platform.

Learning, thinking and co-creating as embodied dialogue – a dialogic-inclusional approach
Keywords: Creativity/Divergent Thinking, Dialogic Pedagogy, Knowledge Construction, Social Interaction
Presenting Author: Eva Vass, Western Sydney University, Australia

In our attempts to reimagine education we need to return to the body and cultivate our receptiveness towards an embodied aesthetics of understanding. This has never been more pressing than in our post-pandemic path-seeking. Responding to this urgency, this theoretical paper draws on the vision of the self as deeply rooted in embodied experience and sees mutually receptive-responsive dialogue as foundational in collaborative learning, thinking and creativity. The paper draws on extensive research on collaborative learning and co-creativity in various educational contexts (primary schools, university settings and informal learning environments). In particular, it revisits the core themes arising from my most recent body of work on the Kokas music pedagogy and presents the theorisations that have evolved in synergy with my engagement with research data. It discusses the inclusional-dialogic approach developed through this research, marrying Bakhtinian dialogism and the ecological wisdom of Natural Inclusionality (Rayner, 2022; 2017). It is argued that, through the broadening of legitimised modes of educational and scientific inquiry, we can re-imagine learning and teaching (and therefore theorising and research on these) as embodied, co-creative, receptive-responsive dialogue towards discernment and creative knowledge. Through these considerations, the paper aims to re-ignite educational interest in experience-centered pedagogies, and problematise the ways in which the pervasive dominance of online education in the past few years has distanced – and oftentimes fully removed – us from crucial, nurturing opportunities to learn, teach or co-create through collective, lived experiences of being and becoming.

Are peer interaction during school recess and motor performance related in 6- to 8-year olds?
Keywords: Developmental Processes, Peer Interaction, Primary Education, Social Interaction
Presenting Author: Dagmar Derikx, University Medical Center Groningen / University of Groningen, Netherlands; **Co-Author:**Marina Schoemaker, University Medical Center Groningen / University of Groningen, Netherlands; **Co-Author:**Suzanne Houwen, University of Groningen, Netherlands; **Co-Author:**Esther Hartman, University Medical Center Groningen / University of Groningen, Netherlands

Motor development during childhood is predictive for success later in life, but motor skill levels have decreased significantly over the past decades. Therefore, it is important to identify potentially modifiable risk- or enabling factors. Through interactions with other people, children may improve their motor skills by observing and imitating the motor skills of others and by practicing their own motor skills. School is an influential place, as children spend many hours there. Recess is the main setting for children to interact relatively freely with peers, which provides opportunities to practice motor skills. Therefore, the aim of this study is to examine the relationship between the amount and type of interaction with peers during recess and the motor performance of 6- to 8-year-old typically developing children. Motor performance is measured with the Movement Assessment Battery for Children-2. Interaction with peers during recess is observed using an adapted version of the System for Observing Children's Activity and Relationships During Play during which the physical activity level, group size, group composition, activity type, and interaction type are notated. The sample presently consists of 72 children (mean age 89.0 ± 5.6 months, 55.6% boys), but data collection is still in progress (required $n = 95$). As far as we know, we are the first to investigate this relationship in 6- to 8-year-old typically developing children. Knowledge regarding this relationship will give teachers and policy makers the opportunity to create the most optimal situations during recesses in which motor performance can be practiced and improved.

Predicting Teacher Attrition at Disadvantaged Schools – Impact of a Mentoring Intervention
Keywords: Educational Policy, In-service Teachers, Mentoring and Coaching, Teacher Professional Development
Presenting Author: Marcus Kindlinger, University of Duisburg-Essen, Germany; **Co-Author:**Eva Anderson-Park, University of Duisburg-Essen, Germany; **Co-Author:**Hermann J. Abs, University of Duisburg-Essen, Germany

One common problem education systems face is high attrition among novice teachers. This problem is even more prevalent at schools in disadvantaged areas where teachers are often confronted with a combination of different challenges such as limited resources, , higher proportion of students who display challenging behaviours, and students who lack basic skills and abilities (Martínez, 2014; Tannehill & MacPhail, 2017).Adaptive mentoring has been proposed as a possible method to support beginning teachers in the first years in their new jobs. In our study, we evaluated an EU-funded international policy experiment on adaptive mentoring for novice teachers in the context of disadvantaged schools. Using a quasi-experimental design, we analyse questionnaire data from novice teachers in control and treatment groups. We focus on novice teachers' self-reported intention to leave the teaching profession either in the short or long term. Preliminary results indicate that the mentoring programme did not have an effect on novice teachers' intention to quit. Our data further indicates that novice teachers' intention to quit is strongly related to personal preconditions such as their age and job motives, structural conditions such as perceived satisfaction with the workplace. While those factors may be hard to influence through mentoring, the data also showed that teacher resilience leads to a decrease in intentions to quit. Future mentoring programmes may benefit from focusing on fostering resilience and self-regulation of beginning teachers.

Teachers' Self-Regulated Learning behaviors as a predictor of self-regulated learning teaching

Keywords: In-service Teachers, Mixed-method Research, Self-regulated Learning and Behaviour, Teacher Professional Development
Presenting Author: Tova Michalsky, Bar-Ilan University, Israel

In this study, the predictive value of three aspects of teacher self-regulated learning (SRL) as learners regarding teachers' promotion (SRL) in their actual teaching is modelled by means of structural equation modelling. These include teacher SRL skills as learners (1) planning, (2) monitoring, and (3) evaluation. 421 mathematics high school teachers participated in the study. Path analysis revealed that teachers' monitoring skills, along with their evaluation skills as learners, were predicting teachers' promotion of SRL in their teaching positively. The results offer new insights into teacher SRL skills and how they account for teacher practice regarding the promotion of SRL in their students. This study is particularly innovative as it is the first study in the field of teachers and SRL to investigate teacher SRL skills as learners (online measure) and teacher promotion of SRL in their classroom. These results can serve to construct a model of teachers' promotion of SRL, as well as provide ideas on how to help teachers supporting SRL in their teaching.

School-based Professional Learning Communities in a centralized educational system
Keywords: Communities of Learners and/or Practice, Educational Policy, In-service Teachers, Teacher Professional Development
Presenting Author: Christina Stavrou, Cyprus Pedagogical Institute, Cyprus; **Co-Author:**Efi Paparistodemou, Cyprus Pedagogical Institute, Cyprus; **Co-Author:**Pavlina Hadjitheodoulou-Loizidou, Cyprus Pedagogical Institute, Cyprus

Teachers' Professional Learning approaches, in the centralised public educational system of Cyprus, are taking steps towards the creation of school-based Professional Learning Communities (PLCs) as a more effective and participatory model. This study aims to investigate the characteristics within PLCs and elements that Cyprus teachers take into consideration for implementing practices and actions. Data was collected via questionnaires and interviews with teachers, as part of a funded project. Findings showed that trust, open communication, feeling of reinforcement in the group are some valuable characteristics of PLCs. Empowering teachers as leaders and coordinators and creating time slots dedicated to discussion, interaction and reflection emerged, to see how in the context and characteristics of a centralised educational system can contribute to a PLC culture. Policy implications regard the support of PLCs towards more autonomous and effective ways for teachers' professional learning.

Measuring Content- and Technology-Related Knowledge of Teachers – Self-Reports vs. an Knowledge Test
Keywords: Competencies, Educational Technologies, Self-efficacy, Teacher Professional Development
Presenting Author: Timo Kosiol, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

Self-Reports are often used to measure professional knowledge as described in the TPaCK framework, because objective test instruments for the technology-related facets of the framework are not available. It remains uncertain if the reported self-efficacy measured by these self-reports provides a valid assessment of individual knowledge. Furthermore, self-reports fail to consistently replicate the theoretical structure of the TPaCK framework. N=207 teachers and N=185 teacher students at secondary level answered the test instrument of the content- and technology-related facets of the TPaCK framework (CK, PCK, TCK, and TPCK). N=78 of the teachers and N=99 of the teacher students also provided self-reports on these facets of professional knowledge. The answers of the test instrument were analyzed using a Rasch model. The reliabilities of the different facets were acceptable to good for both measures. The theoretical structure could be confirmed empirically for both self-reports and the knowledge test instrument. Correlations indicate that self-reports, especially for PCK and TPCK, do not validly represent individual knowledge as measured by the test instrument.

Comparing Frameworks for Professional Standards and Competencies for Teacher Education Worldwide
Keywords: Educational Policy, Higher Education, Teacher Professional Development, Teaching Approaches
Presenting Author: Susanne Narciss, TU Dresden, Germany; **Co-Author:**Jörg Zumbach, University of Salzburg, Austria

Ever since the World Education Forum in Dakar in 2000, the development of teaching standards has been an important topic on the global education agenda. The aim has been to improve the quality of education to equip learners with the competencies for effective participation in today's societies and economies. Hence, professional standards of teaching, as well as teaching competency frameworks, have been developed worldwide in order to specify the necessary knowledge, skills, strategies, values, and attitudes, as well as teaching activities that contribute to successful professional behaviors in the field of learning and instruction. These standards provide the basis for teacher education and for promoting teachers' continued professional development (Centre of Study for Policies and Practices [CEPPE], 2013). Furthermore, they provide a yardstick that enables teachers to track their professional conduct concerning the various competency domains of teaching (e.g., instructional design, classroom organization and management, and learning assessment and feedback). This paper presents a review and comparison of selected teacher standards and competency frameworks from different regions of the world, including Australia, Europe, Southeast Asia, the United States, and Africa. Furthermore, it will discuss the implications raised by the commonalities and differences among these frameworks.

Teachers' shift of attention in authentic teaching situation
Keywords: Cognitive Skills and Processes, Eye Tracking, Mixed-method Research, Teacher Professional Development
Presenting Author: Maikki Pouta, University of Turku, Finland; **Co-Author:**Erno Lehtinen, University of Turku, Finland; **Co-Author:**Tuire Palonen, University of Turku, Finland

The aim of this study was to explore differences in student teachers' and experiencedteachers' shift of attention during authentic mathematics lesson and its relation to their judgements of pupils. To guide pupils optimally, teachers need professional vision skills and accurate judgements of individual pupils need for help. Professional vision is known to be a situated process. Identifying pupils' individual needs demands accurate judgements skills, which relation to professional vision has only recently been investigated. One mathematics lesson from student teachers (n=4) and experienced teachers (n=4) was recorded with Tobii Pro Glasses 2 mobile eye-tracking device. Before the lesson, each participant evaluated their pupils' mathematical competencies with judgements survey. Teachers' shifts of attention was studied with times of interest analysis of the eye movements and its relation to teacher's judgements with correlation analysis. The results show that the correlations of student teachers' and experienced teachers' judgements in different areas of mathematics varied between particular student teacher – experienced teacher pairs teaching the same group of pupils. Interestingly, student teachers and experienced teachers were similar in their shifts of attending, despite more individual differences among student teachers. Both experienced teachers and student teachers were mostly attending to the pupils they were guiding. Results indicate that both student teachers' and experienced teachers' shift of attention is situation-specific rather than fixed by their knowledge of a pupil's need for support in mathematics.

Extending Design Thinking with Digital Technologies
Keywords: Classroom Assessment, Educational Technologies, Secondary Education, Teacher Professional Development

Presenting Author: Manolis Mavrikis, UCL Knowledge Lab, United Kingdom; **Co-Author:**Marcelo Milrad, Linnaeus University, Sweden; **Co-Author:**Chronis Knyigos, National and Kapodistrian University of Athens, Greece; **Co-Author:**Marianthi Grizioti, National and Kapodistrian University of Athens, Greece; **Co-Author:**Christothea Herodotou, Open University, United Kingdom; **Co-Author:**Lieva Van Langenhove, Ghent University, Belgium; **Co-Author:**Katrien Strubbe, Ghent University, Belgium; **Co-Author:**Sofia Papavlasopoulou, Norwegian University of Science and Technology (NTNU), Norway; **Co-Author:**Carina Girvan, Trinity College Dublin, Ireland; **Co-Author:**Filothei Chalvatza, SIMPLE, Greece

The use of emerging technologies (ET), such as Artificial Intelligence (AI), Augmented Reality (AR), 3D printing and Virtual Robotics (VR) are amongst the EU targeted actions for supporting the digital transformation of education (Digital Education Action Plan, 2021-2027). Yet, despite these technologies being accessible to education stakeholders, there is a lack of concrete pedagogy and teachers' professional development for their meaningful infusion into the current educational context. Extending Design Thinking with Emerging Digital Technologies (Exten (D.T.)2) is a [name of funder removed] project aiming to use: AI, AR, VR and 3D printing technologies, to enhance the pedagogical value, sustainable digitization and potential for wide deployment of Design Thinking (DT). DT (Brown, 2008) is a promising pedagogical innovation, based on interdisciplinary co-creation, that can lead to sustainable and feasible product solutions, which has yet to be tested widely in education. Through Design-Based Research (DBR) and a co-production approach with teachers, Exten (D.T.)2 will use emerging technologies and design thinking to design, pilot and scale up a sustainable learning implementation that can foster students' 21st century skills.

Socially Withdrawn Students' Engagement in Classroom Discussions Under Three Learning Modalities

Keywords: E-learning/ Online Learning, Educational Technologies, Engagement, Social Interaction

Presenting Author: Yue Sheng, The Ohio State University, United States; **Co-Author:**Monica Lu, The Ohio State University, United States; **Co-Author:**Ziye Wen, The Ohio State University, United States; **Co-Author:**Eric Anderman, The Ohio State University, United States; **Co-Author:**Tzu-Jung Lin, The Ohio State University, United States; **Co-Author:**Michael Glassman, The Ohio State University, United States; **Co-Author:**Saetbyul Kim, The Ohio State University, United States

Classroom dialogic interaction has the potential to promote students' social, psychological, and cognitive development. However, socially withdrawn students often show limited participation in discussions due to social anxiety. With the advancement of classroom technology, dialogic interaction can be extended beyond face-to-face to online environments. This study examined how social withdrawal relates to 4^{th} and 5^{th} graders' learning engagement under three modalities: face-to-face small group discussions, asynchronous text-based discussion boards, and an asynchronous video-based discussion forum (e.g., Flipgrid). Results from regression analysis indicated that when students engaged in face-to-face small group discussions, there was no significant relation between social withdrawal and engagement. This finding calls for the need to create an inclusive learning environment for socially withdrawn students to voice their opinions. In contrast, we found that socially withdrawn students are less engaged than their peers while using Flipgrid. Results suggested that educators should consider providing students with diverse learning opportunities to keep all students engaged.

Tools to create adaptive learning technologies without programming

Keywords: Computer-assisted Learning, Educational Technologies, Instructional Design, Tool Development

Presenting Author: Vincent Aleven, Carnegie Mellon University, United States; **Co-Author:**Jonathan Sewall, Carnegie Mellon University, United States

Intelligent tutoring systems (ITSs), an essential form of adaptive learning technologies, have been shown to be very effective in helping students learn a range of subject matter. These systems support learning-by-doing of complex problem-solving skills with a variety of adaptive instructional features, including repeated practice on well-tailored tasks in varied contexts with explanatory feedback and as-needed instruction.
Given the proven effectiveness of ITSs, a key question is: How can we facilitate their development? Over a period of 20 years, we have developed the Cognitive Tutor Authoring Tools (CTAT), which introduce a new paradigm for ITSs called example tracing tutors. These tools permit users to create adaptive tutors without writing program code, hence enabling educational researchers, instructional designers, instructors, and teachers to author their own ITSs. Key authoring tasks made easy by CTAT are (1) creating a tutor interface through drag-and-drop methods, (2) representing problem-solving knowledge in a problem-specific behavior graph through programming by demonstration, and (3) embedding tutors in a standard learning management system. A new feature is that CTAT is now web-based, which streamlines authoring, makes it easier to get started, and hopefully will attract more authors.
To illustrate the efficacy and utility of these tools, we discuss how many people have used CTAT for real projects: many tutors built with CTAT have been shown to help students learn in real educational settings. Authoring tools such as CTAT may contribute to the widespread development and adoption of ITSs.

Written- or video-feedback? A study of the students' feedback use, perceptions and performance

Keywords: Educational Technologies, Feedback, Higher Education, Instructional Design

Presenting Author: Ignacio Máñez, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Noemi Skrobiszewska, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:**Adela Descals, University of Valencia, Spain; **Co-Author:**María José Cantero, University of Valencia, Spain; **Co-Author:**Rafael García, University of Valencia, Spain; **Co-Author:**Raquel Cerdan, University of Valencia, Spain; **Co-Author:**Óscar Fernando García, University of Valencia, Spain

Students often ignore the feedback messages they receive through digital learning environments, probably due to the presentation format employed. Although university students tend to prefer the video format, professors usually employ the written format to deliver feedback on their assignments. The present study aims to analyze the extent to which the feedback presentation format (Video-feedback vs Written-feedback) influences the students' decision to access Elaborated Feedback (EF) messages digitally delivered for the academic assignments, their exam performance, and their feedback perceptions (satisfaction with EF and its perceived usefulness). One hundred seventy-one freshmen students enrolled in the degree in Teacher Training for Early Childhood/Primary Education participated in the study. Seventy-eight students received EF on the assignments in written format and ninety-three in video format. Feedback messages were provided through the digital platform the day after the assignment deadline and no additional feedback was provided in the classroom. Finally, students took the course exam. The results suggest that the feedback presentation format influences the students' decision to access EF messages, indicating that students in the Written-feedback group accessed more EF messages than their Video-feedback counterparts. However, the presentation format did not influence performance outcomes and feedback perceptions. Practical implications on how to deliver formative feedback through digital environments will be discussed.

The authentic use of interleaving: How can students be supported to mix categories?

Keywords: Educational Technologies, Instructional Design, Learning Strategies, Metacognition

Presenting Author: Erdem Onan, Maastricht University, Netherlands; **Co-Author:**Felicitas Biwer, Maastricht University, Netherlands; **Co-Author:**Roman Abel, Ruhr University Bochum, Germany; **Co-Author:**Wisnu Wiradhany, Binus University, Indonesia; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

Effective learning strategies are desirably difficult for students. These strategies are more effortful and may impair immediate performance but enhance long-term learning. Interleaved practice (mixing examples of to-be learned categories) is one desirably difficult strategy for students. Helping students to adopt interleaved practice, however, is a major challenge. Past research showed that over 40% of students refrain from interleaved practice despite strategy interventions. Furthermore, it remains unclear whether students would apply interleaved practice when they need to create their own study order, by making item-based decisions. Therefore, in this study, we will test the efficacy of a novel intervention that aims to promote the use of interleaved practice in educationally more authentic scenarios. This intervention will confront two main reasons that seem to undermine students' adoption of interleaved practice: Erroneous beliefs about the efficacy of interleaved practice and inaccurate monitoring of effort and learning during strategy implementation. Furthermore, the intervention will provide students with a metacognitive tool that would help students to verify the instructions with their own experiences. In a pre-test/post-test design, strategy intervention will be manipulated between subjects. All students will learn visual categories, but unlike prior research, they will not only indicate the strategy they want to use but will also create their own study order. The findings of this study will inform the development of an online strategy module that can stand alone or be combined with existing strategy trainings.

Teacher Students Discourses of Programming Activities in Teacher Education

Keywords: Educational Technologies, Instructional Design, Problem Solving, Teacher Professional Development

Presenting Author: Jeanette Sjöberg, Halmstad university, Sweden; **Co-Author:**Emma Edstrand, Halmstad University, Sweden

In recent years, programming as a subject have increasingly become an important part of primary school curriculum in many countries. As a consequence, programming activities have also been merged into teacher training programs in higher education as part of content knowledge for future school teachers. In this paper we investigate how groups of teacher students in their discussions constructs ideas about programming while performing different programming tasks within their teacher training education. The study is drawn from online workshops where the teacher students are engaged in programming activities working in groups. The research questions we ask in this paper are: 1). In what ways do teacher students concretise their comprehension of creating didactical conditions for teaching programming as a subject in primary school? and 2). How are different discourses about the learning process and didactical potential in relation to programming activities constructed in teacher students' discussions while involved in programming activities in teacher education? Using a discourse analytical approach, the results of the study show conflicting contradictions among the teacher students' opinions of programming as a teaching subject within primary school.

Identification in Vocational Education and Training: effects of training quality and satisfaction
Keywords: Emotion and Affect, Quantitative Methods, Social Development, Vocational Education and Apprenticeship Training
Presenting Author: Eveline Wuttke, Goethe-Universität Frankfurt, Germany; **Co-Author:**Karin Heinrichs, Pädagogische Hochschule Oberösterreich, Austria; **Co-Author:**Kristina Kögler, University of Stuttgart, Germany

The development of identification with a company and/or an occupation is, besides the acquisition of vocational competence, a central target of vocational education and training (author 2020; authors 2022). Identification with an occupation and/or a company is important from the point of view of employees and employers because it goes along with occupational satisfaction, has a system-stabilising effect, and is intertwined with occupational competence development (Baethge et al., 2006). However, there is a lack of findings on the characteristics, conditions, and effects of social identification within the framework of vocational education and training. In our study we address this gap and analyse what leads to identification with a company and/or an occupation and how this is related to job satisfaction.

Adolescents' mind wandering during reading on paper and screen
Keywords: Comprehension of Text and Graphics, Digital Literacy and Learning, Metacognition, Vocational Education and Apprenticeship Training
Presenting Author: Viktoria Foss, University of Stavanger, Norway

Teachers are increasingly adopting digital textbooks into their teaching, adding to the hours that students are already spending on their digital devices at school and in their spare time (EU Kids Online, 2020; Bakken, 2021). However, recent meta-studies have found consistent print advantages in reading comprehension and metacognitive calibration when comparing screen and print reading conditions (Delgado et al, 2018; Clinton, 2019). Less research has looked at the direct effect of the digital medium on attention during the reading process along with the individual characteristics of the reader that interplay with these conditions. Using a within-subjects design with existing class samples, the present study will test Norwegian vocational students (n=100-200) with informational texts in both print and screen reading conditions on the following measures: reading comprehension (RC), mind wandering through the proportion of task-unrelated thoughts (TUT) and accuracy of metacognitive calibration through judgment/prediction of performance (JOP/POP). We will also investigate individual participant features, such as media use habits and preferences; and traits of cognitive control, such as sustained attention capacity, working memory and inhibition. Importantly, the study will be conducted in a classroom with ecologically valid materials, including participants' own laptop computers and authentic school texts in both media. Consistent with previous research, we expect that participants reading on screen will demonstrate less on-task attention, less accurate calibration and reading comprehension than those reading the printed texts, and that the difference in reading comprehension can be explained by the other variables.

VOICE workshop: Supporting Early Childhood Education Teachers to enhance children's participation

Keywords: Early Childhood Education, In-service Teachers, Synergies between Learning / Teaching and Research, Teacher Professional Development
Interest group: SIG 11 - Teaching and Teacher Education

The aim of this workshop is to provide teacher educators and researchers with a methodology for supporting early childhood education (ECE) teachers in enhancing children's participation in decision making about and during the educational process. The necessity for enhancing children's participation stems both from children's right for their voices to be listened to as well as from constructivist theories of learning that emphasise children's active participation as a precondition for learning. The necessity for supporting teachers in providing opportunities for children's participation stems from research evidence showing that ECE teachers' beliefs of children as lacking abilities (deficit model) often act as obstacles for enhancing participatory ECE practices. Research based on observations of teachers' practices also shows in some cases children's limited opportunities for participation in decision making in ECE settings. The workshop is organised with the use of evidence-based and applied educational material and tools produced within an educational programme (VOICE). It is based on several interactive activities that assist teacher educators and researchers to provide opportunities for ECE teachers to reflect, question and rethink their beliefs and practices, familiarise with the preconditions and possibilities for children's participation as well as with relevant research and reflective tools for achieving a critical awareness of their practice.

Appwel, measuring and increasing the school well-being of pupils

Keywords: Bullying, Emotion and Affect, Secondary Education, Well-being
Interest group: SIG 08 - Motivation and Emotion

Please bring your own device if you are attending this ICT demonstration.Wellbeing and involvement are two important conditions for learning (Laevers, 2015). Like wise, school success and ambition lead to a higher wellbeing (Hargreaves & Shirley, 2018). As such, attention for wellbeing and learning performance should coincide, strengthening each other mutually. Setting the bar high for everyone both in terms of school success and in terms of wellbeing should be goals that every school strives for.In the present study, we focus on the school's context and talk about school wellbeing as a multidimensional, holistic concept that impacts all parts of life (Hird, 2003). We work with five subconstructs: satisfaction, engagement, academic self-concept, social relations and pedagogical climate.Recently there has also been an increased focus from social and policy perspective on the wellbeing of pupils and students at school. In the context of education there was a lack of dynamic monitoring instruments that are ready to use for practice in schools. Hence, there is an urgent need of schools for an instrument to measure school wellbeing and support schools in their endeavour to achieve high levels of wellbeing for every student. The goal of the Appwel-project became clear and relevant. Currently, 162 schools with a total of around 40 000 students work with Appwel today. In the ICT demonstration, we explore the possibilities of Appwel. We briefly discuss the creation of the tool and its relevance to the field.. At the end of the workshop, time will be made to give feedback and share experiences.

Human-based simulation in a virtual space: "walk the talk" of training educators in an uncertain era

Keywords: Conceptual Change, Peer Interaction, Simulation-based Learning, Teaching/Instructional Strategies
Interest group: SIG 11 - Teaching and Teacher Education

Please bring your own device if you are attending this ICT demonstration.Simulation-based learning (SBL), which simulates the professional arena for learning and practice purposes, is increasingly common in the field of teacher education. Nowadays, the two types of simulation most commonly used in SBL are human-based and computer-based simulations. In the following presentation, I will demonstrate the SBL model that I developed, which combines the use of human and virtual elements. This model was developed and implemented during the COVID-19 pandemic but has the potential to serve educators also during routine times. The empirical evidence revealed that using this model makes it possible to adequately address the needs of learners from various cultures and backgrounds and, thus, it promotes equitable learning and teaching. I will first describe the theoretical basis underlying the SBL process as used in teacher-training workshops and explain why this process in effect promotes the notion of "education as hope" in uncertain times. Then, I will demonstrate in real-time how the implementation of the SBL process achieves this desired effect (generating hope and openness to learning). The enactment of the simulation scenario is followed by a group debriefing, in which the focus of the discussion is on the transformation of knowledge into practice, highlighting ideas of critical thinking, conceptual change, and problem-solving. To conclude, we will engage in a group discussion on the affordances of SBL in teacher education in uncertain times, with an eye toward future research collaborations that may enhance our theoretical understanding of uncertainty harnessed as a factor that promotes opportunities for educational change.

Human-based simulation in a virtual space: "walk the talk" of training educators in an uncertain era

Why Deny? The Psychology of Public Misunderstanding of Science

Keywords: Critical Thinking, Emotion and Affect, Misconceptions, Pandemic
Interest group:
Chairperson: Lucia Mason, University of Padova, Italy

Many individuals are perplexed by family members, friends, and co-workers who avoid vaccinations or believe climate change is a hoax. Democracies depend on educated citizens who can make informed decisions about scientific issues. The COVID-19 pandemic brought these issues into sharp relief. In Science Denial: Why It Happens and What to Do About It, Sinatra and Hofer examine the psychological factors contributing to science doubt, resistance, and denial. This presentation will focus on the themes from the book including the role of psychological constructs such as cognitive biases, emotions, identity, epistemic cognition, and motivated reasoning in public (mis)understanding of science. Sinatra will overview significant motivational and emotional challenges to public understanding of science and provide research-based solutions to each challenge for individuals, educators, policy makers, and science communicators.

Individual Differences in Early Numeracy, Executive Functions, Motor Skills and Physical Activity

Keywords: Early Childhood Education, Learning and Developmental Difficulties, Mathematics/Numeracy, Special Education
Interest group: SIG 15 - Special Educational Needs
Chairperson: Jo Van Herwegen, United Kingdom

My talk focus on our research groups' latest research findings about young children's early numeracy learning and possible learning difficulties in it. We aim to produce new scientific evidence about developmental dynamics in early numeracy, executive functions, motor skills and physical activity. We also control for fine motor and language skills, and family socioeconomic-status. The study line started with an observation that children's physical activity, motor skills and the knowledge of mathematical skills have been decreasing during the last decade. Is it so that an inactive lifestyle causes problems for learning?Empirical evidence from school age children has recently been obtained concerning the positive association between motor and academic performance in cross-sectional and longitudinal paradigms. For instance Diamond (2000) suggested that the close association between motor and cognitive development is mediated by the coactivation of the cerebellum (critical for complex and coordinated movements) and the prefrontal cortex (critical for higher- order cognitive functioning, for example, the executive functions. Early numeracy development has been shown to be associated with children's EF and language skills, but less studies have studied them together particularly with a focus on children with mathematical learning difficulties.We collected longitudinal data from three measurement points with 300 children aged 3-6 years. We have also used the interventions to manipulate the developmental trajectories: we investigate the effects of three interventions: early numeracy and motor skills intervention, motor skills intervention, and early numeracy intervention. Our preliminary results demonstrate a mediating role for executive functions in relation between motor and early numeracy skills. The results from the pilot intervention study suggest that it is beneficial to combine motor and early numeracy skills practice with preschoolers' having low early numeracy performance. In EARLI 2023 I present the results from the longitudinal data set and two intervention studies.

Individual Differences in Early Numeracy, Executive Functions, Motor Skills and Physical Activity

My talk focus on our research groups' latest research findings about young children's early numeracy learning and possible learning difficulties in it. We aim to produce new scientific evidence about developmental dynamics in early numeracy, executive functions, motor skills and physical activity. We also control for fine motor and language skills, and family socioeconomic-status. The study line started with an observation that children's physical activity, motor skills and the knowledge of mathematical skills have been decreasing during the last decade. Is it so that an inactive lifestyle causes problems for learning?Empirical evidence from school age children has recently been obtained concerning the positive association between motor and academic performance in cross-sectional and longitudinal paradigms. For instance Diamond (2000) suggested that the close association between motor and cognitive development is mediated by the coactivation of the cerebellum (critical for complex and coordinated movements) and the prefrontal cortex (critical for higher- order cognitive functioning, for example, the executive functions. Early numeracy development has been shown to be associated with children's EF and language skills, but less studies have studied them together particularly with a focus on children with mathematical learning difficulties.We collected longitudinal data from three measurement points with 300 children aged 3-6 years. We have also used the interventions to manipulate the developmental trajectories: we investigate the effects of three interventions: early numeracy and motor skills intervention, motor skills intervention, and early numeracy intervention. Our preliminary results demonstrate a mediating role for executive functions in relation between motor and early numeracy skills. The results from the pilot intervention study suggest that it is beneficial to combine motor and early numeracy skills practice with preschoolers' having low early numeracy performance. In EARLI 2023 I present the results from the longitudinal data set and two intervention studies.

Journal Writing as Medium for Thinking and Learning

Keywords: Knowledge Construction, Metacognition, Self-regulated Learning and Behaviour, Writing/Literacy
Interest group: SIG 06 - Instructional Design
Chairperson: Eleftheria Gonida, Aristotle University of Thessaloniki, Greece

Journal Writing as Medium for Thinking and Learning: Instructional Support to Foster Self-Regulated LearningWriting, just as reading, is basic to academic learning both in school and at the university. With the advent of a scientific writing pedagogy in the early seventies of the last century, the idea was born that writing is a natural tool for thinking and learning. This idea was first suggested by the educational reform movement "writing across the curriculum" in the UK and soon spread over to many high schools and universities in the USA. By drawing on classic theoretical ideas from writing-research, models of self-regulated learning and cognitive load theory, I will propose the self-regulation view in writing-to-learn as a promising theoretical perspective. According to this perspective,

writing has the potential to scaffold self-regulated learning due to the cognitive offloading written text offers as an external representation and memory aid, and due to the offloading, that specifically results from the genre-free principle in journal writing.I will then present the main tenets of a research program on journal writing – “the Freiburg Self-Regulated-Journal-Writing Approach” – which I conducted with colleagues from the University of Freiburg (Germany) during the last 20 years. In this research program, we developed and tested instructional support methods to help students use the journal writing to enact knowledge construction processes that result in deep comprehension and long-term retention of subject matter, as well as effective preparation for future problem-solving. My discussion of these more than 20 experimental and correlative studies will show that, with appropriate instructional support, journal writing indeed is a valuable medium for thinking and learning that enables students to take responsibility for their own learning process, by helping them to recognize their individual learning needs and develop their ideas about complex subject matter issues. Fostering such self-regulated learning competence is both an important goal and hope of education particularly in uncertain times.

Invited Symposium

The Effects of Social and Emotional Learning on Children’s Cognitive and Psychological Wellbeing

Keywords: Cognitive Development, Cognitive Skills and Processes, Cultural Diversity in School, Early Childhood Education, Educational Neuroscience, Emotion and Affect, Inclusive Education, Multicultural Education, Pandemic, Primary Education, Resilience, Secondary Education, Social Aspects of Learning and Teaching
Interest group:
Chairperson: Katariina Salmela-Aro, Helsinki University, Finland
Chairperson: Barbara Schneider, Michigan State University, United States
Discussant: Felice Levine, American Educational Research Association, United States

This invited symposium of four international experts, highlight recent findings regarding the importance of placing more emphasis on social and emotional learning especially with respect to equity and inclusion. The symposium opens with a presentation from Dr. Vincent-Lancrin, the Deputy Head of the Centre for Educational Research and Innovation (CERI) and a Senior Analyst at the Organisation for Economic Co-operation and Development (OECD), who describes the impact of COVID-19 on cognitive achievement and other societal disruptions such as geopolitical conflicts and sets the backdrop to the focus on social and emotional learning and children’s psychological well-being. Professor Motti-Stefanidi from the National and Kapodistrian University of Athens, discusses the evidence from the Athena Studies of Resilient Adaptation project on immigrant students’ psychological well-being in the Greek school context, where systemic and structural discrimination against immigrants has prompted assimilation policies to achieve a more equitable educational system. Dr. Suad Nasir, President of the Spencer Foundation, which conducts and supports high quality educational research, will discuss results from studies directed at improving the social and emotional learning of all children. Finally, Dr. Schneider the John A. Hannah University Professor from Michigan State University provides new results obtained from elementary and secondary students indicating how and when students social and emotional learning is enhanced when engaged in cognitive educative experiences.

The effects of COVID on learning outcomes and equity: international outcomes

Invited Symposium

Assessment and Evaluation

The Social Dimensions of Peer Assessment

Keywords: Classroom Assessment, Cooperative/Collaborative Learning, Feedback, Gender Issues, Higher Education, Mixed-method Research, Peer Interaction, Secondary Education, Social Aspects of Learning and Teaching, Writing/Literacy
Interest group: SIG 01 - Assessment and Evaluation
Chairperson: Tijs Rotsaert, Ghent University, Belgium
Organiser: Jose Carlos Ocampo, University of Deusto, Spain
Organiser: Morgane Senden, Université catholique de Louvain (UCL), Belgium
Discussant: Javier Fernández, Universidad de Leon, Spain

Peer assessment has been widely used in a variety of academic disciplines and educational levels due to its documented educative benefits. Since peer assessment is social and collaborative in nature, attention to the social nature of peer assessment has been increasing in recent years. This symposium presents theoretical and empirical evidence on the interplay between social variables and other contextual factors that influence peer assessment. The first contribution, by Alqassab et al., introduces the Multi-level Multi-process Interactive Peer Assessment (M^2IPA) framework that integrates both the overt and covert processes of peer assessment and its possible outcomes. Additionally, this framework considers how peer assessment can be influenced by learners' individual characteristics and the contextual factors that underlie it. On the other hand, the second contribution, by Aben et al., investigates whether cognitive sub-phases of the process of dealing with errors can be distinguished during peer-feedback provision and processing, as well as the extent to which this process is related to interpersonal factors in secondary students' argumentative writing outputs. The third contribution, by Ocampo et al. examines the effects of assessor's gender and peer feedback content on men and women assessees' academic performance, and perceptions of peer feedback a writing focused task. Finally, in the fourth contribution, Senden and Coertjens investigate the effect of an intervention designed to enhance students' feelings of trust during peer assessment via training, and back-evaluation. Implications for teaching and assessment practice and future directions for research will be addressed.

Peer assessment as a multi-level multi-process interactive practice: The M2IPA framework
Presenting Author: Maryam Alqassab, Universidad de Las Palmas de Gran Canaria, Spain; **Co-Author:**Jan-Willem Strijbos, University of Groningen, Netherlands; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany

Peer assessment is nowadays considered a central learning activity in schools and higher education. Various theoretical attempts to capture learning from peer assessment exist. However, there seems to be an unbalanced emphasis in these models either on (a) processes involved in peer assessment or (b) processes influencing the effectiveness of this learning activity. In this contribution we propose a framework that integrates the pre-existing theoretical models on peer assessment and provides a more holistic description of peer assessment as a learning activity. Unlike prior theoretical contributions, the Multi-level Multi-process Interactive Peer Assessment (M^2IPA) framework takes into account the effects of covert processes, individual factors and interpersonal factors, while describing overt processes of peer assessment (e.g., judging peer performance, providing feedback) and their subsequent outcomes (e.g., feedback message vs. self-regulation). We argue that this holistic description of peer assessment offered by the M^2IPA framework can support the development of better understanding of peer assessment as a learning activity and facilitate the design of peer assessment activities in different learning environments.

Dealing with errors while providing and processing peer-feedback on texts: A mixed-methods approach
Presenting Author: Jochem Aben, University of Nijmegen, Netherlands; **Co-Author:**Mayra Mascareño Lara, University of Groningen, Netherlands; **Co-Author:**Anneke Timmermans, University of Groningen, Netherlands; **Co-Author:**Filitsa Dingyloudi, University of Groningen, Netherlands; **Co-Author:**Jan-Willem Strijbos, University of Groningen, Netherlands

Although previous research has stressed the central role of errors during feedback processes, the role of errors may depend on interpersonal relationships between actors involved in feedback activities. Therefore, this study investigates, in the context of peer-feedback on argumentative writing, (1) which cognitive sub-phases are distinguishable during the process of dealing with errors and (2) the extent to which dealing with errors relates to the interpersonal relationship. Six dyads of Dutch 11th grade students provided and processed peer-feedback on argumentative texts while thinking-aloud, and they reflected on the feedback-processes in a post-interview. The think-aloud utterances and interviews were analyzed with a mixed-methods, exploratory sequential design, applying a quantitative content analysis, and a qualitative thematic analysis. The dealing with errors during the provision of peer-feedback displayed two patterns. In the first pattern, error identification seemed to happen simultaneously with the decoding, and often any evaluation-related thoughts were lacking. In the second pattern, error-identification seemed to occur as a result of an interpreting/evaluating phase. Also during the processing of peer-feedback, two main patterns were visible: students either knew immediately whether they agreed with a feedback remark, or they first had to study the feedback remark more thoroughly. Additionally, 10/12 students *seemed* (in the think-aloud data) to be affected by the interpersonal relationship with the feedback recipient while providing feedback, whereas they *declared* (in the interviews) not to be so. By contrast, 8/12 students did declare (in the interviews) to be affected by the interpersonal relationship with the feedback provider while processing feedback.

The impact of training and backward evaluation on students' feeling of trust during peer feedback
Presenting Author: Morgane Senden, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Liesje Coertjens, Université catholique de Louvain (UCL), Belgium

Peer feedback can have a very positive impact on students' learning, but only if students have at least some trust in themselves and their peers' abilities to provide feedback, which is often not the case. To enhance these feelings of trust, we created an intervention composed of two elements (1) the provision of a training session that aims to improve trust and (2) the presence of backward evaluation and implement it in a course with multiple peer feedback activities. We tested the intervention's efficacy through a quasi-experimental study with 144 education master students. We hypothesise that students who will receive the intervention will have a higher increase in their feeling of trust, the quality of the feedback they will provide and their performance than students who will participate in peer feedback without the intervention.

Gender and Peer Feedback Content's Effects on Academic Performance and Peer Feedback Perceptions
Presenting Author: Jose Carlos Ocampo, University of Deusto, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Fernando Díez, Universidad de Deusto, Spain; **Co-Author:**Iván Sánchez-Iglesias, Universidad Complutense de Madrid, Spain

The role of gender in peer feedback has received increasing attention in recent years. When providing peer feedback, studies suggest that women may tend to give better quality peer feedback, and be more comfortable in doing so. When receiving feedback, literature forwards that women assessees are more likely to implement peer feedback on their work. However, studies have not yet examined if peer feedback is more likely to be implemented based on the assessor's gender. This is crucial as literature has warned against the possibility of gender stereotypes in peer feedback. When not managed, this may affect students' perceptions of peer feedback, which may influence various outcomes. In this study, we examined the effects of gender and peer feedback content on academic performance, and perceptions of peer feedback. Our participants submitted an essay where they received concise general or elaborated specific peer feedback from a fictitious male, female, or anonymous peer assessor in a computer-supported collaborative learning platform. After going through the peer feedback, participants answered a peer feedback perceptions questionnaire, and submitted a revised version of the essay. Our preliminary result suggests that women scored higher in the pre-test version of the essay. Also, men reported that they experienced negative affect when going through the peer feedback given by an anonymous and by a women assessor. We suggest for the implementation of training to support students' emotions when receiving peer feedback.

Symposium

Teaching and Teacher Education

The Development of Core Practices from a Cross-National Perspective

Keywords: Feedback, Learning Strategies, Motivation, Pre-service Teachers, Teacher Professional Development, Teaching Approaches, Teaching/Instructional Strategies
Interest group: SIG 11 - Teaching and Teacher Education
Chairperson: Pamela Grossman, University of Pennsylvania, United States
Chairperson: Urban Fraefel, Switzerland
Discussant: Tina Seidel, Technische Universität München, Germany

The turn towards practice-based teacher education has been well documented in the US. This symposium aims to provide researchers and teacher educators in teacher education with an early sense of how the ideas and approaches related to practice-based teacher education are being taken up by universities in Europe. The institutional efforts share common ground around their commitment to placing practice at the center of their curriculum.We understand core practices in teaching as identifiable components fundamental to teaching, grounded in disciplinary and pedagogical goals that teachers enact to support learning. Core practices consist of the enactment of knowledge, beliefs, and dispositions through pedagogical approaches, strategies, routines, and moves that can be unpacked and learned by teachers. Core practices recognize the highly intersubjective and complex nature of teaching and are deeply connected to the goals of disciplinary learning.The focus on core practices in teacher education research and practice has developed significant momentum in the second decade of this century. Professionals in Germany, Norway, the Netherlands, and Switzerland continue to develop the concept, in interaction with local contexts, and research how the concept of core practices can best contribute to the practical preparation of pre-service and in-service teachers. Specific elements of this work will be presented in the symposium. Discussion with the discussant and participants will include what to focus on in researching and developing the use of core practices in the near future.

A motivational perspective on learning core practices: the case of a Dutch teacher education program
Presenting Author: Hanna Westbroek, Vrije Universiteit, Amsterdam, Netherlands; **Co-Author:**Anna Kaal, University of Amsterdam, Netherlands; **Co-Author:**Sebastiaan Donszelmann, University of Amsterdam, Netherlands

This contribution presents how motivational aspects of mastering core practices were addressed in a Dutch PBTE program (1 year). Two design principles guided the design of our program: 1. Provide student teachers with opportunities to encounter, explicate and examine *personal learning needs*. 2. New core practices should be ‘practically useful’ to students. We discuss two courses that were based on these design principles: a general course that offers student teachers a sequence of core practices in a blended learning approach, and a course, 4 months course that takes teaching practices that student teachers have developed as a starting point. In this contribution we will illustrate key features of the program with the case of Nicole, a representative student teacher. Both courses were evaluated with a survey (general course, n=43/48 total; GSR course n=20/50 total). Additionally, structured focus group interviews were conducted to gain more insight in student experiences (two hours, one group of three student teachers and three groups of two students). Results show that the general, adaptive features of the program are recognized and generally positively valued by student teachers.

Using Core Practices to Improve Connections between Theory and Practice in Teacher Education
Presenting Author: Kirsti Klette, University of Oslo, Norway; **Presenting Author:**Inga Staal Jenset, University of Oslo, Norway; **Co-Author:**Gøril Brataas, University of Oslo, Faculty of Education, Norway

Researchers around the world agree on the importance of connecting theory and practice in teacher education, and many programs are adopting practice-based teacher education and core practices of teaching as a way to do so. In this paper, we report on redesign efforts from a five-year secondary university-based teacher education program in Norway, using two illustrative examples of how attention to core practices was used to strengthen TCs’ opportunities to study and enact authentic teaching practices during coursework. Data sources include candidate surveys, logs and interviews from the teacher candidates, as well as fieldwork observation data. Findings underscore how systematic focus on core practices like Feedback, Modeling and Strategy Use and Instruction support candidates’ analytical gaze through decompositions of multiple representations of practice (e.g., videos of teaching, teaching materials and lesson plans). Our findings indicate that attention to core practices of teaching during coursework can indeed influence candidates teaching practice, and point to the importance of combining attention to core practices of teaching with attention the specific context of the teaching, and the overall purpose of education.

How Can the Acquisition of Core Practices be optimally fostered? A Research Agenda and First Results
Presenting Author: Hadmut Hipp, Albert-Ludwigs-Universität Freiburg, Germany; **Co-Author:**Anna Holstein, Leuphana University Lueneburg, Germany; **Co-Author:**Matthias Nückles, University of Freiburg, Germany; **Co-Author:**Marc Kleinknecht, Leuphana University Lueneburg, Germany

Recently, the notion of core practices has been suggested as principle around which teacher education may be organized. A strength of the core-practices concept is that the concrete and situated demands of teaching come into focus. We have developed an experimental research program, in which we investigate how the training of core practices should be optimally designed. Our program is based on a theoretical discussion of the Learning Cycle by McDonald et al. (2013), Anderson’s (1982) skill acquisition model ACT-R, and Kapur’s (2008) Productive Failure. This interdisciplinary discussion has spawned several research questions which we believe are fundamental to the teaching of core practices: Which phases should a core practice training be composed of? Which sequence of phases supports core practice acquisition best? What is the added value of approximations of practice (e.g., microteaching with peers)? Which benefit results from peer- and expert feedback?In our presentation, we will start with an overview of our discussion of the aforementioned theoretical approaches. Then follows a first intervention study in which we addressed the composition and the sequencing question. Results suggest that offering preservice teachers the opportunity to enact a core practice independently with students was more beneficial than simply having them reflect on the performance of a teacher modelling the core practice. Nevertheless, in line with the Learning Cycle and ACT-R, independent enactment of the core practice was most successful if preservice teachers studied the modelling example and a principle-based explanation of the core practice as preparation to the enactment phase.

Supporting teachers’ learning through co-planning, rehearsing and co-enacting instruction
Presenting Author: Kjersti Waege, Norwegian University of Science and Technology (NTNU), Norway; **Presenting Author:**Janne Fauskanger, University of Stavanger, Norway; **Co-Author:**Reidar Mosvold, University of Stavanger, Norway

The *Mastering Ambitious Mathematics teaching* professional development and research project (MAM) takes a core-practices approach to supporting in-service teachers’ development of ambitious mathematics teaching by inviting them into learning cycles of enactment and investigation. Whereas multiple studies have analysed opportunities for learning in particular settings, this study investigate opportunities for learning core practices of ambitious teaching as they were emphasized in co-planning, rehearsals and co-enactments. Findings indicate that different practices were emphasized in different settings and the participants focused on different aspects of the practices in the three settings. It is thus important to include all three settings in future professional development.

Session I 4

24 August 2023 12:00 - 13:30
UOM_A08
Symposium
Teaching and Teacher Education

Obstacles and Opportunities: New insights into (student) teachers' attitudes on inclusive education

Keywords: Assessment Methods, Attitudes and Beliefs, In-service Teachers, Inclusive Education, Pre-service Teachers, Self-efficacy, Special Education, Teacher Professional Development
Interest group: SIG 15 - Special Educational Needs
Chairperson: Charlotte Sophie Schell, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany

Chairperson: Hannah Kleen, Germany
Organiser: Charlotte Sophie Schell, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany
Organiser: Charlotte Dignath, TU Dortmund University, Germany
Organiser: Hannah Kleen, Germany
Discussant: Sabine Glock, Bergische Universität Wuppertal, Germany

As the United Nations have been promoting the inclusion of students with special educational needs (SEN) into regular classrooms, (prospective) teachers feel faced with new opportunities, but also with obstacles for their teaching. Teachers' attitudes towards students with SEN and their inclusion play a major role in how (student) teachers (will) manage to successfully implement inclusion in their classrooms. The goal of this symposium is to shine a light on those attitudes of (student) teachers as well as related constructs in this relatively young field of research. The symposium starts with an overview of similarities and differences in the attitudes student teachers hold towards pupils with different SEN. Since teachers' attitudes towards pupils with SEN may affect their attitudes towards inclusion, the second contribution presents a validation study on a scale to measure teachers' general as well as personal attitudes towards inclusion. As personal attitudes are related to professional training, the third study firstly presents a meta-analysis on the relation of attitudes and self-efficacy and secondly investigates the causality between those two constructs. Coming from an individual level to a systemic one, the symposium concludes with a study investigating the relation between teachers' attitudes towards inclusion and systemic values. This symposium aims to provide more detailed information about teacher attitudes and related constructs that may affect the inclusion of pupils with SEN into regular classrooms, by combining research on attitudes towards pupils with SEN, attitudes towards inclusive education, self-efficacy beliefs regarding the implementation of inclusion, and systemic values regarding inclusion.

Investigating Student teachers' attitudes towards children with special educational needs
Presenting Author: Charlotte Sophie Schell, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany; **Co-Author:**Charlotte Dignath, TU Dortmund University, Germany; **Co-Author:**Hannah Kleen, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany; **Co-Author:**Mareike Kunter, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany

Practice and research show that stereotypes about learners with special educational needs (SEN) are widespread in society and also present among student teachers. Such stereotypes could be barriers to professional diagnosis if they lead to overlooking or overestimating certain student information. In this study, we aim to describe student teachers' stereotype content of children with SEN focussing on children with Down syndrome, autism spectrum disorder and learning difficulties. In a first and qualitative study, we interviewed a sample (N = 13) of different student teachers about potential stereotypes. In the second and quantitative study (N = 213), we build on these answers constructing a questionnaire to measure and verify those stereotypes and additionally assessed stereotypes using the Stereotype Content Model by Fiske et al. (2002). The results showed distinctive stereotype content for students with Down syndrome, autism spectrum disorder and learning difficulties.

Development of the Teacher Attitude to inclusion Scale
Presenting Author: Christopher Boyle, University of Adelaide, Australia; **Co-Author:**Joanna Anderson, University of New England, Australia

Providing an effective and high-quality education for all children and young people remains a significant challenge throughout the world. Disputes and contradictions contribute to the prevailing debate as to the justification and merits of inclusive education. One of the reoccurring themes within the literature on inclusive education is the relationship between the successful application of teachers' knowledge, skills, and abilities utilised to include inclusive strategies in their classrooms, and their attitude towards inclusion. A teacher with more positive attitudes will be more accepting of students, build more successful relationships with them, aid in a child's sense of belonging, student academic success and social integration. To address this issue, the Teacher Attitudes to Inclusion Scale (TAIS) was developed by the first author to measure the attitudes of qualified (in-service) teachers towards inclusive education. Using an Exploratory Principal Components Analysis and Reliability, a revised version of the TAIS, the TAIS-R provides a psychometrically validated measure of two constructs – a global attitude and a personal attitude towards inclusive education that provides an accurate evaluation tool for research and practice.

Teacher attitudes towards inclusion – the role of self-efficacy believes
Presenting Author: Hannu Savolainen, University of Eastern Finland, Finland; **Co-Author:**Akie Yada, University of Jyväskylä, Finland; **Co-Author:**Susanne Schwab, University of Vienna, Austria

Teacher attitudes towards inclusion (TA) are often regarded as one major obstacle on the way towards more inclusive education as attitudes seem to be related to teacher behavior. Teachers' self-efficacy believes (TSE) are important for the successful implementation of inclusive education. While systematic reviews are existing for TA (e.g. Avramidis & Norwich, 2002; de Boer et al., 2011), and plenty of studies have examined the relation between TA and TSE, but a meta-study about the relation between TA and TSE is currently missing. Further, the direction of causality between the concepts can be questioned. Study 1 is a meta study including 41 studies. The selection of this studies was based on the RISMA statement protocol using several databases (e.g. ERIC, WoS, EBSCOhost). A sample size weighted correlation coefficient between teachers attitudes and TSE of r = 0.35 was found. Neither sample characteristic nor publication characteristics moderated this correlation. Study 2 was conducted as an electronic survey including data from 1326 Finish teachers. TSE was available at five measurement points and teachers attitudes at three measurement points. The results of a cross-lagged analysis showed high stability of both constructs. The result suggest that the direction of causality is such that TSE predicts teachers' attitudes rather than vice versa. The findings of the two studies imply that increasing TSE might be a way to improve teacher attitudes in the future. Therefore, ways to support TSE need to be addressed pre- and in-service teacher education.

Enhancing values in the educational system: effects on teachers attitudes toward inclusive education
Presenting Author: Anne-Laure PERRIN, University of Lille -PSITEC - EA 4072, France; **Co-Author:**Mickaël Jury, Clermont Auvergne University, France; **Co-Author:**Caroline Desombre, Université de Lille, France

To enable inclusive education values, organization, and functioning of the educational system have been reshaped (Bonvin et al., 2013) but some barriers remain, and among them teachers' attitudes toward inclusive education. These attitudes are notably related to teachers' values (Perrin et al., 2021). Due to the values the educational system also conveys, we assume that making salient those known to be positively linked to attitudes could enhance more positive attitudes among teachers in comparison with a control condition or with negatively linked values. To test this hypothesis, 527 volunteer teachers were randomly assigned to 4 experimental conditions enhancing specific values in a fictitious front page of a teachers' monthly magazine that they had to read before completing a measure of attitudes toward inclusive education. Results partially support the hypothesis but support the idea that the values promoted by the educational system could influence teachers' attitudes toward inclusive education, and open up prospects for enhancing inclusive policies and finally making inclusion an undeniable success.

Session I 5

24 August 2023 12:00 - 13:30
UOM_A02
Symposium
Cognitive Science, Learning and Special Education

The neural, (non-)cognitive and home predictors of individual differences in childhood learning

Keywords: Cognitive Development, Developmental Processes, Educational Neuroscience, Gifted and Talented Students, Learning and Developmental Difficulties, Mathematics/Numeracy, Quantitative Methods, Reading, Special Education
Interest group: SIG 05 - Learning and Development in Early Childhood, SIG 15 - Special Educational Needs
Chairperson: Jessica Vergeer, Radboud University Nijmegen, Behavioural Science Institute, Netherlands
Organiser: Bob Kapteijns, Behavioural Science Institute, Radboud University Nijmegen, Netherlands
Discussant: Daniel Ansari, University of Western Ontario, Canada

Individual differences at young ages are predictive of educational outcomes in later school years. It is essential for researchers and educators alike to recognize individual differences between children, in order to optimally meet their educational needs.

This symposium will present findings from multiple domains of research, providing different yet overlapping perspectives on the neural, cognitive, non-cognitive, and familial/home factors that underlie individual differences in childhood learning trajectories. Different theoretical and methodological approaches are presented, ranging from more explorative child-oriented approaches to large-scale neurodevelopmental cohort studies.
The first contribution will present results from a quantitative study on the home, school and cognitive predictors of early numeracy and literacy development in a large sample of 220 kindergartners.
The second contribution presents multivariate analyses of neuroimaging data from children and their mothers and discusses familial influences on the neural correlates of numerical and literacy performance, as well as the neural resources that are shared between both domains.
The third contribution has implemented generative network modelling to provide a computational framework for understanding neurodevelopmental diversity in a large sample of neurodiverse children (n=270).
The fourth contribution uses Latent Class Analysis (LCA) to explore profiles of non-cognitive characteristics in a small neurodiverse sample of twice-exceptional learners, to examine whether the profiles of these characteristics transcend traditional boundaries of classification.

Methodologies and findings from these studies will shed new light on the factors underpinning individual differences in childhood learning and development. Various scientific and educational implications will be addressed throughout this symposium.

Home, school and cognitive predictors of individual differences in early math and reading skills
Presenting Author: Bob Kapteijns, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Anne van Hoogmoed, Radboud University, Netherlands; **Co-Author:**Marco van de Ven, Radboud University, Netherlands; **Co-Author:**Evelyn Kroesbergen, Radboud University, Netherlands; **Co-Author:**Rogier Kievit, Radboud University, Netherlands

The development of early math and reading skills, and their relationship with ‘general’ cognitive development, has been the subject of much investigation throughout recent years. Still, a comprehensive framework of the interrelations between math, reading and general cognitive development in early childhood is lacking. In this ongoing project, we are conducting a longitudinal investigation of early cognitive, numerical and literacy development over a period spanning from kindergarten until the second grade of primary school in a large sample of children (n=220). School and home predictors (e.g., parental activities and expectations) are investigated as well, in order to examine the roles of various environmental factors in these learning trajectories.
Ultimately, this project aims to investigate the ways in which executive functioning (EF), working memory (WM) and fluid intelligence dynamically develop over time, and how they may interact bidirectionally with number sense, early numeracy and early literacy development. Taken together, this approach will help us to better understand individual differences in the dynamic relationships between various components of early child development.
Data collection for this longitudinal project is currently ongoing. The project consists of five separate time points, spanning approx. 2,5 years. The first wave of data is being collected in the Fall of 2022, and the second wave will be collected in the Spring of 2023 (February through April). Therefore, this presentation will present results from the first two time points.

Familial influences on the neural correlates of Math and Reading
Presenting Author: Aymee Alvarez Rivero, University of Western Ontario, Canada; **Co-Author:**Lien Peters, The University of Western Ontario, Canada; **Co-Author:**Daniel Ansari, University of Western Ontario, Canada

Math and reading are fundamental academic skills that have been largely studied. Multiple behavioral, longitudinal and genome-wide association studies have revealed strong associations between these skills. However, the neuroimaging evidence about shared neural correlates between both domains is still scarce. We also know that reading and math abilities are highly heritable. However, studies directly comparing the functional organization of the neural pathways that support math and reading from parents to children are still lacking. In the current study, we aim to use fMRI combined with multivariate methods to assess similarities in the neural patterns of brain activation associated with phonological decoding and arithmetic in a group of 47 children and their mothers. By administering the same neurocognitive tasks to both mothers and children we aim to uncover familial influences in the functional organization of the brain regions engaged during reading and math. Preliminary analyses of behavioral data point to significant associations between children’s reading and math abilities, as well as significant associations between mother-child reading and math performance. In addition, preliminary univariate analyses of neuroimaging data have revealed at least three clusters that are significantly active during both reading and arithmetic. Further analysis using RSA will reveal whether these clusters also display similar patterns of distributed activation across multiple voxels for math and reading, and whether we can use these patters to identify child-mother dyads.

CANCELLED: Modelling neurodiversity with a generative approach
Presenting Author: Danyal Akarca, University of Cambridge, UK, United Kingdom; **Co-Author:**Petra E. Vértes, Department of Psychiatry, University of Cambridge, United Kingdom; **Co-Author:**Edward T. Bullmore, Department of Psychiatry, University of Cambridge, United Kingdom; **Co-Author:**the CALM team, MRC Cognition and Brain Sciences Unit, University of Cambridge, United Kingdom; **Co-Author:**Duncan E. Astle, MRC Cognition and Brain Sciences Unit, University of Cambridge, United Kingdom

This presentation has been cancelled and will not be presented at EARLI 2023.Individual differences in childhood developmental trajectories can be measured at a range of different levels, including behaviour, cognition and the brain. But what drives these differences over time? At the level of the brain, the continual refinement and change in brain networks represents crucial developmental processes that can drive individual differences in cognition and which are associated with multiple neurodevelopmental conditions. But what mechanisms drive diversity in brain organization? In this work, we use generative network modelling to provide a computational framework for understanding neurodevelopmental diversity in a large sample of neurodiverse children (n=270) from the Centre for Attention, Learning and Memory (CALM) cohort. Within this framework, macroscopic brain organization is an emergent property of a generative model that shapes brain connectivity by renegotiating its biological costs with its topological values continuously over time. The rules governing the model are controlled by a set of tightly framed parameters, with subtle differences in these parameters steering brain network growth towards different neurodiverse outcomes that are associated with the child’s cognition, including e.g. math performance. Importantly, for each child, we can estimate a model that best explains their individual trajectory – giving us a way to clearly conceptualize individual differences in childhood development.

Non-cognitive characteristics in a sample of (presumable) twice-exceptional students
Presenting Author: Marielle Wittelings, Behavioural Science Institute, Radboud University Nijmegen, Netherlands; **Co-Author:**Lianne Hoogeveen, Radboud University, Netherlands; **Co-Author:**Evelyn Kroesbergen, Radboud University, Netherlands

Research has underlined the importance of identifying student’s non-cognitive characteristics in addition to their cognitive characteristics to inform identification and intervention practices. However, recognizing non-cognitive characteristics can be a challenging task for (educational) professionals, especially when students show characteristics of giftedness and co-occurring learning, developmental, and/or behavioural disabilities (twice-exceptional students). At the same time, it is questioned whether differentiation based on classifications will lead to more insights, and research in other psychological domains suggested studying individual symptoms, their patterns, and associations. The aim of this study was therefore to explore whether profiles of non-cognitive characteristics in a small sample (n = 35) of (presumable) twice-exceptional students transcend the boundaries of classifications. Both student and parent questionnaire data were derived from a larger research project on the identification and educational adjustments for (presumable) twice-exceptional students in Dutch primary and secondary education. The students' (66.7% male) ages ranged between 5-16 years and parents' (71.4% female) ages ranged between 30-53 years. Student and parent questionnaires measuring different non-cognitive characteristics are analyzed using Latent Class Analysis (LCA). The first findings of this exploratory study show (large) variation on non-cognitive characteristics. Additionally, upcoming results from the LCA are aimed to reveal if there are profiles of non-cognitive characteristics underlying this variation and to investigate if this may be explained by the students’ classification or not. Findings are informative for

both the theoretical debate on classifications and future research designs, as well as for potentially identifying student's non-cognitive characteristics and educational needs within the educational practice.

Session I 6

24 August 2023 12:00 - 13:30
UOM_A04
Symposium
Assessment and Evaluation

Self-assessment: how students do it, how accuracy develops over time and the role of feedback

Keywords: Achievement, Assessment Methods, Classroom Assessment, Feedback, Higher Education, Secondary Education
Interest group: SIG 01 - Assessment and Evaluation
Chairperson: Leire Pinedo, Universidad de Deusto, Spain
Organiser: Leire Pinedo, Universidad de Deusto, Spain
Organiser: Laurie Delnoij, Maastricht University SBE, Ts 53, Netherlands
Discussant: Juuso Henrik Nieminen, The University of Hong Kong, Finland

Self-assessment is a crucial instructional practice that can help students develop their evaluative judgments and self-regulatory processes. To make sure self-assessment is effective and meaningful in practice, we need insight into how students' ability to self-assess accurately develops (over time), the processes involved in self-assessing, and the role of feedback in scaffolding this crucial skill. Therefore, in this symposium, we synthesize research on these topics conducted in diverse educational contexts using both qualitative as quantitative approaches. In the first two contributions, self-assessment accuracy is discussed from two different perspectives. The first contribution addresses how self-assessment accuracy develops over time and relates to performance in quantitative methods in higher education. This presenter also discusses the role of general feedback in self-assessment. The second paper will go beyond by comparing the effect of elaborated feedback versus a rubric on self-assessment accuracy in secondary education. Then, we shift the focus from accuracy to underlying mechanisms, i.e., what actually happens in the self-assessment process. The third paper examines students' real-time cognitive and affective processes using rubrics and exemplars to self-assess their analytical writing in secondary education. The fourth contribution takes it even further by identifying self-assessors' profiles as well as the effects of feedback on self-assessment in both secondary and higher education. By integrating the insights from these four presentations, we aim to advance empirical knowledge on the topic. Specifically, we unravel the (inner) processes of self-assessment and discuss how self-assessment practice can be improved through feedback.

Self-assessment accuracy over time, the role of general feedback and performance in higher education
Presenting Author: Laurie Delnoij, Maastricht University SBE, Ts 53, Netherlands; **Co-Author:**Christian Kerckhoffs, Maastricht University, School of Business and Economics, Netherlands; **Co-Author:**Therese Grohnert, Maastricht University, Netherlands; **Co-Author:**Simon Beausaert, Maastricht University, Netherlands

To improve performance, students need to be effective self-regulated learners. They should know what their abilities are, monitor their progress, and determine the next steps in learning. Self-assessment is a promising instructional strategy to support students in this. This study explored self-assessment (accuracy) in relation to practice testing in an 8-week quantitative methods course at a first-year undergraduate university level (N = 1336). At the end of each week, an initial multiple-choice practice test took place in which students also estimated the number of items answered correctly. Feedback involved their score, the correct answers alongside references to the study material, and a general statement that overconfident students would benefit from participating in repeated practice testing. Students could opt for repeated practice testing the same content (with different test items) until the initial practice test on the next week's course content. Exploratory correlational analyses replicate the robust testing-effect by confirming that both singular practice testing and repeated practice testing relate positively to end-of-course performance. Regarding the self-assessment effects, we found minor evidence for the expectation that initially overconfident students would be more likely to participate in repeated practice testing. Additionally, we expected that self-assessment accuracy would develop positively over time, which did not appear to be the case. Also, self-assessment accuracy was not related to end-of-course performance. In the EARLI symposium, we aim to focus on implications for self-assessment practice, for example, by discussing the relevance of personalized feedback and student agency in choosing the content of practice tests and self-assessment.

How to improve students' self-assessment accuracy? Rubrics versus elaborated feedback
Presenting Author: Lucas Liebenow, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Johanna Fleckenstein, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Jennifer Meyer, IPN - Leibniz Institute for Science and Mathematics Education, Germany

Self-assessment accuracy is essential for effective self-regulated learning and can foster academic performance. Elaborated feedback and rubrics both have the potential to improve the accuracy of student self-assessment, but there is a significant lack of empirical research comparing effect sizes. Therefore, this study examines the question whether the effect of elaborated feedback on self-assessment accuracy is larger compared to a rubric. In total, 130 secondary school students from Germany participated in this study and were randomly assigned to a feedback condition (n = 60) and a rubric condition (n = 70). After students had written a text, they received a computer based rubric or elaborated feedback and were asked to revise their texts based on that information. Before and after the revision, students self-assessed their performance. Regression analysis indicated that students show higher self-assessment accuracy in the feedback condition compared to the rubrics condition, when controlling for prior self-assessment accuracy. Implications for practice and directions for future research are discussed.

How Learners Self-Assess Using Rubrics and Exemplars: Tracing Cognitive and Affective Processes
Presenting Author: Nathan Rickey, Queen's University, Canada

Cultivating student self-assessment (SA) in K-12 education is critical for fostering learner agency students need to successfully navigate unprecedented societal challenges. However, the cognitive and affective processes of learners using rubrics and exemplars to self-assess are understudied, meaning that supporting learners with developing key SA skills is implausible. The purpose of this paper was to examine the real time cognitive and affective processes of senior secondary school learners using rubrics and exemplars to self-assess their analytical writing. Drawing on a theory of classroom assessment as the co-regulation of learning, I employed a collective case study using digital trace data to infer the ways in which a class of Year 12 students in the UK thought and felt while self-assessing their writing using a rubric and contrasting exemplars on a website. Matomo Analytics, a web analytics platform, collected heatmap and session recording data which elucidated *traces* of each participants' cognitive and affective operations. Participants completed qualitative exit surveys to further characterize their processes. I analyzed trace data using graph theoretic statistics to uncover relational patterns among traced operations. Triangulation of trace data and inductive analysis of keystroke logs and exit surveys revealed that (a) *progress monitoring against standards*, using the rubric and exemplars, was a central initiator of strategies to support revisions, and (b) unpleasant affective states provoked productive progress monitoring using the rubric and exemplars and a shift to positive affective states. Findings offer novel insights into cognitive and affective underpinnings of SA to drive theory and practice.

How do students self-assess? Identifying self-assessment profiles in secondary and higher education
Presenting Author: Leire Pinedo, Universidad de Deusto, Spain; **Co-Author:**Javier Fernández, Universidad de Leon, Spain; **Co-Author:**Ernesto Panadero, Universidad Deusto, Spain; **Co-Author:**Iván Sánchez-Iglesias, Universidad Complutense de Madrid, Spain; **Co-Author:**Daniel Garcia, Universidad Complutense de Madrid, Spain

While self-assessment is a widely explored area in educational research, our understanding of how students generate self-feedback is quite limited. In this study we explored and integrated two data collections (i.e., 67 secondary and 111 higher education) that investigated students' real actions while generating self-feedback. Data was collected using think aloud protocols, direct observation (video recordings) and self-reported data. By combining such data, we explored (1)

what are the different self-assessment profiles, (2) similarities and differences between secondary and higher education students, (3) similarities and differences between writing and mathematics tasks, and (4) the effects of external feedback on self-assessment. We identified six main processes (read, recall, compare, rate, assess, and redo) and four self-assessment profiles (No Self-assessment, Superficial, Intermediate and Advanced self-assessment). Secondary and higher education students showed the same actions and very similar profiles, and external feedback had a negative effect on the self-assessment except for the less advanced self-assessors. Implications for practice as well as promising steps for future research will be addressed.

Session I 7

24 August 2023 12:00 - 13:30
AUTH_T002
Symposium
Motivational, Social and Affective Processes

Motivation-performance connections in writing from elementary to secondary school

Keywords: Attitudes and Beliefs, Goal Orientations, Mindsets, Motivation, Self-efficacy, Writing/Literacy
Interest group: SIG 12 - Writing
Chairperson: Ana Camacho, University of Porto, Portugal
Chairperson: Rui Alexandre Alves, University of Porto, Portugal
Discussant: Michael Hebert, University of California, Irvine, United States

Writing motivation is a key factor in writing performance. Traditionally, the writing research field devoted more attention to cognitive and linguistic processes rather than to motivational factors. Over the past decades, however, theoretical models of writing have increasingly recognized the importance of motivational variables. Consequently, the field has witnessed a growth of studies about writing motivation. Notwithstanding the remarkable growth, there is still room to push this research field forward. In this symposium, we have a twofold aim. First, we will present current research on writing motivation across Europe. Second, we will discuss how teachers can enhance students' writing motivation. Altogether, the papers in this symposium target: (a) both widely studied (e.g., self-efficacy) and understudied motivational constructs (e.g., implicit theories); (b) different school-aged samples (early elementary, middle, and secondary school students); (c) diverse research methods (cross-sectional, longitudinal, and quasi-experimental). Specifically, the first presenter examined the associations between self-efficacy for self-regulation and writing proficiency among early elementary Norwegian students. The second presenter focused on the gender-specific changes in writing achievement goals among Icelandic middle school students, and its role in writing performance. The third presenter tested an intervention aimed at enhancing self-efficacy, implicit theories, and writing performance of Portuguese middle schoolers. Finally, the fourth presenter explored the relations among implicit theories, achievement goals, self-efficacy, writing motives, and writing performance of Flemish secondary school students. These complementary studies will allow us to synthesize research on the motivation-performance connections in writing and discuss directions to further advance the writing motivation research field.

The relationship between self-regulation and writing proficiency
Presenting Author: Gustaf Bernhard Uno Skar, Norwegian University of Science and Technology, Norway; **Co-Author:**Steve Graham, Arizona State University, United States; **Co-Author:**Alan Huebner, University of Notre Dame, United States; **Co-Author:**Arne Johannes Aasen, Norwegian University of Science and Technology, Norway, Norway

The aim of this investigation was to increase knowledge about the associations between self-efficacy and writing proficiency among young students. Participants were 2,054 students enrolled in second grade in Norway in 2021. We measured a specific aspect of self-efficacy, self-regulation (Bruning et al., 2013). Three measures of writing were included: two performance measures (handwriting fluency, and text quality) and one attitude measure. To investigate the extent to which self-regulation could explain variance in the three outcome variables we fitted three regression models. Due to the nested structure of the data, we applied a multilevel modeling (MLM) approach. After controlling for students' language background, age and the school level predictors, self-regulation was found to be a significant predictor for handwriting fluency, text quality, and attitudes to writing. The results confirm earlier research documenting an association between self-efficacy and writing performance, and it does so with a little-researched age group (second graders) in a little-researched context (Norway). The result adds backing to the proposition that it might be worthwhile to help students get more efficacious, and especially experience increases in self-regulation. If students are taught strategies to cope with the writing process, it might have beneficial consequences for their writing development.

Development of writing motivation and its contribution to gender differences in writing performance
Presenting Author: Freyja Birgisdottir, University of Iceland, Iceland; **Co-Author:**Kristján Ketill Stefánsson, University of Iceland School of Education, Iceland

Despite extensive research and governmental initiatives, females continue to outperform their male counterparts in assessments of literacy, often with larger effect sizes for writing than for reading. Although factors that result in literacy achievement are many and varied, motivation is widely considered one of its most important elements. However, few longitudinal studies exist on the development of writing motivation and its contribution to gender differences in writing performance. The current study aimed to explore gender-specific changes in writing motivation across middle school and its role in writing performance. Participants were 400 children (44.75% male) whose writing achievement goals were assessed on a yearly basis across Grades 5 to 7. Specific questions concerned whether the development of such goals would be less adaptive among boys than that of girls, and whether task-, ego-, and work-avoidance goals across Grades 5 to 7 would mediate the effect of gender on writing performance in Grade 7. Results indicated a general decline in writing achievement goals across Grades 5 to 7, except for the work-avoidance subscale, which remained stable over time. Boys exhibited higher levels of work-avoidance goals than girls, while girls scored higher on other goal subscales. Work avoidance negatively predicted writing quality, while other achievement goals were unrelated to writing. Gender had a direct effect on writing quality, as well as a weaker indirect effect via work avoidance. These findings underline the importance of targeting work avoidance in writing, particularly among boys, both for intervention purposes and in further research on writing motivation.

Does adding a mindset intervention to a writing program enhance writing motivation and performance?
Presenting Author: Ana Camacho, University of Porto, Portugal; **Co-Author:**Mariana Silva, Faculdade de Psicologia e de Ciências da Educação da Universidade do Porto, Portugal; **Co-Author:**Joana Cadima, University of Porto, Portugal; **Co-Author:**Nadine Correia, ISCTE - Instituto Universitário de Lisboa, Portugal; **Co-Author:**Paula Cristina Ferreira, Instituto Politécnico de Leiria, Portugal; **Co-Author:**João R. Daniel, ISPA - Instituto Universitário / U.I.P.C.D.E., Portugal; **Co-Author:**Rui Alexandre Alves, University of Porto, Portugal

Self-Regulated Strategy Development (SRSD) is an evidence-based instructional approach combining background knowledge, writing, and self-regulation strategies. While the positive impact of SRSD on writing performance variables is well-established, mixed findings were found for motivational variables. In this study, we examined the impact of an SRSD program on two extensively studied writing performance variables (text quality and text length) and on two motivational variables (self-efficacy and implicit theories). We also tested whether adding a brief growth mindset intervention to SRSD instruction would result in gains in writing motivation and performance. We enrolled 191 sixth graders, from 11 classes, and their Portuguese language teachers to participate in a six-week intervention study. The classes were assigned to one of three conditions: active control condition; SRSD group; and SRSD plus growth mindset intervention group (henceforth, SRSD+GM). Our results showed that the SRSD and the SRSD+GM groups outperformed the active control in text quality and length at posttest. The SRSD and the SRSD+GM groups did not differ from the active control in self-efficacy and implicit theories of writing at posttest, except in self-efficacy for ideation. We did not find an added value of the brief growth mindset intervention. Our study showed that a short SRSD program enhanced students' writing performance and self-efficacy for ideation. However, the brief nature of both SRSD and growth mindset interventions may have precluded a broader positive impact on motivational beliefs.

Relating implicit beliefs, achievement goals, self-efficacy, motives, and writing performance
Presenting Author: Fien De Smedt, Ghent University, Belgium; **Co-Author:**Yana Landrieu, Ghent University, Belgium; **Co-Author:**Bram De Wever, Ghent University, Belgium; **Co-Author:**Hilde Van Keer, Ghent University, Belgium

It is well established that students' motivation for writing is a key predictor of their writing performance. The aim of the current study is to study and map the mechanics underlying different motivational constructs (i.e., implicit theories, achievement goals, self-efficacy, and writing motives) and to investigate how these contribute to students' writing performance. For that, 390 Flemish students in the academic track of secondary education completed questionnaires measuring their implicit theories of writing, achievement goals, self-efficacy for writing, and writing motives. Furthermore, they completed an argumentative writing test. Path analysis revealed statistically significant direct paths from (1) entity beliefs about writing to performance avoidance goals (β = .23), (2) mastery goals to self-efficacy for writing ($\beta_{argumentation}$ = .14, $\beta_{regulation}$ = .25, $\beta_{conventions}$ = .18), performance-approach goals to self-efficacy for writing ($\beta_{argumentation}$ = .38, $\beta_{regulation}$ = .21, $\beta_{conventions}$ = .25), and performance-avoidance goals to self-efficacy for writing ($\beta_{argumentation}$ = -.30, $\beta_{regulation}$ = -.24, $\beta_{conventions}$ = -.28), (3) self-efficacy for regulation to both autonomous (β = .20) and controlled motivation (β = -.15), (4) mastery goals to autonomous motivation (β = .58), (5) performance approach and avoidance goals to controlled motivation (β = .18; β = .35), and (6) autonomous motivation to writing performance (β = .11). This study moves the field of writing motivation research forward by studying the contribution of implicit theories, achievement goals, and self-efficacy to students' writing performance, via writing motives.

Session I 8

24 August 2023 12:00 - 13:30
UOM_A03
Symposium

When does feedback unfold its benefits? Insights from studies taking multiple perspectives.

Keywords: Attitudes and Beliefs, Cognitive Skills and Processes, Computer-assisted Learning, Feedback, Instructional Design, Interest, Mathematics/Numeracy, Motivation, Primary Education, Reading, Secondary Education, Self-regulated Learning and Behaviour
Interest group:
Chairperson: Robbert Smit, University of Teacher Education St.Gallen, Switzerland
Discussant: Susanne Narciss, TU Dresden, Germany

Decades of feedback research have revealed that feedback is a core factor for learning and instruction, but if and how feedback is unfolding its effects depends on various factors (see e.g., Hattie & Timperley, 2007; Kluger & DeNisi, 1996; Lipnevich & Panadero, 2022). Based on two recent reviews of 14 prominent feedback frameworks Panadero and Lipnevich (2022) have identified five groups of central factors explaining the large variability of feedback effects on learning outcomes: Message, Implementation, Student, Context, and Agents. The four studies of this symposium provide insights into the role of some of these factors by investigating main and interactive effects of two or more of the factors. In these studies, feedback is provided by two types of agents: computers and teachers. The studies' contexts range from reading comprehension and math to problem solving tasks and writing. Additionally, Swart combines message and implementation characteristics by investigating the effects of elaborateness and timing of feedback on reading comprehension. Smit and colleagues combine message and student characteristics by investigating the effects of teachers' feedback messages on mathematical reasoning for students with differing levels of interest in mathematics. Laudel and colleagues combine implementation and student characteristics by investigating the effect of prompting internal feedback and/or self-compassion on individual differences in the perception of negative feedback and post-feedback learning behavior. Bahr and colleagues combine message and student-agent interaction by investigating the effect of different feedback messages on perceived usefulness and situational interest.

The effect of timing and elaborateness of feedback to support and teach reading comprehension
Presenting Author: Elise Swart, Leiden University, Netherlands

Reading comprehension is essential for success in education. However, the number of children with reading difficulties is high (OECD, 2019). The need for developing knowledge about effective instructional methods to improve reading comprehension is thus undeniable. This concerns instructional methods to support both text comprehension, i.e. learning texts, and to teach students comprehension skills that they can use when reading new texts. Recent literature studies (Author et al., 2019, 2022) have shown that feedback can be an effective method of instruction to support and teach reading comprehension, but that its effectiveness strongly depends on the way in which feedback is designed. The aim of the present study is to systematically investigate the effect of different types of feedback (in terms of timing and elaborateness of the feedback) on reading comprehension. It examines the effectiveness for both supporting the comprehension of a text and for teaching reading comprehension skills that can be used when reading new texts. In an experimental study, the effect of different types of feedback will be investigated in 150 5^{th} grade students, who will be divided into four experimental conditions and two control conditions. The expected results provide guidelines for shaping instruction to prevent and remediate reading comprehension problems.

Hattie & Timperley's feedback levels applied for subject specific content – A math example
Presenting Author: Robbert Smit, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Patricia Bachmann, University of Teacher Education St.Gallen, Switzerland

We present a study that tried to combine feedback elements that were derived from the well-known feedback model of Hattie & Timperley (2007) with feedback that relates to subject specific content. The aim was to explain the impact of feedback for the learning of mathematical reasoning in primary school. It is assumed that reasoning tasks have the potential to trigger students' interest (Sullivan et al., 2012). Feedback needs to be aligned to the learning phase, in the beginning more task feedback is valuable (Hattie & Clarke, 2019). Based on the video-analysis of 44 teachers of 5^{th} and 6^{th} grade primary school classes (N = 804) we examined how feedback on the task level related to two steps (approach and operationalization) of the mathematical reasoning process. In our structural equation model, it further showed that feedback on the task level predicted student achievement in mathematical reasoning via students' interest in mathematics. It might be concluded that the four levels of feedback should be applied by the teacher in such a way that they focus on the current problem that is occurring as the student is solving a task.

How to receive negative feedback well? The effects of internal feedback and self-compassion
Presenting Author: Susanne Narciss, TU Dresden, Germany; **Co-Author:**Helena Laudel, Dresden Technical University, Germany

A new perspective in feedback research focuses on how learners receive and process feedback. The present study adopts this perspective in examining how learners can be supported in receiving negative feedback well. Negative feedback that indicates a discrepancy between the current achievement and the standards can be perceived as self-threatening and hinder learning. Especially learners with low perceived competence often do not benefit from negative feedback. This study aims at investigating the effects of a) a brief internal feedback intervention prior to external negative feedback, and b) a brief self-compassion intervention after receiving negative feedback on feedback perception and post-feedback learning behavior. A sample of N=250 participants is assigned to one of four groups in a 2x2-factorial design. Trait self-compassion and perceived competence are included as moderating factors to account for the relevance of learner characteristics. Data collection is expected to be finished in March 2023. We expect the interventions to support more conducive feedback perception and more adaptive post-feedback learning behavior compared to the control group. Findings will be discussed with regard to their implications for further research as well as their insights on the practical relevance of self-compassion and internal feedback for supporting adaptive coping with negative feedback.

Automated Feedback Effects on Interest Development: Mediated by Feedback's Perceived Usefulness
Presenting Author: Luca Bahr, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Lars Höft, IPN - Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Thorben Jansen, Leibniz Institute for Science and Mathematics Education, Germany

Developing interest is one of the central goals in K-12 science education. Specific feedback provided by a teacher has been shown to trigger interest via the student perception of feedback usefulness. However, providing specific feedback with a digital agent (i.e., computer) is challenging as algorithm feedback only matches performance in 80% of cases. Thus, we investigated how (mismatched) computer-generated feedback affects feedback working mechanisms in online learning environments. Specifically, we compared the effects of specific feedback, either given algorithm-based to adapt it to performance or at random (less

likely to match performance) with general feedback (matching performance) on changes in situational interest – with a particular focus on the mediating role of feedback's perceived usefulness. 463 secondary school students participated in the experimental study with varied feedback in a between-subject design and three measurement points. Students wrote an argumentative text, received feedback, and revised their texts. Results from path analysis indicated that both specific feedbacks (algorithm-based and random) were perceived as more useful than the general feedback. The working mechanism of computer-generated feedback did not differ from teacher provided feedback since specific feedback (algorithm-based and random) had significant indirect effects on changes in situational interest after feedback and after revision via the perception of feedback usefulness. These preliminary findings suggest that specific feedback comments are better at fostering interest than general comments, despite a potential mismatch with actual performance. At the time of the conference, the observed fit of feedback-student text will have been calculated and practical implications will be discussed.

Session I 9

24 August 2023 12:00 - 13:30
UOM_CR
Symposium
Motivational, Social and Affective Processes

University students' motivation: Recent developments in Expectancy-Value Theory

Keywords: Attitudes and Beliefs, Emotion and Affect, Higher Education, Motivation, Quantitative Methods
Interest group: SIG 08 - Motivation and Emotion
Chairperson: Julia Dietrich, Friedrich-Schiller-University Jena, Germany
Chairperson: Alexander Naumann, Friedrich-Schiller-University Jena, Germany
Discussant: Burkhard Gniewosz, University of Salzburg, Austria

The symposium brings together four papers which each addresses a new aspect to the research on modern Expectancy x Value-Theory (EVT, Eccles & Wigfield, 2020), one of the most influential motivation theories at present. EVT posits that expectancy (can I learn this?) and value beliefs (do I want to learn this?) are central factors influencing outcomes such as effort and persistence, achievement-related choices, and performance. Given the already existing large body of research on EVT, what new can be learnt? For example, the presentations add to recent debates about how the structure of expectancy-value facets can be described and predicted not only on the level of individual students but also on the level of learning situations. The new aspects presented in this symposium concern the methodology to measure expectancy-value beliefs, thus far uncharted or under-researched correlates, and the generalizability of findings. The papers take up recent methodological developments such as network analysis, experience-sampling, and ManyLab data collections. The four papers have in common their research context, namely, university. They also have in common that they use inductive research methods like latent profile or network analysis, which calls not only for replications but also a debate about the conditions under which certain results are found. ReferenceEccles, J. S., & Wigfield, A. (2020). From expectancy-value theory to situated expectancy-value theory: A developmental, social cognitive, and sociocultural perspective on motivation. Contemporary Educational Psychology, 61, 101859.

How can motivational psychology benefit from different approaches to network analysis?
Presenting Author: Julia Dietrich, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Miriam Jähne, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Alexander Naumann, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Julia Moeller, Universität Leipzig, Germany

Academic motivation is central to successful learning of university students. Especially, the dimensionality of Eccles and Wigfield's (2020) expectancy-value theory (EVT) has received closer attention. Nonetheless, EVT has rarely been studied from the psychometric network approach which understands motivational facets in a system of complex, mutual interdependencies. Moreover, there is little guidance on how such network analysis can be used in motivational research. Our paper presents three variants of network analysis (correlative, partial-correlative, co-endorsement) and illustrates how they can be used and interpreted specifically for the study of academic motivation. (Partial)correlative networks examine the (partial)correlations between variables and determine the centrality of the variables within the network. Co-endorsement networks use binary data to show the extent to which two motivational facets are agreed with. 341 first-semester students from different disciplines (biology, nutrition, teaching, medicine, psychology, law, economics) were surveyed cross-sectionally to record how motivating in terms of expectancy, values, and costs the students experienced their first semester. In the analyses, both the correlative and the partial correlative network primarily identified correlation among the task values and among the costs, respectively. In contrast, preliminary results of the co-endorsement network analysis indicated that positive task values and negative costs occur together. All analyses have in common that the intrinsic value is assigned a rather prominent position. Depending on the network analysis method used, it differs which value facets are central within the network or occur particularly frequently together and thus represent possible starting points for interventions and (more individuum-focused) future research.

Stability of Motivational Profiles, the Predictive Role of Perfectionism, and Links to Well-being
Presenting Author: Henriikka Juntunen, University of Helsinki, Finland; **Co-Author:**Heta Tuominen, University of Eastern Finland, Finland; **Co-Author:**Riikka Hirvonen, University of Eastern Finland, Finland; **Co-Author:**Jaana Viljaranta, University of Eastern Finland, Finland; **Co-Author:**Auli Toom, University of Helsinki, Finland; **Co-Author:**Markku Niemivirta, University of Eastern Finland, Finland

Students demonstrate qualitatively diverse motivational profiles that also relate to academic outcomes differently, but little is still known about the stability of the profiles and the possible predictors. In this study, we investigated university students' expectancy-value-cost profiles and their stability over time, the role of perfectionism as a predictor, and profile differences in well-being, within the latent variable modelling framework. Data were collected from Finnish university students (N = 426) over two timepoints during the pandemic. We identified five distinct expectancy-value-cost profiles: positively ambitious (T1 28%, T2 29%), struggling ambitious (T1 22%, T2 19%), moderately motivated (T1 24%, T2 23%), indifferent (T1 18%, T2 22%), and disengaged (T1 7%, T2 7%). Overall, 85% of all students demonstrated a stable profile over a semester, positively ambitious profile showing the highest stability. Perfectionism seemed to be an important predictor of students' likely motivational profiles and some transitions. For example, higher levels of perfectionistic concerns predicted an increased likelihood of membership into the disengaged group and a decreased likelihood into the positively ambitious profiles. Differently motivated students' also differed significantly in the well-being outcomes. Overall, the positively ambitious students displayed the most adaptive well-being and the disengaged students the most maladaptive. The findings offer insights on the associations between general perfectionistic tendencies, expectancy-value-cost motivation regarding studies, and both academic and more general well-being.

Determinants of Motivational Constellations During University Students' Exam Preparation
Presenting Author: Theresa Schnettler, Mannheim University, Germany; **Co-Author:**Brian M. Galla, University of Pittsburgh, United States; **Co-Author:**Anne Scheunemann, Ruhr-University Bochum, Germany; **Co-Author:**Lena Sofie Kegel, Educational Psychology, University of Münster, Germany; **Co-Author:**Stefan Fries, University of Bielefeld, Germany; **Co-Author:**Stefan Janke, University of Mannheim, Germany; **Co-Author:**Carola Grunschel, University of Münster, Germany

Students' motivation is pivotal for effective learning, particularly during performance-critical times such as exam preparation (Capelle et al., 2021). According to Situated Expectancy-Value Theory (SEVT, Eccles & Wigfield, 2020), motivation is situated and comprises expectancies for success, positive and negative value components. Initial studies found that these components fluctuate in varying constellations within students across learning situations during a lecture (Dietrich et al., 2019). SEVT theorizes that gender, temporal proximity of the exam, and task-difficulty are important determinants of situational motivation. In the present study, we investigated intraindividual motivational constellations (profiles) during exam preparation and how gender, temporal proximity, and task difficulty related with the likelihood to experience any of the motivational profiles. A total of 93 undergraduate university students provided data on 645 learning situations in an experience-sampling study during ten days before an exam. Using multilevel latent profile analysis, we identified four profiles of motivational constellations during exam preparation. Two profiles comprised medium and highly motivating situations whereas one profile contained valuable but costly situations, and one profile comprised high-cost situations. The likelihood to experience each of the profiles was unrelated to gender and temporal proximity of the exam. Very low

and very high task difficulty increased the likelihood to experience valuable but costly situations and high-cost situations, whereas the other two profiles co-occurred with moderate task difficulty. Our study advances the theoretical understanding how motivational components combine in performance-critical situations and how task difficulty impacts learning motivation. We further conclude to develop context-sensitive motivational interventions.

Generalizability of situated expectancy-value findings: Invitation to a ManyMoments data collection
Presenting Author: Jessica Baars, Leipzig University, Germany; **Co-Author:**Lennart Nörenberg, Universität Leipzig, Germany; **Co-Author:**Julia Moeller, Universität Leipzig, Germany

Intensive longitudinal studies investigate phenomena that change over time, people, and contexts. The experience sampling method (ESM) gathers fluctuating psychological states. When examining motivation and emotions with ESM, challenges to the generalizability and replicability arise (Table 1). In addition to general challenges depicted in Table 1, there are further reasons to systematically compare findings of situational academic motivation and emotions across contexts. For instance, first empirical studies on situated expectancy-value experiences (Dietrich et al., 2017; 2019; Moeller et al., 2020; 2022) relied on pilot data from one university lecture only and therefore need to be replicated and tested for generalizability across contexts. To prepare such a systematic replication, we invite the audience to join a multi-lab study of situated expectancy-value measures across university lectures, forming part of the ManyMoments Project.
This multi-lab project aims to investigate assumptions central to the situated expectancy-value theory (Eccles & Wigfield, 2020) and the DYNAMICS framework (Figure 1; Moeller et al., 2022). It will examine the short-term development of situational expectancy-value experiences, as well as heterogeneity versus generalizability across individuals, time points, and contexts.
The presentation presents the research design that will be used in the ManyMoments project. We hope to start a debate about needs and solutions for replicable ESM research on academic emotions and motivation and to invite the audience to join the ManyMoments project for a joint data collection of situated expectancy-value experiences in university classes.

Effective language programs for students who need extra language support: A systematic meta-review
Keywords: Foreign and Second Language Acquisition, L1/Standard Language Acquisition, Meta-analysis, Writing/Literacy
Presenting Author: Jordi Casteleyn, Antwerp University, Belgium; **Co-Author:**Mathea Simons, University of Antwerp, Belgium; **Co-Author:**Tom Smits, Antwerp University, Belgium

There is a clear need for language programs catering for students with insufficient command of the instruction language. But what are the features of effective language programs? To find the answer, we adopted the procedure of an umbrella review, which only uses systematic reviews, with or without a meta-analysis, and thus does not include primary studies. We identified studies (N=952) based on relevant keywords, after which publications were excluded based on title, abstract (n=727) and full text (n=184). In the second phase, we assessed methodological quality, resulting in an additional 8 studies being excluded. Eventually, these studies (n=33) were simultaneously analyzed by several researchers to ensure the validity of the project results. We ultimately identified six ‘building blocks’ that are essential in developing an effective language program: the first being education as a multi-tiered approach, the second the step-by-step development of skills, the third focusing on the oral skills, the fourth building block a focus on literacy skills, the fifth being high-quality instruction and finally, as the sixth corner stone, monitoring student progress. In this session, we will further describe the results of the project and define how these building blocks will help colleagues who experience similar challenges.

Enhancing genre knowledge of argumentative texts through learning from comPA(I)Ring exemplars
Keywords: Argumentation, Knowledge Construction, Secondary Education, Writing/Literacy
Presenting Author: Tine Mombaers, University of Antwerp, Belgium; **Co-Author:**Roos Van Gasse, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, Antwerp University, Belgium

Poor writing skills are problematic in today’s society where writing expertise is essential in personal, academic and professional contexts. Students struggle most with argumentative writing. To write a good argumentative text, students need genre knowledge on this type of text. After all, genre knowledge has been proven to be related to writing quality. Despite its relevance, existing literature does not describe how to best enhance genre knowledge. Learning from (comparing) text exemplars might be the missing link. This study aims to investigate whether learning from (comparing) text exemplars can enhance genre knowledge. A quasi-experimental study with 77 11^{th} grade students was carried out to test the effects of four conditions on genre knowledge of argumentative texts. Findings show that looking for differences seems less effective than searching for similarities. In addition, learning from comparing text exemplars does not increase genre knowledge more than learning from singe, sequential exemplars.

Development of student feedback literacy through peer feedback in an online cross-cultural setting
Keywords: Engagement, Feedback, Peer Interaction, Writing/Literacy
Presenting Author: Qiyun Zhu, Guangdong University of Foreign Studies, China

Peer feedback conceptualized as a collaborative peer dialogue is considered an effective way to develop student feedback literacy (SFL) which refers to students’ capacities and dispositions to use feedback. However, dialogic peer feedback is particularly challenging for second language (L2) learners due to cultural and linguistic concerns. This study situated in a writing curriculum for L2 learners in a Chinese university aims to understand the development of SFL through dialogic peer feedback in online cross-cultural settings. 23 Chinese participated in a one-month peer feedback with their American counterparts. Data were mainly derived from reflective journals and interviews with the Chinese students. The data were thematically analyzed. The students were found to engage behaviorally, cognitively and affectively. Also, the study reveals task design and teacher scaffolding as two major facilitative contextual factors. The design of the task included asynchronous written peer feedback, prior peer feedback among Chinese students, and the writing task of film review. Teacher scaffolding involved teacher guidance in communication strategies such as being proactive and asking questions related to sociocultural issues, and teacher feedback in a wrap-up seminar addressing the students’ writing skills, socio-cultural issues and proactivity in peer feedback. The study questions the cultural appropriateness of peer feedback whilst accentuating the role of task design and teacher support in addressing culturally-rooted concerns and fostering the development of SFL. The study carries important pedagogical implications for peer feedback in the post-COVID-19 era where virtual student mobility is increasing.

Student and Classroom-Level Predictors of Keyboard-Based Writing in Early Primary
Keywords: Digital Literacy and Learning, Primary Education, Teaching/Instructional Strategies, Writing/Literacy
Presenting Author: Anabela Malpique, Edith Cowan University, Australia, Australia; **Co-Author:**Debora Valcan, Murdoch University, Australia; **Co-Author:**Deborah Pino-Pasternak, University of Canberra, Australia; **Co-Author:**Susan Ledger, The University of Newcastle, Australia; **Co-Author:**Mustafa Asil, University of Otago, New Zealand; **Co-Author:**Timothy Teo, The Chinese University of Hong Kong, Hong Kong

In today's fast paced digital world, keyboard-based writing has become a key component in daily communication activities and professional working. Nonetheless, there's a lack of systematic studies investigating keyboarding and its relationship with written products. The current study had two primary aims: 1) to examine unique student-level predictors of keyboard-based writing for Year 2 children, which included keyboarding automaticity, literacy skills (e.g., reading and spelling), executive functioning, writing attitudes, and gender; 2) to examine classroom-level factors predicting keyboard-based writing in Year 2, such as teachers' preparation and instructional practices for writing. The current study involved 544 Year 2 students enrolled in 47 classrooms from 17 primary schools in Western Australia. Student and classroom-level factors were evaluated using multilevel-modelling analyses. Results revealed that keyboarding automaticity, spelling, word reading, reading comprehension, general attitudes toward writing, and gender were uniquely related to keyboard-based compositional quality. Keyboarding automaticity, word reading, and gender were also uniquely related to keyboard-based compositional fluency. Results also showed that female students outperformed their male peers in keyboarding automaticity, compositional quality and fluency, but also on attitudes toward writing and reading comprehension. For classroom-level factors, findings showed time teaching keyboarding and revision strategies positively related to compositional fluency. Time teaching handwriting was negatively related to compositional quality. The novel findings from this study suggest that, to support Year 2 students' keyboard-based writing, attention must be placed on multiple components predicting students' writing performance, including writing and reading skills, motivational factors, and gender, as well as instructional practices promoting effective writing.

Analyzing the Writing Processes in the Project Fair Debating and Written Argumentation in Grade Nine
Keywords: Inclusive Education, Mixed-method Research, Quantitative Methods, Writing/Literacy
Presenting Author: Winnie-Karen Giera, Institute of German Studies, University of Potsdam, Germany; **Presenting Author:**Lucas Deutzmann, University of Potsdam, Germany; **Co-Author:**Sarah Risse, Institute of German Studies, University of Potsdam, Germany

The teaching and research project Fair Debating and Written Argumentation is a controlled, quasi-experimental intervention study in panel design in grade 9 at schools with higher education and non-higher education track with 355 students. In this context the central question is, how (written) language competences of ninth-grade students can be assessed and developed by two series of lessons on the topics of debating and argumentative writing. The study examines the mutual influence between debating competence (treatment D) and writing competence (treatment E). The lesson series were conducted by the team of the chair and include debating (inspired by *Jugend debattiert*) and argumentative writing (in the sense of SRSD, Graham & Harris, 2017). The measurement of writing competence was realised in a mixed methods design by four writing tasks (argumentative writing) from selected intermediate secondary school exams of the past ten years. All anonymised written argumentations (n =1,000) were holistically and analytically rated within a double-blind review process on Likert scale quantitatively (Cohen's Kappa =.828). The presentation focuses on the results of the intervention study about the text length, the text quality (overall impression), and selected data of digitally recorded writing processes. The results show for example, regarding the order of the treatments, that the texts of those students, who debated first and then composed written argumentations, had a greater text length and quality than in the other intervention group and the control group (also in the non-higher education track).

Learning in Design Work: Developing Patient Information Systems through Object Construction
Keywords: Communities of Learners and/or Practice, Informal Learning, Lifelong Learning, Qualitative Methods
Presenting Author: Christopher Sadorge, University of Oslo, Faculty of Education, Norway; **Co-Author:**Monika Nerland, University of Oslo, Norway

Learning at work emerges through the active participation of practitioners in dynamic work settings (Billett, 2021) and is closely related to the tasks that professionals perform. One of the expanding tasks that professionals face when political and organizational ambitions move from stand-alone technologies to fostering digital transformation (Wessel et al., 2021) is design work. This study explores how health professionals take part in designing technologies to support care pathways, and how tensions between multiple locations and contexts are negotiated in efforts to align and standardise practices to a shared interface of patient information from other time and places. We followed design meetings over two years with a team of health professionals and software developers mandated to develop a system for the registration and sharing of patient information across healthcare units. Data from the meeting observations were analysed to explore how the design team constructed and explored a series of intermediary objects through which problems of information sharing between health units were framed and explored and generated new questions that needed to be resolved. This oscillation between exploring the intermediary objects at hand and stabilising them provides important learning opportunities at work.

Use and appropriation of digital technologies in an informal work context
Keywords: Communities of Learners and/or Practice, Cooperative/Collaborative Learning, Immersive Technologies for Learning, Informal Learning
Presenting Author: Valérie Payen Jean Baptiste, University of Geneva, Switzerland

This contribution presents the epistemological foundations underlying an ethnographic research conducted on the processes of use and appropriation of digital technologies in an informal work context, mainly, in sales and repair communities in [anonymized].Based on a theoretical mixed, articulating Rabardel's instrumental theory (1995, 2014), the theory of communities of practice (LAVE, 1991; Wenger, 2009) and the theory of skills enactment (le Boterf, 2001, 2018; Masciotra, 2017; Masciotra et al., 2018) the research explored the modalities of knowledge and skills acquisition of actors of the informal sales and repair communities through their uses of digital technologies in the context of their professional activities. The results show the interdependence between the activities mediated by digital technologies and the socio-economic context in which they are situated.

Uncertainty as a driver for informal learning in crowdwork practices
Keywords: Informal Learning, Knowledge Construction, Problem-based Learning, Qualitative Methods
Presenting Author: Karen Schwien, Helmut Schmidt University, Germany; **Co-Author:**Tim Thrun, Helmut-Schmidt-Universität Hamburg, Germany; **Co-Author:**Tobias Schlömer, Helmut-Schmidt-University/University of the Federal Armed Forces Hamburg, Germany

How can workers learn to deal with uncertainty, a vital skill in the new world of work? Crowdwork, which describes platform-mediated online tasks offered by clients to mostly self-employed crowdworkers, could offer an informal learning opportunity for learning those skills in work practices. It is characterized by various kinds of uncertainty. In our study we examine uncertain situations in crowdwork from the perspective of the crowdworkers, their practices to deal with these situations and how they develop those practices in the course of their work. Therefore, we conducted 17 narrative interviews in November 2021. Data was analysed based on theoretical coding. Especially situations of epistemic uncertainty could be derived mainly due to the digitally mediated environment, lack of information provided by the platform and lack of professional testing and crowdwork capabilities of the crowdworkers. In their pursuit to decrease uncertainty crowdworkers self-directedly develop those skills, they also perform a high amount of interpretation work trying to close information gaps. Educational measures integrated in crowdwork settings could help prevent misinterpretations and feelings of insecurity especially for beginners. Crowdwork can also serve as a real-life example for future digital work which can be used in formal education.

How Do Preschool Teachers Foster Children's Understanding of Scientific Inquiry?
Keywords: Early Childhood Education, Qualitative Methods, Science and STEM, Science Education
Presenting Author: Ada Haen, University of Hamburg, Germany; **Co-Author:**Mirjam Steffensky, University of Hamburg, Germany; **Co-Author:**Ilonca Hardy, Goethe-Universität Frankfurt, Germany; **Co-Author:**Miriam Leuchter, RPTU Landau, Germany; **Co-Author:**Henrik Saalbach, University of Leipzig, Germany; **Co-Author:**Anika Bürgermeister, University of Leipzig, Germany; **Co-Author:**Katharina Junge, University of Hamburg, Germany; **Co-Author:**Laura Venitz, University of Koblenz-Landau, Germany

In order to participate in modern society, knowledge of scientific concepts as well as an understanding of scientific inquiry is essential. Children develop initial knowledge and skills about scientific inquiry, such as identifying patterns, long before entering school. It can be assumed that explicit and stimulating instruction of scientific inquiry fosters this development. This study explores which inquiry activities are implemented in science learning environments in preschool and if these activities are explicitly combined in terms of an inquiry cycle. Further, we examine the quality of instructional support preschool children receive to understand scientific inquiry. Therefore, we analyzed 49 videos of learning environments in which preschool teachers interact with 4-6 children on the topic of materials (e.g., wood, plastic, or metal). We observed the implementation of selected inquiry activities using a dichotomous scheme and rated the instructional quality. The results show that in most learning environments, children had multiple opportunities to conduct inquiry activities (e.g., observing, predicting). Often, these activities were combined in a (simple) inquiry cycle such as predict – test - interpret. At the same time, the instructional quality of the learning environments was rather low based on the conducted analysis. Almost all preschool teachers in this sample implement inquiry activities. However, stimulating interactions about scientific inquiry are rare, suggesting that children's understanding of inquiry – an essential component of scientific literacy - is not sufficiently fostered in the analyzed videos.

How Does Critiquing Peer Ideas Help Students Revise Their Science Explanations?
Keywords: Inquiry Learning, Instructional Design, Mixed-method Research, Science Education
Presenting Author: Katharina M. Bach, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Sarah Bichler, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Marcia Linn, University of California-Berkeley, United States

Revising science explanations allows learners to develop a coherent understanding of scientific phenomena by integrating different ideas, a key learning outcome according to the Knowledge Integration (KI) Framework (Linn & Eylon, 2011). We explore the design of critique activities and analyze how peer critique helps 1305 middle school students to revise science explanations. We compare three alternative designs that differ in the characteristics of the peer ideas the student is asked to critique. Specifically, students critiqued a peer's explanation about thermodynamics that describes observations (intuitive); combines intuitive and normative ideas (partial); or connects a claim with scientific evidence (linked). Students wrote and revised their explanation and critiqued their peer's ideas in an online learning environment with random assignment to the critique conditions. Initial and revised explanations were scored using a KI rubric that rewarded linking claims and evidence. Overall, students improved from initial to revised explanation. Students in the linked condition received the highest KI scores. Additionally, in all conditions, students who started with a higher KI score had an advantage over students who started with a lower KI score. This difference was strongest in the intuitive condition. Qualitative analyses indicated that many students copied ideas from the example, regardless of their correctness. This might explain why students in the linked condition performed better in the revision than those in the partial or intuitive conditions. We suggest that a more effective critique activity is to compare two explanations and offer more guidance for students (e.g., evaluation criteria or reflection prompts).

Inquiry learning in science education with combined real and virtual experiments
Keywords: Educational Technologies, Inquiry Learning, Science Education, Secondary Education
Presenting Author: Salome Flegr, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Jochen Kuhn, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Katharina Scheiter, University of Potsdam, Germany

One fundamental aim of science education is fostering students' conceptual understanding. The instructional approach of inquiry learning has proven to be one possibility to effectively foster this understanding of concepts. Inquiry learning has traditionally always been implemented with real, hands-on experiments. Nowadays, digital technologies also allow for the implementation of virtual experiments (interactive simulations). Recent research suggests that combinations of real and virtual experiments are more effective for improving students' conceptual understanding than single experimentation formats alone. However, more research is needed in this behalf concerning different learning topics and age groups than in the previous studies. Moreover, the role of sequencing these experimentation formats is yet unclear. In the present study, 186 middle school students were involved in inquiry learning in a physics lesson. They worked either with a combination of real and virtual experiments in two different sequences or with the real, hands-on experiment only. In line with our hypotheses, inquiry learning fostered students' conceptual understanding in physics and students in the combination conditions learned more than students in the single experiment condition. The superiority of learning with combined real and virtual experiments can be explained by the complementary advantages offered by the different experimentation formats. Moreover, we investigated whether one sequence of experiments might be better to the other, but both combinations were equally effective for fostering students' conceptual understanding. In conclusion, this study suggests that combinations of real and virtual experiments can be recommended for inquiry learning in science education regardless of their sequence.

Strengthening Creative Problem Solving in Elementary Science Education.
Keywords: Inquiry Learning, Qualitative Methods, Science Education, Teaching/Instructional Strategies
Presenting Author: Ard Lazonder, Radboud University, Netherlands; **Co-Author:**Robin Willemsen, Radboud University, Netherlands; **Co-Author:**Evelyn Kroesbergen, Radboud University, Netherlands; **Co-Author:**Isabelle de Vink, Radboud University, Netherlands

While educational experts stress the importance of creative problem solving (CPS), elementary school teachers struggle to incorporate this way of thinking into their classrooms. The science curriculum could provide room for CPS, since CPS is an integral aspect of scientific inquiry. Unfortunately, studies investigating the possibilities to strengthen CPS within scientific education seem limited in number. In this intervention study, we examined the effectiveness of a lesson series for fourth-to-sixth graders (N = 241). All classrooms received five scientific inquiry lessons, in which ample room was provided for creative modes of thought (specifically, divergent and convergent thinking). Although the structure for each lesson was the same across all classes, two conditions were created based on the creativity instruction given to pupils. In the intervention condition the processes of divergent and convergent thinking were introduced, explained and exemplified prior to practice, whereas the control condition entailed no creativity-specific instructions. Herewith, we could assess whether and to what degree we can strengthen creative problem-solving skills within primary school's science education. Divergent and convergent thinking were assessed through pre- and posttests and by assessing the lessons' worksheets. Preliminary analyses show an overall increase in convergent thinking, but no improvement in terms of divergent thinking. Additionally, no differences were found between conditions. These results show that ways to strengthen creativity within the science curriculum might not be as straightforward as theories suggest.

Does teacher training support implementing inclusive education? - A systematic meta-analysis
Keywords: In-service Teachers, Inclusive Education, Meta-analysis, Teacher Professional Development
Presenting Author: Elisabeth Graf, University of Vienna, Austria; **Co-Author:**Johanna Donath, University of Vienna, Austria; **Co-Author:**Timo Lüke, University of Graz, Austria; **Co-Author:**Thomas Götz, Developmental and Educational Psychology, Austria

Inclusive education is a teaching approach aimed at educating all students in general classrooms independent of diversity features such as special educational needs, giftedness, or migration. To successfully implement inclusive education, teachers need to be equipped with positive beliefs towards inclusive education, knowledge about the diverse needs of their students, and skills to address these needs. Usually, teachers are supported through professional development opportunities, where teachers come together to receive training but are left alone with the implementation. Are these professional development opportunities effective in supporting teachers to develop the necessary knowledge, beliefs, and skills, and are these trainings effective in improving student behavior in schools (e.g., on-task behavior, school achievement)? We conducted a systematic review and meta-analysis to address these questions. The screening of the 12,050 search results revealed 342 eligible studies that provided a sum of 1,123 effect sizes. We observed significant positive effects on all outcome categories in varying degrees. We analyzed design aspects of teacher training that might explain differences in the strength of training effects and discussed implications for future research and teacher training.

Content and duration of inclusive training: systematic review and analysis of teachers' discourse
Keywords: Attitudes and Beliefs, Inclusive Education, Pre-service Teachers, Teacher Professional Development
Presenting Author: Kamilla Khamzina, Université de Lille, France; **Co-Author:**Arnaud STANCZAK, Université Blaise Pascal - Clermont-Ferrand II, France; **Co-Author:**Celenie Brasselet, Université de Lille, France; **Co-Author:**Federica Cilia, Université de Picardie Jules Verne, France; **Co-Author:**Nicolas Guirimand, Université de Rouen Normandie, France; **Co-Author:**Sandrine Rossi, Université de Caen, France; **Co-Author:**Camille Legrain, Université de Lille, France; **Co-Author:**Caroline Desombre, Université de Lille, France

Teachers' inclusive attitudes are one of the most important factors to promote a fully inclusive society. In turns, they are shown to be influenced by various factors such as teachers' self-efficacy or students' type of learning difficulty. Inclusive education training has also an impact on teachers' inclusive attitudes and behaviors. However, while the literature consistently shows such a positive effect, there is little evidence on the optimal duration and content to consider when designing such trainings. To address this question, we conducted (1) a systematic review of literature to examine the effects of content and duration of the trainings and (2) a set of semi-directive interviews among general teachers of the French northern region (both studies are pre-registered). The systematic review on 36 interventions showed the overall positive effect of both stand-alone and infused trainings as well as information based cognitive and mixed ones. Moreover, twenty-four semi directive interviews by using a thematic discourse analysis revealed that supplemental needs such as a need of interprofessional collaboration with other social and medical professionals (e.g., special educators, speech therapists, etc.) should be emphasized in an educational teacher training. Such findings allow to inform educational policy makers when it comes to conceive a successful training to be further implemented in the university curricula to promote a fully inclusive school setting.

Validation of a French scale to assess educators' attitudes toward inclusive education
Keywords: Attitudes and Beliefs, Inclusive Education, Social Sciences and Humanities, Tool Development
Presenting Author: Camille Legrain, Université de Lille, France; **Co-Author:**Célénie Brasselet, Université de Lille, France; **Co-Author:**Kamilla Khamzina, Université de Lille, France; **Co-Author:**Mickaël Jury, Clermont Auvergne University, France; **Co-Author:**Caroline Desombre, Université de Lille, France

Inclusive education is a major concern for education systems around the world and the French one in particular. However, its implementation faces many difficulties. Among the leverages and barriers to this implementation, the attitudes toward inclusive education were particularly studied. In the present research, two studies to develop and validate a scale to assess the teachers' and para-professionals' attitudes from French-speaking countries were conducted. An in-depth study of the literature and pre-existing scales available in English allowed the construction of a 19-item scale in French. In Study 1, 177 in-service and pre-service teachers and para-professionals completed this new scale. Exploratory factor analyses allowed to identify two factors and led us to remove three items. The first factor represents items that relate to the impact of inclusive education on instruction, while the second factor represents items related to the impact of inclusion on all students. In Study 2, 228 participants (teachers and para-professionals) completed the 16-item revised scale. Statistical analyses revealed satisfactory psychometric qualities such as the bi-dimensional structure, a good internal consistency (ω=.92) and a satisfactory convergent validity. Altogether these results confirm that this new scale is satisfactory and, by allowing to measure attitudes of both teachers and para-professionals in French-speaking countries, could contribute to overcome the recent interdisciplinary challenges of inclusive education.

Measurement of Multidimensional Classroom Composition Using The Concept of Hypervolumes
Keywords: Achievement, Classroom Assessment, Cultural Diversity in School, Quantitative Methods
Presenting Author: Merle-Sophie Thielmann, University of Mannheim, Germany; **Co-Author:**Karina Karst, University of Mannheim, Germany

The present study proposes a new measure of classroom composition, which allows the integration of diversity on several social dimensions into a single index. Classroom composition can thus be characterized in a more complex way, which is especially promising from an intersectional viewpoint. We adapt the hypervolume concept from ecological trait modeling, which represents students as points within a multidimensional trait space spanned by the composition variables of interest, and classrooms as so-called hypervolumes which describe the space covered by these points (Blonder et al., 2018). Hypervolumes can be characterized through their volume and average distance of students from the hypervolume centroid (dispersion).Using data from 62 fifth-grade classrooms in Germany, we investigate the relationship of hypervolume indices and single-dimension measures of classroom composition. Additionally, hypervolume indices are tested as predictors of individual student achievement in multilevel models. We find significant correlations (r = 0.20 – 0.61) between volume and dispersion of hypervolumes and range and standard deviation on single dimensions. Hypervolume indices do not significantly predict individual student achievement. Our correlative results indicate the concurrent validity of hypervolume measures. Further investigation of their predictive validity is needed and might be obtained by using larger datasets.

The (Un)political Perspective on Climate Change in Education—A Systematic Review
Keywords: Citizenship Education, Curriculum Development, Science and STEM, Sustainable Development
Presenting Author: Martin Schwichow, University of Education Freiburg, Germany; **Co-Author:**Johanna Kranz, Center of Excellence for Climate Change Impacts, Research Institute of Forest Ecology and Forestry Rhineland-Palatinate, Germany; **Co-Author:**Petra Breitenmoser, Zurich University of Teacher Education & University of Zurich, Switzerland; **Co-Author:**Kai Niebert, Institute of Education, University of Zurich, Switzerland

Mitigating and adapting to climate change requires foundational changes in societies, politics, and economies. Greater effectiveness has been attributed to actions in the public sphere than to the actions of individuals. However, little is known about how climate literacy programs address the political aspects of mitigation and adaptation. The aim of this systematic literature review is to fill this gap and analyse how public-sphere actions on mitigation and adaptation are discussed in climate literacy programs in schools. Based on database searches following PRISMA guidelines we identified 75 empirical studies that met our inclusion criteria. We found that central aspects of climate policy such as the 1.5-degree limit, the IPCC reports, or climate justice are rarely addressed. Whilst responsibility for emissions is attributed to the public sphere, the debate about mitigation usually focuses on the private sphere. Climate change education does not, therefore, correspond to the climate research discourse. We show that effective mitigation and adaptation are based on public-sphere actions and thus conclude that effective climate education should discuss those public actions if it is to be effective. Hence, we propose that climate education should incorporate political literacy to educate climate-literate citizens.

Using Data to inform Classroom Practice for Climate Change Education
Keywords: Assessment Methods, Curriculum Development, Sustainable Development, Teacher Professional Development
Presenting Author: Paul Howard-Jones, University of Bristol, United Kingdom; **Co-Author:**Nicola Warren-Lee, University of Bristol, United Kingdom; **Co-Author:**Chris Aldred, Sidcot School, Winscombe, United Kingdom

We report on the implementation by teachers of a brief survey evaluating a science program on Climate Change and how the data arising was used to inform its development. Unlike most areas of education, the learning objectives of climate change are intended to include development of attitudes and behaviour, which are outcomes requiring different approaches their evaluation compared with knowledge and understanding. The survey supported evaluation of the programme (N=62, 11-14 years) in terms of student belief, self-efficacy, action, intended action, and anxiety related to climate change. Only self-efficacy was found to benefit, suggesting students were more confident in their abilities to act but had not developed in their intentions to do so. Subsequent discussion focused on the emotional and motivational content of the programme, prompting several novel modifications. Results are discussed in terms of the potential of the survey to support reflective practice and development of pedagogy in this important and challenging area.

Scientific literacy, agency and the future: students' images of sociotechnical change
Keywords: Critical Thinking, Science and STEM, Science Education, Sustainable Development
Presenting Author: Tapio Rasa, University of Helsinki, Finland; **Co-Author:**Jari Lavonen, University of Helsinki, Finland; **Co-Author:**Antti Laherto, University of Helsinki, Finland

The goal of formal education is, in a sense, to prepare young people for the future. Meanwhile, images of the future tend to be somewhat dominated by expectations, hopes and fears regarding scientific and technological advancements and their various impacts on societies and human life in general. Interestingly, while various trends in education highlight the importance of pedagogies that address societal and environmental questions and promoting students' agency, research has only recently been exploring how to inform the development of "future-oriented science education". To inform the construction of a comprehensive framework to this end, the research outlined here explored the connections between students' scientific literacy and their futures thinking, especially focusing on the agency-oriented "Vision III" perspective on scientific literacy. To root the argument in students' thinking, we set out to address this issue by investigating 58 secondary school students' essays describing their image of the future. Qualitative content analysis showed that students' images of the future feature technological changes ranging from improved everyday devices to large-scale technologization, thus spanning discussions of incremental and radically transformative sociotechnical change and nonproblematic and complexly value-laden issues. Importantly for agency-oriented scientific literacy, students' socioscientific thinking around agency over such change was mostly vague, even if some students constructed detailed narratives about expert and nonexpert roles in deep socioscientific discourse. We conclude by discussing the implications for the development of future-oriented science education.

Students' meaningmaking processes in a school project about sustainable development
Keywords: Cooperative/Collaborative Learning, Critical Thinking, Social Interaction, Sustainable Development
Presenting Author: Anniken Furberg, University of Oslo, Norway; **Presenting Author:**Kenneth Silseth, University of Oslo, Norway; **Co-Author:**Marthe Wiseth Fundingsrud, Department of Teacher Education and School Research, University of Oslo, Norway

This paper reports on a study of how students' experiences from their everyday lives can become resources in school projects about sustainable eating habits and food production. The data were produced during a school project about sustainable development in an upper secondary school in Norway. The project took place during 12 school lessons distributed over a period of three weeks. By taking a sociocultural and interactional approach on learning and instruction, this article provides insight into how student resources - experiences, ideas, and assumptions from their everyday lives, are made sense of and applied in the ongoing interactional work carried out by students and their teachers. Microanalyses of classroom interactions display that the student resources became mediational means in the sense of enabling students to formulate and provide complex reasoning about sustainable eating habits and food production, as well as providing the teachers insights into students' conceptual understandings and challenges. However, what proved to be more demanding for both students and teachers was to contextualize the personal and local initiatives and challenges related to eating habits and food production in a global perspective. The findings are discussed according to possible implications for instruction.

Engagement as an emergent, collective process: A review of the literature
Keywords: Engagement, Peer Interaction, Social Aspects of Learning and Teaching, Social Interaction
Presenting Author: Mayra Mascareño Lara, University of Groningen, Netherlands; **Co-Author:**Elisa Kupers, University of Groningen, Netherlands; **Co-Author:**Naomi de Ruiter, University of Groningen, Netherlands; **Co-Author:**Fenna Wolthuis, University of Groningen, Netherlands

Engagement is one of the most important conditions for learning, and it is typically understood as a multidimensional, individual construct. New conceptualizations of engagement expand the concept, claiming that engagement is also an emergent, collective process. We reviewed the empirical literature

on engagement to examine a) how engagement as a collective process is defined and operationalized; b) what are the mechanisms for its emergence; and c) what is the role of the teacher in its emergence anf management. The majority of included studies inferred engagement as an individual construct influenced by the context. However, we also identified studies that a) inferred engagement at the level of collectives; b) proposed a the dual/dialectic individual and collective character of engagement; or c) inferred group engagement by aggregating individual measures. For collective engagement to happen individuals need to be able to meaningfully engage with a task, express their engagement—discursively and bodily—and participate in a coordinated, self-sustaining process of sense-making at the group level. Teachers need to skillfully read the ebb and flow of group interaction, in order to properly time their interventions and monitor a balanced distribution of autonomy in the group activity. Their role is crucial in proposing educational approaches that favor group discussions, collaboration and discovery, and in securing that these take place in a climate of social-emotional cohesion.

Evidence for Reciprocal Effects in the Classroom: An Explorative Approach
Keywords: Developmental Processes, In-service Teachers, Motivation, Social Aspects of Learning and Teaching
Presenting Author: Alexander Jonas Jung, Hector Research Institute of Education Sciences and Psychology, Germany; **Co-Author:**Cora Parrisius, University of Education Karlsruhe, Germany; **Co-Author:**Benjamin Nagengast, Eberhard Karls Universität Tübingen, Germany; **Co-Author:**Kou Murayama, Eberhard Karls Universität Tübingen, Germany

Interactions between teachers and students are mostly studied according to one-dimensional theories: Researchers analyse how teachers impact students. However, recent theoretical papers emphasize potential reciprocal effects in the classroom. Students' behaviour and motivation are not only influenced by teachers but are also assumed to influence teachers' motivation and behaviour in return. The field's empirical evidence on reciprocal effects between students and teachers, though, is scarce. Using an explorative approach, we were able to gain new insights on reciprocal relationships between teachers and students. We estimated a total of 1716 bivariate cross-lagged panel-models between 44 student-rated and 39 teacher-rated scales for a sample of 181 German classrooms measured at 5 times over a one-year period. We found that student-ratings are as predictive for the change in subsequent teacher-ratings as teacher-ratings are predictive for subsequent student-ratings, supporting the emerging theories of reciprocal effects between teachers and students. Furthermore, we found that students' perceptions of teachers are more predictive for subsequent changes in teachers than students' self-ratings of, for example, interests, effort, and motivation. Our results allow to further the development of more fine-grained theories on interactions between teachers and students.

Dynamic social network perspective on interaction in collaborative learning in elementary classrooms
Keywords: Cooperative/Collaborative Learning, Dialogic Pedagogy, Peer Interaction, Social Interaction
Presenting Author: Tomáš Lintner, Masaryk University, Czech Republic; **Co-Author:**Tomáš Diviák, University of Manchester, United Kingdom; **Co-Author:**Zuzana Šalamounová, Masaryk University, Czech Republic; **Co-Author:**Klara Sedova, Masaryk University, Czech Republic; **Co-Author:**Martin Sedláček, Masaryk University, Czech Republic; **Co-Author:**Roman Švaříček, Masaryk University, Czech Republic

Collaborative learning has potential to promote student peer relationships, help to develop positive learning attitudes, and improve learning outcomes. Moreover, the more students talk, the more they learn. On the other hand, student disengagement from a collaborative task renders the task useless. It is therefore beneficial to understand the processes driving interactions of individual students during collaborative tasks and processes leading to some students being excluded from group interactions. This research builds on videorecorded collaborative tasks collected from 40 groups – each comprising 3 to 6 students – from 6 Czech elementary classrooms. The collaborative tasks were implemented by 6 different teachers under the supervision of our research team as part of a larger research project aimed at improving communication in classrooms. This research employs dynamic network actor models to addresses the question “What influences interaction during collaborative tasks in elementary classrooms?”. The results suggest that our collaborative tasks minimized the differences between vocal and silent and popular and unpopular students in communication. Gender homophily in communication was also minimized and reciprocity of communication was high.

Assessing a peer mediation teaching intervention in primary school: Pupils’ perceptions
Keywords: Communication Skills, Peer Interaction, Primary Education, Qualitative Methods
Presenting Author: Angeliki Lithoxoidou, University of Western Macedonia, Greece

Conflict in school settings is a phenomenon that obstructs the teaching process and disrupts classroom climate in general. Additionally, conflicts may include physical and verbal violence; thus, entailing serious consequences for pupils. Conflict resolution education and peer mediation may stand as means of peacefully resolving school conflicts; thus protecting school communities against violence. Simultaneously, conflict resolution programs equip pupils with skills considered as appropriate for every domain of their social life, such as communication, problem-solving and decision-making. This study focuses on a conflict resolution program with emphasis on peer mediation carried out in the 4^{th} and 5^{th} class of two primary schools in a semi-urban area. It aimed at: a) designing and implementing a twelve-hour teaching intervention for pupils to be instructed in order to become mediators as well as b) assessing the intervention in the light of pupils’ perceptions. As the analysis of the qualitative data indicated, pupils seem to have acquired conflict resolution skills, cultivated the concept of justice and care as well as exhibited prosocial attitudes. These findings probably suggest that pupils –even from a young age– can be empowered in order to construct a values framework when they play an active role in conflict resolution programs.

Effect of Linguistic challenges on pre-service teachers’ self-efficacy in English medium instruction
Keywords: Foreign and Second Language Acquisition, Mixed-method Research, Pre-service Teachers, Self-efficacy
Presenting Author: Charles Selorm Dzormeku, University of Turku, Finland; **Co-Author:**Koen Veermans, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

This study attempts to categorize Ghanaian pre-service teachers according to the levels of linguistic challenges they encounter due to English Medium Instruction (EMI). It further explores the disparities between the self-efficacy belief levels of these groups with reference to their EMI linguistic challenges. Adopting a sequential mixed method approach, a total of 300 participants were surveyed in the Ashanti region of Ghana, followed up by 8 interviews. Participants completed the 45-item EMI challenges instrument (Aizawa et al., 2020) and the short form of the Teachers’ Sense of Efficacy Scale (Tschannen-Moran & Hoy, 2001). Eight participants also participated in a semi-structured interview based on the findings from the quantitative analysis. Writing was the most challenging of the four language skills for pre-service teachers in Ghana. Moreover, the prevailing evidence suggests that limited vocabulary, inability to develop coherent paragraphs, pronunciations, and orthographical as well as grammatical inaccuracies, are the paramount challenges participants face. A Latent Profile Analysis revealed four groups with different levels of EMI linguistic challenges among participants. A series of ANOVA conducted also indicated that the

higher the EMI linguistic challenges of a group, the lower their self-efficacy beliefs in their teaching ability. These results suggest that more emphasis should be placed on English language teaching during teacher education programs. Further research should also examine effective pedagogical approaches to enhance English language acquisition from the basic school level to the higher education level.Keywords: English Medium Instruction; language skills; pre-service teacher; teacher self-efficacy beliefs

Teacher students' understanding of migrants' identities in fiction in the context of EFL
Keywords: Migrant / Refugee and Minority students, Multicultural Education, Social Sciences and Humanities, Teacher Professional Development
Presenting Author: Jon Brodal, Western Norway University of Applied Sciences, Norway

The proposed study sets out to examine how teacher students understand migrant identity issues in fiction in the context of ESL – English as a second language – and how they plan to teach identity issues to pupils. Data are collected from interviews with the students and from their term papers on fiction that thematizes migrant and minority identity. i.e. Hanif Kureishi's *My Son the Fanatic* and Sherman Alexie's *The Absolutely True Diary of a Part-Time Indian*. The study is expected to be completed in spring 2023. The theoretical framework of the analysis will consist of Anthony Giddens' theory on reflexive identity, Peggy Levitt's theory on transnationalism and Edward Said's concept of Orientalism. Of particular interest is whether migrants' identities are recognized as products of the reflexive, self-conscious choices that according to Giddens constitute selfhood in late modernity or whether they are interpreted as expressions of traditional identity patterns or cultural alienation. If migrant selfhood is consistently misrepresented as the incapable Other of the Western reflexive Self it could potentially hamper the identity learning outcomes of pupils, particularly those with migrant backgrounds.

Capturing Professional Bilingual Teachers' Conceptualisation(s) of their Professionalism
Keywords: Bilingual Education, Competencies, Qualitative Methods, Teacher Professional Development
Presenting Author: Luisa Scherzinger, University of Tübingen, Germany; **Co-Author:**Taiga Brahm, University of Tübingen, Germany

Bilingual teachers need to have an extended range of competences as they integrate content and language as well as intercultural aspects during lesson planning. Existing theoretical competence frameworks for Content and Language Integrated Learning (CLIL) emphasise this fact, however, these theoretical constructs have not yet been compared with bilingual education practitioners' perceptions of their own professionalism. This mixed-methods study addresses this research gap by capturing the conceptualisations of professionalism in two groups: experienced bilingual education teacher educators, who are still active as in-service teachers, and bilingual education trainee teachers taking part in a bilingual education training program. Both groups were teaching at German Grammar schools. We analysed data from an online questionnaire (n = 32) and semi-structured interviews (n = 11) using qualitative content analysis as well as descriptive statistics. Our findings emphasise the importance of high motivation, additional psychological-pedagogical knowledge, internationally-oriented content knowledge as well as high language proficiency and yield important implications for bilingual teacher training. Our study is theoretically relevant as it extends the knowledge about CLIL teachers' professionalism and in parts, also their professional development. At the same time, it highlights the need for further support for bilingual teachers, for instance, in the form of learning material.

Effects of inhibitory control on language development in dual-language learning preschoolers
Keywords: Bilingual Education, Cognitive Development, Metacognition, Quantitative Methods
Presenting Author: Robin Segerer, University of Basel, Switzerland; **Co-Author:**Leila Teresa Schächinger Tenés, Faculty of Psychology, University of Basel, Switzerland, Switzerland; **Co-Author:**Jessica Carolyn Weiner, University of Basel, Switzerland; **Co-Author:**Alexander Grob, University of Basel, Switzerland

For decades, it has been assumed that dual language learners develop a special advantage in inhibitory control in comparison to single language learners. This is explained by the assumption that dual language learners actively inhibit the one of their languages they do not use in a communicative situation (Bialystok, 2010). Recently, however, Giguere et al. (2022) assumed that the dual language learning advantage in inhibition may be better explained by a specific selection effect. A special relationship between dual language learners' societal language competence and inhibitory control might cause the inhibition advantage of dual language learners if the drawn sample of dual language learners has non-representatively high levels of societal language skills. We examined this hypothesis with longitudinal data from a cohort-sequence study with single and dual language learning preschoolers in Switzerland and Germany. At present, 317 single and 214 dual language learners ($M_{baseline\text{-}age}$(SD) = 48.60(8.08) months; 50% girls) with the societal languages French (32%) or (Swiss-)German (68%) and the heritage languages Turkish (50%) or Italian (50%) participated. Children were assessed in average over 20 months across three measurement points. Inhibitory control, societal and also heritage language skills were assessed via standardized tests. Longitudinal inhibitory control effects, were found in the societal language sentence comprehension test only. As anticipated, the proficiency increase was more strongly positively predicted by inhibitory control in dual than single language learners. The effects longitudinally confirm the assumption of a special importance of inhibitory control for the societal language development in young dual language learners.

Reflective Competence Development in Teacher Education – Becoming Professional through Podcasting
Keywords: Competencies, Peer Interaction, Pre-service Teachers, Teacher Professional Development
Presenting Author: Annette Busse, University of Kassel, Institute of Educational Science, Germany; **Presenting Author:**Dorit Bosse, University of Kassel, Institute of Educational Science, Germany

This paper focuses on the concept of reflective competence development which comprises the aim to promote professional competence during teacher education. Reflective competence development is understood as the development of competences evolving reflectively with the aim of acquiring professional competence. From a didactical point of view, learning environments that can be linked to this conceptualization of reflective competence development are necessary to focus on the students' learning process. This is realized by the didactical use of collaborative podcasts to improve their professional vision of classroom management: Students are seen as knowledge creators where self-created podcasts support the promotion of deeper learning. With this approach, we pursue the question of whether the learning environment, in which student teachers produce collaborative podcasts in pairs of two, supports them in acquiring professional vision and leads to a change in beliefs. Podcasting addresses the willingness to reflect as a basic attitude. We present results of a study in a pre-post control group design (N_{EG} = 242; N_{CG} = 180) while the experimental group produces podcasts in contrast to the control group. A preliminary study suggests that professional vision can be enhanced through the production of collaborative podcasts compared to writing blogs. Additionally, we want to analyse the change in beliefs and the willingness to reflect via podcasting.

Principals' views on new teachers' competence – A Q study in Sweden
Keywords: Competencies, Pre-service Teachers, Q-methodology, Teacher Professional Development
Presenting Author: Adrian Lundberg, Malmö University, Sweden; **Presenting Author:**Philippe Collberg, Halmstad University, Sweden; **Presenting Author:**christina lindh, Faculty of Teacher Education, University of Kristianstad, Sweden

The transition from pre-service education to in-service teaching can result in a reality shock. Negative experiences might lead to new teachers suffering from ill-being and leaving the profession. This contributes to a teacher shortage, which is currently lingering in various countries. This study aims to contribute to a better

understanding of a possible gap between newly qualified teachers' professional competence and the profession's requirements. Data is drawn from school principals' participation in a Q methodological study in Sweden. They were sampled because of their critical role in teachers' transition into their professional practice. Results show some consensus regarding new teachers' ability to plan teaching, offer pupils different ways of expressing their knowledge and work with digital tools. In addition, principals are skeptical if new teachers can competently deal with pupils with special needs, or parents in difficult conversations. The analysis also yields a range of disagreements among principals and illustrates the complexity of the subject matter. The study accentuates the importance of distinguishing between formal and actual teacher competence. While new teachers are regarded as competent in the theoretical and even practical aspects of their professional activity, they struggle with the real and situated enactment of their plans. The study presents suggestions for future research and evidence-based recommendations for policy and practice.

How do pre-service teachers perceive the teacher's role in guiding students' peer interactions?
Keywords: Competencies, Peer Interaction, Pre-service Teachers, Teacher Professional Development
Presenting Author: Olli-Pekka Heinimäki, University of Turku, Finland; **Co-Author:**Anu Kajamies, University of Turku, Finland; **Co-Author:**Mikko Tiilikainen, University of Turku, Finland; **Co-Author:**Marja Vauras, University of Turku, Finland

Peer interactions are vital for individual development and learning, and therefore teachers must provide meaningful peer interaction opportunities. However, just providing such opportunities does not guarantee positive outcomes, highlighting the crucial role of the teacher in guiding peer interactions. This guidance can, however, challenge teachers as it might require them to adopt new kinds of roles they are less familiar with. To this end, the main aim of the present study was to shed light on how pre-service teachers perceive the teacher's role in guiding peer interactions. Furthermore, the ways the pre-service teachers evaluate their own competencies in that regard, and how these perceptions and self-evaluations possibly evolve over time, are also examined for further insights. The participants were second-year classroom teacher students enrolled in a course on teacher interaction skills. The data were collected with an electronic questionnaire at the beginning (N=56) and the end (N=51) of the course, containing 16 closed (quantitative analysis) and one open-ended question (qualitative analysis). The analysis revealed five distinct roles: instructor, supported, modeler, enabler, and facilitator. Qualitative differences were also identified, relating to perceived role flexibility and depth of reasoning concerning the mentioned roles. The conference presentation will elaborate on these preliminary findings. Furthermore, we also examine how these perceptions possibly differed between the pre- and post-questionnaire, and how the students' self-evaluated competencies could bring further clarity to these perceptions. Finally, the implications for practice and teacher education will be discussed.

Teacher education in conflict-affected societies: What future teachers in Iraq learn post-ISIS?
Keywords: Competencies, Curriculum Development, Pre-service Teachers, Resilience
Presenting Author: Vasileios Symeonidis, University of Education Freiburg, Germany; **Presenting Author:**Heike Wendt, University of Graz, Austria; **Presenting Author:**Amal Zedan, University of Mosul, Iraq; **Co-Author:**Felix Senger, TU Dortmund University, Germany; **Co-Author:**Saraa Salim, University of Mosul, Iraq; **Co-Author:**Fawzi Jebrail Ibrahim, University of Mosul, Iraq

Considering the critical role of teachers in post-conflict societies, little is known about the challenges with initial teacher education in post-crisis contexts, or about the quality of teaching in such contexts. This paper aims to identify the challenges with providing quality teaching and teacher education in crisis situations by studying the case of Mosul University in Iraq. Focusing on developments post-Islamic State, the study looks at expert interviews with teacher educators at different faculties of Mosul University and analyzes the development and implementation of the teacher education curriculum. Our findings provide insights into teacher education structures in Iraq and the broader challenges presented by crisis contexts. A core challenge appears to be the centralized curriculum, which focuses on subject specific knowledge rather than other types of knowledge that are of key importance for prospective teachers in areas affected by conflict.

Childbearing motivation, postpartum depression, and child adjustment: A 5-year longitudinal study
Keywords: Early Childhood Education, Motivation, Parents' Beliefs and Affect, Self-determination
Presenting Author: Reut Nachoum, Bar Ilan University, Israel; **Co-Author:**Anat Moed, Bar Ilan University, Israel; **Co-Author:**Nir Madjar, Bar Ilan University, Israel; **Co-Author:**Yaniv Kanat-Maymon, Reichman University, Israel

Postpartum depressive symptoms (PDS) are not only highly prevalent but also considered to significantly harm child development. Using a Self-Determination Theory framework, the current study aims to examine whether autonomous (volition and self-fulfillment) and controlled (coercion or guilt) childbearing motivations serve as early factors of PDS. This study suggests a process model in which prenatal childbearing motivations predict PDS, which, in turn, predicts autonomy-supportive versus controlling parenting styles and child developmental functions years later. Data were longitudinally collected from 324 Israeli mothers who reported their childbearing motivations during pregnancy, PDS at four months postpartum, parenting styles at 20 months postpartum, and child adjustment at 4.5 years. Child adjustment included behavior problems (internalizing, externalizing), social functioning (prosocial behavior, peer problems), emotional functioning (emotion regulation, lability), and mastery motivation (mastery pleasure, negative reaction).A structural equation modeling revealed autonomous and controlled prenatal childbearing motivations were negatively and positively associated with PDS at four months, respectively. PDS, in turn, was positively associated with controlling parenting style at 20 months but was not significantly associated with autonomy-supportive parenting. However, autonomous motivation was directly associated with autonomy-supportive parenting. Then, autonomy-supportive parenting at 20 months increased child adaptive functioning and decreased maladaptive behaviors at 4.5 years. Controlling parenting increased maladaptive behaviors while undermining adaptive functioning. Our study underscores the importance of childbearing motivations as early indicators of PDS, parenting styles, and child adjustment. Knowing the possible influences of childbearing motivations may encourage parents to pay closer attention to autonomous reasons when expanding their family.

Relations between maternal perfectionism, young children's forgiveness, and social skills
Keywords: Early Childhood Education, Parents' Beliefs and Affect, Peer Interaction, Social Development
Presenting Author: Bertha Hei Ching Kum, The Education University of Hong Kong, Hong Kong; **Co-Author:**Sum Kwing Cheung, The Education University of Hong Kong, Hong Kong; **Co-Author:**Rebecca Y. M. Cheung, University of Reading, United Kingdom

Previous research suggested that parental expectations are linked with social outcomes in children. It should, however, be noted that there are different ways for parents to express their high expectations. Inspired by studies on perfectionism in the family setting, the present study sought to examine whether mothers' perfectionistic strivings about children (i.e., setting high performance standards for children) and perfectionistic concerns about children (i.e., critical evaluations of the discrepancy between the ideal and actual performance of children) were related to their young children's social skills. In addition to parental expectations, forgiveness is often found to predict social skills. Hence, another aim of the present study was to examine whether the relations between parents' perfectionistic tendencies and young children's social skills were mediated by young children's forgiveness. Participants were 238 kindergarten children and their mothers in Hong Kong. Mothers were asked to report their perfectionistic tendencies about children, children's forgiveness, and social skills through a questionnaire. Results of path analysis showed that after controlling for children's age, mothers' perfectionistic strivings about children only had a positive direct link with children's social skills. Mothers' perfectionistic concerns about children, on the other hand, had a negative direct link with children's social skills, as well as an

indirect link via children's forgiveness. These findings suggest the importance of helping parents understand how to express their expectations to young children in a constructive manner, so as to better promote their young children's early social skills development.

Profiles of sibling relationships and their association with social-emotional skills
Keywords: Peer Interaction, Quantitative Methods, Self-concept, Social Interaction
Presenting Author: Elena Wittmann, Leibniz Institute for Educational Trajectories (LIfBi), Germany; **Co-Author:**Ilka Wolter, Leibniz Institute for Educational Trajectories (LIfBi), Germany

Although the influence of the family environment on social-emotional skills is hardly disputed, research predominantly focuses on the parent-child relationship. However, most people grow up with at least one sibling. Siblings fulfil important socialisation functions for each other; they argue and disagree, share and cooperate, and learn to resolve conflicts among themselves. This paper aims at describing the quality of the sibling relationship and its connection with social-emotional competencies. Using latent profiles and regression analyses, it can be shown that the perceived quality of the sibling relationship is closely related to prosocial behavior, problem behavior, and self-esteem. Therefore, the sibling relationship deserves more attention both in research and in clinical settings.

Teacher Education and Social and Emotional Learning: A Swedish Case Study of Intended Curriculum
Keywords: Emotion and Affect, Pre-service Teachers, Primary Education, Social Aspects of Learning and Teaching
Presenting Author: Blanka Rósa, Stockholm Univerisity, Sweden

International and national initiatives to reframe the concept of quality education increasingly highlight the importance of attending to the holistic developmental needs and health of all pupils. Accordingly, teachers are expected to do more than attend to pupils' academic progression. The task of a teacher inevitably involves caring for pupils' social and emotional learning too, yet, teachers' ability to attend to social and emotional developmental needs is highly dependent on the training they receive. The focus of this present study was then to investigate how social and emotional learning is integrated into the curriculum of a K-3 teacher education programme at a large university in Sweden. Policy documents governing the intended aims of the teacher education programme were collected, and semi-structured interviews with course leaders were conducted. Informed by the CASEL framework's conceptualisation of social and emotional learning, a qualitative content analysis was carried out on all data. The preliminary results point in two directions: firstly, references to social and emotional learning seem to be present in the curriculum but are implicit, and secondly, this implicit focus is predominantly laid on the social dimension of the concept while the emotional learning aspect is rather neglected. These results imply insufficiencies in how teacher education lives up to the expectations set by the national curriculum. The findings serve as an important basis both for comparisons with other K-3 teacher education curricula in and outside of Sweden and for contrasting them with teacher students' and teachers' experiences of the training they undergo.

Genuine, Faked, and Hidden Teacher Emotions in the Classroom: Are they Transmitted to Students?
Keywords: Emotion and Affect, In-service Teachers, Quantitative Methods, Secondary Education

Teacher emotions experienced in the classroom can be transmitted to students. However, to make their emotional expressions appropriate to classroom situations, teachers can choose to genuinely express, fake, or hide their experienced emotions. Thus, to fully understand emotional transmission in the classroom, it is important to consider strategies teachers use to regulate their emotional expressions. This study examined the associations of genuinely expressed, faked, and hidden teacher emotions with student achievement emotions. In total, 1006 teachers (733 females) and 14339 students (8773 females) from 73 secondary schools in Croatia participated in the study. Teachers' self-reports on genuine expression, faking, and hiding of positive (e.g., enthusiasm, excitement, pride, happiness) and negative emotions (e. g, anger, shame, anxiety, disappointment, hopelessness) were matched with students' self-reports on class-related achievement emotions (i.e., enjoyment, hope, pride, anger, anxiety, shame, hopelessness, boredom). Multilevel structural equation modeling (MSEM) showed that genuine expression of teacher positive emotions is positively related to all student positive emotions, while genuine expression of teacher negative emotions was positively related to all student negative emotions. Next, genuine expression of positive emotions was negatively associated with students' negative emotions, while genuine expression of negative emotions was negatively associated with students' positive emotions. In addition, faking negative emotions was positively related to students' anger, anxiety, and hopelessness, while hiding negative emotions was positively related to students' anger, shame, and hopelessness. Lastly, teachers' faking and hiding of positive emotions were unrelated to students' class-related emotions. This work was supported by Croatian Science Foundation (Grant No. IP-2019-04-5472).

The passion transmission model: Examining the mediating role of emotions
Keywords: Emotion and Affect, Higher Education, Social Aspects of Learning and Teaching, Teaching Approaches
Presenting Author: Tanya Chichekian, Université de Sherbrooke, Canada; **Co-Author:**Robert Vallerand, Université du Québec à Montréal, Canada

In accordance with the Dualistic Model of Passion, a passion transmission model was examined in which teachers' passion and autonomy support were hypothesized to influence students' passion for a subject matter via positive and negative emotions. In Study, a path analysis with 208 teachers through an online recruitment showed that teachers' autonomy support and passion for teaching led them to experience more positive emotions and fewer negative emotions in their classes. In addition, positive emotions while teaching were positively associated with teachers' perceptions of their students' harmonious passion, while both positive and negative emotions were associated with perceptions of their students' obsessive passion. In Study 2, a university-wide recruitment of 123 university professors described the extent to which they considered themselves as passionate for teaching and how they displayed this behavior in class. Developing a relationship with students was the most prominent feature regarding professors' passion for teaching. Specifically, professors displayed actions related to facilitating student interactions, acting as a role model, developing students' interest, making the course material relevant, incorporating student feedback in teaching, and maintaining students' motivation as behavioral actions related to their passion for teaching. Overall, these findings are the first to propose a passion transmission model in education. Implications for such a model and the mediating role of emotions are discussed.

Mentoring teachers' perspective of student teachers' emotional challenges
Keywords: Emotion and Affect, Higher Education, Mentoring and Coaching, Pre-service Teachers
Presenting Author: Henrik Lindqvist, Linköping University, Sweden; **Co-Author:**Maria Weurlander, Stockholm University, Sweden; **Co-Author:**Linda Barman, KTH, Royal Institute of Technology, Sweden; **Co-Author:**Annika Wernerson, Karolinska Institutet, Sweden; **Co-Author:**Robert Thornberg, Linköping University, Sweden

Learning to work as a teacher in teacher education includes encountering schools during work-based learning. This period includes having mentoring teachers assigned to support student teachers in acquiring teaching skills and guiding in understanding teachers' work. Mentoring conversations are commonly carried out, but rarely focus on student teachers' coping with emotional challenges. Therefore, we aimed to investigate mentoring teachers' perspectives on scenarios

on student teachers' reported emotional challenges. We conducted a constructivist grounded theory study where 22 mentoring teachers were interviewed, using scenarios from student teachers' narratives. The data were analysed through initial, focused, and theoretical coding. The findings show that mentoring teachers' main concern was that student teachers should consider all situations, including emotionally challenging episodes, as opportunities for learning. When discussing the scenarios, they emphasized strategies that involved regulating, engaging/helping, being exemplary, and taking charge. The findings are discussed in relation to existing literature on mentoring. This study is theoretical and educational significant as we use the perspectives of the mentoring teachers in relation to student teachers' emotional challenges. Mentoring teachers' perspectives are important, if we want student teachers experiences during work-based learning to soften the practice shock associated with being a new teacher.

Patterns of Teachers' Occupational Well-Being During the COVID-19 Pandemic
Keywords: Attitudes and Beliefs, In-service Teachers, Primary Education, Well-being
Presenting Author: Sanni Pöysä, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

This study examined profiles of teachers' occupational well-being during the COVID-19 pandemic, and possible differences in self-reported experiences of exhaustion, recovery, and interactional styles of teaching between the profile groups. The data were collected from 279 Finnish primary school teachers during the spring of 2020. The Latent Profile Analysis was used, and four profiles were identified: 1) teachers with mediocre stress and work engagement (34.4%); 2) teachers with mediocre stress and lowest work engagement (11.5%); 3) teachers with highest stress and work engagement (26.5%); and 4) teachers with lowest stress and highest work engagement (27.6%). The findings indicated that there was diversity in ways on how different negative and positive aspects of occupational well-being were drawn into patterns. The further analyses were done to examine the extent to which the profile groups would differ with respect to teachers' experiences of emotional exhaustion, recovery from work, and interactional styles of teaching. The results revealed that during the first few months of the COVID-19 pandemic many teachers experienced occupational stress as well as some increase in stress due to the pandemic. In addition, the findings provided new insights concerning how teachers' work engagement was perhaps not severely affected during the first few months of the pandemic, and on how different teaching styles were associated specifically with different aspects of occupational well-being.

A comparison of students' well-being before, during and after the peak of the COVID-19 pandemic
Keywords: Burnout, Higher Education, Pandemic, Well-being
Presenting Author: Josina Schriek, University of Hildesheim, Germany; **Co-Author:**Bastian Carstensen, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Renate Soellner, University of Hildesheim, Germany; **Co-Author:**Uta Dr. Klusmann, Leibniz Institute for Science and Mathematics Education (IPN), Germany

The mitigation measures to suppress the spread of the COVID-19 virus led to significant disruptions in everyday life at university. Educational institutions had to close and university students faced unprecedented economic, social and educational challenges across multiple life domains (e.g. social isolation, financial pressure). Cross-sectional studies show that those demands were associated with higher depression and stress accompanied by lower motivation and engagement. Students' well-being is strongly associated with their performance. For example, students with low burnout levels and high satisfaction levels show better academic performance and lower dropout rates. However, longitudinal studies focusing on students' well-being before, during, and after the first peak of the COVID-19 pandemic are scarce. The aim of the present study is to examine how student well-being evolves during the period January 2020 to January 2022. A total of $N = 1{,}800$ students assessed their emotional exhaustion and enthusiasm at three measurement points. Multilevel models revealed that emotional exhaustion levels are significantly higher in 2021 ($\gamma_{10} = 0.44$, p

Children's descriptions and drawings of SARS-CoV-2
Keywords: Pandemic, Primary Education, Science Education, Student Drawings
Presenting Author: Vasilia Christidou, Aristotle University of Thessaloniki, Greece; **Co-Author:**Fotini Bonoti, University of Thessaly, Greece; **Co-Author:**Penelope Papadopoulou, University of Western Macedonia, Greece; **Co-Author:**Polixeni Doumpala, Aristotle University of Thessaloniki, Greece

Although the consequences of the COVID-19 pandemic on children have been vastly examined by research over the last years, children's perspective of SARS-CoV-2 has not been investigated extensively. This study examined children's conceptions of SARS-CoV-2 and if these vary according to their age, the mode of expression or the time they are recorded during the evolution of the pandemic. The sample consisted of 1072 children in Greece, distributed in to three age groups with a mean age of 5, 7, and 9 years, who were asked to verbally describe and draw Coronavirus during the first (2020, n = 342), second (2021, n = 271), and third (2022, n = 459) phase of the pandemic. Content analysis of the data revealed four main themes, namely (a) Coronavirus, (b) Medical dimensions, (c) Psychological implications, and (d) Social implications. Results indicated that children, across all age groups and since the beginning of the pandemic, have developed a complex and multidimensional construct about the novel coronavirus, which is not restricted to SARS-CoV-2 per se, but also involves medical, psychological, and social dimensions of COVID-19. Moreover, children tend to emphasise different aspects of SARS-CoV-2 according to their age, mode of expression, and pandemic phase.

A learning analytics approach to teachers' use of ICT during and after the COVID-19 health crisis
Keywords: Educational Technologies, Learning Analytics, Pandemic, Primary Education
Presenting Author: Catalina Lomos, LISER - Luxembourg Institute for Socio Economic Research, Luxembourg; **Co-Author:**Hans Luyten, University of Twente, Netherlands; **Co-Author:**Frauke Kesting, SCRIPT (Service de Coordination de la Recherche et de l'Innovation pédagogiques et technologiques), Luxembourg; **Co-Author:**Filipe Lima da Cunha, SCRIPT (Service de Coordination de la Recherche et de l'Innovation pédagogiques et technologiques), Luxembourg

Teachers' use of ICT has been paid significant attention, especially during the COVID-19 health crisis, when a tremendous sense of urgency was imposed on teachers' work. We saw an increase in teachers' use of ICT during the school lockdown periods in most educational systems. The relevant question that follows is if teachers continued using ICT in the same numbers in the years following the COVID-19 health crisis and which characteristics would be relevant for a sustained ICT use. In this study, we used the log data of 800 teachers working on a digital learning platform for mathematics in 2019-2020, and their descriptive data for two years before and two years after that year. Our findings show that in the two years following the COVID-19 health crisis year, teachers went back to their ICT presence specific for the two years before the same year. More specific, the teachers who continued in the highest numbers to work actively on the platform in the following two years were those who spent more time on the platform during COVID-19 school lockdown, who had previous experience with the learning platform, and who performed meaningful ICT-behaviors while online. We used the SAMR model to describe and categorize teachers' ICT behavior. This work facilitates the reflection on the dynamics of the change and adoption process and the relevant role of intrinsic motivation for the continuation and

persistence of an adopted behavior.

Re-Personalizing and Re-Socializing the Cognitive Processes of Distance Learning
Keywords: Cognitive Skills and Processes, Instructional Design, Pandemic, Teaching/Instructional Strategies
Presenting Author: William Whitten II, Total Experience Design, LLC, United States; **Co-Author:**Sandra E. Whitten, Fordham University, United States

The pandemic of 2020-2021 created an acute need for students to engage in distance learning. Current technology, while miraculous in some respects, limits student-to-student and student-to-teacher interactions. These limitations, combined with a greater emphasis on homework, have de-personalized and de-socialized distance learning. Distance learning can be re-personalized and re-socialized, and in general made more effective and engaging, by designing homework questions that evoke learning-effective cognitive processes which naturally occur in the interactive classroom environment. Guided Cognition is a new instructional design approach where homework tasks are designed to guide learners to engage in specific, observable cognitive events that are hypothesized to elicit underlying theoretical cognitive processes that result in learning. Several observable cognitive events were abstracted from normal classroom instructional interactions and activities. The cognitive events studied in our experiments are: relate to prior experience, visualize and illustrate, consider divergent answers, brainstorm and evaluate, and role play. Students read a section of a novel, and then were assigned either Traditional or Guided Cognition homework questions. Three days after the homework, they were given a surprise quiz on the content of the novel. Students assigned Guided Cognition homework performed about 10 percentage points better than students assigned Traditional homework questions.Distance learning tends to include a larger proportion of learning time with characteristics of traditional homework: unsupervised, individual, self-paced, solitary, self-monitored, and informal. Guided Cognition Design enriches distance learning homework questions, giving students the benefits of engaging in learning-effective cognitive processes typically experienced in more personal and more social learning environments.

Teachers' Perception of miscommunication between educational policy and schools during COVID-19
Keywords: Communication Skills, Educational Policy, Pandemic, School Leadership
Presenting Author: Julia Hafenscher, University of Vienna, Austria; **Co-Author:**Flora Woltran, University of Vienna, Austria

With the rise of COVID-19 cases in 2020, uncertain and chaotic periods for students and teachers all over the world began. In times of crisis, a trustworthy and clear communication by educational policy is essential. The aim of this study is to investigate teachers' perception of communication by educational policy makers during COVID-19 pandemic. In study 1, data from 907 teachers, which participated in a nationwide online-survey, were analyzed. In study 2, five semi-structured online-interviews were conducted with teachers. Overall, the results show that a large number of teachers perceived that education policymakers have failed to communicate measures and information for school in a timely manner as well as in clarity during the first three years of the COVID-19 pandemic.

Writing your own story about a statistical graph is more interesting than reading one
Keywords: Engagement, Interest, Science and STEM, Teaching/Instructional Strategies
Presenting Author: Liva Martinussen, University of Oslo, Norway; **Co-Author:**Anine Riege, University of Oslo, Norway; **Co-Author:**Rolf Reber, University of Oslo, Switzerland

Despite a need for more people educated in STEM-fields it has become a less popular study choice. Interventions to increase situational interest (SI) may serve as a starting point for individual interest. One way to increase SI could be by asking students to write stories. In an online between-Ss experiment, we examined the effect of writing a story about a graph, compared to reading a story, on SI. We also explored if differences in instructional wording affected SI differently depending on whether it asked participants to make a story interesting for others or to themselves. Students were recruited via Prolific and randomized into groups instructed to either write a story interesting for others (n = 157), themselves (n = 170), or read a story (n = 179), to either an increasing or decreasing graph. Triggered-, Maintained-feeling, and Maintained-value-scales were administered to measure the different facets of SI. A 2x3 ANOVA for each SI facet, with instructional group and type of graph as independent variables yielded a significant main effect of instructional group on triggered SI. Triggered SI was significantly lower for the reading-group compared the other-group and the self-group, respectively. We found no effect of instructional wording (interesting for yourself versus others). These findings suggests that writing stories, compared to reading a story, increases triggered SI. As triggered SI, according to the empirically supported model by Hidi and Renninger, develops into maintained SI, this increase is an important first step to develop more stable individual interest.

Reading Fluency: Influences of Word Recognition and Comprehension
Keywords: Cognitive Development, Comprehension of Text and Graphics, Primary Education, Reading
Presenting Author: Luciana Vellinho Corso, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil; **Co-Author:**Amanda Oliveira Meggiato, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**Helena Corso, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**RAQUEL WEBER, Universidade Federal do Rio Grande do Sul, Brazil; **Co-Author:**Fabiana de Miranda Rocha Luna, Universidade Federal do Rio Grande do Sul, Brazil

Reading involves word recognition, fluency, and comprehension. However, fluency has only recently been studied, and studies dealing with the relationship between fluency and other reading skills are scarce. Existing research also does not assess fluency dimensions (accuracy, automaticity, and prosody) in an integrated manner, and does not make clear whether fluency contributes to comprehension, or whether comprehension promotes fluency, or yet whether this relationship is reciprocal. This empirical research aimed to investigate the relationships between word recognition, fluency, and reading comprehension skills of Brazilian students in the 5th grade of elementary school. The participants were 57 students (M = 10.30, SD = 0.63 of age) from 5th grade of public schools. *Pearson* correlation analyses showed that skills are weakly to moderately correlated, with stronger correlations between prosody and comprehension (questionnaire) and between accuracy and comprehension (retelling). In the multiple regression analysis, fluency and word recognition explained 11% to 13% of the variance in comprehension, whereas the inverse, word recognition and comprehension explained 15 to 19% of the variance in fluency. The findings contribute to the development of more effective work with reading in the classroom and is fundamental to ensure the concomitant teaching of fluency and comprehension skills, since fluency can explain and be a product of proficient comprehension.

Reading achievement in a national university admission assessment: impact of motivation dimensions
Keywords: Achievement, Motivation, Reading, Self-efficacy
Presenting Author: Gabriela Gabriela Gómez, Universidad de O´Higgins, Chile; **Co-Author:**Marlene Rivas, Pontificia Universidad Católica de Chile, Chile

Several dimensions of motivation have been shown to impact reading performance. This proposal presents preliminary results of a national study searching to establish a relation between reading performance in a university access exam and non-cognitive dimensions related to reading motivation. 4945 candidates completed an on-line questionnaire after passing the admission reading test. The data was supplemented with official records about the test achievement, school, and individual socioeconomic characteristics. Using hierarchical linear models, we found a significant impact of the frequency of reading novels, journals

and newspapers, engagement in online social networks and webs about news and information. We also found a significant impact of the perception of vocabulary and text difficulty on the test. This study underlines that self-perception and reading habits have a role even in the contexts of a high stake test achievement.

Are speech sound difficulties a marker of difficulties in language and later reading skills?
Keywords: At-risk Students, Learning and Developmental Difficulties, Meta-analysis, Reading
Presenting Author: Line Walquist Sørli, UIT The Artctic University of Norway, Norway; **Co-Author:**Trude Nergard Nilssen, UiT The Arctic university of Norway, Norway; **Co-Author:**Monica Melby-Lervåg, University of Oslo, Norway; **Co-Author:**Bjarte Furnes, University of Bergen, Norway; **Co-Author:**Ømur Caglar-Ryeng, UiT The Arctic University of Norway, Norway

Abstract This systematic meta-analysis reviews 66 publications that have examined children with speech sound disorders and their skills in language and later reading. To be included in the review, the studies had to compare groups of children with and without speech sound difficulties in preschool age on language and/or later reading skills or be cross-sectional and longitudinal studies focusing on relationship between speech sound skills and language and/or reading. The studies were coded, and Hedges' g was calculated for group differences. For the studies with individual differences uncorrected bivariate Pearsons correlations were coded and transformed to Fishers z to adjust to a normal distribution. The result will be analysed with R package Robumeta and will be ready to present at the EARLY conference.

Do we understand the same when reading on tablets as we do on paper? A multilevel meta-analysis
Keywords: Comprehension of Text and Graphics, Educational Technologies, Meta-analysis, Reading
Presenting Author: Lidia Altamura García, University of Valencia, Spain; **Co-Author:**Anastasia Karagiorgi, Julius-Maximilians-Universität, Würzburg, Germany; **Co-Author:**Cristina Vargas, University of Valencia, Spain; **Co-Author:**Ladislao Salmerón, University of Valencia, Spain

Previous meta-analytic research has evidenced that readers tend to understand slightly worse when reading on-screen than when reading the same text in print. Because hand-held digital devices can offer a closer reading experience to print media, in this meta-analysis we aim to analyze the differences on reading comprehension when reading on tablets or e-readers, compared to print reading. Specifically, we aim to examine the differences between both hand-held devices, since e-readers are even closer to print-reading materials. Secondly, we will evaluate individual reader characteristics, such as the educational stage. A final selection of 29 studies (38 effect sizes), published between 2010 and 2022, were included in the analysis. Multilevel random-effects analysis were performed, the average effect size supported the prevalence of the "screen inferiority effect" (g = -.111, 95% CI: -.221, -.009; p = .033; k = 38, n= 29). This effect emerged, specially among university students. Moderator analysis regarding type of handheld device did not show significant differences. Methodological and educational implications are discussed.

Promoting Effective Scaffolding for Self-Regulated Learning Strategies
Keywords: Computer-assisted Learning, Educational Technologies, Learning Analytics, Self-regulated Learning and Behaviour
Presenting Author: Tongguang Li, Monash University, Australia

Self-regulated learning (SRL) is a concept that describes how a learner controls, monitors, and regulates their learning process. Being able to effectively choose and use learning strategies and tactics in different learning contexts is crucial to becoming a skilled, self-regulated learner. Researchers aim to help learners improve their self-regulated learning and corresponding learning strategies and tactics by implementing learning analytics (LA), and academics have attempted to design LA-informed scaffolds and feedback targeting SRL and SRL strategies. However, previous studies have shown a lack of significant associations between scaffolding and learners' use of SRL strategies. This issue reflects how scaffolding could effectively facilitate and influence learners' SRL had not been adequately addressed in previous studies. As such, this doctoral proposal aims to fill the research gap by introducing and designing more effective and meaningful scaffolding targeting learners' SRL skills and their use of learning strategies and tactics. This research aims to address the current issue of scaffolding on SRL strategies by implementing state-of-the-art temporal and sequential analysis to identify learning signatures for each learner, which will reflect how learners use, regulate, and monitor their learning and their use of SRL strategies and tactics. Learning signatures will be used for identifying the learner's zone of proximal development (ZPD) in terms of SRL strategies. It is hypothesized that when the design and implementation of scaffolding is informed by the creation of learning signatures and by the identified ZPD, the scaffolding will become more adaptive and actionable to learners.

On the perception of social robots by higher education students
Keywords: Attitudes and Beliefs, Computational Thinking, Educational Technologies, Higher Education
Presenting Author: Josef Guggemos, University of Education Schwäbisch Gmünd, Germany; **Co-Author:**Stefan Sonderegger, University of St. Gallen, Switzerland; **Co-Author:**Sabine Seufert, University of St.Gallen, Switzerland

Social robots have the potential to play a vital role in education. For a successful adoption, technology acceptance may be necessary. Based on the ICAP framework, we have developed eight vignettes describing scenarios for the use of social robots in higher education, e.g., teaching assistant. Students in an introductory university course (N = 361) answered questions based on the unified-theory-of-acceptance-and-use-of-technology (UTAUT) as well as on their ethical approval. A confirmatory factor analysis showed that eight scenarios of robot use can be separated. A latent profile analysis identified four profiles. One profile is particularly noteworthy. It comprises students who accept social robots not as a means of instruction, e.g., as a tutor, but as a tool, e.g., to promote computational thinking.

Building Learning Theories with AI-Enhanced Conjectural Mapping
Keywords: Artificial Intelligence, Computer-assisted Learning, Educational Technologies, Learning Analytics
Presenting Author: Junsong Huang, National Institute of Education, Singapore; **Co-Author:**Susan Gwee, National Institute of Education/Nanyang Technological University, Singapore, Singapore; **Co-Author:**Jing Wu, National Institute of Education, Singapore; **Co-Author:**Simone Ann D Souza, National Institute of Education, Singapore

We propose to enhance conjecture mapping with Artificial Intelligence (AI) to make design-based research (DBR) more systematic and efficient in building learning theories. DBR seeks to simultaneously build learning theories and improve education practices through an iterative process of improving learning in authentic settings. To overcome methodological concerns on DBR, the conjecture mapping framework requires researchers to articulate explicitly the design and theoretical conjectures and to examine whether the desired learning outcomes can be traced back in the learning processes to designed elements. Because learning takes place in context-rich settings, systemically generating and testing all possible combinations of conjectures can be labor-intensive and inefficient, leading to slow progress in theory building. With the rise of AI-enabled adaptive learning systems (ALSs), we propose to enhance conjecture mapping research in two ways. First, applying machine learning on ALS-generated big data can significantly enrich the sources of conjectures. Pedagogical models of

ALSs can be further enhanced to allow systematic generation and rigorous testing of rich conjectures for discursive examination between learning theories and data-driven conjectures. Second, rigorous testing of conjectures can be conducted in ALS with AI-enhanced learner profiling, sampling, and learning analytics in real-time at the backend. Testing conjectures in ALS allows researchers to manipulate content and pedagogical approaches to create design experiments seamlessly with optimal use of samples. The proposed AI-enhanced conjecture mapping research not only contributes to the systematic and efficient building of learning theories but also reduces biases of AI for scalable adoption of ALSs to enhance learning practices.

SENSEitive Systems: Can physiological and eye-tracking data be indicators of learner emotions?
Keywords: Educational Technologies, Emotion and Affect, Eye Tracking, Learning Analytics
Presenting Author: Sharanya Lal, University of Twente, Netherlands; **Co-Author:**Tessa Eysink, University of Twente, Netherlands; **Co-Author:**Hannie Gijlers, University of Twente, Netherlands; **Co-Author:**Bernard Veldkamp, University of Twente, Netherlands; **Co-Author:**Willem Verwey, University of Twente, Netherlands

Emotions are a notable part of the learning experience. This in turn has a significant effect on learning outcomes. Therefore, it stands to reason that learners will benefit from digital learning systems that take their emotions into account. The prerequisite to this is a system's ability to detect emotions real-time, which may be made possible by sensors that continuously collect physiological and eye-tracking data. However, this is challenging because learning situations usually stimulate subtle emotions which may be difficult to detect. In this study, we investigated features derived from skin conductance, skin temperature, and eye movements that could be potential indicators of learner emotions. Forty-four university students completed three math related tasks during which sensor and self-reported data on the learner's emotional state were collected. Results indicate that skin conductance response peak count, saccade amplitude, fixation dispersion, and skin temperature are significant indicators of learner emotions. These features may be used to make learning systems more emotionally sensitive.

Long-term relations between teachers' attitudes towards technology and its use in the classroom
Keywords: Attitudes and Beliefs, Computer-assisted Learning, Educational Technologies, In-service Teachers
Presenting Author: Barbara Rončević Zubković, University of Rijeka, Faculty of Humanities and Social Sciences, Croatia; **Co-Author:**Rosanda Pahljina-Reinić, University of Rijeka, Faculty of Humanities and Social Sciences, Croatia; **Co-Author:**Martina Bažon, University of Rijeka, Faculty of Humanities and Social Sciences, Rijeka, Croatia; **Co-Author:**Svjetlana Kolić-Vehovec, University of Rijeka, Faculty of Humanities and Social Sciences, Croatia

In several theories and models on the adoption of modern technologies, attitudes are considered one of the main predictors of technology use, but the relationship between attitudes and digital technology use may even be reciprocal. However, longitudinal studies examining this relationship are scarce. Therefore, to investigate this assumed reciprocal relationship, the present study examined the longitudinal within-person dynamics of teachers' attitudes towards use of ICT (information and communication technologies) in teaching and learning (T&L) and their reported use of ICT-based teaching activities for students using a three-wave dataset gathered among 772 Croatian elementary and high school teachers and a random intercept cross-lagged panel model. This study was conducted as a part of a larger evaluation study examining the effects of the e-Schools project carried out by Croatian Academic and Research Network, with the aim of creating digitally mature schools in Croatia through the informatization of school operation and teaching processes. The results suggest that teachers' attitudes towards ICT use in T&L and the use of ICT-based teaching activities are jointly shaped by stable individual characteristics as well as situational factors. Some initial evidence for the expected reciprocal relationship between the perceived benefits of ICT use and the use of ICT-based teaching activities was provided, but no significant cross-lagged paths were identified for the perceived risks of ICT use and the use of ICT-based teaching activities. These findings provide an interesting point for further longitudinal examination of the relationship between teachers' attitudes and their use of ICT in the classroom.

Undergraduates' perceptions of an online training to integrate conflicting sources in writing
Keywords: Educational Technologies, Higher Education, Learning Strategies, Writing/Literacy
Presenting Author: Ruth Villalon, University of Cantabria, Spain; **Co-Author:**Maria Luna, Universidad a Distancia de Madrid (UDIMA), Spain; **Co-Author:**Isabel Martínez-Álvarez, Madrid Open University, Spain; **Co-Author:**Mar Mateos, Universidad Autónoma de Madrid, Spain

Integrating conflicting information from multiple sources is an essential skill in today's society. This ability can be developed in the field of education through tasks such as writing a synthesis after reading sources that present contradictory views about a topic. In this work, we focus on the design of an intervention on argumentative writing through the Moodle platform with students from an online university. The participants were 44 students of the Degrees of Psychology and Education. As an academic task, they were asked to write different syntheses after reading two sources presenting conflicting positions on various educational topics. Students received training about the processes involved on the synthesis task. The training includes different tools, using videos, graphic mediators and exercises, including an explicit instruction, as well as a modelling about the different phases of the synthesis writing process, focusing especially on integration. In this work we present, on the one hand, the particularities of the intervention and, on the other, the perception of the participants in terms of: (1) the degree of improvement in their skills, (2) the usefulness of the aid received and (3) their degree of satisfaction with the intervention. The results show that, in general, students consider that their skills have improved significantly and that the aids provided have been effective. In addition, their satisfaction with the intervention is high.

Internships and its influence on self-assessed competences of teacher students
Keywords: Competencies, Mentoring and Coaching, Mixed-method Research, Teacher Professional Development
Presenting Author: Carina Caruso, University of Paderborn, Germany

A lot of research on teachers' professional development focuses on formal learning in educational institutions. Competence-based teacher training raises questions for empirical research particularly regarding the impact of internships and practical phases as regular parts of study programmes: At the same time, many teacher education programmes nowadays implemented long-term internships. The main purpose of these internships aims at the development of competencies and skills through practical experience. This contribution discusses (1) challenges and potentials of learning in practice as well as (2) exemplary findings of a mixed-methods study that investigates the development of self-perceived didactic competencies and skills of teacher students during a long-term internship (5 months) in a German teacher education master programme. The results reveal in which didactic fields the students improved during the internship and in which they did not.

An exploratory study: perspectives of mentors on longterm internships at school
Keywords: Competencies, Mentoring and Coaching, Qualitative Methods, Teacher Professional Development

Internships are an important part of many teacher education programmes around the world. From a theoretical perspective, such internships aim at student teachers' development of competencies by experiential learning through the engagement in school practice as well as by relating those practice-based experience with theoretical and conceptual knowledge learned at university (e.g., Allen & Wright, 2014). Within the literature, mentors—that is, more experienced teachers that support, coach, and evaluate student teachers (e.g., Wang, 2018)—have been emphasised to play an important role in these development processes. In fact, without the guidance of more experienced practitioners, student teachers quickly lose themselves in the complexity of pedagogical situations, are incapable to recognize and interpret what is going on in schools, as well as are unable to reflect their experiences theoretically (Berliner, 2001). And although the importance of mentors have often been acknowledged almost nothing is known about the mentors' perspective on student teachers' internships as well as on the development processes they are supposed to support and supervise. The aim of this contribution is close this research gap. Based on an interview study with 23 experienced teachers that regularly serve as mentors during internships the following research questions will be answered: (a) What professional goals do mentors attribute students' teacher internships and how do they try to meet those goals? (b) What challenges do mentors face during their mentorship practice in the context of internships?

Second career teachers to the rescue? New insights on the development of their teaching skills
Keywords: Higher Education, Mentoring and Coaching, Pre-service Teachers, Primary Education

The immediate employment of second career teachers is seen as a solution for the increasing shortage of teachers in the Netherlands. This group with a prior academic degree starts teaching right away, while simultaneously studying to obtain a degree in teaching. This work/study combination is well known for its extreme workload and high dropout rate. Surprisingly, little is known about the process of learning to teach and the development of effective teaching skills of this specific group of teacher trainees.
At a teacher training college in a large urban area an effective developmentally appropriate coaching approach is used to align theory taught on effective teaching skills (proven to achieve maximum learning gains in children) with practice in elementary schools. This study researches how the teaching skills of second career teachers trained with this coaching approach develop. Furthermore, it studies whether there are differences in the way these skills develop, compared to those of other types of student teachers (i.e., part-time, or regular student teachers).
Using a paired t-test, the average growth of teaching skills of second career teachers (n=30) trained with the developmentally appropriate coaching indicates to be large (in effect sizes) on all six scales of the ICALT-observation-instrument. Yet, the growth of teaching skills of regular student teachers measured (n=159) is medium.
These insights can be used to further match training programs to the needs of second career teachers to become good teachers in the briefest possible time span.

Enabling Emerging Teacher Resilience through Reflective Writing
Keywords: Mentoring and Coaching, Pre-service Teachers, Qualitative Methods, Resilience
Presenting Author: Mikko Tiilikainen, University of Turku, Finland; **Co-Author:**Olli-Pekka Heinimäki, University of Turku, Finland; **Co-Author:**Janne Lepola, Univ. of Turku, Finland; **Co-Author:**Anu Kajamies, University of Turku, Finland

The purpose of this roundtable presentation is to discuss work in progress where we use systematic written reflection to study and support emerging teacher resilience in the context of teaching practice. Based on previous studies, teacher resilience is understood as a positive and functional adaptation process taking place when teachers deal with critical events in their teaching. Studies that aim to connect teacher resilience to instructional core practices – pedagogical, curricular, and didactical encounters in teaching – are lacking. Also, tools to promote resilience during teacher education remain scarce. Drawing on developments in parallel fields, especially in psychotherapeutic research, we suggest that emerging teacher resilience could be supported through carefully supervised written reflection practices. The empirical part of the study is based on systematically guided written portfolios that were collected from 32 student teachers during their second teaching practicum. The portfolio reflection focused on critical – empowering and challenging – teaching incidents that student teachers selected from their teaching practice. In-depth qualitative data are analyzed abductively using three lenses: How student teachers deal with a) instructional core relations, b) potential and actual adversity, and c) positive adaptation in their reflective episodes. The study constructs a theoretical framework for emerging teacher resilience as a transactional experience-reflection -process. Uncovered qualities of student teachers' reflection can be used to develop reflective practices in teacher education. The study provides a realistic and practice-based tool to promote emerging teacher resilience by modifying widely used practicum portfolio assignments.

Session I 24

24 August 2023 12:00 - 13:30
UOM_R08
Workshop
Teaching and Teacher Education

FLORERAAR?! A board-game to enhance (pre-service) teachers' resilience

Keywords: Game-based Learning, Pre-service Teachers, Resilience, Well-being
